Beyond the queries and objections lodged in relation to each of the genres presented, a wider concern can be aired: that right across these options revisiting ‘Marxism and religion’, the question of *science* is insufficiently foregrounded – the form of materialism that is appropriate to science, the status of Marxism’s affiliation with science, the right way to pitch the science–religion relationship. No doubt one reason for this neglect is that serious difficulties and deficits have beset previous attempts to articulate a Marxist understanding of ‘scientificity’, from Lenin’s materialist assault on ‘fideist’ empirio-criticism, through the catechism of Soviet ‘Diamat’, to Althusser’s anti-empirical conventionalism. Nevertheless, the strands of thought discussed in this chapter seem to eschew *any*

explicit positioning of religion in relation to science. Could it be that today's postsecular Marxists are too captivated by the 'revival of religion' to register fully the growing centrality of science itself in the life, thought, and prospects of humanity? Lacking space for detailed elaboration of these points, and in recognition of their complexity, the following assertions must serve as prompts to further necessary debate:

- Around the time of *The German Ideology*, Marx made a decisive move out of the problematic of religion as screened through *philosophy*, into the *empirical* study of human social formations and behaviour. Images of the postsecular Marx gloss over this crucial shift of perspective.
- Marx and Engels were impressed by scientific studies of religion in their time, and closely followed specialist developments in the scientific standpoint, not least Darwin's insertion of 'nails in the coffin' of religion and theology.
- Engels' later writings on science and materialism may have been clumsy and inconsistent, but they were neither crassly positivistic nor metaphysically materialist. Arguably, they were 'scientific realist' in character (O'Neill, 1996).
- However, we need to be careful here. Critical scientific realism as introduced to deserved applause by Roy Bhaskar (for example, 1979) somewhat exaggerated from the outset the primacy of *ontology* in specifying both the work of science and the function of philosophy. Bhaskar's later transition from 'depth' realism concerning science to hypostatized gnoseological 'realism about God', the 'Ultimatum', the 'cosmic envelope', and so forth, was thus not entirely incongruous (McLennan, 2009).
- Whatever the fortunes of Marxism as historical and social science, its impulse to be, epistemically and culturally, *on the side of science* is sound. This entails a view of philosophy as *part of* scientific endeavour, not as standing outside or above it. This is not a reassertion of positivism as such, because science, while systematically disciplined by empirical rigour, inevitably exceeds it in various ways.
- As a mode of knowing, modern science has been unprecedentedly successful and world-transforming (Gellner, 1992). Even if many individuals find ways of reconciling science and religious faith, both institutionally and cognitively the latter has steadily ceded ground to the former (Gingras, 2017).
- Scientific knowledge is imperfect and socially constructed, but it is also distinctively critical, consensual, and self-revising. Religions by contrast – monotheisms at any rate – can never completely erase their conflictual, absolutist rationale (Sloterdijk, 2009).
- Secular epistemology cannot expunge the need for metaphysical reflection, thereby leaving open to interesting exploration, for instance, the relationship between scientific realism and 'speculative realism' (Harman, 2018). Yet ontology and metaphysics are not more *fundamental* than epistemology, because foundational conceptions of whatever it is that deeply conditions the empirical and the possible often turn out to be parasitical upon the current state of scientific knowledge. Thus, Žižek's proposed 'new foundation of dialectical materialism' startles us with the proposition that the only good materialism today is idealism, 'matter' now being understood by physicists as mathematical structures (Žižek, 2014: 5–7). Entirely trading on the authority of contemporary science in this way, Žižek then blithely proceeds to the stale and dubious deduction that contemporary science has merely vindicated Hegel.
- Neither science nor philosophical naturalism *refute* religious beliefs or eliminate the openings for theological construction. But they have no overwhelming need to; the attraction of secularism and non-religion is more to do with the way social processes and cognitive breakthroughs gradually intensify the cognitive dissonance entailed by the metaphysical dualism that underpins religion in the modern context.

- While Marxists should fully appreciate the social importance, imaginative resources, and subjective appeal of religion, they should remain unapologetic in upholding the integrative pluralism of the secular scientific outlook.

Utopia

Chiara Giorgi

INTRODUCTION¹

The concept of utopia is highly contested and, in many respects, problematic, but it remains indispensable for the prefiguration of an alternative society, for moving beyond a system of power perceived as unjust, oppressive, obscure.² Utopia is problematic for its polysemic meaning (as illusion, the impossibility to achieve, a critical tool, a project, a dream), and for its controversial link with (but also distinction from) the concept of ideology (Mannheim, 1953). It is problematic if considered in its connection to constructions of imaginary and indeterminate worlds that are not anchored to reality, material conditions and social subjects, nor to concrete possibilities of transformation. And yet utopia is indispensable in its function of contestation – the ‘weapons of critique’ – in ‘the capacity to break through thickness of reality’, and in its ‘fictional power of redescribing life’ (Ricoeur, 1986: 309–10). Moreover, the concept of utopia is indispensable as a possible horizon for real historical processes; it sustains the idea of a movement of history towards a future that is paradigmatically valid to guide present action, together with the very possibility of building an alternative society (Cacciari and Prodi, 2016). In fact, utopias are essential in providing materials for the imagination and design of another world, and of a non-capitalist society in particular. Finally, utopia is indispensable in its allusion to a ‘principle of hope’, as Ernst Bloch would define it, capable of projecting the present into the open time of the future, of the possible-future.

In this chapter, moving from the modern form of utopia as inaugurated by Thomas More and Tommaso Campanella, I reconsider the relationship of Marx and Engels with utopian socialism. I then explore the idea of ‘concrete utopia’ in Bloch and some of his contemporaries, leading finally to an analysis of twentieth-century Marxist and radical thinkers – such as Immanuel Wallerstein, Fredric Jameson and Erik Olin Wright – who redefined the issue of utopia by linking it to the possibility of constructing concrete alternatives to capitalism. While some critics have expressed diffidence towards the ineffectiveness of utopian views, and others have pointed out the risk of totalitarian developments from utopian thinking, there is currently a renewed interest in the ideal and political dimensions of utopia.

FROM UTOPIAN SOCIALISM TO MARX AND ENGELS

These perspectives on and challenges to the concept of utopia are already present in the works of Marx and Engels. They devote part of the third chapter of the *Manifesto* (1848) to a critique of ‘critical-utopian’ socialists, addressing two central aspects of the question.

The first one is the attack on ‘Critical-Utopian Socialism and Communism’, and authors such as Fourier, Saint-Simon, Owen (to name just the better-known figures), whose dreams of the future end up deceiving the struggles of the new revolutionary subject: the proletariat. Their ideals ‘spring into existence in the early undeveloped period, [...] of the struggle between proletariat and bourgeoisie’. The main weakness of these authors, and of the movements derived from them, lies in the fact that – although they start from a rejection of the bourgeois world – ‘the proletariat, as yet in its infancy, offers to them the spectacle of a class without any historical initiative or any independent political movement’. As Marx and Engels continue: ‘Since the development of class antagonism keeps even pace with the development of industry, the economic situation, as they find it, does not as yet offer to them the material conditions for the emancipation of the proletariat’. The proponents of utopian socialism allow their personal inventive action to usurp historical action together with the historically generated conditions of emancipation. Their socialism is ‘an organisation of society especially contrived by these inventors’ instead of being a result of ‘the gradual, spontaneous class organisation of the proletariat’ (Marx and Engels, 1976: 514–5).³

As recently observed, the third chapter of the *Manifesto* introduces an important break with ideology: it is necessary to ‘break away’ with the discourses inherited from history – including those taking the side of the proletariat – in order to provide a representation of ‘the *totality* of interests and of the *future* of the movement of exploited subjects’ (Balibar, 2018a: 172). The crucial step made by Marx and Engels is therefore their speaking ‘the true language of the “*real*”’, of the class struggles that are ignored by other socialist theorists. What is left out

in all socialist literatures, including that of the critical-utopian socialists, is the '*irreconcilable character* of the class struggle that is deep-rooted in the regime of capitalist property' (Balibar, 2018a: 173).⁴ Class politics is thus situated on a completely different plane from that of utopia, as is scientific socialism with respect to utopian socialism, which corresponds to an embryonic stage of development of the labour movement. Marx and Engels write that the undeveloped state of the class struggle leads socialists of this kind to consider themselves superior to all class antagonisms and to appeal to society at large, including the ruling class (Marx and Engels, 1976: 515).

The second aspect concerning these authors and ideals that Marx and Engels grasped – reflecting the first impulses towards a general transformation of society of a proletariat that is not yet fully developed and therefore inclined to represent itself in a fantastical way – resides in their propulsive function. As argued by Marx and Engels: 'They attack every principle of existing society. Hence, they are full of the most valuable materials for the enlightenment of the working class' (Marx and Engels, 1976: 516). In particular, the practical measures proposed by utopian socialists are part of the broader project of an alternative to capitalism. As recently argued, the very text of the *Manifesto* is a real 'palimpsest', which incorporates countless words and phrases from the critical-utopian socialists and communists (Balibar, 2018a: 172).

There might seem to be a sort of political contradiction here, associated with the controversial meaning of the concept of utopia itself: its critical function, its allusion to an alternative project (but also its distinction from ideology), fuels the communist desire for transformation. In other words, there is a sort of split for the proletariat (and the communists) between the consciousness of their history (which is the history of the world, the history of a great civil war at the end of which they will free humanity) and the imaginary of a future whose profile is borrowed from utopian systems and which feeds the communists' transformative passion (Balibar, 2018a: 175).

The crux of the matter emerges in the final observations reserved for critical-utopian socialists. Marx and Engels argued that the class base of utopian socialist views had to be identified; some utopian socialist positions rested on a bourgeois perspective, hiding the reality of the class struggle, in opposition to the historical development of the proletariat. A crucial step here is the identification of the social subject of transformation, as a necessary component of the communist project, a requirement for 'the effectiveness of communist politics both in its critical dimension and in that of prefiguring a future free from the domination of capital' (Hardt and Mezzadra, 2018: 279–80).⁵ In this sense, the main purpose of the *Manifesto* was to identify a subject that was capable of subverting capitalist society and building a new world. Marx and Engels place the proletariat at the centre of revolutionary politics as a real subject. It is the new subject writing the history of the anti-capitalist class struggle in modernity and at the same time delineating the shape of a liberated future. Here lies the (original and enduring)

political force of the *Manifesto* and, at the same time, the break by Marx and Engels from the traditions of utopian socialism. This is a rupture with the modern form of utopia, as a prefiguration of a harmonious order, aimed at neutralizing contradictions and harnessing conflict.

Engels further develops the opposition between utopian socialism and scientific socialism in *Anti-Dühring* (1878), and in *Socialism: Utopian and Scientific* (1880). In these works, Engels takes up the arguments in the *Manifesto* again, addressing the limits of the positions of the founders of socialism, whose 'crude theories' coincide with 'the crude conditions of capitalistic production' and 'crude class conditions'. What was envisaged by utopian thought corresponded to a historical period, one that preceded the Industrial Revolution, in which socialist ideals could only have an abstract and arbitrary nature, being an expression of an era in which the development of capitalism and class antagonism was limited. In this context Engels argued that the utopians 'had to construct the elements of a new society out of their own heads' (Marx and Engels, 1987: 246, 253).

Despite recognizing the work of three utopians reviewed (Saint-Simon, Fourier, Owen), Engels pointed out the 'absolutist', anti-historical and eclectic nature of their socialism, to which he opposed scientific socialism. In place of a subjective and moralistic rejection, what is needed is a real understanding of the historical dynamics of the capitalist mode of production, of class antagonism and of the conflicts that may overcome it (Marx and Engels, 1987: 20 ff.).

According to Engels, it was thanks to Marx's two 'great discoveries, the materialistic conception of history and the revelation of the secret of capitalistic production through surplus-value', that socialism became a science (Marx and Engels, 1987: 27). The modern proletariat was the bearer of the historical mission of universal emancipation, of scientific socialism, rooted in the understanding of historical conditions, in the development of the working class and of its political struggles to overthrow the social order.

The Paris Commune has a major importance in this perspective. In the last revolution Marx saw, the last revolution in the heart of nineteenth-century Europe, the working class had at last discovered the political form under which to work out the economic emancipation of labour. A "'possible" communism', Marx argued in *The Civil War in France* (1871), had been achieved in the Paris Commune: 'a working class government, the product of the struggle of the producing against the appropriating class'. Here lay the political force of the working class, of the revolutionary subject, aware that for their own emancipation and the realization of a higher form of society there were no 'ready-made utopias to introduce *par décret du peuple*'; the working class 'will have to pass through long struggles, through a series of historic processes, transforming circumstances and men' (Marx and Engels, 1986: 334–5, emphasis in the original). The working class, Marx wrote preemptorily, has 'no ideals to realize, but to set free the elements of the new society with which old collapsing bourgeois society itself is pregnant' (Marx and Engels, 1986: 334–5).

The same question of transition to the new liberated society – a theme with a deep utopian dimension – will be outlined in anti-utopian terms in the *Critique of the Gotha Programme*, Marx's most explicit discussion of a post-capitalist society, where he envisages the qualitative leap that will take place in the move towards a communist society.

MARXISM AS CONCRETE UTOPIA: ERNST BLOCH

After the horrors of the Great War and the hopes of the October Revolution, there was a decisive development in the concept of utopia, at a philosophical level, in the writings of Ernst Bloch. He put utopia at the centre of his thinking combining a Marxist approach with radically new perspectives. The innovative meaning of utopia emerging from Bloch's work lies in its character as 'concrete utopia', understood as a principle of the struggle that points towards how much still remains to be explored. Bloch's first book, *The Spirit of Utopia* (1918), written during the First World War and full of *Sturm und Drang*, as he recognized retrospectively, represents a strong reaction to the positivistic culture of that period and, at the same time, manifests the incredible versatility of the young Bloch.

Here his fierce criticism of capitalism and imperialism, which he held responsible for the war, was also a protest against a world in which human contact with one's deepest and most intimate self was impeded by the anonymous, cold and speculative character of capitalist technology. Bloch, close to the artistic vanguards of his time, expressionism in particular, investigated the complex relationship between interiority and exteriority – with the intention of reconstructing a connection between them. He took his cue from his own experience of a precise historical moment that coincided with the collapse of many previous certainties, a profound spiritual crisis and the urgency of an immersion of the subject into him- or herself. Bloch did this by reviewing particular objects and specific situations and above all by an analysis of the language of music and of philosophical reflection itself. In his attempt to formulate a comprehensive philosophical conception, utopia immediately became the theoretical centre of Bloch's thinking, which aimed to establish it as the philosophical category of the twentieth century. Instead of letting himself be seduced by forms of negativity, Bloch tried to redeem the dissatisfaction for the present in an overall project of cultural, spiritual and philosophical refounding (Rampinini, 2018: 15–17). It is utopia itself that makes this redemption possible, for it is not the designation of a distant place, separate from the present, but the emergence of a tendency that causes the cage of the present to explode, and projects people into the forefront of the process (Cesarale, 2015: 108). Drive towards the future, recovery of lost sense, 'self-encounter', but, above all, concepts like 'the darkness of the lived moment' and the 'not-yet-conscious knowledge' constitute the main elements of this first conceptualization of the utopian. Specifically, what keeps these concepts

together, Bloch says, is the category of the 'not-yet', which enters the waking dreams of all of us. Daydreams, very different to night-dreams, refer to the not-yet that nevertheless also has a being: it is a not-yet-being. The not-yet-conscious and the not-yet-become appear in the world as something that is not yet there but is an emerging tendency.

In this sense, the very meaning of a better life – of the realm of freedom and a classless society – though not yet present, can be understood and shows itself as tendency and latency. For Bloch, the utopia of a better life has always been revolutionary. The relationship with Marx and Marxism is embedded within this trajectory. The final part of *The Spirit of Utopia* (1918) is in fact dedicated to Marx, to the thinker who allows the interiorization of the exterior and the externalization of the interior to be approached in an alternative way to the bourgeois and capitalist world. As Bloch will reiterate later, it is the Marxist mediation between theory and praxis and the Marxian critique of 'contemplative consciousness' that allow a different way of looking at the present and future together, as well as making it possible to grasp the inherence of the future to the present. In Marxism, utopia becomes a kind of pre-appearance, unlike in 'classical' utopian theories. If the great utopians, from Fourier to Saint-Simon, built imaginary places in a dreamlike image of the near future, Marxism went further, linking its practice to a finally realizable, concrete transformation, criticizing the abstraction of the previous utopianization, while remaining much more loyal to the orientation towards the future of the utopian function. For Bloch, Marxism is not a non-utopia, but the *novum* of a concrete utopia, of a utopia that set on its feet. This concept is contained in Bloch's masterpiece, *The Principle of Hope* (1986a) (written between 1938 and 1947). The motif of utopia is also present in *Thomas Müntzer as the Theologian of Revolution* (1921), a book inspired by the enthusiasm for the October Revolution and for the defeated German revolutions that followed in its wake. In this work, a kind of appendix for *The Spirit of Utopia*, it is more evident than ever that Bloch's concept of utopia feeds on the hopes and expectations aroused by the October Revolution and by Lenin's strategy, which allowed latent possibilities to emerge in the process of building socialism in a country usually considered far from the conditions of a revolution (Bodei, 1982). Müntzer, in many respects similar to Liebknecht and Lenin himself, illuminates the revolution's most powerful aim. He is a communist chiliast engaged in the struggle against exploitation, against princes and privileges, against theologians compromised with power (Luther himself), and he is, above all, a precursor of what will happen. In this sense the past, *in its incomplete and open character*, harbours events that are full of the light of the future – the still latent images of communism; utopias (including the Müntzerian one) feed the commitment and the transforming passions of the present and continue to project their potential of unexpressed possibilities towards the future.⁶

The insurrection of 1525 against the German princes held in itself the 'not-yet', the utopian call for the realization, here and now, of the potential and latencies

immanent to the present (Cesarale, 2015: 109). The utopian anticipation of the future is combined with an unprecedented conception of the past itself, and of time in general. The possibility of opening an access to a future hidden away in the unexpressed or repressed potentialities of the past (awaiting redemption) is combined with the retroaction of the present onto the past itself, assuming a profoundly political and *practically* productive meaning (Bloch, 2009).

No doubt, this is in harmony with Walter Benjamin's thesis *On the Concept of History* (Benjamin, 2006), especially with regard to the Messianic need and to the possible redemption of the past. A key concept here is that of *Eingedenken* (recollection, remembrance). This is not a mere memory, but the emergence of the potential that still awaits realization: the sudden irruption of the past into the present, breaking up the continuum of a purely chronological time, paving the way for unforeseen, subversive possibilities of the existent.

"Now-time" is the dialectical link between the unaccomplished past and the utopian future', and the 'history is not only a "science" but also, and perhaps the first of all, "a form of recollection"' (Traverso, 2016: 223; see also Bloch and Benjamin, 2017). On the other hand, one should recall that the well-known *Multiversum* metaphor (developed by Bloch to express the concept of a plural temporality (see Morfino, 2013; Morfino and Thomas, 2017)) stands out against the dominant line of historical progress, against the abstract temporality of capital, leaving the possibility 'to think the division between historical temporalities where nobody can talk for another or claim for oneself to be located on the high point of the tendency'. This leaves as a legacy a conception of the alternative that is situated elsewhere and behind us: in the possibilities not taken up by Western modernity, in the other beginnings that have been opened up by past struggles and that this modernity has foreclosed (Tomba, 2013: 17 ff.).

The Principle of Hope (1986a) represents Bloch's *magnum opus*, a sort of 'encyclopaedia of human wishful content' (Bloch, 1970: 115) intended to renew twentieth-century Marxist thought. This work established a new vision of the world, whose originality consists in wondering whether there is a possibility of a utopia existing in a still unactivated reality (Münster, 1977). Marxist philosophy – extensively discussed in *The Principle of Hope* and whose 'warm stream' Bloch was determined to valorize – is the philosophy of the future for Bloch, 'the philosophy of the New', the philosophy of conscious hope, of 'forward dreaming' (as Bloch puts it, borrowing Lenin's words) (Bloch, 1986a: 6, vol. I). Marxist philosophy is 'that of the future, therefore also of the future in the past', in that its past contains an unredeemed future, and hence an unconsumed reserve of possibility. It is this quality of being a living theory and practice tied to a *novum* that permits the unfolding of a transformative action, which at each moment realizes potentialities contained in the past (1986a: 9).

In this sense Marxism, as a theory-practice, is a philosophy and a politics of anticipation, a concrete utopia. 'True Marxism is, and must be, humanism and humanitarianism enhanced', as it is essentially a struggle against the dehumanization

which reaches its acme in capitalism. Marxism is – as Bloch would repeat in his work *Changing the World: Marx's Theses on Feuerbach* – not contemplation, but a directive for action, and it has produced the theory and practice of a better world not in order to abrogate the present one, as in most of the abstract social utopias, but in order to transform it economically and dialectically (Bloch, 1971: 36). The Blochian analysis of music deserves a special mention here, since music is the utopian art *par excellence*, in which the utopian nucleus is preserved, that is to say the excess with respect to the historical time and society in which it took shape, waiting to be brought to light, redeemed, realized in the future. The language of music, due to its open, indeterminate and indefinite character, is the one that can best express the Blochian ‘not-yet’, the possible becoming. As Bloch had already observed in *The Spirit of Utopia*, (1918) great musical masterpieces matter due to the newness they announce, which they *predict* and promise to implement.

According to the difference outlined in *The Principle of Hope* (1986a), concrete utopias differ from ‘the chimeric, Promethean dreams haunting the imagination of a society historically unable to realize them’, from abstract and compensatory utopias, qualifying them as ‘anticipatory hopes inspiring a revolutionary transformation of the present’ (Traverso, 2016: 7). In the Blochian proposal of an articulation of the possible, latent in the present, the concrete utopia is prefiguration, it is the realm of ‘not-yet’, ‘which by no means coincides with abstract utopian dreaminess’ (Bloch, 1986a, vol. 1: 146).⁷ Bloch opposes a mechanistic vision of Marxism and asserts his view of emancipatory Marxism, dialectical-utopian materialism, ‘real humanism’, claiming the importance of *the Ideal* and *the Final Utopia*. The latter are realities belonging to Marxism, where there is not only political economy but also the latent tendency towards an ultimate reality that affects the current one (Bloch, 1971: 171).

Criticizing the way Marxism had slipped from utopia to science, he challenged the abstract and illusory notion of utopia that had often prevailed, as well as the empirical notion of science. In doing so, Bloch upholds the values of ‘natural law’ – human rights, personal freedoms and the dignity of the human individual, which were wrongly liquidated by certain forms of Marxism – as a crucial legacy for a humanistic and democratic socialism.⁸ A utopian aspect is present in the ‘final goal’ of the struggle (a concept dear to Rosa Luxemburg) – the ‘transformation of the realm of necessity into that of freedom’ – an element that remains present in the memory of the oppressed, as an immanent latency in each strike and battle. In its being not yet visible, not yet manifest, the final goal remains in fact open to different possible contents that animate struggles, a utopian presence capable of concretely influencing reality. Bloch’s Marxism, the dialectical-historical science of knowledge of tendency, ‘is the interposed futuristic science of reality plus the objectively real possibility contained within it, and is wholly concerned with the goal of action’ (Bloch, 1971:103). An action oriented towards a transformation of the world, with a crucial role played by hope. The rehabilitation of utopia by Bloch represents a major novelty within Marxism, representing

within its ambit an original philosophy emphasizing real humanism, emancipatory goals, the revolutionary potential of past history and the open horizon of the future, in what ultimately amounts to a ‘theology of the revolution’.

REVIVING UTOPIAS

Utopia has returned to the forefront in the reflections and analyses of many contemporary Marxist authors, not only as a response to the anti-utopianism of the end of the twentieth century, but especially as a reaction to the ‘cold stream’ of neoliberal economic reason, as an effort to reappropriate a future that is being absorbed and abolished by a pervasive ‘presentism’ (Traverso, 2016: 7–8), as well as a starting point for designing an alternative to capitalism. The latter is increasingly characterized by brutality, exorbitant inequality, omnivorous financialization, de-democratization, and multiple phenomena of destruction, spoliation, expulsion (Sassen, 2014) and global economies of extraction (Mezzadra and Neilson, 2019).

Extractive logic and practices of dispossession, exploitation and expropriation, private appropriation of social value and common wealth are at the base of the current processes of valorization and accumulation of capital, in keeping with what Marx described at the origins of capitalism, but also in new and intensified forms (Harvey, 2005, 2010, 2014; Mezzadra and Neilson, 2013). A fundamental element of the current reorganization of capital is that valorization has seized one domain of life and human agency after the other, and particularly has latched onto the whole sphere of *social reproduction*. The economic and political rationality of neoliberalism, its technology of government and legitimation strategies (Ong, 2006) have emphasized the ‘natural’ character of the current social order, built on political resignation and the impossibility of change, a view summarized in Margaret Thatcher’s acronym: TINA, ‘there is no alternative’.

At the end of the twentieth century, facing the rise of neoliberalism and the new injustices of the global order after the end of the Cold War and the collapse of ‘really existing-socialism’, several radical intellectuals addressed the challenge of systemic change in new ways. In the UK, New Left intellectuals offered a rethinking of the future and of political strategies, building on previous works that had recovered neglected utopian socialist traditions against the legacy of Stalinism (Thompson, 1955; Williams, 1958). This is the case of E. P. Thompson’s biography of William Morris and of Raymond Williams’ *Culture and Society*; they both moved from a study of the romantic critique of industrial modernity and utilitarianism, turning it into a new source for socialist ideals. In *Towards 2000*, Williams – one of the most important scholars of utopian and dystopian literary forms, as well as of their historical and social conditions (Williams, 1977) – built on his work on culture and politics and argued for combining utopian perspectives and politically viable activism (Williams, 1983).

In France, André Gorz moved from a radical left position to a rethinking of key elements of change in the context of the decline of the 'waged labour society'. Reduced working time, minimum income, greater social activities carried out outside market relationships and widespread participation could all contribute to greater spaces of alternative social arrangements (Gorz, 1983, 1987). In a radically different context, that of Eastern Germany, Rudolph Bahro proposed a radical democratic reform of the socialist state with *The Alternative* (Bahro, 1978); after emigrating to Western Germany, he developed a 'red-green' vision of change (Bahro, 1984).

The global nature of contemporary capitalism, characterized by growing financial activities, the spread of information and communication technologies, and increased trade and investment, was challenged at the turn of the century by the rise of global social movements that developed a common agenda of change under the banner of 'Another world is possible' (Arrighi et al., 1989; Anheier et al., 2001; Wallerstein, 2002; Della Porta, 2007; Pianta and Marchetti, 2007). The rejection of neoliberalism and the heritage of Left political cultures was combined in these mobilizations with the utopian and participatory dimension rooted in community struggles and action by indigenous people.⁹

One of the most fruitful approaches for understanding the global dimension of capitalism has been developed by the world system approach, especially in the contributions of Wallerstein (1979) and Arrighi (1994). A later book by Wallerstein directly addresses the question of utopia. Facing the crisis of global order, he argues that 'utopistics' is 'the serious assessment of historical alternatives, the exercise of our judgment as to the substantive rationality of alternative possible historical systems [...] Not the face of perfect (and inevitable) future, but the face of an alternative, credibly better, and historically possible (but far from certain) future' (1998: 1 ff; Gordon, 2016). The relevant point is that the time is ripe for utopistics when there is a 'transformational TimeSpace', that is, moments of systemic bifurcation, of historical transition, when individual and collective action can have a major impact on the new shape of the world (Wallerstein, 1998: 1). In a similar perspective the alternative scenarios for the evolution of the world system in the twenty-first century are discussed by Arrighi in the Postscript to *The Long Twentieth Century* (2010). A first possibility is the enforcement of global political and military power by the USA; a second one is the rise of East Asia as the centre of a global market society respecting all cultures of the world; a third scenario is the possibility of global chaos (Arrighi and Silver, 1999).

After the crisis of 2008, the question of an alternative to capitalism has once again become a central concern for critical theories of the present, often being substantiated by more or less well-founded utopian references. The term utopia is used, provocatively in some cases, to refer to post-capitalist scenarios, as well as to capture how contemporary Marxist critical thought, working on several fronts to analyse the current conditions of the crisis, might envisage ways out

of it and outline the future of a radical transformational project (Kunkel, 2014). Facing an increasingly destructive form of capitalism and a left-wing politics that has been often unable to 'think' of an alternative, 'real utopias' have been proposed, concrete steps for change, for new non-capitalist forms of organizing social-economic life. This is the long-term project of Erik Olin Wright, who has investigated the transformations of capitalism and has explored and valorized the existing tension between dreams and practices, transforming this tension into 'utopian ideals that are grounded in the real potentials of humanity, utopian destinations that have accessible waystations, utopian designs of institutions that can inform our practical tasks of navigating a world of imperfect conditions for social change' (Wright, 2010: 6). Wright's empirical and theoretical intent has been 'to try to think of institutions which themselves are capable of dynamic change, of responding to the needs of the people and evolving accordingly, rather than of institutions which are so perfect that they need no further change' (2010: x). His book *Envisioning Real Utopias* moves from a critique of existing institutions to the search for emancipatory alternatives, in an effort to contrast widespread cynicism about the human capacity to realize egalitarian and emancipatory values. He first develops a critique of the present in the perspective of an 'emancipatory social science'. Second, he formulates specific alternatives (key examples include participatory city budgeting, Wikipedia, the Mondragon worker-owned cooperatives, unconditional basic income). Third, he discusses strategies of transformation, stressing the 'multiple pathways of social empowerment', and the uncertainty about the final outcomes we can reach.

From a different perspective, equally inclined to redevelop the idea of utopia, other Marxist critics have indicated in the concept of utopia the possibility of a space for thought and a philosophical and political laboratory that is historically necessary for envisaging a reality informed by new principles. In particular, Fredric Jameson has investigated the literary, philosophical and historical twists and turns of the utopian form, as well as its historical conditions of possibility. In this perspective, the political dimension of utopia, with its inherent ambivalences and antinomies, has a revived vitality and usefulness. In our times, characterized by empty imaginaries and the colonization of the future, the function of utopia is to help envisage political and empirical possibilities. While practical resistance to the system largely lacks programmes on how to achieve a global transformation, utopia plays a key political function well beyond a simple ideological reaction, asserting the possibility of an alternative. The utopian form (more than its content) 'is itself a representational meditation on radical difference, radical otherness, and on the systemic nature of the social totality', (Jameson, 2005: xii). Imagining any profound change in society presupposes in fact freeing utopian visions. In this way, utopia is as a form of 'disruption', breaking the continuity of time and habits and challenging the stereotypes of a future that remains homogeneous with the present. The radical break comes not so much from a representation of how things would be in the future, but rather from forcing us to think

about the break itself, starting from a meditation on what it may be impossible to achieve within the bounds of the present.

A key distinction made by Jameson is that between utopian programme and utopian desire. The latter is an opportunity to liberate and socialize energies and underground images of transformation able to affect daily life. In spite of its structural ambiguities, Jameson argues that the notion of ‘anti-anti-Utopianism’ might be proposed as a viable strategy (2005: xvi).¹⁰ Given the importance of imagining possible futures, Jameson devotes extensive attention to the literary texts that have addressed utopian themes. Science Fiction is of major importance here and utopia (as well as dystopia) is seen as a socio-economic sub-genre of Science Fiction, where utopian themes and impulses for action have been widely explored.¹¹

Jameson’s latest treatment of utopia, *An American Utopia: Dual Power and the Universal Army* (2016), comes from the need to imagine an alternative future to contemporary capitalism, having an elaborate and ‘positive’ utopian vision at one’s disposal that is capable of feeding and contrasting the imaginary of a present with no way out. Going beyond the traditional approaches (revolution or reform), here Jameson critiques political theory and politics itself, arguing for the emergence of dual power where the desire of utopia could find expression. His provocative proposal (an organization of society inspired by the model of universal conscription for virtually the entire adult population) comes from the will to revitalize and use the well-known concept of dual power originated by Lenin and Trotsky. Therefore, the effort is to imagine specific institutions that may help replace the dominance of contemporary capitalism, solving the problem of distribution while challenging the neoliberal *credo* (and falsehoods) of austerity, together with the inexorable force of market and its hold over our desires. In a time like the present in which ‘the past is gone’ and ‘we can no longer imagine the future’, the conceptualization of dual power is therefore a new way to think revolution (Jameson, 2016: 13). This formulation of dual power calls into question some of the most relevant issues regarding the future of the alternative to capitalism, such as the difference between constituent and ‘destituent’ power, the definition of politics,¹² the nature of conflict (that is, of the subjects and issues at stake, and the practices developed) and especially how we understand the transition out of capitalism.

However, the problematic character of the concept of utopia has attracted criticism from those who reject the utopian/dystopian binary. For example, in the context of current dystopian or techno-utopian narratives produced in connection with technological development, emphasis has been placed on a Marxian approach aimed at finding practical technological paths able to face the need for new social relations, new conceptual frameworks, a new interaction with nature and all the associated transformations required to escape from the despotism of capital and the madness of economic reason. Here, the terrain of the alternative is outlined starting from capital’s *contradictions*, from the *unity* of the multiple and radical struggles in the present and future, from the force of an emancipatory

politics – incarnated by a collective political subjectivity – that knows how to liberate immense productive forces from the domination of capital and from imperialist and authoritarian state apparatuses (Harvey, 2018: 126).

PERSPECTIVES FOR AN ALTERNATIVE

In our age of transition, which can be effectively described, following Antonio Gramsci, as an ‘interregnum’, reclaiming the future, via an action of prefiguration – the paradoxical ‘concrete utopia’ in Bloch’s rendering of Marx – is an urgent task. In Marx, however, there is no utopia; what is there is the ‘imagination’ of an alternative society – the self-government of free producers – who collectively shape the system of production, reproduction and distribution to satisfy one’s needs in relation to one’s strength and productive capacities. According to Balibar, in contrast to Messianic notions of change, in Marx we have ‘the idea of practice, or of liberation as transformation by one’s own labours’, on the basis of production and his conditions (Balibar, 1995: 99 ff.). Against evolutionary interpretations of Marx’s philosophy, we encounter in his writings constant reminders of the unexpected, of the multiplicity of processes and of the potential for revolutionary rupture. It is no coincidence that among the living elements of Marx’s thought we discover politics in its most creative dimension. Marx’s notion of the alternative is that of the fork in the road, not of a simple point of arrival; the alternative at stake goes well beyond the historic failure of socialist countries in the twentieth century. The force and actuality of Marx resides also in his allusion to an open and non-linear process of transformation.

What in fact Marx does, and therein lies his current relevance, is ‘to think the change of historical institutions on the basis of the relations of force which are immanent in them, in a way that is not merely retrospective, but above all, prospective’ (Balibar, 1995: 120). Moreover, the very image of communism as the ‘real movement which abolishes the present state of things’ enables us to clear the field of evolutionism and to rediscover, in Marx’s thought, the immanence of communism in the struggles of the present and in the transformation that these produce in society and its actors. As suggested by Althusser (2016), communism is an objective tendency already inscribed in our society.

In composing his most important work, *Capital*, Marx was ‘obsessed’ not only with understanding the laws of capitalism, but also with its future tendencies, where it could open itself to revolution, how it could be possible to exit capitalism (see Hudis, 2013). In this sense, in *Capital* there is not only the political economy of capitalism and its critique, but also the materialist ‘beyond’. Alongside the scientific critique of capitalism, politics and class struggles are equally present. Such coexistence is grounded in Marx’s conviction that capital ‘is not a *thing* but a *social relation* between persons which is mediated through things’ (Marx, 1990: 932). This formulation lies at the basis of Marx’s new materialism and

opens the way to an understanding of the ‘production of subjectivity’. The process of valorization of capital also produces and reproduces the social subjects of the capitalist and the wage labourer, in a complex interweaving around the notion of capital as social relation (Mezzadra, 2018).

The term ‘relation’ implies both the ‘conditions of subjection’ and the potential of ‘subversion and transformation’ on the terrain of the valorizations of capital itself, which is ‘the same terrain on which the contradictions and antagonisms that characterize the capitalist mode of production are formed and become visible – as a material basis for the interruption of its historical continuity’ (Mezzadra, 2018: 96–7). In *Capital*, Marx emphasizes the constant movement of capital, with its contradictory internal logic: the inevitable conflict between the operation of capitalism with its endless search for profits, and the *socialization* of productive forces it generates. To adopt Luxemburg’s formulation, this is a case of a *contradictory logic* inscribed within capital.

Marx pointed out this conflict between two opposing social tendencies: on the one hand, the progressive force driven by the *socializing* logic of the development of forces of production, on the other hand, the dynamics of capital accumulation that work to prevent this socialization. This is an antagonism between tendencies and counter-tendencies to socialization. In other words, ‘What we have [...] is a growing contradiction between *two tendencies*: the socialization of production [...] and the trend towards the fragmentation of labour-power, towards super-exploitation, and insecurity of the working class’ (Balibar, 1995: 95). The class struggle plays a decisive role in resolving the objective contradiction that is transformed into conflict and *vice versa* (Balibar, 2018a: 157). Here organized politics has a crucial function, specifically animated by those political subjectivities that are capable of inserting themselves within these contradictions and using them in the struggles they wage.

Building on this internal contradiction of capital, and on the tension we pointed out between utopian visions and concrete struggles, new forms of conflict may emerge. They can invest the materiality of life, the relations of production, reproduction and production of subjectivity with demands for equality, freedom and justice on a planetary scale. The concept of utopia could be reformulated moving from the contradictory internal logic of capital and opening the way to a process of liberation. If considered in these terms, anticipation is not something belonging to the world of dreams. On the contrary, the possibility of transforming our world follows from the potentiality of conflict, the expansion of democracy and the reshaping of social subjects, allowing us to re-imagine the link between freedom and equality in a future that is already present.

Notes

- 1 I thank Gabriella Bonacchi for her contribution to an earlier draft of this chapter, Alberto Toscano for his suggestions and Mike Harakis for the English translation of parts of the text.
- 2 See Capdevila (2015) and his definition of utopia as a ‘concept in play’ (*Un concept en jeu*).

- 3 Some authors have distanced themselves from Marx's critique of utopian socialism, seen as reflecting the paradigm of Western civilization, and have reconsidered the non-Marxist tradition. In particular, see the link with the black radical tradition proposed by Cedric J. Robinson (1983, 2019).
- 4 My translation.
- 5 My translation.
- 6 The view of Bloch is challenged by Lukacs who considers him as the main representative of the utopian strand of communism, depicted – as argued by Toscano – as 'the historical counterpart of a Christian dualism that left the City of Man unscathed, deporting human wishes to the City of God' (2010: 82). In fact for Lukacs, Bloch 'is unable, as was Müntzer, to extricate himself from a theology that impotently juxtaposes a transcendent humanization to a dehumanized world, the utopian to the concrete'.
- 7 In this sense, in the seventies Bloch would distance himself from the 'too idealistic' concept of utopia of Marcuse (1967).
- 8 In this regard, it should be remembered that in *Principle of Hope* Bloch includes natural law in political utopias, subsequently developing the implications of this choice (see Bloch, 1986b).
- 9 Typical of this combination was the revolt of the Zapatistas in Chiapas, Mexico, that started in 1994.
- 10 On this see Cazdyn (2007). In Jameson (2009) the function of utopian allegory is discussed further, using the example of Wal-Mart and its monopoly power on production and consumption models.
- 11 On the connection between fiction and utopia see Beaumont (2005) on nineteenth-century utopian literature and in particular the work by Suvin (1979) on Science Fiction.
- 12 For more details, see the considerations by Alberto Toscano in the book containing Jameson's essay and responses to it, edited by Slavoj Žižek (Jameson, 2016: 211–41).

Affect

Emma Dowling

In *The Eyes of the Skin*, Juhani Pallasmaa tells us the ‘atmospheric characteristics of spaces, places and settings are grasped before any conscious observation of details is made’ (2015: 15). Yet when we attend to our surroundings, we usually think foremost of what people, buildings and material infrastructures look like, rather than what they feel like. Even less so do we consider what they enable us to do and be – how they affect the ways that we relate to one another. We do not often reflect on whose lives are made possible or impossible by physical infrastructures, or the sorts of social relationships and convivialities they promote or prevent. Pallasmaa thus invites us to immerse ourselves in architectural space with an ‘epistemology of the senses’ against the ‘dominance of the eye that pushes us into detachment, isolation and exteriority’ (2015: 21).

When we do so, our senses are more than the sum of their parts. Not simply providing us with an aggregate of information, they produce in us affective states, corporeal dispositions and psychic conditions. They induce feelings that propel us to think certain thoughts and engage with the world in certain ways – sometimes reinforcing, sometimes pushing at the parameters of the possible constituted by the feedback loop between the self and the world the body encounters (with all of its senses) as we go about our daily lives. This shifts the focus away from the internal world of the individual subject and what drives it ‘from within’ towards attention to the ways in which bodies are constantly responding to other bodies and objects, even before a conscious thought has been formed or a word

spoken. Brian Massumi (2002: 219 f. 17) calls this a 'processual oscillation' to describe how we are always enmeshed in affect – in embodied communication – and the resonances this enables.

Since the early 2000s there has been marked by the rise of an interest in affect across the social sciences and humanities. What Patricia Clough and Halley (2007) discuss under an 'affective turn' is a movement drawing on a mix of theoretical heritages from across philosophy, psychology and neuroscience. For Gregg and Seigworth (2010: 3) there are two lineages of affect. First, there are theoretical approaches that draw on the affect theory of US psychologist Silvan Tomkins (1962/1963), for whom affects constitute a set of circumscribed bodily sensations akin to emotional responses and hard-wired into human physiology. Second, there is a body of work that looks to the non-Cartesian philosophy of Benedict Spinoza (2001), to Henri Bergson (2007) and to the late-twentieth-century French poststructuralists Gilles Deleuze and Félix Guattari, who, as Gregg and Seigworth summarise, determine affect as an 'ethology of bodily capacities' beyond the individual subject and across organic and inorganic life (2010: 5). However, where Spinoza locates affect with human subjects, Deleuze and Guattari have a much more transversal, impersonal conception of autonomous affects. Some approaches, such as that of neuroscientist Antonio Damasio, cut across different lineages – for example, operating with a framework of primary emotions while also drawing on Spinozist philosophy (Damasio, 2003; Leys, 2011). Concepts that traverse different academic disciplines and scientific traditions can often run into problems of translatability. Therefore, we should bear in mind that there is neither one clear theory of affect, nor do all deployments explicitly subscribe to one or another lineage. Indeed, much contemporary thinking is taking place precisely at the aporia, interstices and crossings between these different connotations of affect.

The concept of affect does have explanatory value for understanding societal phenomena and has been taken up in Marxist analyses of contemporary capitalism in at least three ways: first, as a corrective to narrow interpretations of ideology and the governance of subjects as reduced to language and signification; second, in the analysis of contemporary modes of capitalist valorisation – the exploitation of affective labour and the rendering productive of sensations, moods and atmospheres (including through digital technologies); and, third, in the analysis of social movements and the potentials for transforming capitalist social relations and the affective imaginaries and practices these are manifest in. I will discuss each of these points in turn. I begin with a discussion of the concept of affect. I argue that an understanding of affect that serves a Marxist theorisation of the capital relation is one that conceives the affective as a register. Conceived as such, affect does not need to displace existing analytical frameworks. Instead, it functions as an attribute that expands Marxist theory in generative ways.

THE AFFECTIVE TURN

Affect opens up a terrain of sense-making focused on the corporeal modes of communication that organise bodies as movements of social relations. Affect is produced in the ways that bodies engage (with) one another. This is not to be understood simply as the capacity of one isolated, atomised, self-contained individual body. Instead, this is capacity as generated through movement and through the contact, connection and encounter with other bodies. Affect, then, is concerned with the relationality of 'sense' and describes physiological shifts or transmissions of energy, mood or intensity before these are verbalised in emotion, thought or speech (Redman, 2009). Apparent here is not only a sense of affect as the 'inbetweenness' (Gregg and Seigworth, 2011: 3) between bodies and objects; there is also importance attributed to movement in terms of shifts in energy or intensity, but in terms of something that is in a process and therefore open-ended, expressive of potentials that can augment or diminish our capacities (power) to act on and in the world (Massumi, 2002: 16).

Affects are understood as intensities that – while perhaps malleable and in flux – are nonetheless reified. Affects become entities (albeit co-produced through communication) that can be detected in their effects either by the human body or by technologies, and the latter may be able to register these in ways that escape human perception, or are, at the very least, prior to – or maybe on the cusp of – consciousness. Affect is said to be concerned not with what something is, but *how* it is – or, more precisely, how it affects and is affected by other things. As Elspeth Probyn suggests, 'affects make us feel, write, think and act in different ways' (2011: 14). While for Probyn the human subject is the sensing-feeling-thinking entity, Marie-Luise Angerer goes a step further to suggest that, 'for the theorists of affect ... representation is a focus of criticism, being viewed as a mediator of the world and the subject that always interposes itself, thus obstructing access to reality' (2015: 107). The suggestion here is that affects do indeed have a life of their own that are in excess of the subjects that seek to interpret them.

Affect theory prioritises an ontological focus on the affects themselves. These are understood to be situated outside the subject, circulating around and through individual bodies and subjects. There are a number of contemporary developments that facilitate such an ontological shift, including neuroscientific and neurobiological engagements with the brain alongside genetic engineering and assistive technologies that manipulate and change the body; or the turn to biological and physical science, from cellular processes to quantum physics. These developments go hand in hand with a questioning of the centrality of the human subject within a continuum of human, animal, organic and inorganic life, something which contemporary 'new materialisms' as well as trans/posthumanism turn their attention to (Coole and Frost, 2010). An attention to affect also coincides with the rise of digital technologies, where 'forms of communication in

digital media simply omit the stage of articulation in words, entering into a gradual symbiosis with the physical body' (Angerer, 2015: 5) with attempts to 'grasp affects via digital computing and recording techniques' (Angerer, 2015: 6). What motivates affect theory in the focus on the non-verbal, the gestural, the pre-cognitive and non-conscious dimensions of communication is the question of that which language cannot grasp, what goes on in this realm beyond and aside from the thinking-feeling subject and how it might be theorised and understood.

CRITIQUES OF THE AFFECTIVE TURN

However, while an ontological concern with affect yields a productive perspective from which to radically decentre modern constructions of the human, it confronts an epistemological impasse where theory must not only describe but also explain – that is, generate meaning out of that which is observed, felt, calculated or thought. The risk is that the physical body is placed on a continuum with a supposed reality and in its autonomic responses to the external world it continuously encounters and is enmeshed in speaks its own truth – supposedly 'free' from the discursive constructions of social meaning and their conflicting interpretations, beyond ideological interpellation or the overdetermined intentionality of the Freudian unconscious. Even Nigel Thrift, who coined the term 'non-representational theory', has conceded: 'whilst refusing to grant reflexive consciousness and its pretensions to invariance the privilege of occupying the centre of the stage, dropping the human subject entirely seems to me to be a step too far' (2007: 13), while Damasio (2003) insists on the continued relevance of our sense of self and – we might add – agency and responsibility in the social and political world.

Psychologist Margaret Wetherell offers a corrective when she states that

very complicated and mostly seamless feedbacks occur between accounts, interpretations, body states, further interpretations, further body states, etc. in recognisable flowing and changing episodes. The phenomenon, the unit of analysis for social and cultural research on affect, is not an inarticulable, momentary, spurious, hard-to-detect, pre-conscious judder. It is affective-discursive practice, or that domain of social practice which bears on and formulates the conduct of activities we conventionally recognise as making psychological and emotional sense, and, in the process, making psychological subjects and emotional events. (2015: 152)

In other words, to reduce the study of the social to affects is unnecessary and in the last instance problematic, because it limits our understanding, as opposed to expanding it. It may be that a methodological focus on affects for the purposes of analysis can be helpful in sharpening our attention and generating novel insights, but it cannot replace the rich and complex theoretical heritage with which we make sense of the social. Set alongside current debates on technological developments, the effects of automation and the rise of so-called 'post-truth

politics' (Roberts, 2010),¹ an articulation of affects with the reflexive and thinking human subject is paramount, albeit one that rejects the anthropocentrism, sexism and racism that has informed humanism in the past.

THE AFFECTIVE AS A REGISTER

Much of the affective turn rests on drawing a stark distinction between affect and emotion, where before the two terms were interchangeable. Where emotions are considered verbalised feelings ensconced in cultural signification, affect is supposed to capture that which precedes or stands aside from such signification. Affect exists before personal interpretation takes place and describes how individuals are affected by their environments as 'receivers, interpreters of feelings, affects, attentive energy' (Brennan, 2004: 87). While the boundaries remain fluid, not least if we consider the affectivity of language itself (Hutta, 2015), this distinction between affect and emotion helps to heighten awareness of the different dimensions of embodied sociality. All conceptualisations of affect have in common a commitment to making sense of how we are affected by and affect one another and the environments we move in, and how we come to judge or value a person or an object by the response they elicit in us, as Spinoza urged.² Consequently, I propose to think of the affective in terms of a *register*, because while affect might be considered that which lies between, below, beyond or beside subjects (Protevi, 2009), affects are connected to the bodies and thus the subjectivities involved in both producing and responding to them. The affective register has both an ontology and an epistemology: it is a component part of how we think-feel, how we literally *make sense* of the social. Affect describes how individuals are affected by their environments and how bodies are perceptors connecting us as social subjects to one another and to the space and time we move through. We produce knowledge about the world(s) we inhabit, through how we are immersed in the materiality of life with our bodies: what we pick up through the different ways that bodies communicate with one another, through language, sight, sound, touch and smell, and how these communications circulate between people, constituting relationships and making and remaking the everyday. In that *sense*, we are enmeshed in affective environments. These are environments that we read through an 'affective reconnaissance' (Dowling, 2012: 3). We are constantly picking up cues with our bodies that certainly influence – even if they do not wholly determine – how we feel. As we experience this influence, we are also responding to it and acting on it. Thus, we act on our environments and the sensations, rhythms and vibrations that circulate through them and compose them. Affect denotes the relationality of sense, sensation and sense-making: how we respond to an encounter or experience in terms of the physiological responses we produce and the physical environment – for example, in the resonances and attachments to objects (Sedgwick, 2003; Ahmed, 2014; Berlant, 2011). Affect

relates to how an encounter feels on our skin, the resonances that make us embrace or shy away from someone or something, or from an activity. To be attracted or repelled – to be excited or depressed; to be swept up in something; what catches our attention, how and why; to be compelled to take a particular action or not; to sense moods and levels of energy, the impulses of attention along with trajectories such shifts in attention open up or close down; to be disposed towards something, to anticipate, to respond to bodily murmurs and gestures, postures and stances; the resonance of a tone of voice; facial expressions, charisma, intuition; atmospheres and moods; architectural environments, smells, tastes, feelings – these all denote the affective register. This register may be understood as a (sub)terrain on which bodies record and transmit communications that shape our very being in the world – our excitement, passion, joy and ease; as well as our boredom, aches and pains; our frustrations, fears and anxieties. Not always in conscious ways, but always embodied in circulations productive of moods, atmospheres and sentiments, as well as through the affective dimensions of social relationships: the connections and disconnections, divisions and hierarchies, affections and disaffections, investments and disinvestments, associations and dissociations that are sensed and acted upon. What happens on this register is relevant to the shaping of what it is possible – or indeed impossible – for subjects to imagine, describe and enact when it comes to the social.

AFFECT AND IDEOLOGY

Yet, how do we study what we cannot yet – or even ever – put into words? What happens to the political when we are attentive to gestures and sounds, bodies and their movements? How do we grasp cultural moods and atmospheres and make sense of their political significance? An early cue for affect theory came from Marxist cultural and literary theorist Raymond Williams (1977: 132–4), who introduced the term ‘structure of feeling’, with which he tried to capture emergent social and cultural changes that are beyond signification and representation (Grossberg, 2011: 318). For Williams, ‘we are talking about characteristic elements of impulse, restraint and tone; specifically, affective elements of consciousness and relationships: not feeling against thought, but thought as felt and feeling as thought: practical consciousness of a present kind, in a living and interrelating continuity’ (1977: 132). Williams was interested in the moment ‘at the very edge of semantic availability (before) specific articulations – new semantic figures – are discovered in material practice’ 1977: 134). Structures of feeling are not reducible to ideology or to formal class relations, but point to changes in class relations that are emerging, hypothetical even. As such, they may not (yet) be clearly articulated.

In the context of contemporary capitalism, Patricia Clough argues, ‘ideological interpellation and subject disciplining can no longer be the centrepiece of

an understanding of sociality, even though disciplining and socialising go on. It would seem necessary that we add to an understanding of sociality the modulations of the affective background of a way of life' (2009: 54). Beyond Foucauldian governmentality, this is framed as a management of populations where affective capacities are modulated as ways of 'grabbing' and thus occupying attention in specific ways, instilling particular responses, states of being and ways of life that are self-reproducing in the circulation of affects within a population, notably augmented through the instantaneous reach of digital communications. One can look here to Brian Massumi's (2005: 33) analysis of the politics of securitisation operative through fear in the face of potential terrorist attacks. One can also look to how the Institute for Precarious Consciousness (2014) designates anxiety as neoliberalism's dominant affect. Jeremy Gilbert (2015: 29) proposes the term 'disaffected consent' to describe a profound dissatisfaction with both the consequences and the ideological premises of the neoliberal project; on the other hand, it involves a general acquiescence with that project, a degree of deference to its relative legitimacy in the absence of any convincing alternative, and a belief that it cannot be effectively challenged.

This is similar to Mark Fisher's (2009) notion of 'capitalist realism', which demonstrates the deeply felt truth of there being no alternative to the status quo.

A difficult relationship between the possibility of empirically detecting affect and the productivity of theorisation about the affective register remains: while depression, anxiety and disaffection might be identifiable in populations, the interpretation of these affects in the ways the authors cited here contextualise them requires more than simple attention to affect. Affects require interpretation. Nonetheless, we live in an age where capitalism is penetrating deeper into our lives. An attention to the affective register is the condition for making sense of such developments. An important realm in which affects are rendered productive today is in the realm of work, where the concept of 'affective labour' has been introduced to explain the ways in which this phenomenon occurs.

AFFECTIVE LABOUR

Waitresses, nannies, psychotherapists, politicians, campaigners, teachers, customer-service advisors, call-centre workers, managers, retail workers, sex workers, fortune tellers, tour guides, nurses, carers for the elderly, actors, managers, cuddle therapists, social workers – an affective labourer is anyone whose work 'involves the production and manipulation of affect and requires (virtual or actual) human contact, labour in the bodily mode (whose) products are intangible, (such as) a feeling of ease, well-being, satisfaction, excitement or passion' (Hardt and Negri, 2000: 292). It is not the labour in itself which is intangible, as 'it involves our bodies and brains as all labour does' (Hardt and Negri, 2005: 109), but rather its product. Affective labour, according to the authors who coined the

formula, produces 'social networks, forms of community, biopower [where] the instrumental action of economic production has been united with the communicative action of human relations' (Hardt and Negri, 2000: 293). In other words, affective labour does not help to sell the product: it *is* the product. The turn to affect is a response to the transformations of capitalism and work under conditions of Post-Fordism. The notion of 'affective labour' (Hardt, 1999; Hardt and Negri, 2000) was elaborated in Marxist analyses informed by Italian Post-Workerism (*post-operaismo*). Affective labour explains the transformations of the capital–labour relationship under conditions of Post-Fordism and the expansion of forms of service work that demand from workers that they put their communicative skills to work directly in the production of services. As a term for critical political economy, the concept was mobilised to analyse the capitalist valorisation of human affectivity.

Affective labour allows for an understanding of the ways that workers engage their affective capacities vis-à-vis co-workers and the customers with whom they have to interact to produce a particular service, which is at the same time always also an affective experience. Affective labour involves the embodied work – mental, emotional, corporeal, verbal and non-verbal – performed to produce certain moods, feelings or sensations – for example, feelings like enthusiasm, inspiration, motivation or excitement, or the sense of being cared for. It is work through which we (usually) enhance our own and others' capacities to act. Affective labour does not just produce experiences or environments; it produces relationships and subjectivities: ways of seeing the world, ways of being in the world. Affective labour can also be governmental: managing moods, modes of conduct or flows of people.

The products of affective labour are unlike physical objects, such as washing machines or cars, in that they are not detached from the act of producing them. Think, for example, of the work of marketing and advertising (on- or offline), or of a worker making and receiving calls in a call centre, constantly having to manipulate their voice to convey and produce certain mental states in customers in order to sell them products or address their concerns (Woodcock, 2016). Or think of the work of a waitress in a restaurant or in a bar, who, in order to do her job anticipates and produces her customers' needs. Or think of the work of a teacher, who has to be able emotionally to read and respond to their students in order to create a classroom environment conducive to learning. The psychotherapist or the nurse has to be able to empathise with their patients; the shop assistant has to make the customer feel 'satisfied', whatever it may take. Or think of how the conductor on a railway or metro platform has to use their affective capacities to steer the flows of people getting on and off the trains. Some contemporary forms of affective labour may also require the deliberate production of negative affect – for example, in administering sanctions and having to enforce austerity measures on welfare recipients (Friedli and Stearn, 2015). All of this work may well take place along a continuum of psychic alienation – that is, with more or

less personal investment in the job – but these workers are required to put their very *selves* to work to a greater or lesser degree.

Rendering affective labour maximally productive requires that it is abstracted, quantified and measured, controlled, regulated and managed by employers (Dowling, 2007, 2012; Moore and Robinson, 2016). This is achieved through the quantification of the qualitative dimensions of social relationships. In the ‘Nosedive’ episode of the dystopian TV series *Black Mirror* (2016: season 3, episode 1), scripted by Charlie Brooker, a near-future society is depicted as functioning on the basis of a reputational economy, in which the ratings of social interactions people give to each other via their smartphones – as affable dinner party guests, loyal friends or amenable customers – function as the currency for social inclusion and economic success (e.g. holding down a job or buying a house). While Brooker’s social critique uses fiction and hyperbole for the sake of effect, the production of affect is increasingly achieved by introducing metrics that measure affective outcomes within a hierarchy of quality that in turn is, or can be, linked to economic value. The call-centre worker whose successful manipulation of affect translates into sales (Woodcock, 2016); the academic institution whose rankings in student evaluations of teaching determine student numbers and access to funding (Holligan and Shah, 2017); the social worker whose work with teenagers improves their attitudes towards their education or even helps to reduce recidivism (Dowling and Harvie, 2014) – these are all examples of areas in which a metricisation of affect is occurring in the workplace, in which not only are the affective products of work being subjected to the calculative eye of capital in general terms, but this calculative eye is still very much bound up with the maximisation of productivity and cost-efficiency under the pressure of time.³

When affective capacities are directly commodified and rendered productive for capital, they promote the deeper penetration of the capitalist logic into the social fabric in a labour process. In terms of the capital–labour relation, this presents new challenges for a Marxist theory of alienation. There is an emotional tug of war that takes effect here. On the one hand, the worker has to put a lot of affect in, really *invest* to do the job well. On the other, withdrawing affect – that is, not investing too much – becomes a way of coping, a way of developing a strategic, instrumentalised, relationship towards feelings. We try not to get too involved in order to protect ourselves from becoming over-invested and thus hyper-exploited, although sometimes it might seem that there is no longer much of a difference when we come to (over-)identify with our work, such that we feel like we are exploiting ourselves. This is especially the case when the emotional tug of war of this work also relies on an ‘affective remuneration’ (Dowling, 2016): job satisfaction, skills training, enhanced wellbeing in lieu of getting paid, having fun at work. Or, conversely, it might utilise a form of ‘affective blackmail’ (Berg, 2014) that relies on us doing the affective labour of worrying, internalising responsibility and going beyond the call of duty or simply providing services even when pay is low or cuts to wages occur. This phenomenon is particularly prevalent in

caring professions, where, as feminists have long noted, the consequences of not caring are hugely detrimental to those who rely on the receipt of care (Precarias a la Deriva, 2011).

Taken together, these affective interpellations underscore the dynamics of 'dewaging' (Lorey, 2016: 43) and the increase of 'shadow work' (Lambert, 2016) that characterise financialised capitalism. They also sync well with the 'regressive recovery' (Green and Lavery, 2015) that is happening in the wake of austerity and crisis, which has seen a rise in the amount of unpaid reproductive labour being performed in households and in communities in countries like the UK (Pearson and Elson, 2015). Furthermore, against the backdrop of increasing precarity and job insecurity, we constantly have to render ourselves employable by enhancing our competitive advantage through skills, knowledge or other assets. We are compelled to do this, Michel Feher (2009) says, to ensure that the value of our labour power does not depreciate.

Precarious forms of work have an affective composition (Read, 2014), but they are also marked by considerable tensions and conflicts among and across class relations that come with heightened competition, precarity and the increasing scarcity of employment. Not least, the service economy organises the affective composition of work that structures the social relations between customer and employee. This rests upon an unequal power relation, mediated by exchange relations, that counterposes the needs and interests of the customer against the needs and interests of the service provider, playing one off against the other, where the (paying) customer has a control function that is outsourced from management. This shapes the service provided and the subjectivities produced. Moreover, the aforementioned efforts to dewage work and externalise the cost of social reproduction facilitate further wealth extraction as a form of dispossession, considering that many individuals and households are forced not only to earn a wage, but to take on debt to cover living costs. This also has significant affective dimensions in the way that indebtedness can reinforce feelings of inadequacy and shame within the context of rising social and economic inequality (Davies et al., 2015).

FEMINIST CRITICISMS OF THE AFFECTIVE TURN

There are three aspects of the feminist critique of the affective turn that are relevant here. First, Sara Ahmed (2014: 206) has pointed out that there is really nothing new about the importance of affects, emotions and embodiment for understanding the social, and feminist work has from the outset challenged mind–body dualisms and the distinction between reason and passion. By turning to affect, social and cultural theory seems to turn away from such theoretical lineages. Second, we find related concerns voiced by critics of affective labour who take it to task for underplaying of the persistence of gender, race and class in the structuring of work and the expectations placed on workers' performances.

Angela McRobbie (2010) has insisted that any analysis of contemporary forms of work must be attentive to these different affective dimensions – for example, when particular roles are ascribed to men or to women based on their gender; with regard to the distribution of responsibilities and decision-making power; in terms of pay inequalities; or when a woman or gay or transgender person experiences harassment. As McRobbie asks, ‘How do young men and women experience distress differently in their attempts to make an independent living in these new informal fields of work? And how would such affective states be analysed?’ (2010: 65). Third, the turn to affect has been questioned for its sidelining of reproductive labour as a category of analysis. Feminist scholar Silvia Federici has criticised affective labour as regressive. She argues that the concept erases the analytical work feminists did to make women’s reproductive and care work visible. Affective labour refers primarily, she argues, to the commodification of the unpaid, invisibilised reproductive labour carried out in the home by women, which is work that reproduces labour power and thus the conditions for capitalist valorisation. The problem is that the ‘collapsing of all distinctions between production and reproduction, waged and unwaged, risks obscuring a fundamental fact about the nature of capitalism ...that is, capital accumulation feeds on a systematic devaluation of reproductive work’ (Federici, 2011: 60). Here lies a cause of disagreement between Marxist Feminism and Post-Workerism regarding the nature of work under Post-Fordism. Marxist Feminism, alongside Black and Third World Marxisms, excavated the differential value of labour power, seeing it as going far deeper than the mere demarcation of skill-differentials and hierarchies within the labour process. Feminist interventions demonstrated the interlocking of oppression and exploitation: gender and race/citizenship play a significant role in determining both the value of labour and economically ascribed roles across a spectrum of waged and unwaged work. The claim that under Post-Fordism the commodity form reaches everywhere surrenders some of the very tools required to analyse capitalist social relations. By ignoring the concept of reproductive labour (and its gendered and racialised dimensions) and thus erasing the concomitant analysis of social reproduction, Post-Workerism arguably misrepresents contemporary capitalism and once again renders the continued existence of the sphere of unpaid reproductive labour in the home and elsewhere invisible. For example, in the UK, the Women’s Budget Group has shown that in the wake of the Global Financial Crisis of 2008 and the ensuing austerity regime the amount of unpaid reproductive labour carried out by women has increased and women have been picking up the tab for this restructuring (Pearson and Elson, 2015). Such analytical insights are politically extremely relevant and would be impossible without an understanding of the interplay between production, reproduction, gender, race and class.

The debate above is indicative of some of the confusion around the term ‘affective labour’ and its analytical value for taxonomising forms of labour. A closer look at the literature shows that there is a considerable degree of conflation

in such taxonomies of labour that span the fields of emotion, affect, relationships and service provision. The distinction between 'affective' and 'emotional' labour remains unclear, save to indicate the disciplinary home or intellectual corner from where an author hails. However, if we are to enable affective labour to do some analytical work, which I believe it can do, then we have to be more precise in defining it and distinguishing it from other existing concepts.

RE(DE)FINING AFFECTIVE LABOUR

While the Marxist-Feminist analysis of social reproduction must not be displaced by the concept of affective labour, affective labour remains analytically useful for making sense of the ways in which social relations and human capacities are rendered productive for capitalist valorisation. This is especially important as we conduct analyses of the ever-expanding service sector and the effects this has on social relationships. Affective labour must be distinguished from other terms such as 'emotional labour', defined as 'the management of feeling to create a publicly observable facial and bodily display; emotional labour is sold for a wage and therefore has exchange value' (Hochschild, 1983: 7). Hochschild enquires into the labour process of the flight attendant and the ways that her ability to manage her own feelings and those of others is put to work for the corporation – that is, for the purposes of making passengers feel cared for and at ease during their flight, and for the purposes of making a profit. While focusing on the concrete experience of the flight attendant working for Delta Airlines in the early 1980s, this is an analysis that extrapolates from the specificity of the particular experience to all of 'us who have jobs that require some handling of other people's feelings and our own' (Hochschild, 1983: 11).

There is a great deal of overlap between emotional and affective labour – its gendered dimensions and performativity, the negotiations over authenticity and the way that the corporation deskills, manipulates and harnesses the relational capacities of the worker. We can, however, distinguish between emotional and affective labour in a way that allows for the concept of affective labour to be deployed analytically such that it adds to rather than replaces – or, worse, displaces – extant feminist analyses. For Hochschild, the defining component of emotional labour is the worker's management of their own or other feelings for the purposes of producing profit. I wish to propose that the lens of affect enables us to describe and analyse the not always verbal, not always conscious, sometimes only sensed and embodied ways in which workers interact with each other and with clients in order to produce intended and unintended effects, while creating and responding to atmospheres, moods and environments. Affective labour broadens the register of analysis and enables us to be attentive to more than the management of feelings. Nonetheless, the question that animates both the concepts of emotional and affective labour is one that asks about the emotional

investment we have in the status quo, the work we do, the way we live and the basis for organising for possible change. It is to the question of organisation and change that my contribution now turns.

AFFECT, RESISTANCE AND ORGANISING

If capitalism today operates on the register of the affective, how might this affective register be relevant as a site of struggle for emancipatory social change? While Laurent Berlant has noted that ‘shifts in affective atmosphere are not equivalent to changing the world’ (2011: 116), a number of scholars and activists have been concerned with the affective dimensions of resistance: workplace and neighbourhood organising, as well as social and political protest. From understanding the production and reproduction of public feelings (Cvetkovich, 2007) to the role of affects in social movements (Sitrin, 2012), there is a growing interest in the relationship between affect and political organising. Some authors have suggested that the withdrawal of affect or its redirection away from the demands of capitalist valorisation could be a useful strategy for building resistance (Lordon, 2014; Trott, 2017). However, the problem here is that the withdrawal of affect would also mean the diminution of capacity to act; it would mean precisely a *disengagement* in the absence of any alternative collectivities. Writing about the counter-globalisation protest against the G8 summit in Heiligendamm, Ben Trott (2007) links the affective experience of collective protest to the broader political effect it may or may not have. He argues that it matters if a protest *feels* effective, even if in the grand scheme of things a particular protest might not make that much of a difference. The positive affect generated among participants who experience themselves as part of a social movement is something these subjects carry home with them back into their everyday lives, where it takes effect in their actions, or the explicit organising and campaigning that they do. For Stephen Shukaitis (2009), it is the affective register of resistance that serves to sustain actors and the social movements they comprise, beyond a mere concern with tactical or strategic effectiveness.

Others have considered the politics of affective dispositions and the link between thinking, feeling and action. Combining affect theory with the philosophy of Ernst Bloch, Kathi Weeks (2011: 195) considers the political significance of ‘hopefulness’ as a desire for a future that can be envisioned as different from the present. Such an affective disposition of hopefulness is a possible springboard for pushing back against the clouds of disaffected consent (Gilbert, 2015) of neoliberal ideology, while also resisting ‘left melancholia’ (Brown, 1999) by releasing the handbrake of nostalgia towards potential new futures emerging out of present struggles. Spaces of resistance and processes of organisation in workplaces, in neighbourhoods, in squares become realms of reorganisation of

affects and the production of new subjectivities and connections that can enact new possible worlds. Yet, on which values might these new possible worlds be premised? In addition, who will be involved in bringing them about? Can emancipatory change be solely based on the affective and the enhancement of capacities to act? Moreover, is it possible to distinguish on an affective register between emancipatory progressive politics and reactionary right-wing kinds? Here, we come full circle to the question of what affects are and what they can or cannot help us to do. If affect is merely characterised as the ‘excess’ or ‘surplus’ of conscious thinking-feeling, it becomes paramount to reconnect the former with the latter. Social transformation still requires consciousness, reflexivity and critical literacy in order to confront and transform the affective modulations of contemporary capitalism in the struggles against oppression, exploitation and war.

CONCLUSION: A MARXIST THEORY OF AFFECT?

In this chapter, I have assessed the political economy of affect and the implications for Marxist theorisation of the capital–labour relation. Focusing on central elements of affect theory as they have influenced and challenged the process of theorising social relations, I critically assessed the ‘affective turn’ that began to shape social, cultural, political and economic theory at the end of the 1990s. The chapter has explained the concept of affect and points to its different theoretical lineages across Spinozist and poststructuralist philosophy, neuroscience and psychology, and the theoretical work being done across these traditions. I have emphasised the impossibility of isolating a single definition of affect, while also seeking to draw together overlapping tenets and proposing the idea of an affective register as a way to bring together the strength of an attention to affect against a reductive reading that privileges affect as an autonomic bodily response, or indeed as detached from social subjects and processes of subjectivation. The chapter then discussed the relationship between affect theory and Marxism with regard to three core aspects: affect and ideology, affective labour and affect and organising – and with that, protest, resistance and change. The chapter has paid particular attention to the ways in which these concepts have been deployed in the analysis of the political economy of Post-Fordism and the nature of contemporary forms of capitalist valorisation and exploitation, ‘immaterial’, precarious and unwaged work, as well as Marxist Feminist debates on gender, labour and social reproduction. I have argued that while there is no distinct Marxist theory of affect, the affective register is pertinent for the contemporary Marxist critique of political economy and the analysis of ideology, subjectivation and alienation, along with the ways in which the capitalist valorisation of labour occurs today and the forms of resistance that emerge.

Notes

- 1 The term 'post-truth politics' gained much ground after the events of 2016, notably the UK referendum on Brexit and the election of President Donald Trump in the USA. The term refers to a situation in which the emotional quality of politics – whether public debates or assertions by political actors seeking to influence an electorate – matters more than any relationship to truth or rational deliberation.
- 2 'For the excellence of ideas, and the actual power of thinking are measure by the excellence of the object' (Spinoza, 2001: 32).
- 3 Hardt and Negri (and other Post-Operaist thinkers) suggested that the relative importance of new forms of (immaterial and) affective labour for capital means that this workforce has considerable power in the struggle against capital. This power stems from the fact that, in contrast to previous industrial workers, (immaterial) and affective workers 'own' their means of production – their cognition, their intellect, their emotions, their creativity. These developments have not in any way eradicated existing power differentials and stratifications within class composition and the gendered and racialised international division of labour (Hardt, 1999: 98). However, under Post-Fordism, according to their argument, capital no longer organises labour but simply 'captures' – in the sense of siphoning off – the surplus value produced by immaterial labourers. This means that the conditions for liberation from the capital relation are 'internal to labour' and reside with these workers and in the forms of community and collectivity that are being established. The yoke of capital can be cast off once workers realise the parasitic nature of its rule. Moreover, as contemporary capitalism operates directly on the level of subjectivity, the classical Marxist theory of alienation has to be abandoned for one that doesn't so much hark back to an original essentialised state of unalienated existence as look to the possible new (progressive) subjectivities emerging out of the present (Berardi, 2009: 44ff.; Weeks, 2011: 205–8). I argue that the power of capital to subsume affective labour and not only harness it but also organise it in specific ways is much stronger than was accounted for in early Post-Operaist theorisations.

The Body

Søren Mau

‘Certainly man is of kin to the beasts by his body; and, if he be not of kin to God by his spirit, he is a base and ignoble creature’ (Bacon 1985: 53).¹ This quote from Francis Bacon’s *Essays* (1625) sums up well a widespread attitude towards the body in Western intellectual culture. The body has been made to represent everything we ought to strive to liberate ourselves from: bestiality, nature, labour, pain, lust, mortality and profanity, in contrast to the spirit, which then comes to represent the bond between humans and the divine, civilisation, reason, science, culture, bliss and immortality. Although we should avoid the simplified narrative of this dualism as a uniform and unquestioned presupposition running down the entire Western history of ideas, it is well-documented that there has been a consistent tendency to shroud the body in an atmosphere of mistrust, hostility and disparagement, especially in the last four centuries.² This devaluation of the corporeal has always been intimately connected to colonialism, capitalism, sexism and racism by facilitating the forging of ideological bonds within which women, the colonised, people of colour and the poor appear as closely connected to the body and hence to that which has to be contained, tamed and civilised (Bordo, 1993; Fanon, 2008; Federici, 2004; Spelman, 1982).

Since the 1980s there has been a consistent effort among critical scholars in the humanities and social sciences to untie these ideological knots by highlighting and examining the corporeal dimensions of human life. This *corporeal turn*, as it is often called, was inaugurated by feminist and post-colonial scholars, and it began to pick up steam just as the renaissance of Marxism came to an end in

the late 1970s and 1980s. On a theoretical level, the corporeal turn thus came to be dominated by phenomenology, psychoanalysis, new materialism and so-called post-structuralism.³

Something close to a consensus about the irrelevance of Marxism quickly emerged in these debates about the body. As Michel Foucault (1980: 58f) put it in an interview in 1975: 'Marxism considered as a historical reality has had a terrible tendency to occlude the question of the body' (1980:58f). This statement might be a bit one-sided, but as a claim about the dominant Marxist trends in the first three-quarters of the twentieth century, it is certainly not unfounded. In the same interview, Foucault also mentioned that 'there are some very interesting things about the body in Marx's writings'; a suggestion which has rarely been given the attention it deserves. Foucault most likely had Marx's analysis of factory discipline in mind, but he was more right than he knew. Although frequently overlooked, the body occupies an absolutely central place in Marx's writings (Fox, 2015; Fracchia, 2005, 2021).

MARX

In 1844, Marx realised that the emphasis among certain Young Hegelians on 'criticism' as a vehicle of political change was inadequate. In order to break with this intellectualist view of politics and the human being, Marx reached out for the 'real, corporeal *human being*, standing on solid ground, exhaling and inhaling all the forces of nature', which he found in the work of Ludwig Feuerbach (Marx and Engels, 1975a: 336, translation amended). As an antidote to (Young) Hegelian idealism, Marx insists that the human being is 'a part of nature', which means that it 'must remain in continuous interchange' with external nature as its 'inorganic body'. Despite this, the young Marx of 1844 still takes (self-) *consciousness* to be the defining feature of the human being: only by virtue of consciousness is this peculiar being a 'species-being', capable of elevating itself above the animal by relating to itself as a universal being (Marx and Engels, 1975a: 275ff, translation amended). In this respect, Marx is still moving within the boundaries of traditional dualisms of human/animal and mind/body (Bates, 2015; Benton, 1993).

The emphasis on the naturalness and hence also the *corporeality* of the human being is also found in *The Holy Family*, where Marx accuses Young Hegelians of separating 'the soul from the body' and thereby reproducing the Christian view of the body as something sinful, in contrast to holy nature of the soul (Marx and Engels, 1975b: 150, 177).

In the *Paris Manuscripts* of 1844, Marx had already replaced Feuerbach's abstract notions of love, will and reason with a Hegelian notion of labour in his attempt to identify the essence of the human being. In the 'Theses on Feuerbach' (1845), he radicalises this idea with his claim that we need a materialist appropriation of the idealist emphasis on the subject's active and transformative relationship

to its surroundings in order to counter the tendency in materialist thought – including that of Feuerbach – to think of the human being as something purely passive. At the same time, however, Marx also breaks with the idea of labour as the human essence: *essence* is replaced with the notion of an ‘ensemble of social relations’, and *labour* is replaced with *praxis* (Marx and Engels, 1976a: 3ff).

In the manuscripts known as *The German Ideology* (1845–46), Marx and Engels reap the rewards of this fusion of an idealist emphasis on subjectivity and a materialist emphasis on corporeality. Human beings are no longer distinguished from other animals with reference to consciousness, but rather by the fact that they *produce*, i.e. that their access to means of subsistence requires them to actively transform their surroundings – ‘a step which is conditioned by their corporeal organisation’ (Marx and Engels, 1976a: 31, translation amended). The human being is, in other words, defined by the specific structure of its body, which accordingly becomes ‘the first fact’ of Marx and Engels’ new materialist social theory (Fracchia, 2005; Marx and Engels, 1976a: 31). In an intriguing note in the margin of the manuscript, Marx traces human historicity to the structure of the human body: ‘humans have history because they must *produce* their life, and indeed must do so in a *specific* way: this is given by their corporeal organisation’ (Marx and Engels, 1976a: 43). Despite these potentially far-reaching ideas, however, the analysis of the body remains sketchy and underdeveloped in *The German Ideology*.

As natural, corporeal beings, humans have certain *needs* which have to be met in order for them to exist. Throughout his entire *oeuvre*, Marx consistently emphasises that although it makes sense to speak of a certain set of basic, natural needs which *have* to be met, these needs are always shaped by and fulfilled in and through historically specific social relations (Heller, 2018; Marx, 1993: 278; Marx and Engels, 1977a: 216; Soper, 1981). The ‘production of life’ thus ‘appears as a double relation: on the one hand as a natural, on the other as a social relation’ (Marx and Engels, 1976a: 43).

Inspired by advances in sciences such as physiology, thermodynamics and chemistry, Marx begins to incorporate concepts such as energy, force and – most importantly – *metabolism* into his materialist social theory in the early 1850s. His theory of the corporeal nature of human subjectivity and historicity is now coupled to an understand of labour as a part of a metabolic flow of energy; a conception which reinforces the emphasis on corporeality and opens up a radical ecological perspective (Foster, 2000: 5; Marx and Engels, 1991b; Rabinbach, 1992; Saito, 2017: 2; Wendling, 2009: 2).⁴

In the *Grundrisse* (1993), written in 1857–58, Marx continues to develop the notion of metabolism, which he now connects to ‘labour’ (*Arbeit*), after a period of 12 years (1845–57) in which he reserved that term for the specifically *capitalist* form of ‘activity’ (*Tätigkeit*). This allows him to develop an analysis of the ways in which the logic of capital inserts itself in the processes ‘through which the body reproduces its necessary metabolism’, thereby fortifying its power on the most fundamental level of social reproduction (Marx, 1993: 640).

By inserting itself in this metabolism, capital isolates the proletarian body as a 'purely subjective existence' or a 'naked life', cut off from direct access to its objective conditions (Marx, 1993: 296, 607ff; Marx and Engels, 1976b: 499). In the *Grundrisse* we also find the first seeds of what will eventually become the celebrated analysis of 'the so-called primitive accumulation' in *Capital*. In this analysis, Marx demonstrates that the emergence of capitalism was premised on a separation between the immediate producers and the means of production, and that in order to establish this separation, 'bloody means of coercion' had to be used against the rebellious bodies of the proletarians *in spe* (Marx, 1993: 736).

The *Grundrisse* is also a birthplace for an idea which will become central in the analysis of labour and technology in the *1861–3 Manuscript* – a 2,500-page long and rather chaotic manuscript, initially intended as the continuation of *A Contribution to the Critique of Political Economy* (1859) – and the first volume of *Capital*: the centrality of tools in the human metabolism. In the *Grundrisse*, Marx begins to refer to tools as *organs*, i.e. as *parts of the human body* (Marx, 1993: 693, 706). This idea is expanded and deepened in Marx's technological studies in the *1861–3 Manuscript* and in *Capital*, most likely under the influence of Charles Darwin, whom Marx greatly admired after having read the 'epoch-making' *On the Origin of Species* in 1860 (Foster, 2000: 6; Marx, 1990: 461). Marx appears to have been particularly interested in Darwin's analysis of 'the history of natural technology, i.e. the formation of the organs of plants and animals, which serve as the instruments of production for sustaining their life' (Marx, 1990: 493; Marx and Engels, 1991a: 387). Marx realised that the peculiar thing about human beings is that rather than possessing a set of specialised organs which are functionally related to a specific environment, they have a body which enables them to use a wide array of different tools, i.e. they are able to couple and uncouple organs from their bodies, depending on the environment and the specific task at hand. Marx refers to tools as *organs* because they are a *necessary* part of the human metabolism: 'just as the human being requires lungs to breathe with, so it requires something that is the work of human hands in order to consume the forces of nature productively' (Marx, 1990: 285, 493, 508; Marx and Engels, 1988: 58, 59, 65, 75f, 295). He thus approvingly quotes Benjamin Franklin's definition of the human being as a 'tool-making animal' (Marx, 1990: 286; Marx and Engels, 1988: 98). This does not mean that *individuals* are forced to mediate their relationship to the rest of nature through tools, but rather that *someone* in the social units which guarantee the reproduction of the individual will have to.

Even though Marx does not make the connection himself, the analysis of tools in the writings from the 1860s could be read as a belated specification of the concept of 'corporeal organisation' from *The German Ideology*. There, Marx and Engels claimed that humans *produce* their means of subsistence because of the structure of their bodies, but they did not specify what they meant by this. After the introduction of the concept of *metabolism* and the idea of *tools as organs*, it becomes possible to see how the specifically human corporeal organisation is defined by the fact that

the human body is fitted for the use of tools rather than a specific ecological niche. Human *produce* their means of subsistence because their metabolism with the rest of nature is necessarily mediated through tools. Humans have no natural habitat, they do not fit in any specific environment – or rather, they fit equally well in all, or at least most, environments. The universality of the human being, which the young Marx interpreted as a result of (self-) *consciousness*, is thus now understood to grow directly out of human corporeality.

Marx's theory of the tool-mediated metabolism also allows us to revisit the claim from *The German Ideology* about historicity being the result of the human corporeal organisation. The thing about tools is that although they are a kind of organ, that is, a *part of the body*, they are also much easier to *separate* from the rest of the body than organs such as the liver or the skin. Furthermore, although tool-use is a *necessary* moment of the human metabolism, there is no *specific* set of tools which every individual must necessarily make use of. In order for humans to live, their metabolism must be organised, but there is no immediately given or natural way of organising it. The human being is biologically underdetermined by virtue of the structure of its body; it is an unfinished being whose organs are produced and circulated in a social environment, where they can also end up as someone else's property and thereby a means of coercion.⁵ The structure of the human body thus entails a unique degree of flexibility with regards to the ways in which the social reproduction of human communities can be organised; only because of this is something like different modes of production possible, or, in other words: *human historicity is directly rooted in the structure of the human body* (Hoffmann, 1982: 96; Malm, 2016: 280; Soper, 1995: 126, 139).

Another topic which also makes its first appearance in the *Grundrisse* and then becomes central to the *1861–3 Manuscript* and *Capital* is the analysis of the effects of capitalist production on proletarian bodies. Inspired by Andrew Ure's (2006) apologetic celebrations of capitalist industry, Marx identifies yet another Feuerbachian inversion of subject and object in the relationship between workers and machinery: instead of workers using tools or machines as organs, the capitalist factory becomes an 'automaton consisting of numerous mechanical and intellectual organs, so that the workers themselves are cast merely as its conscious linkages' (Callard, 1998: 395ff; Marx, 1990: 4, 1993: 692, see also 690; Marx and Engels, 1991a: 497, 1994: 30, 37). In connection with his studies of technology in the *1861–3 Manuscript*, Marx then begins to discover how this industrial regime involves the radical remoulding of proletarian bodies in order to calibrate them to the rhythms of capital – an analysis he continues to develop in the first volume of *Capital*. As competitive pressures force capitalists to constantly revolutionise the production process, workers are compelled to adapt their 'own movements to the uniform and unceasing motion of an automaton' (Marx, 1990: 546; Marx and Engels, 1988: 332). The 'compulsion of the workshop ... introduces simultaneity, regularity and proportionality into the mechanism of these different operations, in fact first combines them together in a uniformly

operating mechanism' (Marx and Engels, 1988: 271, see also 259). This corporeal calibration is closely connected to energy forms: by replacing the unreliable and irregular animate power stemming from the muscles of humans and other animals with the unremitting, flexible and submissive power of coal or oil, capital greatly enhances its capacity to ensure the worker's 'subordination to the system of machinery as a whole' (Malm, 2016: 310; Marx and Engels, 1988: 269, 342, 1989: 419, 1991a: 488f, see also 491, 497, 1994: 29, 98, 102).

Another place where the corporeal is intensely present in Marx's text is in his powerful, graphic and damning descriptions of the noisy, hot, suffocating, dangerous and claustrophobic realities of the capitalist workplace in *Capital*. These vivid descriptions bring out very well what Joseph Fracchia (2008) calls 'the corporeal depths' of Marx's critique of capitalist immiseration. This dimension of Marx's critique is not limited to the production process, but concerns several other aspects of the proletarian condition, such as the food available to proletarians. A good example is Marx's nauseating description of the ingredients of bread from the cheap bakeries of nineteenth-century London: 'human perspiration mixed with the discharge of abscesses, cobwebs, dead cockroaches and putrid German yeast, not to mention alum, sand and other agreeable mineral ingredients' (Marx, 1990: 359, see also 807). The corporeality of capitalist immiseration also emerges very clearly in Chapter 25 in the first volume of *Capital*, where Marx provides many examples of the dangerous and unhealthy living conditions of the British and Irish proletariat (Marx, 1990: 802ff).

MARXISM

While the body is central to Marx's social theory and critique of capitalism, the same cannot be said of the classical Marxism in the era of the Second International. Although Engels (Marx and Engels, 1987: 330, 457), Karl Kautsky (1929, 1989), Georgi Plekhanov (1947: 146ff) and Nikolai Bukharin (1928: 5) deserve credit for recognising what Kautsky calls the 'ambiguous nature' of tools, i.e. that they 'belong to man as his organs and are yet at the same time part of his environment', the conclusions they drew diverged dramatically from those reached by Marx. Whereas Marx's study of the technologically mediated nature of the human metabolism in the early 1860s had led him to *abandon* the idea that history was driven by an inherent and transhistorical tendency for the productive forces to develop, the first generation of Marxists took the exact opposite path: for Kautsky and Plekhanov – and, although to a lesser degree, Engels – the analysis of tools became the basis for a determinist conception of history according to which 'the productive forces at man's disposal determine all his social relations' (Plekhanov, 1971: 115).

Classical Marxists such as Lenin, Antonia Labriola, Rosa Luxemburg, Franz Mehring and Rudolf Hilferding were generally not particularly interested in

the body. A minor exception is August Bebel, whose influential *Women and Socialism* briefly discusses the differences between the male and the female body in order to reject reactionary arguments about the natural inequality of the sexes and affirm that woman 'should have the freedom of disposing of her own body' (1910: XIV). A similar emphasis on women's right to their own bodies can be found in Lenin's discussion of abortion and contraception (Vogel, 2014: 123).

The situation is not much different among so-called Western Marxists such as Georg Lukács,⁶ Karl Korsch, Antonio Gramsci,⁷ Lucio Colletti, Louis Althusser and Guy Debord. There are a number of exceptions to this general picture, however. Corporeality is certainly present in the thought of Freudo-Marxists such as Wilhelm Reich, Erich Fromm and Herbert Marcuse, although this is more the result of the influence of Freud than a specifically Marxist engagement with the body. The psychoanalytical focus on the body as a seat of desire and drive also plays an important role in the thought of Max Horkheimer and Theodor W. Adorno, who identified a 'love-hate' relationship to the body running down through the history of Western culture: 'The body is scorned and rejected as something inferior, enslaved, and at the same time is desired as forbidden, reified, estranged' (Horkheimer and Adorno, 2002: 193). This ambiguity, which is ultimately grounded in the (class) division of labour, reaches its zenith in the fascist unity of violent annihilation and quasi-religious worshipping of the body; 'those who extolled the body in Germany, the gymnasts and outdoor sports enthusiasts, always had an intimate affinity to killing, as nature lovers have to hunting' (Horkheimer and Adorno, 2002: 195. See also Adorno, 2007: 202, 400, 2005: 242; Lee, 2004).

Prior to the corporeal turn of the 1980s, the most consistent effort to make the body a central object of theoretical attention took place in the path-breaking phenomenological analyses of corporeal experience undertaken by Simone de Beauvoir (2015), Frantz Fanon (2008), Maurice Merleau-Ponty (2013) and Jean-Paul Sartre (2003). Although these thinkers can in varying degrees be labelled as Marxists, their analyses of the body remain grounded in a phenomenological framework, and their Marxism had more to do with their political engagements than their theoretical work. For this reason, it would be misleading to talk of a Marxist theory of the body in the work of these thinkers.

Up until the 1970s, it is thus not wrong to say, as Foucault did, that Marxists had a tendency to neglect the body. This silence should be understood in relation to their intellectual context. The eagerness among Western Marxists to break with the Darwinism and positivism of orthodox historical materialism and party-approved Marxism-Leninism tended to result in an absence of interest in the natural preconditions of social forms (Foster, 2000: 231, 244ff). Although their adherence to materialism committed them to reject the classical idealist dualism of mind and body, they did not put the body at the centre of their philosophical theories and critique of capitalism in the way Marx did.

The 1970s was also the period where this situation began to change. The emerging green movement forced Marxists to reconsider the relationship

between capital and nature, and thereby also, on a philosophical level, the relationship between the human being and the rest of nature. Feminist movements similarly led to a surge of Marxist analyses of the entanglement of capitalism and the oppression of gendered bodies – an analysis which was expanded to include other corporeal hierarchies based on racialisation, sexuality, nationality, etc. The uptick in struggles at the point of production also led to a new attention to the mechanisms by means of which the body is shaped and disciplined in the capitalist labour process. In other words, Marxists began to examine what we could call the *natural body*, the *exploited body* and the *hierarchised body*.

NATURAL BODIES

The Western Marxists' criticism of the Darwinism and positivism of traditional Marxism resulted in a certain reluctance to talk of nature, thereby 'essentially ceding that entire domain to positivism', as John Bellamy Foster (2000: vii) puts it. Adorno was once again a partial exception with his analysis of the modern quest for the domination of nature as an expression of a profound alienation from nature: 'Enlightenment is ... nature made audible in its estrangement' (Horkheimer and Adorno, 2002: 31f; Cook, 2014). It is thus not surprising that it was a student of Adorno's, Alfred Schmidt, who was the first to re-examine Marx's analysis of tools and the concept of metabolism on the basis of an explicit critique of Engels's dialectics of nature and Kautsky's Darwinian Marxism. In Schmidt's view, Marx's concept of metabolism 'introduced a completely new understanding of the human relation to nature' by stressing the double mediation of nature and society: not only is the natural world socially mediated – a common idea among Western Marxists (Korsch, 1971, 2017: 138ff) – but the social world is equally mediated by nature (Schmidt, 2013: 76, 92). Schmidt also underlined the importance of human tool use, although this remains an underdeveloped aspect of his reading of Marx (Schmidt, 2013: 15, 45f, 101ff).

With the emergence of the green movement it became common to accuse Marxism of being on the wrong side of history. The celebration of industry in Marxism–Leninism and the enthusiasm for technological mastery of nature in traditional Marxism led many to conclude that Marxism – and Marx – rely on a 'promethean' and dualist conception of the relationship between humans and nature. These charges have been confronted head on in the pioneering work of Paul Burkett and John Bellamy Foster, who have demonstrated not only that Marx was very attentive to the ecological consequences of capitalism but also that his critique of political economy remains unsurpassed as a theoretical framework for understanding capital's ongoing destruction of the biosphere (Burkett, 2014; Foster, 2000; Foster and Burkett, 2000, 2016). The body is not their primary object of analysis, but their attempt to develop a Marxist Ecology has resulted in a renewed attention to the importance of the body in Marxist theory. Of particular

interest here is the emphasis on the concept of metabolism: drawing on an expression used by Marx in his critique of the environmental consequences of capitalist agriculture in the manuscripts for the third book of *Capital*, Foster and Burkett have developed a theory of the ‘irreparable rift’ in the human metabolism created by capital (Marx, 2017: 798; see also Saito, 2017).

Another important Marxist ecological thinker who has written about the body is Kate Soper, whose philosophically sophisticated defence of a notion of pre-discursive nature against post-structuralist idealism in part relies on a trenchant analysis of the human body (Soper, 1995, 1981, 1986; see also Gunnarsson, 2013; Orzeck, 2007). According to Soper, the Marxist emphasis on historical specificity and social mediation does not require us to relinquish any notion of the natural as something which precedes and sets certain limits for the social. If we want to create the strongest possible theoretical foundations for an ecological and feminist socialism, we should stick to the idea of a natural body and insist on the existence of transhistorical biological needs. At the same time, Soper also stresses that humans are ‘endowed with a biology that has enabled them to escape the “necessity” of nature in a way denied to other creatures: to live in ways that by comparison are extremely underdetermined by nature’ (1995:139).

The perhaps most explicit attempt to ground an ecological critique of capitalism in a Marxist theory of the body can be found in the work of Andreas Malm. In his study of the historical emergence of fossil capitalism as well as in his critique of new materialism, Malm argues that humans have a unique way of regulating their metabolism; because of its socially and technologically mediated nature, the human metabolism can be infused with all sorts of social relations of domination: ‘No other species can be so flexible, so universal, so omnivorous in relation to the rest of nature – *but for the very same reason, no other species can have its metabolism organised through such sharp internal divisions*’ (Malm, 2016: 280; see also McNally, 2001). Because of their dependency upon tools, ‘humans have a unique propensity to *actively order matter so that it solidifies their social relations*’ (Malm, 2018: 143). Furthermore, Malm also draws attention to what he calls ‘the peculiar human capacity for energetic division’, i.e. the fact that humans are able to connect their organ-tools to external energy sources – a unique capacity which further increases the possibility of humans getting caught up in complex infrastructures of energy and technology imbued with relations of domination (Malm, 2016: 315; see also Scarry, 1985: 250).

EXPLOITED BODIES

Neither traditional nor Western Marxists devoted much attention to the study of how capital carves itself into proletarian bodies within the workplace. In the case of traditional Marxism, this was partly the result of the idea that the capitalist rationalisation of the production process represented the germ of socialism – an

attitude epitomised in Lenin's enthusiasm for Taylorism. In this view, it is not the concrete character of the labour process which is the primary problem with capitalism, but rather the social property relations under which production takes place and exploitation that results from these relations (Braverman, 1974: 8ff; Postone, 2003). Gramsci tended to follow Lenin in his positive view on Taylorism, although more cautiously. Adorno demonstrated a certain attentiveness to the inscription of bodies in technological infrastructures, as did Marcuse: 'The machine process in the technological universe breaks the innermost privacy of freedom and joins sexuality and labor in one unconscious, rhythmic automatism' (2007: 30; see also Adorno, 2005: 40). However, such criticisms tended to remain on a very general and philosophical level, as part of a broad critique of the alienating world of capitalist modernity.

Harry Braverman's *Labor and Monopoly Capital* (1974) picked up where Marx left off. Braverman notes that like all 'forms of life', humans 'sustain themselves on their natural environment' (1974: 45). The specificity of the *human* relationship to the natural environment resides in its lack of coherence, or, as Braverman puts it, its 'indeterminate' character. The labour required to sustain the metabolism of this peculiar animal is not regulated by instincts, and it can be separated at several points: the worker can be separated from the tools, the motive force can be separated from the labour, and conception can be separated from execution (1974: 1). Braverman is especially interested in the latter, which he regards as characteristic of the 'degradation' of work in the twentieth century. In his analysis of Taylorism he shows how capitalist production relies on the systematic and continuous remoulding of the labouring body: workers are deprived of the knowledge of the production process of which they are a part, and their bodily movements are meticulously studied in order to split up the entire process, rationalise and streamline its part and reassemble it in order to increase productivity. Capitalist production thus 'dismembers the worker' (Braverman, 1974: 82, 78). The logic of capital is thereby inserted as the mediator in the gaps of the fractured proletarian body.

Such an analysis has obvious overlaps with Michel Foucault's analysis of the production of 'docile bodies' in modern factories, and Foucault himself readily acknowledged his debt to Marx on this point (Foucault, 1991: 163f, 175, 221, 2012; see also Guéry and Deleule, 2014). His influential idea of a 'micro-physics' of power and his call to study the corporeal effects of power in turn left its mark on several Marxist discussions of production process (Fracchia, 1998; Harvey, 2000: 6, 2010: 149; Macherey, 2015).

Since Braverman reintroduced the study of corporeal discipline in the capitalist production process and the general 'corporeal turn' across the humanities and social sciences, several Marxist scholars have turned their attention to the effects of the logic of capital on proletarian bodies, within as well as outside the workplace. This has resulted in many interesting concrete analyses of topics such as death by starvation in late nineteenth- and early twentieth-century

Britain (Rioux, 2019), contemporary garment sweatshops in India (Mezzadri, 2016), slum cities of the global south (Davis, 2017), indigenous female fur coat producers in 1940s Canada (Sangster, 2007) and cosmetic saleswomen in Taiwan (Lan, 2003), just to mention a few examples.

HIERARCHISED BODIES

The perhaps most damaging blind spot of Marx's critique of political economy is his failure to systematically examine the processes and social relations through which labour power is reproduced, daily as well as generationally. The labour required to reproduce labour power has always been forced upon women, and Marx's blind spot reveals a certain tendency of his to naturalise the gendered nature of reproductive labour. Marx was relatively progressive compared to many other male intellectuals in his time, but the analysis of the situation and oppression of women outside of the factory was, to put it mildly, not his forte. Despite some attempts in traditional Marxism (Zetkin, Bebel, Lenin), a sustained effort to systematically integrate gender oppression into Marxist theory did not emerge until the 'domestic labour debate' of the 1970s, which was centred on the question of how to understand women's unwaged housework in a Marxist perspective (Arruzza, 2013; Benston, 2019; Eisenstein, 1979; Sargent, 1981; Vogel, 2014). These early Marxists feminists emphasised how capitalism relies upon reproductive work which takes place outside of workplaces, in the privatised and de-politicised sphere of the home. Because of their economic dependency upon the male wage labourer, women are forced to assume responsibility for the generational as well as daily reproduction of labour power, a task which not only requires bodily work such as pregnancy, lactation, care and so on, but also requires sexual and emotional labour in order to ensure the male breadwinner's ability to return to the workplace every day in order to produce surplus value for the capitalist. What these debates demonstrated is that capitalism relies on a certain distribution of sexed bodies, a regime of corporeal difference in which female bodies are subjected to a distinct form of oppression. The central theoretical role assigned to the body in some of these arguments comes out very clearly in the work of Lise Vogel, for example, whose theory of gender oppression and capitalism relies on an analysis of the relationship between class structure and the fact that only women have the capacity to bear children (Vogel, 2014; see also Brenner and Ramas, 2000).

In addition to this *systematic* theory and analysis of corporeal hierarchies under capitalism, Marxist feminists have also examined the corporeal aspects of the *history* of the capitalist mode of production. Of particular importance here is Silvia Federici's influential study of the ways in which a 'war against women' was waged in early modern Europe in order to pave the way for capitalism by disciplining and appropriating the female body (Federici, 2004: 14, see also 2018; Mies, 1984: 3).

Many Black feminists have pointed out that there was a tendency in the domestic labour debates of the 1970s to universalise the perspective of the White, Western – and, we might add, heterosexual and cis-gendered – woman, leading to an inability to adequately theoretically accommodate capital's reliance on racism (Davis, 1983; Ferguson, 2019: 103ff; Ferguson and McNally, 2013; Joseph, 1981; Lewis, 2016: 155ff). Such criticisms opened up important new avenues for a Marxist theory of the entanglement of capital and (racialised) bodies.

In recent years, a number of scholars have integrated the insights of earlier Marxist feminism into a broader framework and project under the rubric *social reproduction theory* (SRT). SRT concerns itself with the social relations which govern all those activities which are not directly incorporated into the circuits of capital, but are nevertheless necessary for the daily as well as generational reproduction of labour power (Arruzza, 2016; Arruzza et al., 2019; Bhattacharya, 2017; Ferguson, 2019; Rioux, 2015). By avoiding the presumption of a specific site of reproductive labour (e.g. the home) and a specific identity of those who perform it (e.g. women), SRT is able to broaden the scope and shed light not just on the oppression of women under capitalism, but also on the connection between capitalism and racism, transphobia, heteronormativity and other forms of oppression.

In the Marxist-Feminist debates of the 1970s and 1980s it was generally assumed that the categories of 'women' and 'people with a uterus' were identical. In recent years, this lack of critical engagement with concepts of woman and gender in Marxist theory has been remedied by the growing and promising fields of Queer and Trans-inclusive Marxism, which offer new and important perspectives on the corporeal hierarchies reproduced by the capitalist mode of production (Arruzza, 2013; Drucker, 2016; Floyd, 2009, 2016; Gleeson, 2019; Gleeson and O'Rourke, 2021; Lewis, 2016, 2019; Manning, 2015; O'Brien, 2019; Sears, 2017).

Another important research field which has flourished in recent years concerns the relationship between capital and racism. The capitalist mode of production has always relied on racialised hierarchies, which has not only allowed the capitalist class to exploit colonised and enslaved people but also to curb the power of the working class by splitting it along racialised lines. The 'tendency to divide workers by turning their differences into antagonism and hostility' is, in the words of Michael Lebowitz, 'an essential aspect of the logic of capital' (2006: 39). Taking up the thread of Marx's analysis of racist attitudes towards Irish immigrants among British workers in the nineteenth century, several scholars have demonstrated the usefulness of understanding contemporary forms of racism through the lens of Marx's theory of relative surplus population, according to which the immanent dynamics of capitalism constantly uncouple a part of the proletariat from the circuits of capital (Anderson, 2016: 4; Benanav and Clegg, 2018; Deleixhe, 2019; Endnotes, 2010; Marx, 1990: 25; Marx and Engels, 1985: 88, 120). From such a perspective, scholars have analysed contemporary police violence towards and 'hypercarceration' of Black people in the USA (Chen,

2013; Gilmore, 2006; Rehmann, 2015; Wang, 2018) as well as Islamophobic racism in Europe (Farris, 2017). What these and other scholars have demonstrated is that capitalism systematically divides the proletariat by nourishing hierarchies of racialised bodies which expose people of colour to an extra level of exploitation and violence (Bannerji, 1995; Davis, 1983; Hudis, 2018; McCarthy, 2016; Roediger, 2017; Taylor, 2019; Wright, 2015).

Yet another research field where Marxists have pushed the body to the forefront is in disability studies. Marxist critics of ableism have forcefully demonstrated how capitalist relations of production rely on and reproduce an oppressive stratification of bodies on the basis of their conduciveness to the valorisation of value. Marxist contributions to disability studies thus emphasise that ‘ending the systemic oppression of disabled people demands dismantling capitalism’ (Jaffee, 2016: 1; see also Bengtsson, 2017; Gleeson, 1997; Oliver, 1992, 1999; Pass, 2014; Russell, 2001; Russell and Malhotra, 2002).

CONCLUSION

Summing up, we can conclude that the body was at the very centre of Marx’s thought, on more than one level of abstraction. The body plays an important role not only in Marx’s general conception of the human being, nature, society and history but also in his critique of the capitalist mode of production. In traditional Marxist terminology, the body plays a central role in historical materialism as well as in the application of historical materialism to the capitalist mode of production. This was initially lost on many of Marx’s followers, but in recent decades the body has again become a central concern for Marxist scholars, in several forms, as a re-reading and re-discovery of Marx’s analysis, as a continuation and expansion of topics and themes which were underdeveloped in Marx’s writings, or as the conscious effort to fill in gaps in Marxist theory.

Notes

- 1 I would like to thank the editors and the two anonymous reviewers for their generous and helpful criticisms and suggestions. The research published in this chapter has been supported by a postdoctoral grant from the Independent Research Fund Denmark (grant 9055-00086B).
- 2 The literature on this is enormous. For a selection, see Bordo, 1993; Bynum, 1995, 2017; Federici, 2004; Garrison, 2014; Judovitz, 2001; Kalof, 2014; Laqueur, 1992; Montserrat, 1998; Porter, 1991, 2002; Quinn, 1993; Robb and Harris, 2013; Smith, 2017.
- 3 See, for example, Becker et al., 2018; Bordo, 1993; Brook, 1999; Butler, 2011; Ebert, 1995; Foucault, 1991, 1998; Freund, 1982; Grosz, 1994; Haraway, 1991; Irigaray, 1985; Johnson, 1990; Kirby, 1997; Laqueur, 1992; Latour, 2004; Leder, 1990; Nancy, 2008; Scarry, 1985; Sheets-Johnstone, 1990, 2009; Shilling, 2012; Spelman, 1982; Turner, 2008; Young, 1980.
- 4 Marx first used the concept of metabolism in 1851, in a short text called ‘Reflections’ (Saito, 2017: 70f). Note that in the *Collected Works*, *Stoffwechsel* is sometimes translated as ‘material exchange’. See Marx and Engels (1977b: 508f, 1978: 590, 1986: 233).

Animals

Oxana Timofeeva

What is the relevance of animals for Marxist thought? Or rather, what is the relevance of Marxist thought for animals? What does Marxism have to do with animality?¹ Before approaching these questions, we have to provide a very brief outline of the history of the question of the animal, as it impinges on a wide range of contemporary research and debate. The animal matters both practically and theoretically, and can be approached as a subject, an object, a notion, an image, or a conceptual metaphor.

Animals as subjects, and particularly legal subjects, are the focus of practical philosophy, which reconsiders human attitudes towards other species and puts an emphasis on the struggle for animal rights and liberation. They are objects for natural sciences and sciences of life and environment – ecology, biology, zoology, zoo-psychology, etc. The notion of the animal we have inherited is grounded in a system of (largely Aristotelian) theoretical definitions and is linked to other notions, such as human being, life, body, soul, reason, mimesis, etc. Animal as image relates to other images in the order of symbolic mediations and operates as an element of a metaphoric language used by human beings to talk either to themselves about themselves (where images of animals represent certain characteristics or passions of humans), or about others. In the latter case, when animals (together with aliens, monsters, robots, etc.) are culturally, politically, or ideologically enlisted to represent others, they most often stay on the side of the subaltern and excluded, such as women, children, migrants, slaves, refugees, or the poor.

When an image and a concept conjugate, i.e. when there is a concept or a system of concepts behind the image, we get a conceptual metaphor. This is, among others, the case for Marx, in whose writings figures of animals are linked to the notions of capitalist and non-capitalist (for instance, feudal) oppression, exploitation, and alienation. In Marxian thought, which is itself not particularly focused on animals, this conceptual metaphor marks some strong connecting points between theory and practice. We will come to these points after a general survey of what is understood as theory and what is understood as practice when it comes to the question of the animal.

The practical side of the question comprises various strategies for including non-human animals in the human (and essentially humanist) spheres of the law, rights, subjectivity, politics, language, art, communication, cooperation, cognition, recognition, and culture. This tendency is actualized, first of all, by the animal rights and animal liberation movements launched in the twentieth century. They were inspired by such authors as Peter Singer, who, following Jeremy Bentham and his utilitarian theory, affirmed that animals have interests that must be taken into account in our policies and regulations, and, moreover, that they have to be granted equal rights not because of their intellectual or other human capacities, but because they can actually feel pain (Singer, 1975), or Tom Regan, who considered animals as persons equal to humans (Regan, 1983). Deprived of any rights, animal beings continue to suffer, and humanity must finally take responsibility for that. From this perspective, the question of the animal arises today with real urgency at the borders of ethics and politics, on the one hand, and ecology and economy, on the other.

At the intersection of ecology and economy, what is at stake is the industrial activity of humans on Earth and the way in which it affects the environment (Huber, Chapter 39, this *Handbook*). Its negative effects are global warming, general pollution, the sweeping extinction of various animal species, and other disturbing and disastrous phenomena. The scale of these processes is so wide that the new term 'Anthropocene' was introduced by Eugene F. Stoermer and Paul J. Crutzen (Crutzen & Stoermer 2000) as a name for a new geological period marked by human activity bringing about irreversible transformations to the planet, where the reproduction of one species (*homo sapiens*) comes at the price of the destruction of countless others.

At the intersection of ethics and politics the main problem is the cruel and exploitative treatment by humans of other living beings, until now legitimized by the bankrupt idea of humans' superiority over all other species and the absolute value of human life which requires, in order to maintain its supremacy, the massacre of other animals on an industrial scale. The struggle for animal rights, for equality, and a respectful attitude towards non-human creatures sets an important task for social debate. One of its leading motifs is that violence done by humans to other animals is a model for violence done by humans to other humans: such are, to take the most obvious examples, sexual or racist violence, whose victims are often imagined as animals unable to resist.

In this practical sense, ‘animal’ is one of the names of the other, the relation to whom becomes a matter of ethics and politics. Among such others, one finds not only non-human animals but also human ones whose juridical and civilian status is in question. The struggle for animal rights – which often foregrounds data from the natural sciences about the presence of complex forms of communication, intellect, affects, etc. in various animal species – is a necessary and novel step in a broader movement of emancipation concerned with the widening of the sphere of rights. In this regard, it was preceded by such powerful historical shifts in culture and society as decolonization, the abolition of slavery, as well as struggles for the rights of industrial and precarious workers, women, children, migrants, minorities, etc.

None of these movements, however, is yet truly complete, and a striking description of the social pyramid, suggested by Max Horkheimer in the 1930s, thus remains more than relevant today:

A cross section of today's social structure would have to show the following: At the top, the feuding tycoons of the various capitalist power constellations. Below them, the lesser magnates, the large landowners and the entire staff of important co-workers. Below that, and in various layers, the large numbers of professionals, smaller employees, political stooges, the military and the professors, the engineers and heads of office down to the typists; even further down what is left of the independent, small existences, craftsmen, grocers, farmers *e tutti quanti*, then the proletarian, from the most highly paid, skilled workers down to the unskilled and the permanently unemployed, the poor, the aged and the sick. It is only below these that we encounter the actual foundation of misery on which this structure rises ... Below the spaces where the coolies of the earth perish by the millions, the indescribable, unimaginable suffering of the animals, the animal hell in human society, would have to be depicted, the sweat, blood, despair of the animals ... The basement of that house is a slaughterhouse, its roof a cathedral, but from the windows of the upper floors, it affords a really beautiful view of the starry heavens. (Horkheimer, 1978: 66–7)

This slaughterhouse system, upon which the pyramid of domination is actually and metaphorically based, has sometimes been compared to the Holocaust. Thus, Emmanuel Levinas, who was a prisoner of war in a Nazi camp in 1940–45, made the following remark about being observed from the outside, by ‘free’ human beings:

But the other men, called free, who had dealings with us or gave us work or orders or even smile – and the children and women who passed by and sometimes raised their eyes – stripped us of our human skin. We were subhuman, a gang of apes. A small inner murmur, the strengths and wretchedness of persecuted people, reminded us of our essence as thinking creatures, but we were no longer part of the world ... We were beings entrapped in their species. (Levinas, 1990: 153)

This recalls the famous quotation – wrongly attributed to Theodor Adorno but in fact taken from PETA’s campaign *Holocaust on Your Plate* – ‘Auschwitz begins wherever someone looks at a slaughterhouse and thinks: they’re only animals’ (Patterson, 2002: 51). Although Adorno never said that, there is, according to Marco Maurizi, ‘much more that Adorno (along with Horkheimer and Marcuse)

could contribute toward a better understanding of our relationship with nature and to animal studies in general' (2012: 68). Outlining a Marxist dialectical theory of animality building on the tradition of critical theory, Maurizi states that: 'The Frankfurt School has, in turn, underscored how a materialistic ethic should ground itself in the *solidarity* between beings who share suffering, pain and death' (2012: 87–8). It is precisely this solidarity, in Maurizi, that must become the *praxis* of the human–animal relationship.

Whereas ethics posits, first of all, questions regarding the extent of our responsibility towards other animals, interrogating whether they can suffer, love, feel compassion, think, communicate, etc., and political thought focuses on the limits of violence and the ways to struggle against it, theoretical philosophy questions the limits and conditions of possibility of those human–animal relations that practical philosophy addresses. Philosophical ontology tries to reflect on the very being of the animal and the forms in which subjectivity is constituted; deconstruction interrogates the frameworks and operations that differentiate between the human and the non-human; phenomenology explores animal life-worlds and forms of perception; psychoanalysis inquires after the instincts and drives of human animals; while anthropology closely borders ethology in studying cultural factors and invariants of human beings' self-determination with regards to others that do or do not resemble them.

'Nothing in nature is as distinct in itself as is the animal, but as its nature is the speculative Notion, nothing is so difficult to grasp', Hegel remarked in his *Philosophy of Nature* (1970: 110). The notion of the animal refers back to fundamental philosophical and political issues. Since antiquity, the animal being was subject to theoretical reflection. Philosophy constantly creates distinctions between humans and animals, suggesting rational thought, language, or the awareness of death as criteria for such distinctions. However, it is only now that the post-humanist withdrawal of the question of the animal from philosophical metaphysics ruled by anthropocentric projections is beginning to take place.

We can identify the emergence of a zoo-philosophy, or zoo-ontology (Wolfe, 2003), claiming relative theoretical autonomy, against the background of the process of separation of philosophy, taking place over the nineteenth and twentieth centuries, from Christian metaphysics, i.e. the divorce between the Mediaeval pairing of philosophy and theology. At the turn of the twentieth century philosophy truly encounters the other, who, one might say, replaces the God of traditional metaphysics. The vertical relation of man to God, who guaranteed the truth of being, comes to be supplanted by the horizontal address of another human or non-human being. It is precisely this tectonic shift – from the transcendental Other of metaphysics to immanent others – that demands not only a new ethics and politics but also a new ontology that leads to a radical interrogation of the notion of the animal.

More than a notion, 'animal' is indeed a metaphor. A metaphor of what? Of another life that is supposed to be non-human, but is not entirely indifferent to

the human, as it creates the limit of the human – be it an internal limit, the one of our corporeal existence, our instinctive life, etc., or an external one, if we are to determine and understand ourselves as a difference in terms of our species being. It is in this movement towards the other that humanity has to encounter itself.

Theoretical aspects of the question of the animal are to be found in the philosophical critique of the metaphysical tradition and its characteristic binary oppositions – animal/human, nature/culture, body/spirit, affects/reason, etc. – that repress one part and elevate the other, as well as its mechanisms of exclusion of the animal from the world of the human, the latter being defined by the authority of reason, *logos*, language, truth, etc. This critical orientation which aligns with a broader trend of thinking *difference* emerges in Continental philosophy mainly in the second half of the twentieth century and is influenced both by the poststructuralism of Gilles Deleuze and Félix Guattari, and by Jacques Derrida's deconstruction. While in Deleuze and Guattari 'animal' appears as a key term in the conceptualization of becoming (Deleuze and Guattari, 2005), in the last years of his life Derrida seriously delved into the question of animality, deconstructing the very notion of the animal, in its opposition to the human, as a literally stupid (*bête*) metaphysical abstraction that has a repressive character. For Derrida, not an animal in general, but *this* particular animal – his own cat looking at him as he goes around naked – is the irreducible other, towards whom we feel both shame and responsibility (Derrida, 2008).

The line of deconstruction of the figure of the animal in the metaphysical tradition takes different paths in the works of Giorgio Agamben, Elisabeth de Fontenay, Donna Haraway, Cary Wolfe, and other authors who have elaborated new philosophical and interdisciplinary approaches to the non-human (Agamben, 2004; de Fontenay, 1998; Haraway, 2008; Wolfe, 2010). Among contemporary authors who address this issue there is a kind of critical consensus according to which in classical European philosophy and metaphysics the figure of the animal is repressed, marginal, or negative in comparison to the human being's self-determination.

It is true that the traditional representation of animality has always been subjected to an anthropocentric paradigm which now faces intense criticism. Philosophical tradition itself is a target of such critique, as it can be reproached for what may look like a theoretical legitimization of the idea of superiority of the human over other living beings. Contemporary authors accuse past thinkers of their neglect of and disrespect towards animals as allegedly deprived of reason, language, freedom, consciousness, or an unconscious, together with other characteristics that are considered to be specifically human. It is from this critical consensus that *post-humanism* has emerged. Philosophers like Descartes, Kant, Hegel, Heidegger, Lacan, or Levinas are taken to task for their theoretical or practical maltreatment of animals. Marx, too, of course, could be included in this list, as he shared anthropocentric projections and humanist perspectives on animals and nature with other thinkers of his epoch. Not only did he claim that

there is an essence of the human opposed to that of other animals, but he also believed in technological progress as the promise of humanity's mastery over nature. He generally conceived of the latter as a positive historical achievement, indeed one inseparable from communism. However, to limit oneself to such a one-sided view of Marx's account on animality would be to neglect the complexity of his position and its relevance to contemporary debates.

The most problematic tendency within recent cultural interventions against the anthropocentric and humanist character of the previous tradition is that animals are mostly presented as non-human others. But through the critical appropriation of a Marxist perspective we can understand that animals are not others; we are animals. Treating animals as others fails to grasp the dialectical character of the human/non-human opposition and the interdependence of its two terms. Without this dialectical vision, the opposition at stake here can bring us back to a kind of philosophical dualism, whose dogmatic tendencies – like turning to one extreme while totally rejecting the other – must be overcome. This is the deadlock of the liberal understanding of the figure of the other – as an autonomous entity, with whom I have nothing in common, and with regards to whom I have to develop this or that communicative strategy. One looks at an other from the point of view of sameness, or a supposedly stable self-identity: I am here, and the other (an animal, an alien, a migrant, a woman, a refugee, a zombie, etc.) is there; I have to deal with them, and if I am hospitable and friendly, I have to provide them with some recognition, support, etc.; this is a matter of policy. However, even if the other is fully respected, loved, and welcomed, it is after all still the other and not me, and my position towards that other that is not quite here where I am, but always somewhere else, thus remaining in a position of power, even if of a very kind and democratic type.

There are, however, at least two intellectual movements that immanently produce a tool to break through this predicament. These movements are Marxism and psychoanalysis, and the tool they give us is a dialectical vision of ourselves *as others*. Psychoanalysis teaches us that the other (say, the animal) is within, and the unconscious is the effect of our constitutive self-alteration. If the psychoanalytical animal signals repression, the Marxian animal denotes oppression. Marxism destroys the position of power, once we grasp it not as a stable system of doctrinal statements, but as a living, developing structure whose mobility is explained by an inherent and constant passage from theory to practice. Not only does Marx show, in a humanist register, that workers are treated like animals, but he allows us to understand, through identifying with the position of the workers, how animals are treated. This is the key point of a Marxian approach to animality. Where there is a gap between the two, Marx builds a bridge.

Marx was of course preoccupied, both theoretically and practically, with the problems of human society and human history. On the level of practice, he did not really say much about issues concerning animal liberation, his preoccupation being the communist liberation of humanity. On the level of theory, he made a

clear distinction between humans and other animals. In the most significant work of his early, humanist period, the *Economic and Philosophical Manuscripts of 1844*, he defined the human essence as universal production and opposed human beings as essentially free producers to other animals who may also produce things, but do so only in order to immediately satisfy their natural needs:

Admittedly animals also produce. They build themselves nests, dwellings, like the bees, beavers, ants, etc. But an animal only produces what it immediately needs for itself or its young. It produces one-sidedly, whilst man produces universally. It produces only under the dominion of immediate physical need, whilst man produces even when he is free from physical need and only truly produces in freedom therefrom. (Marx and Engels, 2010: 276)

So, human beings produce even when they do not necessarily need to. They produce not simply out of their need, but out of their freedom. By producing without being forced to by whatever necessity or need, they express their essential freedom. Moreover, Marx differentiates between a bird building a nest as instinctual behaviour and a human being building a house as conscious activity:

The animal is immediately one with its life activity. It does not distinguish itself from it. It is *its life activity*. Man makes his life activity itself the object of his will and of his consciousness. He has conscious life activity. It is not a determination with which he directly merges. Conscious life activity distinguishes man immediately from animal life activity. It is just because of this that he is a species-being. (Marx and Engels, 2010: 276)

The term species-being, *Gattungswesen*, applied to humankind, was borrowed from Ludwig Feuerbach. Marx related this definition to a universal character of humans' transformative activity on Earth:

Man is a species-being, not only because in practice and in theory he adopts the species (his own as well as those of other things) as his object, but – and this is only another way of expressing it – also because he treats himself as the actual, living species; because he treats himself as a *universal* and therefore a free being. (Marx and Engels, 2010: 275)

In contrast to a multiplicity of biological species, a species-being is not clearly determined by its environment, not specialized on something particular, like hunting, or fishing, or digging the earth. Being initially indeterminate, the human being can instead freely choose any of these or other activities and engage in them as part of the process of production. As Marx and Engels famously note in the *German Ideology*, in communist society, when labour will be liberated, these activities will vary freely not only from one day to another, but even within the same day: we will be able 'to hunt in the morning, fish in the afternoon, rear cattle in the evening, criticize after dinner, just as I have a mind, without ever becoming hunter, fisherman, herdsman or critic' (Marx and Engels, 1976a: 47). Note that this prophetic vision of communism presented by Marx in the context of the critique of the traditional and current forms of the distribution of labour does not imply the liberation of animals – all activities mentioned here deal with

animals as mere material resources to satisfy human needs. The only exception is the intellectual work of criticizing: hopefully, in the evening liberated communists will criticize what they did to other animals during the day. Marx did not seriously think about that, but we do: only if this potential critique can pass from theory to practice, will real equality be achieved, when no one will be treated as cattle, including cattle themselves.

However, we are not living in a communist society. We do not experience any other reality than a capitalist mode of production, and what Marx criticizes is political economy, where workers are treated exactly like cattle: ‘political economy knows the worker only as a working animal – as a beast reduced to the strictest bodily needs’, who, ‘the same as any horse, must get as much as will enable him to work’ (Marx and Engels, 2010: 241). One might say that this reduction of a worker to a horse is a kind of enslavement, but there is a small distinction that makes a huge difference and opens the way for Marx’s theory of alienation (Wendling, Chapter 28, this *Handbook*): the worker does not work for free, as they receive some money as a wage, although this wage can only cover their immediate expenses, i.e. their survival ‘as a horse’ (which is, of course, not so different from slavery). But the point is not the formal question of waged versus unwaged labour. What is crucial is not so much that, in contrast to their dumb comrade working horse, workers *do not work for free*, but that they *work freely*. Their labour for someone else’s profit is their conscious activity, or, as is said, their free (if constrained) choice. They consciously make themselves working animals in order to survive (as working animals):

It is only because [man] is a species being that he is a conscious being, i.e. that his own life-activity is an object for him. Only because of that is his activity free activity. Estranged labor reverses this relationship, so that it is just because man is a conscious being that he makes his life-activity, his essential being, a mere means to his existence. (Marx and Engels, 2010: 276)

What is alienated, thus, is not only the product of labour, and labour itself, but also and mainly the very freedom that is human essence, now turned into a means of biological survival for the human animal. In order to survive as an animal, i.e. to satisfy my basic natural needs (food, dwelling, etc.), I freely chose to exchange my very essence into working hours and sell it to the owner of the means of production, of which my labour becomes a part, and thus actually turn my freedom into slavery. How does this happen? Here is Marx’s explanation of what constitutes the alienation of labour:

First, the fact that labor is *external* to the worker, i.e., it does not belong to his intrinsic nature; that in his work, therefore, he does not affirm himself but denies himself, does not feel content but unhappy, does not develop freely his physical and mental energy but mortifies his body and ruins his mind. The worker therefore only feels himself outside his work, and in his work feels outside himself. He feels at home when he is not working, and when he is working he does not feel at home. His labor is therefore not voluntary, but coerced; it

is *forced labor*. It is therefore not the satisfaction of a need; it is merely a *means* to satisfy needs external to it. (Marx and Engels, 2010: 274)

Alienated labour, in which ‘Life itself appears only as a *means to life*’ (Marx and Engels, 2010: 276), is the mirror stage at which a working human animal identifies with a working non-human animal:

As a result, therefore, man (the worker) only feels himself freely active in his animal functions – eating, drinking, procreating, or at most in his dwelling and in dressing-up, etc.; and in his human functions he no longer feels himself to be anything but an animal. What is animal becomes human and what is human becomes animal. (Marx and Engels, 2010: 275)

In alienated labour, the human being is deprived of their essence, i.e. their free and conscious productive activity. It is transformed into working hours and exchanged for the wages that allow them to maintain their animal life. This process is characterized by Marx as the dehumanization of the human but thinking of it in terms of a mere reduction of human beings to an animal state is not quite accurate. In fact, what remains of the worker when their human essence is taken out of them and put into a product that does not belong to them, is not an animal in the proper sense, but something else. This is in no way a reverse evolution, as though labour, which once transformed a monkey into a human being, now transforms a human being back into a monkey. According to Frank Ruda, who proposes a brilliant analysis of the figure of the worker in Marx, alienated labour makes one *less than an animal* (2014: 17). Whereas the animal is, as Marx says, identical with its life-activity, the worker’s essential life-activity is estranged from them. Their very species-life vanishes, and they thus become a kind of living dead. In the chapter ‘Human Requirements and Division of Labor under the Rule of Private Property’ Marx describes the conditions of the worker’s life which, in contrast to the animal condition, are not natural, but *denaturalized* as well as *dehumanized*:

This estrangement manifests itself in part in that the sophistication of needs and of the means (of their satisfaction) on the one side produces a bestial barbarization, a complete, crude, abstract simplicity of need, on the other; or rather in that it merely reproduces itself in its opposite. Even the need for fresh air ceases to be a need for the worker. Man returns to a cave dwelling, which is now, however, contaminated with the pestilential breath of civilization, and which he continues to occupy only *precariously*, it being for him an alien habitation which can be withdrawn from him any day – a place from which, if he does not pay, he can be thrown out any day. For this mortuary he has to *pay*. A dwelling in the light, which Prometheus in Aeschylus designated as one of the greatest boons, by means of which he made the savage into a human being, ceases to exist for the worker. Light, air, etc. – the simplest animal cleanliness – ceases to be a need for man. Filth, this stagnation and putrefaction of man – the *sewage* of civilization (speaking quite literally) – comes to be the *element of life* – for him. Utter, unnatural depravation, putrefied nature, comes to be *his life-element*. None of his senses exist any longer, and (each has ceased to function) not only in its human fashion, but in an inhuman fashion, so that it does not exist even in an animal fashion ... It is not only that man has no human needs – even his animal needs cease to exist. (Marx and Engels, 2010: 308)

After some pages Marx returns to his comparison of the worker's condition to cave dwelling and insists on its unnatural and alienated character. A worker is not at home, but at someone else's house, where he does not really live, but dwells for rent, giving 'up to it his own blood and sweat':

We have said above that man is regressing to the *cave dwelling*, etc. – but he is regressing to it in an estranged, malignant form. The savage in his cave – a natural element which freely offers itself for his use and protection – feels himself no more a stranger, or rather feels as much at home as a *fish* in water. But the cellar dwelling of the poor man is a hostile element, 'a dwelling which remains an alien power and only gives itself up to him insofar as he gives up to it his own blood and sweat' – a dwelling which he cannot regard as his own hearth – where he might at last exclaim: 'Here I am at home' – but where instead he finds himself *in someone else's* house, in the house of a *stranger* who always watches him and throws him out if he does not pay his rent. He is also aware of the contrast in quality between his dwelling and a human dwelling that stands in the *other* world, in the heaven of wealth. (Marx and Engels, 2010: 314)

The contrast between the worker's unnatural cave dwelling and 'a human dwelling' standing 'in the heaven of wealth', presented by Marx, evokes the image of a pyramid of social inequality depicted by Horkheimer. Here, again, the upper level of the wealthiest hovers above the clouds, whereas the lowest level is beneath the ground. Let us note that until now, this vertical structure remains the same: at the top of their skyscrapers are the owners of capital, whereas the mass of the poorest live and work literally in the basements, in underground sweatshops and windowless factories. It is as if workers already inhabit the graves that they dig for the bourgeoisie (taking the famous metaphor of the proletariat as a grave-digger from the *Communist Manifesto* (Marx and Engels, 1976b: 496)). What immediately comes to mind here is the figure of an animal that was crucial to Marx – the 'mole' of history, a blind tiny creature that burrows the ground with its sharp claws and thus undermines the root system of the present without even being aware of the fact that it will eventually see the light at the end of its tunnel.

Unlike the Marxian worker, however, the burrowing mole lives in its natural element – like the other creatures Marx mentions as feeling at home in their respective elements, a cave man and, of course, a fish in water. It is interesting to note that this is not the only place where Marx turns to the image of a fish. A fish in water is more notably presented in the *German Ideology*, where Marx criticizes Feuerbach for his 'misunderstanding of existing reality'. Such misunderstanding derives from the idea that 'the conditions of existence, the mode of life and activity of an animal or human individual are those in which its "essence" feels itself satisfied'. If someone or something is not satisfied by their conditions of existence, this is, according to this view, an exception and an 'unhappy chance'. This is Marx's retort:

Thus if millions of proletarians feel by no means contented with their living conditions, if their 'existence' does not in the least correspond to their 'essence', then, according to the

passage quoted, this is an unavoidable misfortune, which must be borne quietly. The millions of proletarians and communists, however, think differently and will prove this in time, when they bring their 'existence' into harmony with their 'essence' in a practical way, by means of a revolution. (Marx and Engels, 1976a: 58)

And this is where a fish suddenly appears, signalling a trademark Marxian passage between theory and praxis, in which a dialectic of the human and the animal is manifest:

The 'essence' of the fish is its 'being', water ... The 'essence' of the freshwater fish is the water of a river. But the latter ceases to be the 'essence' of the fish and is no longer a suitable medium of existence as soon as the river is made to serve industry, as soon as it is polluted by dyes and other waste products and navigated by steamboats, or as soon as its water is diverted into canals where simple drainage can deprive the fish of its medium of existence. (Marx and Engels, 2010: 58–9)

In this passage, as Lawrence Wilde comments, Marx touches upon the problem that 'the development of modern production methods prevents animals from meeting their essential needs' (2000: 46). This passage also links Marx to ecological thinking, in that it shows how not only workers, but all animals and the rest of nature fall prey to the capitalist exploitation of the Earth. Recent debates within Marxist environmental criticism have developed this line of inquiry: the greatest damage to the environment associated with the Anthropocene (or, better, Capitalocene) and its negative consequences is brought not by human beings as species but by a particular mode of production that tends to transform all living forms into commodities (Foster and Clark, 2020; Malm, 2018; Moore, 2015). The particular case of fish was carefully examined by sociologists Longo, Clausen, and Clark in their book *The Tragedy of Commodity: Oceans, Fisheries, and Aquacultures*. From the 1,000-year history of the bluefin tuna fishery in the Mediterranean to the modern Pacific salmon industry, the authors explore how the modern expansion of the seafood market system dramatically destroys ecosystems (Longo et al., 2015). Animal bodies are not only exploited as bodies but manipulated as machines for the production of profit. This is what, analysing aquaculture, Troy Vettese (2020) describes as 'real subsumption' – a term used by Marx to designate the way in which capital creates its own conditions of production by designing the very modes of existence and social relations (Saenz de Sicilia, Chapter 33, this *Handbook*):

Aquaculture illustrates the shift from formal to real subsumption: as populations of many fish species have crashed since the 1990s, there has been a shift to raising fish as livestock. Farmed fish are fed more frequently and richly than they would eat in the wild to fatten them faster. Their size can be further increased through hormonal treatment that can accelerate growth; hormonal treatment can even change a fish's sex, which could be advantageous if there is pronounced dimorphism in a species ... The scale of production can be expanded by concentrating fish far beyond what would be possible in the wild, with all of the attendant problems this brings in terms of waste and disease. The latter can be partially mitigated by plentiful resort to antibiotics, while the former can be a burden imposed on others. (Vettese, 2020)

Capitalist aquacultures not only make profits on fishing but really subsume animal organisms according to the needs of growing markets: why not consider this process as one of estrangement of the very essence of fish as living beings? Deprived of its natural element, the Marxian fish draws a connection between animals, proletarians, and communists. It silently denotes the necessity and urgency of a universal revolutionary transformation. And if the fish cannot make a revolution, in Marx, there are people who can. It is a matter of solidarity that can only be universal and that must break the borders between species in order to bring them to their being from that state of nothingness where they still dwell, in the misery wrought by the systemic injustice of the world that Marx invites us to change.

Desire

Hannah Proctor

SATISFYING WANTS

On the opening page of the first section and chapter of *Capital, Vol. 1* Karl Marx writes:

A commodity is, in the first place, an object outside us, a thing that by its properties satisfies human wants of some sort or another. The nature of such wants, whether, for instance, they spring from the stomach or from fancy, makes no difference. Neither are we here concerned to know how the object satisfies these wants, whether directly as means of subsistence or indirectly as means of production.¹ (Marx, 1967: 43)

This statement is accompanied by a footnote citing the economist Nicolas Barbon proclaiming that ‘desire implies want, it is the appetite of the mind, and as natural as hunger to the body’ (Marx, 1967: 43).² Marx may not have held that desire is natural or ahistorical, as Barbon implies, but in *Capital* the content and specificity of human desire is not his concern; it ‘makes no difference’. What would it take to include desire in his analysis, to ask where desires ‘spring from’, to insist that they do make a difference or to explore how they could become different?

In his *Companion to Marx’s Capital* David Harvey repeatedly uses a trio of words – ‘wants, needs or desires’ – to capture what use-values satisfy in humans (Harvey, 2010: 16, 22, 25, 129, 327). In *Das Kapital* Marx tends to use the

German word *Bedürfnis*, which the two major English translations generally render as ‘want’ rather than ‘need’ (although *Bedürfnis* implies both).³ However, it is less easy to draw neat distinctions between the three words Harvey chooses than it might seem, especially in the context of Marx’s arguments, which are so keen to push the complicated and complicating question of human motivations and passions aside. ‘Want’ is more neutral-sounding than ‘desire’: it implies a more tepid, less passionate kind of feeling; it is also less natural-sounding than ‘need’. According to Giorgio Agamben, ‘desire’ is ‘tied to imagination, insatiable and boundless’ whereas ‘need’, its inverse, is ‘tied to corporeal reality, measurable and theoretically able to be satisfied’ (1993: 26). But Marx perceives that even those wants that appear necessary for survival are also historical and cultural, suggesting that the realms Agamben outlines are not as distinct as he claims. Even seemingly ‘natural wants’, Marx says, ‘such as food, clothing, fuel, and housing’, change not only according to climate or geographical location but also according to social context: ‘the number and extent of his so-called necessary wants, as also the modes of satisfying them, are themselves the product of historical development’ (1967: 168).⁴ The limits of satiability are not fixed or eternal; even the stomach is partly governed by fancy. As Theodor Adorno observes in his ‘Theses on Need’ [*Thesen über Bedürfnis*]: ‘need is a social category’ (2017: 102). Distinguishing biological needs from social ones or outlining needs positively is almost impossible: ‘existing needs are themselves, in their present form, produced by class society’ (Adorno, 2017: 103). With this in mind I will begin by following Harvey in considering want, need and desire together, as intertwined if not interchangeable terms, when considering Marx’s discussions of use-value in *Capital*.

Unlike exchange value, which abstracts from the material properties of objects, use-value is related to the properties of objects themselves but only insofar as people care about those properties. Exchange value extinguishes the qualitative differences between use-values and transforms them into quantities. Iron, corn, diamonds, blacking, silk, gold, wheat, linen, coats, bibles – Marx sometimes implies that the qualitative differences between the use-values he discusses are self-evident or inhere in the things themselves, but ultimately use-value is determined by the relations of people *to* things. People want, need or desire use-values due to their qualitative properties, but there can be any number of reasons for wanting, needing or desiring something. Some things might have customary uses (to borrow Marx’s example, coats are customarily used for keeping warm), but use-value is not identical to most common-sense definitions of utility and is thus far more capacious than this kind of example might superficially suggest. To make the coat a use-value it doesn’t matter what someone does with it once they have it or what they want it for in the first place but simply that they want it.

While it might be empirically the case that some yards of linen are not a coat, when Marx declares that ‘coats are not exchanged for coats’ as if this were a self-evident fact, we can see the limits of his occasional practice of casually implying

an equation of use-value with the material properties of objects (Marx, 1967: 49). Marx's point is simply that there is no reason for someone to exchange something for the exact same thing, but someone might want to exchange a coat for another coat, not only because there are qualitative, material differences between coats themselves – green coats, blue coats, felt coats, velvet coats, trench coats, pea coats, coats with golden trim, coats with floral linings, etc. – but because people might want a different coat to the one they already have for any number of subjective reasons, ranging from the eminently practical to the frankly peculiar: to keep warm, to look fashionable, to wear as a costume in a play, to add to their collection of antique clothing, because this particular coat that is otherwise identical to the one they already own once belonged to their favourite celebrity or former lover, etc. Later, Marx gives the example of a weaver who chooses to exchange their linen for a bible for purposes of 'edification' (Marx, 1967: 107), but this specific example of a use for the bible could be substituted for any other; it *makes no difference* what the weaver wants, needs or desires the bible *for* to make the bible a use-value – all that matters is that the weaver wants, needs or desires it. To reiterate: although use-value is subjective rather than objective and is determined by the wants, needs or desires of people, for the purposes of his arguments in *Capital* Marx is only concerned with whether someone wants, needs or desires to exchange something for something else. 'Could commodities themselves speak, they would say: Our use-value may be a thing that interests men. It is no part of us as objects' (Marx, 1967: 87) – in *Capital* Marx's ventriloquized commodities say more than the people who may be interested in them as use-values. What is the *content* of that human interest? Use-value is presented by Marx as 'plain, homely, bodily' (Marx, 1967: 54). 'There is nothing mysterious' about a commodity considered solely in relation to its use, he declares (Marx, 1967: 76). For Marx, value is weird and ethereal whereas use-value is coarse and material: 'The mystical character of commodities does not ... originate in their use-value' (Marx, 1967: 77). Marx demonstrates that value (socially necessary labour time) lies hidden behind exchange value, but human wants, needs and desires also lie hidden behind use-value. Use-values take varied forms, which are dissolved in exchange value, but the forms of want, need and desire that dictate whether they will be exchanged for other use-values are even more varied.

Money, Marx writes, is a 'radical leveller' that 'does away with all distinctions', yet in *Capital* the 'qualitative difference between commodities ... extinguished in money' has a counterpart in his analysis which extinguishes the qualitative differences between wants, needs and desires and effectively excludes them as factors in his analysis of capitalist accumulation (Marx, 1967: 132). Returning to the opening page of *Capital*, Marx declares that 'to discover the uses of things is the work of history' (Marx, 1967: 43). Again he cites Barbon, refuting the economist's statement that things are intrinsically useful by noting that magnets only *became* useful to people once their polarity was discovered. Yet this example implies that use-values inhere in things rather than being dependent

on the historically shifting wants, needs and desires of people who not only discover uses for things but also create them. The question remains, therefore, to what extent wants, needs and desires are shaped or determined by history and, more specifically, by living under capitalism in its different stages or phases. To cite György Lukács's famous extension of Marx's analysis of the commodity form in *History and Class Consciousness* (1923), under capitalism 'a relation between people takes on the character of a thing' (Lukács, 1923). The logic of exchange value extends to social relations so that human subjects confront one another as static, autonomous objects: isolated, compartmentalized, equivalent, thing-like. For Lukács, formal abstraction pervades social life. This implies that people's qualitative desires themselves appear as being as interchangeable as use-values expressed as quantifiable exchange values, an implication pushed further by Adorno, who was more pessimistic than Lukács about the capacity of the proletariat to resist the brutal logic of abstraction.

The status of history here remains ambiguous, however. Is desire something distorted by capitalism that can be excavated or recovered or is it something inseparable from it that can only be sublated or remade? Can desires formed by existing social relations only reproduce those social relations or can they envisage a world beyond them? How would abolishing the commodity form transform desire, meaning both the relations of people to things and the relations between people? If needs were met would desires be obsolete? Adorno implies that this question is impossible to answer: 'If production were immediately, unconditionally and unrestrictedly reorganised according to the satisfaction of needs – even and especially those produced by capitalism – then the needs themselves would be decisively transformed' (Adorno, 2017: 103). This chapter is not an attempt to provide an answer to these questions, nor does it attempt to give an exhaustive or definitive account of Marxist understandings of desire. Instead, by beginning by noting desire's effective absence from the pages of *Capital* I hope to foreground desire's ambiguous and somewhat troubling (or at least troublesome) status within the Marxist tradition, before exploring some scattered examples of attempts to conceptualize desire in more explicit terms than Marx himself articulated.

DESIRABLE COMMODITIES

Descriptions of people's desires do occasionally appear on the pages of *Capital*, but the desiring people imagined are usually bourgeois and their desires are usually for increased profit and power. Marx speaks of their 'love of lucre' and in a section on hoarding describes the 'passionate desire' to stockpile money, picturing avaricious capitalists captivated by gold, by value in its 'glittering incarnation' (Marx, 1967: 215, 130). The hoarder 'makes a sacrifice of the lusts of the flesh to his gold fetish' (Marx, 1967: 133); commodity fetishism begets sexual

fetishism and displaces sensuality. Later, he refers to the ‘cupidity of mill-owners’ whose ‘were-wolf’s hunger for surplus value’ is like a fiendish companion to the ‘vampire thirst’ of capital for living labour (Marx, 1967: 233, 245). He speaks with pithy disdain of the hypocritical capitalist who may be a sanctimonious ‘model citizen, perhaps a Member of the Society for the Prevention of Cruelty to Animals’, but notes by way of a visceral metaphor that the heart which ‘seems to throb’ in the capitalist’s breast is not their own but the heart of the worker whose labour power they are intent on exploiting (Marx, 1967: 255). This is a slight twist on a metaphor that appears a few pages earlier: ‘a man’s heart is a wonderful thing, especially when carried in the purse’ (Marx, 1967: 219). The capitalist’s purse drips with the blood of the worker’s still-beating heart. The desires of the worker are subordinated to and circumscribed by those of the capitalist, whose own libidinal energies are channelled through and satisfied by the market. When discussing workers’ consumption in *Capital* Marx’s emphasis is on subsistence, on the capitalist’s motivation to pay wages which cover only the bare minimum necessary for the reproduction of labour power (with the usual caveat that the perceived minimum is culturally and historically variable) (Marx, 1967: 536–8). The worker in *Capital* is generally presented in their role as a seller of their labour power rather than as a buyer of commodities. However, in *Grundrisse* he acknowledges that although the capitalist may want his own workers to be abstemious, workers employed by others ‘stand towards him as consumers. In spite of all “pious” speeches he therefore searches for means to spur them on to consumption, to give his wares new charms, to inspire them with new needs by constant chatter etc’ (Marx, 1993: 287).

Capital was published in 1867. Soon after, due to shifts in capitalist development and modes of production, more emphasis began to be placed on the relationships between production, consumption and emotional life; new charms and corresponding new desires proliferated. Capitalists began to harness, shape and direct desire in more elaborate, explicit and sophisticated ways than Marx had envisaged. Advertising executives emerged as theoreticians of desire, masters of seduction, obsessed with manufacturing new needs to enable the proliferation of new commodities. America blazed the trail in the development of consumer capitalism, as William R. Leach discusses in *Land of Desire: Merchants, Power, and the Rise of a New American Culture*:

The United States was the first country in the world to have an economy devoted to mass production, and it was the first to create the mass consumer institutions and the mass consumer enticements that rose up in tandem to market and sell the mass-produced goods. (Leach, 1993: 11–12)

The generation of surplus value and extraction of value was tied to the generation and extraction of surplus desire. Leach traces the enmeshed organizations and institutions involved in this process – from government agencies to corporations, from labour unions to universities – but also highlights the extent

to which realizing these new economic models relied on aesthetic, sexual and psychological theories. These theories were historically specific, but they tended to assume desire itself was eternal, something to be tapped into and profited from rather than something to produce or invent.

Kevin Floyd provides a succinct gloss of the history of capital accumulation and the management of crisis in *The Reification of Desire: Toward a Queer Marxism* (2009). The early twentieth century, Floyd explains, saw an ‘acceleration of demand inducement’ (2009: 51). In the USA, Fordism enabled a coordination of production and consumption, securing the longest boom in the history of capitalism in the country (lasting from the early 1950s to the late 1960s). This precipitated the extension of the commodity relation to ever more spheres of existence, shifting the emphasis from norms of production to norms of consumption, which in turn participated in ‘a normalization of social life operating increasingly at the moment of consumption’ (Floyd, 2009: 51).⁵ As the theorist of regulation Howard Braverman, whose arguments Floyd engages with, writes in *Labour and Monopoly Capitalism* (1974):

So enterprising is capital that even where the effort is made by one or another section of the population to find a way to nature, sport, or art through personal activity and amateur or “underground” innovation, these activities are rapidly incorporated into the market so far as is possible. (Braverman, 1974: 193)

Leach’s emphasis is on the technologies and forums developed to market products and the flourishing of new techniques of display (in spaces like the department store which emerged in the late nineteenth century) whereas Floyd and Braverman also discuss the commodification of services and activities that led to the reification of the most intimate spheres of daily life. Work time and leisure time became increasingly experientially distinct at precisely the moment production and consumption were coordinated, the latter as much governed by the exigencies of capitalism as the former. The repetitive, routine, rhythmic qualities of industrial labour found a compensatory counterpart in proliferating, commodified leisure activities, the enforced tedium of the former set in contrast to the fun and frivolity of the latter.

For Floyd, these processes extended to sex and sexuality. He declares that ‘the reification of sexual desire ... emerges from within capital’s structural volatility’ (2009: 55) and observes that this emergence was contemporaneous with the popularizing of psychoanalysis in America. Adam Curtis presents a crass version of this argument in the 2002 documentary *The Century of the Self*, which makes much of the fact that Sigmund Freud’s nephew Edward Bernays played a major role in the burgeoning the American advertising industry. Floyd is more careful in his positioning of psychoanalysis within the history of capitalism; he insists on historicizing the advertising industry’s relation to commodity production, which he then connects to the emergence and popularization of a particular conceptualization of both sexuality and temporality.⁶ According to Floyd, psychoanalysis

proposed a vision of sexual desire with a temporality distinct from social life while simultaneously proposing that desire determined social life. At a moment when changes in the division of labour were taking place and in which 'personal life is epistemologically disciplined by exchange value', sexual urges and drives were detached from bodily capacities and ascribed an abstract, reified temporality (Floyd, 2009: 55).

Floyd reads psychoanalysis symptomatically, but in the period he is analysing Herbert Marcuse proposed an unorthodox reading of Freud that he claimed might serve as an *antidote* to capitalism. In *Eros and Civilization* (1955) Marcuse argues that Freud was mistaken to claim that the instincts he described were universal and unchangeable rather than specific to a particular, repressive form of social and economic organization. Repression, according to Marcuse, is socially enforced and historical rather than a biological necessity. He proposes that a form of non-repressive sublimation would be possible in a non-repressive society. He reassures his readers that this would not result in a society of 'sex maniacs' as it would see the libido not released but transformed, leading to an 'eroticization of the entire personality' (Marcuse, 1955: 201). This proposition, however, sounds suspiciously like a de-eroticization of the entire personality. Unlike the communist psychoanalyst Wilhelm Reich, who saw unrestrained orgiastic forms of sexual explosion, exploration and expression as a root to freedom,⁷ Marcuse presents them as side effects of repressive societies; wild orgies only erupt when people's libidinal energies are socially constrained and they prove no threat to the constraining society (Marcuse, 1955: 202; 1991: 80–1). In a non-repressive society pleasure would be lasting rather than fleeting, and sexual forms of gratification would therefore become less urgent. Marcuse insists that Freud's vision of humanity is only applicable to capitalism or what he calls, in a book that generally avoids references to Marx or overtly Marxist terminology, the 'administered life', but he nonetheless still implies that there is some kind of ideal, essential, whole humanity that preceded this and could be recaptured; repression is historical, but the instincts remain eternal yet retain none of the inherent destructiveness Freud ascribes to them.

In *Eros and Civilization* mass media replaces the family as the primary site through which ideological messages are transmitted and reproduced, but in *One-Dimensional Man* (first published in 1964) consumerism becomes more central to Marcuse's vision of the administered society. He lampoons the insidious role played by products in 'indoctrinating' people into an acceptance of the status quo (Marcuse, 1991: 14). For Marcuse, liberation 'depends on the consciousness of servitude', but the path to this consciousness is blocked by the internalization of false desires and the creation of illusory new needs, which 'have become the individual's own' (1991: 9). People feel superficially satisfied by things that are repressing them: 'liberty can be made into a powerful instrument of domination' (1991: 9). Marcuse wants to claim that it is possible to separate true needs from false ones but also recognizes that attempting to do so leads to an

impasse: 'how can the people who have been the object of effective and productive domination by themselves create the conditions of freedom?' (Marcuse, 1991: 9). Nonetheless he does seem to locate some kind of truth in a romanticized vision of a past, pre-technological world in which he claims libidinal satisfaction was not sought only in sex. In this un-alienated time, he says, bread was kneaded by human hands rather than made in a factory. Not only does Marcuse seem to see industrialization as more pernicious than capitalism, but he also fails to consider the kind of gender relations he is implicitly affirming by claiming the past might be any less oppressive than the present – who is baking the bread in Marcuse's imagined pre-industrial society? Unusually, given the overt and explicit gendering of consumption and the explicit techniques developed to position women as consumers from the late nineteenth century onwards, gender does not figure prominently in Marcuse's depiction of the 'administered society'; everyone's a dupe.⁸ A more dialectical account would acknowledge the positive aspects of the technological developments unleashed by capitalism and explore the potential role they might play in the reconfiguration of gender roles, sexualities and desires under a different mode of production. After all, there is no going back.

SEX APPEAL OF THE INORGANIC

'The modern advertisement shows ... to what extent the attractions of the woman and those of the commodity can be merged', Walter Benjamin remarks in a fragment of *The Arcades Project*, his posthumously published fragmentary collection of materials pertaining to 'Paris, Capital of the 19th Century', which he worked on between 1927 and 1940, and which charts an emerging consumer culture (Benjamin, 1999: 345). Sexuality, he says, is mobilized by capitalism. Women in *The Arcades Project* are not simply depicted as consumers of commodities or as those whose idealized and sexualized images are deployed to make commodities more attractive to buyers: Benjamin perceives that the commodity form is far more pervasive. Desire is produced and shaped by capitalism; it is not some pre-existing natural reservoir. Under capitalism woman and commodity merge because social relations are governed by the commodity form. Women become *like* commodities, resembling the similarly attired mannequins staring blankly out of the city's show windows (Benjamin, 1999: 78); static and object-like, often deathly, their sexual allure is enhanced by make-up and glittering accoutrements. Commodity fetishism participates in encouraging forms of sexual fetishism which fixate on inanimate objects and inorganic materials; fashion is aligned with death. Benjamin cites fashions for precious jewels, dresses like gold mines, crystal hats and glass shoes. He quotes a male poet that seeks to bind a woman to him with braids of rubies and ropes of pearls, and claims a poem by Charles Baudelaire describing a woman made of 'precious minerals' provides an image of the fetish, which he elsewhere defines as the 'sex

appeal of the inorganic' (Benjamin, 1999: 327).⁹ For Benjamin, 'Under the dominion of the commodity fetish, the sex appeal of the woman is more or less tinged with the appeal of the commodity' (1999: 345). The sparkling and dazzling objects that line the arcades and litter the pages of *The Arcades Projects* may seem distinctively attractive, but for Benjamin these coruscating things are all equally dead, exchangeable and thus indistinguishable: 'Diamond / steel and gold dissolve into one light' (Benjamin, 1999: 327). As commodities, products of abstract labour, the qualitative differences between things dissolve.

Sex sells; sex is also sold. Benjamin's discussions of the gendering and sexualization of commodities is bound up with his obsession with the figure of the Parisian prostitute, who is central to his arguments in *The Arcades Project*. According to Esther Leslie, the prostitute for Benjamin is not an exceptional figure but an exemplary one, the analysis of whom sheds light on capitalist social relations generally, and specifically on the entanglement of capitalism and desire: 'as dialectical image the prostitute synthesizes the exploitative labour of sales and marketing and the commodity as exchange-value, in that she is salesgirl and commodity, "seller and sold", in one' (Leslie, 2006: 106).¹⁰ Benjamin aligns the prostitute, who hides her identity and daubs herself in mask-like make-up, with a mass-produced object. This likeness, he says, finds a correlate at a later historical moment in music hall revues, in vogue at the time he was writing, in which identically clad women performed geometrically precise synchronized dance routines, a phenomenon that had already been analysed by Benjamin's friend Siegfried Kracauer in 'The Mass Ornament' (1927) (Benjamin, 1999: 346; Kracauer, 1995). According to Benjamin, 'Love for the prostitute is the apotheosis of empathy with the commodity' (Benjamin, 1999: 375, 511), echoing a phrase he uses in a later 'Convolute' of *The Arcades Project*: 'Empathy with the commodity is fundamentally empathy with exchange value itself' (Benjamin, 1999: 448).

Leslie is keen to defend Benjamin against liberal feminist critics who have read his discussions of the twinkling arcades as paeans to consumerism and his discussions of the figure of the prostitute as denigrations of women. His analysis, she stresses, is intended as an indictment of the commodity form and of the exploitative economic system under which the Parisian prostitute (and everyone else) lives. Often, however, Benjamin's discussions of the prostitute slip into metaphor, as when he cites Baudelaire's consideration of the 'prostitution of the commodity's soul' (Benjamin, 2006: 32).¹¹ Indeed, Benjamin explicitly states that the 'prostitute does not sell her labour power' (Benjamin, 1999: 348). He seems to view her less as an archetypal worker than as a literal embodiment of Marx's personified, mystical commodity. The intoxicating lure of the commodity is replicated in the prostitute, who is similarly conceptualized as a thing with a soul. But the sex worker is a worker and not a commodity. Benjamin gestures towards a contradiction in his analysis when he imagines a time when workers

might confront their own labour power as a commodity, but the masculine pronouns here suggest that he does not have the figure of the prostitute in mind:

The more conscious he becomes of his mode of existence, the mode imposed on him by the system of production, the more he proletarianizes himself, the more he will be gripped by the chilly breath of the commodity economy, and the less he will feel like empathizing with commodities. (Benjamin, 2006: 33)

He attempts to imagine a time when solidarity between people might overthrow empathy with things, but until such a time as the working class can seize power it will, he says, seek an uneasy enjoyment of existing society ‘derived from a presentiment of its own determination as a class’ (Benjamin, 2006: 34). Unlike Marcuse, Benjamin is not derisive of workers’ desires for commodities, perceiving that they are not based in delusion but function as an attempt to make life more bearable in the present moment, in the meantime, until grander desires can be fulfilled in the future (when people can be liberated from exploitative work *and* enjoy fun activities and sparkling things). The prostitute returns at the end of this paragraph, where Benjamin suggests that workers in the contradictory position of passing time until a revolutionary opportunity arises while being aware of the horrors of their current social existence find ‘charm even in damaged and decaying goods’, which reflect the decaying qualities of bourgeois, capitalist society, citing a Baudelaire poem about a courtesan whose heart is described as being “bruised like a peach” (Benjamin, 2006: 34). Here the proletariat is put in the position of the client/john and the prostitute in the position of the commodity, but this sets up a false distinction between these two subjects who *both* sell their labour power, whose bruised hearts *both* beat in the wallet of the person to whom their labour power is sold (to return to Marx’s metaphor).

The expansion of sexual commerce is part of the economic shifts and expansion of consumption Floyd traces in *The Reification of Desire*. Maya Andrea Gonzalez and Cassandra Troyan reflect on a contemporary iteration of sex work in their analysis of ‘The Girlfriend Experience’, which involves rich, often married men seeking a ‘ready-made companion’ in exchange for gifts and money (Gonzalez and Troyan, 2016).¹² Unlike Benjamin, who ambiguously treats the Parisian prostitute as an object of exchange rather than a seller of her labour power, they position the ‘sugar baby’ as a worker who offers ‘a standpoint on the contemporary predicament of abject subjects’ (Gonzalez and Troyan, 2016). In ‘The Girlfriend Experience’ the services being sold are intimacy or authenticity in addition to sex, a counterfeit version of a genuine romance: ‘The imperative to enjoy authentic sexual enjoyment is to desire authenticity more than sex itself’ (Gonzalez and Troyan, 2016). Gonzalez and Troyan emphasize that the disavowal of the relationship’s basis in exchange is key to the encounter, which must convincingly simulate an authentic bond between sugar daddy and sugar baby. The sugar baby only succeeds in her role through the creation of a

'fantasy of reciprocity' in which her waged status goes unacknowledged, producing what they call 'disavowed intimacy' (premised on disavowed payment): 'Commodifying experience requires an imaginary re-enactment of mutual freedom at the site of asymmetrical power and drudgery' (Gonzalez and Troyan, 2016).

For Marx commodity fetishism is premised on the disavowal of production, and the disavowal of exchange in this encounter has a similar function for Gonzalez and Troyan: the commodity is labour power but its status as a commodity must be disavowed at the same time it is performed (rather than subsequently). The disavowal of exchange thus allows for the labour being performed to seem spontaneous and voluntary: 'Work that appears in the form of pure enjoyment suggests that payment is supplementary or indifferent to desire, when in fact it is the cause' (Gonzalez and Troyan, 2016). This is a slightly different process to what Benjamin refers to as the 'dialectical function of money in prostitution' which 'buys pleasure and, at the same time, becomes the expression of shame' (Benjamin, 1999: 492). Gonzalez and Troyan argue that the fact the relationship is premised on exchange is a source of shame or at least an impediment to pleasure for the client, whereas for Benjamin, through the logic of abstraction, money functions to distance the customer from the guilt he attaches to the purchase: 'The shame-reddened wound on the body of society secretes money and closes up. It forms a metallic scab' (Benjamin, 1999: 492). Gonzalez and Troyan's analysis goes further by suggesting that under existing social relations a metallic scab is preferable to a bloody one, that the heart of the waged girlfriend may be more impervious to bruising, or more capable of inflicting bruises on the body of society, than that of the unwaged one:

When love and care are exploited under the conditions of erasure, to continue to labour is to continue to struggle ... To assert payment for that which is assumed to be free is to say that her body belongs to no one but herself – or to nobody but herself and the body of struggle. (Gonzalez and Troyan, 2016)

Rather than a metaphor for the 'commodity's soul' (Benjamin, 2006: 32), the sugar baby comes to occupy the same 'space for passing time' as the revolutionary workers described by Benjamin: damaged enjoyment pending revolution (Benjamin, 2006: 34).

Drawing on ethnographic fieldwork conducted with male clients of (predominantly but not exclusively female) commercial sex workers in San Francisco's Bay Area in the late 1990s, Elizabeth Bernstein found that 'for many sexual clients, the market is experienced as enhancing and facilitating desired forms of non-domestic sexual activity' (Bernstein, 2001: 389). Bernstein lauds the role of sex work in 'disembedding ... the (male) individual from the sex-romance nexus of the privatized nuclear family' (Bernstein, 2001: 399). She is dismissive of the 'platitudinous view that sexuality has been "commodified" – and by implication diminished – like everything else in late capitalism' (Bernstein, 2001: 398). Bernstein's criticism seems to imply that those who

protest to the commodity form would therefore validate a return to some supposedly more natural or genuine form of romantic encounter and hence uphold oppressive, normative family values and sexual mores. However, Gonzalez and Troyan analyse the labour involved in ‘The Girlfriend Experience’ to shed light not only on other forms of sex work but also on other forms of service work¹³ and, crucially, on the kinds of unwaged, affective labour demanded by unremunerated romantic relationships (particularly heterosexual ones). They depict the gestures performed and emotions expressed in the realm of work as existing in a kind of feedback loop with those outside it. Indeed, the boundaries separating these realms from one another are increasingly porous and ill defined, a porosity they argue, Bernstein’s notion of ‘bounded intimacy’ fails to apprehend. The counterfeit authenticity and feigned intimacy demanded by the particular form of waged work they are analysing does not stand in contrast to some pure, unmediated or genuine form of human interaction outside of it but highlights the impossibility of any such relations within the existing state of things. Similarly, for Leslie the revolutionary dimension of Benjamin’s discussions of ‘women in crisis’ in *The Arcades Project* is that they expose the artificiality of hegemonic gender relations, including the notions that sex should be reproductive, families should be nuclear and women should be confined to the private sphere:

In detailing modern women’s affinity for the unnatural and the commodified, Benjamin is not caught up in a romantic nostalgia for a lost naturalness. His aim is to validate, out of the wreckage, the explicit shift of women into the realm of history and culture, recognizing the enormity of its social and political implications. It is the revolutionary chance for salvation. Benjamin is not a moralist, providing positive images, but a purveyor of a negativity with an explosive charge. (Leslie, 2006: 102)

The female figures he discusses participate in the ‘detonation of nature’: victims of the brutal exploitations of capitalist modernity but also the potential future beneficiaries and agents of a technologized communist future in which their roles would not be prescribed by biological notions (which were themselves cultural and historical all along). Like gender, desire is not natural or eternal. In contrast to Marcuse, who insists that lovemaking in a meadow is preferable to lovemaking in a car whose ‘mechanized environment’ serves to block libidinal flows, Benjamin (like Leslie, and Gonzalez and Troyan) refuses to validate a supposedly natural, lost realm (Marcuse, 1991: 77). Technologies and forms of sexual encounter beyond some mawkish ideal of ‘genuine’ romance are not the problem: capitalism is. Indeed, meadows are not external to capitalism; their enclosure and transformation into private property was key to its development, as Marx makes clear in Chapter 27 of *Capital*. Artificial, historically produced and thus transformable, desire is not something to be recovered or dug up from beneath the debris of capitalist modernity but something to be reached by passing through and beyond capitalism in a process of dialectical sublation. In contrast to these communist theorists who discern a revolutionary ‘explosive charge’

in the figures rendered abject by capitalism, Bernstein's dismissal of Marxist analyses of sex work has more in common with theorists who have sought to see desire as immanent to capitalism.

LIBIDINAL INVESTMENTS

Writing in the early 1970s, in the aftermath of May 1968 and on the cusp of a new crisis of capitalism, *Anti-Oedipus: Capitalism and Schizophrenia* (1972), by Gilles Deleuze and Félix Guattari, rejected not only the traditional psychoanalytic Oedipal triad (mummy–daddy–me) but also pushed against orthodox Marxism, working within and against both traditions. Desire is central to their analysis, which understands people as 'desiring machines' (*machines désirantes*), interconnected, porous and entangled machinic organisms or organic machines – not one id but many. Society and the desiring machines inhabiting and constituting it are animated by flows of libidinal desire. Deleuze and Guattari castigate the Oedipal triangle of traditional psychoanalysis for being too reductive, for repressing the wild pluralities of desire, which can be understood as sexual only insofar as 'sexuality is everywhere' (Deleuze and Guattari, 2011: 322). Marcuse's ideal non-repressive society would see a dispersal of libido whereas Deleuze and Guattari insist libido is already dispersed; they claim the erotic reality of capitalism is repressed rather than libido itself. Moreover, their vision of libidinal diffusion retains an intensity, dynamism and explosivity that Marcuse argues would be diminished if it were spread across a non-repressed society. For Marcuse, sexuality everywhere would mean less actual sex, whereas Deleuze and Guattari seem to say actual sex is already everywhere but not recognized as such. Again and again they insist that they are not being figurative:

The truth is that sexuality is everywhere: the way a bureaucrat fondles his records, a judge administers justice, a businessman causes money to circulate; the way the bourgeoisie fucks the proletariat; and so on. And there is no need to resort to metaphors, any more than for the libido to go by way of metamorphoses. (Deleuze and Guattari, 2011: 322)

Marx described a hoarder substituting sexual pleasure with the pleasure of stockpiling money, whereas in *Anti-Oedipus* there are no such substitutions because the stockpiling of money *is* a sexual pleasure. They are at pains to point out that it is not enough to observe that capital flows and is interrupted *like* libido or that the unconscious produces desire *like* a factory: a 'simple parallelism' should not be drawn between 'capitalist social production and desiring-production, or between the flows of money-capital and the shit-flows of desire', as this implies that desiring machines are external to capitalism whereas 'desiring machines are in social machines and nowhere else' (Deleuze and Guattari, 2011: 332). Though many Marxists reacted with sneering hostility to *Anti-Oedipus*, Deleuze and Guattari insisted that their proposals were revolutionary.¹⁴ The text provides a

foundational definition of what would become known as ‘accelerationism’, proposing that speeding up existing processes of capitalist accumulation was preferable to a withdrawal from them.

In *Libidinal Economy* (1974) Jean-François Lyotard pushes aspects of Deleuze and Guattari’s arguments further and, in the process, seems to dispense with their proclaimed left-wing political allegiances altogether. He later described it as his ‘evil book’ (Noys, 2014: 12). In a section entitled ‘The Desire Named Marx’ he proclaims that ‘desire underlies capitalism’ (Lyotard, 2004: 104); capitalism pulsates with libidinal intensities and is propelled by affective flows. He decries non-alienation as a fantasy, mistakenly located in a past or future pictured as whole and unutilized (a critique that could certainly be levelled at Marcuse). He reads *Capital* as though it were structured by Marx’s own conflicting desires, caught between wholeness and mutilation, remarking that Marx was unable to finish it, that its resolution (read: orgasm) was constantly postponed. In an infamous passage for which he was denounced by many on the left he proposes that industrial workers, far from having no other choice than to work, took masochistic enjoyment in becoming ‘slave to the machine, fucker fucked by it, eight hours, twelve hours, a day, year after year’ (Lyotard, 2004: 109). Lyotard evidently anticipated and even seems to relish the idea of the opprobrium these lines would provoke – ‘hang on tight and spit on me’ – evincing his own masochistic enjoyment in indulging in this grotesque image of the gratifications of exploitative and exhausting labour of a kind he never had to perform:

they enjoyed it, enjoyed the mad destruction of the organic body which was indeed imposed on them, they enjoyed the decomposition of their personal identity, the identity that the peasant tradition had constructed for them, enjoyed the dissolution of their families and villages, and enjoyed the new monstrous anonymity of the suburbs and the pubs in the morning and evening. (Lyotard, 2004: 109–10)

Unlike in Marcuse, consumerism is not presented as having the mollifying function of making production more bearable, and unlike in Benjamin it is not seen as a temporary and necessarily partial pleasure en route to revolution. For Lyotard, the enjoyment found in capitalist society is not presented as false or distorted; even its most seemingly unpleasant aspects (work as well as leisure) can be a source of perverse *jouissance*. In *Malign Velocities*, a critique of accelerationism, Benjamin Noys discusses the unfolding of arguments and counter-arguments across *Anti-Oedipus*, *Libidinal Economy* and Jean Baudrillard’s *Symbolic Exchange or Death* (1976), concluding that:

The result is that each intensifies a politics of radical immanence, of immersion in capital to the point where any way to distinguish a radical strategy from the strategy of capital seems to disappear completely. (Noys, 2014: 13)

Revelling in, surrendering to and pushing to heighten or intensify the libidinal exigencies of capital is proposed as a mode of overthrowing it, but the arguments

prove unconvincing and the human costs such a process would entail – which would presumably be less acutely felt by white male university professors in France than by other people – are not acknowledged.

In *Profit and Pleasure: Sexual Identities in Late Capitalism* (2000) Rosemary Hennessy criticizes the ways in which *Anti-Oedipus* has been lauded by many contemporary queer theorists as a ‘monumental explanation of the materiality of desire under capitalism’.¹⁵ The appeal of their work for theorists of sexuality, she claims, lays in its proposition that desire is disruptive and untethered from prescriptive (i.e. heteronormative or cisnormative) relations between sexual subjects and sexual objects. But according to Hennessy, what such analyses miss is that desire for Deleuze and Guattari is a kind of transhistorical substance: ‘desire is historically invariant matter’ (2000: 70). Here a proximity to Freudian psychoanalysis and Marcuse’s preference for lovemaking in meadows over cars is apparent: Deleuze and Guattari may dispense with the Oedipus complex but they maintain that human existence has a primal substrate.¹⁶ Hennessy argues that this approach ‘glorifies desire’ and obscures the extent to which the desiring subject is formed by history, specifically by different phases of capitalist development:

Deleuze and Guattari acknowledge that capitalism liberates the flows of desire from the clutches of an oedipalizing culture, but it does so under social conditions that continually reterritorialize the desires it unleashes in order to accrue surplus value. As they see it, desire is revolutionary and capable of demolishing social social form. But unfortunately and predictably, the alternative it aims for is not social justice but the ‘body without organs’ – the undifferentiated subject of self-enjoyment. (Hennessy, 2000: 71)

Desire has a privileged status in their account as that which drives history, and the desiring subject takes the place of the proletariat as the primary agent of historical change, but the historical constitution of desire itself is strangely external to these processes. Although Deleuze and Guattari constantly invoke capitalism, Hennessy argues that their account detaches desire from historical and material production, ‘the structures of exploitation on which capitalist production depends have completely disappeared’ (2000: 71). For Hennessy, the challenge is to recognize that desire does not precede the social or economic, and thus cannot be disentangled or considered in isolation from its historical articulation. Indeed, dehistoricizing desire can participate in naturalizing existing social relations, even if Deleuze and Guattari want to claim the opposite. She goes so far as to observe an ‘ideological affiliation’ between queer theorists who celebrate *Anti-Oedipus* with ‘naturalized notions of identity and difference emanating from Madison Avenue and Wall Street’ (Hennessy, 2000: 68). That desire cannot be separated from capitalism and class relations does not, however, lead Hennessy to affirm a position closer to Lyotard’s or to dismiss ‘desire and pleasure as bourgeois inventions irrelevant to material analysis’, as many Marxists have done historically (Hennessy, 2000: 69). Instead, analysing the historical

specificity of desire and its constitutive relation to capitalism might form part of a historical struggle to transform the oppressive world in which people live and want and love and need.

THE DESIRE FOR LIBERATION

Wendy Brown contends that ‘Marxism proved unable to address critical issues of need, desire, and identity formation in late modernity’ (2001: 19). She describes the fracturing of social movements, rise of apathy and a proliferation of micro-causes post-1989 as being related to ‘the loss of a clear object of political desire’ (2001: 29). What would that obscure object be?

A few pages into Chapter 7, ‘The Labour-Process and the Process of Producing Surplus-Value’, Marx admits that his discussion has thus far reduced labour to its ‘simple elementary factors’ and hence treated it in a transhistorical sense (as the metabolic relationship between humanity and nature), with no consideration of the different conditions under which labour processes may be performed or the experiences of the people performing or directing them:

As the taste of Porridge does not tell you who grew the oats, no more does this simple process tell you of itself what are the social conditions under which it is taking place, whether under the slave-owner’s brutal lash, or the anxious eye of the capitalist, whether Cincinnatus carries it on in tilling his modest farm or a savage in killing wild animals with stones. (Marx, 1967: 179)

He does, however, go on to discuss labour processes within a capitalist mode of production specifically, and he subsequently discusses the social conditions under which labour processes take place. The ‘Working Day’ chapter, in particular, attends in detail to the experiences and sufferings of factory workers in Britain. The same cannot be said for his discussion of needs, wants and desires in relation to use-values; Marx is interested in who grew the oats rather than in who eats them or why they might want, need or desire to do so. Yet his discussions of labour do pertain to desire. Workers sell their labour power as a commodity, but the suffering Marx details points negatively to a desire not to be compelled to do so. For Lukács, the proletariat becomes aware that it is selling its labour power as a commodity and through this consciousness can challenge ‘the fetish character of every commodity’ (Lukács, 1923). *Capital* is primarily concerned with labour performed under the ‘anxious eye of the capitalist’, but I want to conclude with a consideration of labour performed ‘under the slave-owner’s brutal lash’.

In his discussion of the fetish character of commodities, Marx imagines a commodity who speaks, but he is only capable of imagining this speaking commodity ‘subjunctively’ (Moten, 2003: 8). Indeed, the supposed impossibility of the commodity’s speech is central to his argument regarding the value that

inheres – hidden and necessarily silent – in it. But as Fred Moten points out, commodities *do* speak: ‘Marx’s counterfactual ... is broken by a commodity and by the trace of a subjectivity structure born in objection that he neither realizes nor anticipates’ (2003:13). The enslaved person is a commodity who not only speaks but shrieks and screams: ‘The history of blackness is testament to the fact that objects can and do resist’ (Moten, 2003: 1). As C. L. R. James writes in *The Black Jacobins*, slaves may have been traded as commodities but they remained ‘quite invincibly human beings’, a fact ‘which explains the unusual spectacle of property-owners apparently careless of preserving their property’ (1989: 11–12). Human beings resist. Moten suggests that the commodity’s ‘secret’ was never fully kept. He reads Frederick Douglass’ descriptions of his enslaved Aunt Hester’s screams of resistance to her master’s brutal beatings as a theory of value; the speaking commodity phonically interrupts the abstracting logics of exchange. Douglass and Marx were contemporaries and Moten reads *Narrative of the Life of Frederick Douglass* (1845) alongside Marx’s *1844 Manuscripts*, proposing that Aunt Hester’s scream anticipates and enacts Marx’s theoretical descriptions of communism as a ‘discovery procedure’:

Just as CLR James could assert – by way of a kind of magic that seems impossible but whose reality is something to which every worker might surreptitiously attest – that socialism is already in place on the shop floor, so can one assert, by way of Aunt Hester and the theoretical catalysis she enacts, that communism-in-(the resistance to) slavery is the discovery procedure for communism out of slavery’s outside. (Moten, 2003: 252)¹⁷

The screaming commodity registers the non-identity between desire and exchange value (even if she remains a use-value in the eyes of the brutal slave-owner). Brown implies that the supposedly lost object of political desire is some kind of distant hermetic society located in an abstract future, positively, if vaguely defined, whereas I have attempted to foreground theories that assert that the future can only be sought negatively, ‘in the degraded present’ (Moten, 2003: 8).

Notes

- 1 In the Ben Fowkes translation ‘wants’ is translated as ‘needs’ and ‘fancy’ is translated as ‘the imagination’, which perhaps better captures the double character of the commodity, that is both material and supersensible (Marx, 1990: 1).
- 2 In German Barbon uses the word *Verlangen*.
- 3 Marx does not tend to use the words *Begehren* (desire) or *Wunsch* (wish).
- 4 Gayle Rubin similarly describes Marx’s understanding of need as combining biological, geographical and cultural factors: ‘beer is necessary for the reproduction of the English working class, and wine necessary for the French’ (Rubin, 2011: 37).
- 5 Floyd also draws on Aglietta (2015).
- 6 Floyd discusses Bernays on page 49.
- 7 See, in particular, Reich’s early writings, completed before his emigration to the USA and contained in the collection *Sex-Pol: Essays, 1929–1934* (2014).

- 8 Floyd draws on Richard Ohmann's *Selling Culture: Magazines, Markets and Class at the Turn of the Century* (1996) in which Ohmann observes that although commodities were marketed to people of both genders and that ideals of attractiveness were pedalled to men, 'then as now, the erotic was primarily a feminine category' (1996; 202). There is a vast scholarly literature on the gendering of consumption. See, for example, Gruber Garvey (1996). The gendered implications of Marcuse's arguments are not very explicit whereas many Marxist critiques of capitalism have been combined with a disdain for mass culture and consumerism, which has often, in practice, involved directing explicit disdain at women. I discuss this phenomenon, with an emphasis on the misogyny displayed by many male writers on the left in the interwar years, in Proctor (2015). This is not only a historical phenomenon, however – for a recent example of the tendency, see Tiquun (2012).
- 9 See also Benjamin (1999: 8, 19). An earlier draft referred to the 'sex appeal of the commodity' (1999: 864).
- 10 According to Leslie, Benjamin chooses the prostitute and the mannequin 'as model figures, emissaries of a whole system of exploitation, reification, alienation. Like the flâneur, and yet more socialized, more representative, these women stand in for every person in commodity-producing society' (Leslie, 2006: 101). There is a large feminist literature on the figure of the sex worker in *The Arcades Project*: see, for example, Buck-Morss (1986) and Schlossman (2004).
- 11 In this essay he talks about an 'empathy with inorganic things' (Benjamin, 2006: 32).
- 12 I focus on this article alone here, but its arguments are broadly in the Marxist-feminist tradition associated with Wages for Housework (and groups like Wages Due Lesbians and the English Collective of Prostitutes), who campaigned against the criminalization of prostitution (Martin, 2012).
- 13 Here they draw on Arlie Hochschild's analysis of the emotional labour demanded of flight attendants (and other service workers) (Hochschild, 1983).
- 14 For a useful overview of the reception of *Anti-Oedipus*, see Herzog (2016).
- 15 Her primary example here is Elizabeth Grosz, but she also mentions Guy Hocquenghem.
- 16 Hennessy's claims bear comparison with the argument advanced by Amia Srinivasan in her 2018 essay 'Does Anyone Have the Right to Sex?'. Srinivasan confronts the implicit assumption, commonplace in contemporary feminist accounts of sex, that desire is external to or prior to the social, identifying a 'convergence, however unintentional, between sex positivity and liberalism in their shared reluctance to interrogate the formation of our desires'. She asks whether we should really just accept 'as a given' that desire exists outside of history, concluding that although the conscious redirection of personal desire might seem impossible, 'the very idea of fixed sexual preference is political, not metaphysical' (Srinivasan, 2018).
- 17 Moten does not cite James here but I assume this is a reference to the arguments made in James and Lee (1974, originally published in 1958).

Filming *Capital*

Pietro Bianchi

There is a famous sequence at the beginning of *Grapes of Wrath*, John Ford's 1940s film based on John Steinbeck's novel, in which we see Tom Joad who, having been released from prison, returns to his family farm in Sallisaw, Oklahoma and finds it empty, destroyed, and abandoned. The land had been confiscated by the banks and his family had moved to California to look for work. But how could someone take over the land where the Joads had lived and worked for more than 50 years? How could it happen? Muley – a man who had camped in the ruins of the abandoned Joad house and refused to flee to California – reveals who is responsible for what occurred to Tom's family. In a three-minute flashback, Ford not only shows, through the words of Muley, a detailed representation of land repossession in Oklahoma during the Great Depression, but also implicitly raises one of the most enigmatic and complex questions of capitalist modernity: how does capitalism manifest itself? What is its face when it appears in our lives with a traumatic event (such as a house eviction)? What is its image?

The flashback takes us back to the day when an agent of the landowners who rented out the fields where Muley used to work comes to deliver an eviction notice to the tenant farmers. The man explains how the sharecropping system is no longer profitable: the company is no longer getting a sufficient return on its investment, now that a man alone with his tractor is able to farm a dozen or more fields that size. It is more convenient to just pay him a salary and take the whole harvest. Muley complains that it is already difficult for them to live off what they earn right now: the children are hungry and dressed in rags. But the

man cuts him short and tells him that he's not the one responsible for any of this; he's only carrying out orders on behalf of the company. 'So, whose fault is it?' a worker asks. 'You know who owns the lands. It's the Shawnee Land and Cattle Company', replies the man. 'And who are they?' replies the farmer. 'Nobody. It's a company'. Then the farmer, starting to get impatient, asks who they should talk to, perhaps with a rifle. But in a kind of infinite regress, responsibilities recede ever farther: shouldn't there be a president of that company? But they're told it is not even him who would be to blame, because the bank told him what to do. And even in the bank, decisions are made by a manager, who is 'half-crazy trying to keep up with his orders'. 'Then, who do we shoot?' one of the farmers asks, now absolutely furious; to which the man finally replies: 'Brother, I don't know. If I did, I'd tell you. I just don't know who's to blame'.

This is the question that haunts the farmers: who's to blame for their despair and injustice? The banks? The man who brings the eviction notice? Or even their neighborhood friend, who is just as desperate as they are, and drives the tractor that is going to destroy their house for three dollars a day? Which of them is the true face of capitalism and responsible for their condition? What is the cause and reason for this process that seems so abstract and opaque? Who is to blame? Today, this question continues to represent a political quandary of great significance, especially in an era when value-chains and the capitalist production network have become so stratified and complex that decision-making centers seem to have become invisible.¹ If everyone, from the small entrepreneur to the CEO of multinational financial groups, are mere emissaries (or *Träger*, as Marx said) of capital, executing orders drafted elsewhere – just like the businessman from *Grapes of Wrath* – who is responsible for these orders? Where is the agency located? The question, even for a political agenda that wants to transform capitalism, remains today the same as the one that haunted the workers of the Dust Bowl: who do we shoot? Who should we point the gun at?

'...SO THAT THE HUMBLE WORKER OR PEASANT COULD UNDERSTAND MARX'S CAPITAL'

This problem forces us to reflect on the nature of the *image* of capitalism and of its modes of sensory appearance: how is it possible to *see* the capitalist mode of production in the midst of the confused and opaque multiplicity of reality? How does capitalism manifest itself in experience given that, as the example of *Grapes of Wrath* shows, most of the time we only see its effects but not its hidden causes? Or – as someone might legitimately ask – does capitalism exist in the first place, given that in our experience it is nowhere to be found?

The question guided Sergei Eisenstein when between 1927 and 1928 he started to work on a project for a film on Karl Marx's *Das Kapital*: a project based on the idea that it was effectively possible to create images that would render capitalism

visible. These were years when Eisenstein was at the peak of his fame, just after the most important commission of his life: a cinematic celebration of the 10th anniversary of the Bolshevik revolution with *October*. The latter turned out to be one of the most expensive blockbusters in the history of Soviet cinema: whereas an average Soviet production cost 30,000–40,000 rubles, for *October* more than 800,000 rubles were spent.² It might have been because of this ecstatic sense of grandeur³ and provisional trust that the Soviet state gave him during those years (which rapidly changed during the 30s) that he thought that such an ambitious and challenging endeavor would have been possible.

As we can see from the scattered and not always coherent information left in his notebooks and diaries (filled with cut-and-paste images and collages, as has now been documented by Elena Vogman (2019)), Eisenstein wanted to construct a didactic project aimed at explaining not so much the conceptual passages of *Das Kapital* but Marx's dialectical method ('to teach the worker to think dialectically. To show the method of dialectics' (Eisenstein, 1976: 10)). A couple of years later Eisenstein would synthesize his approach during a talk at the Sorbonne in Paris:

My new conception of the film is based on the idea that the intellectual and emotional processes which so far have been conceived of as existing independently of each other – art versus science – and forming an antithesis heretofore never united, can be brought together to form a synthesis on the basis of cinedialectic, a process that only the cinema can achieve. A spectator can be made to feel-and-think what he sees on the screen. The scientific formula can be given the emotional quality of a poem. And whether my ideas on this matter are right or wrong, I am at present working in this direction. I will attempt to film *Capital* so that the humble worker or peasant can understand it. (Brody, 1930)⁴

So, what would this project concretely look like and how would it possibly make an illiterate worker understand with images the conceptual intricacies of Karl Marx's *Das Kapital*, which usually requires years of sophisticated intellectual training? The examples imagined by Eisenstein were numerous, eclectic, and ingenious. Take the challenge of visualizing the problem of the relationship between workers and the mechanization of production – between the 'textile machines and machine-wreckers' or luddites, as Eisenstein put it, i.e., the question of the unemployment derived from technological changes in production. Eisenstein proposed to show an 'electric streetcar in Shanghai and thousands of coolies thereby deprived of bread, lying down on the tracks – to die' (Eisenstein, 1976: 8). To represent financial capital, his plan was not to show the stock exchange or the typical images that we associate with finance, but rather 'thousands of "tiny details"' like in the novel *L'argent* by Émile Zola: a concierge who works as a 'broker' on the side and lends money to all residents of the building (1976: 7). But it seems that Eisenstein's approach was closer to Marx when he emphasized the contradictions and antagonisms that coexist within a commodity (almost alluding to a potential reflection on the commodity form); it is reminiscent of the example of 'silk stockings' where 'the fight for the centimeter of silk

stocking' placed one against the other artists and moralists, silk manufacturers and textile masters for long skirts, ending with 'Indian women forced to incubate the silk cocoon by carrying them in their armpits'.⁵ Or, regarding a scene for which Eisenstein seemed to have in mind a concrete shooting plan, he writes:

Throughout the entire picture the wife cooks soup for her returning husband. NB Could be two themes intercut for association: the soup-cooking wife and the home-returning husband. Completely idiotic (all right in the first stages of a working hypothesis): in the third part (for instance), association moves from the pepper with which she seasons food. Pepper, Cayenne, Devil's Island. Dreyfus. French chauvinism. Figaro in Krupp's hand. War. Ships sunk in the port. (Obviously not in such quantity!!) nb Good in its non-banality – transition: pepper-Dreyfus-Figaro. It would be good to cover the sunken English ships (according to Kushner, 103 days abroad) with the lid of a saucepan. It could even be not pepper – but kerosene for a stove and transition into oil. (Eisenstein, 1976: 17)

The soup that the wife prepares for her returning husband would serve as the symbol of the minimal relief that calms down a need for social uprising – 'the "house-wifely virtues" of a German worker's wife constitute the greatest evil, the strongest obstacle to a revolutionary uprising' (1976: 16), as Eisenstein wrote. From that image, a whole series of connections emerged: the worker puts the pepper in the soup, but where does the pepper come from? From 'Cayenne' in the 'French Guyana'; and it was precisely in Guyana, in the 'Devil's Island' just outside Cayenne, where 'Dreyfus' was sent to a forced-labor camp after being convicted in 1894 for the famous *affaire* during which 'French chauvinism' rose to the surface, promoted by 'Figaro'. But who funded Figaro? Krupp, the famous steel conglomerate which didn't just support the newspaper but was also one of the biggest armament industrialists in the world; the latter leads to the 'sunken English ships' that 'it would be good to cover [...] with the lid of a saucepan', exactly as if they were pepper grains in a pan...

In this crazy scene, an object is analyzed and interrogated, revealing a complex network of unexpected associations: from a simple bowl of soup an entire system of relations is exposed and at the end it is almost as if the 'sunken English ships' were really inside of the saucepan, given that effectively it was because of them that pepper was on that table in the first place (at least according to Eisenstein's eclectic logic). Adopting this method, which at first may seem unorthodox, Eisenstein seemed to be aware that the Marxian process of 'opening up' the social implications implied in a commodity is similar to an infinite regression: from the concrete immediacy of an apparently simple object standing in front of our eyes in *Capital* we are brought to discover its invisible social mediations. From the immediacy of the perception of its objecthood ('a commodity appears at first sight an extremely obvious, trivial thing' (Marx, 1976: 163)) we are led to find out its 'sensuous extra-sensory properties' (1976: 163),⁶ i.e., its *non-immediate* properties. Even today, even the most trivial technological product depends on a complex network of logistical systems of transportation, raw material extraction, semi-finished products, and manufacturing plants, as well as engineers, software developers, and system administrators (but also janitors, delivery men, cafeteria cooks, etc.) that are

nowhere to be found if we just look at the product. If we open up what is ‘inside’ a commodity, we find an entire world of social spheres that are completely invisible to its immediate appearance, but at the same time essential to it. The social ‘cause’ that brought that particular commodity in front of us is absolutely opaque.

Alexander Kluge’s 2008 *News from Ideological Antiquity* – a nine-hour essay-film that reflects back on Eisenstein’s project of filming *Capital* – contains a short film-within-a-film that exemplifies this logic of ‘opening up’ the immediacy of an object in order to reveal its hidden social mediations. Realized by Tom Tykwer, it is titled *The Inside of Things* and almost literally reenacts Eisenstein’s method of infinite regress to analyze the commodity form. In this short feature, we see a woman running in front of a building; after a few seconds, the frame suddenly freezes and for about 10 minutes a voice-over isolates one by one the different elements that compose the shot: an intercom, the lock on the door, the house number, the woman’s leather shoes, her purse, and so on. All these objects are analyzed in detail, from a historical and technological point of view: where were they made, in which historical period were they invented, when did they start to be produced, where are they fabricated, etc.? The objects that compose that particular frame – but we could say: almost *any* object that inhabits our world – are none other than commodities. In other words, they imply a world market, a certain organization of production, and all those causal nexuses that are the base of the world capitalist economy. Every object that composes this image (but we could say, *every* image) is ‘opened up’ to its multiple implications. What is interesting here is the sudden feeling of distance that separates the world as an ‘immense accumulation of commodities’, on the one hand, and the immediate and spontaneous impression we experience with our own eyes, on the other. ‘Opening up’ a commodity means showing the route it traveled before it was sold, the workers who produced it, the people who conceived and designed it, the money invested in order to produce it, the bankers and stock market that enabled the investment, etc. The social conditions that made possible the perceivability of that image are erased and excluded from perception.

In order to transition ‘from a bowl of soup to the British vessels sunk by England’ (Eisenstein, 1976: 15), Eisenstein referred to a section of Joyce’s *Ulysses*: namely the chapter called ‘Ithaca’, which is constructed in the form of a rigidly organized scholastic catechism of 309 questions and answers (‘questions are asked and answers given’ (1976: 7)). The continuous back and forth, which goes on for the entire chapter, gives the impression of a never-ending scientific search that at every step goes deeper and deeper into a topic, fully investigating all its possible ramifications, as random and loosely associated as they might be. Every question leads to another and then another, and so on. As Fredric Jameson perceptively claimed, Eisenstein had in mind:

something like a Marxian version of Freudian free association – the chain of hidden links that leads us from the surface of everyday life and experience to the very sources of production itself. As in Freud, this is a vertical plunge downward into the ontological abyss, what he called ‘the navel of the dream’; it interrupts the banal horizontal narrative and stages an associative cluster charged with affect. (Jameson, 2009: 113)

Even though Eisenstein seems to have had a didactic preoccupation – how to translate dialectic in simple visual formulas – what is implicit in his notes is an awareness of the epistemological problem that the commodity form poses. In capitalism, perception is turned upside down: what appears as immediate and objective is in fact the result of a complex mediation of social practices that are invisible. Such an insight is particularly interesting coming from someone who works specifically on the manipulation of images. It is as if the absence upon which the capitalist image is predicated on cannot appear in the imaginary (the Lacanian term for our spontaneous-ideological perception) but has to be unpacked and searched for beyond it: deconstructing the immediate appearance, and reconstruing the chain of hidden links that leads to production. While Marx searched for this dimension of invisibility (which, we will see, is called ‘value’) in the ‘hidden abode of production’, Eisenstein attempted to make it palpable or perceivable through the means of montage, which is not merely the juxtaposition of a series of images, but according to him something much more theoretical.

A FIGURATIVE UNDERSTANDING OF CAPITAL

In his *Memoirs*, in what is certainly a fictional ex-post invention of childhood memories, Eisenstein recalls what marked his premature affinity toward cinema and figurative arts: ‘the incomparable compositions’ of Degas; a close-up in a short story by Edgar Allan Poe; a white lilac swaying above his cot just after his birth. And among them he lists the novels of Pushkin as well, which for the first time gave him the awareness of a profound figurative link between literature and painting. It is from a figurative interpretation of Pushkin’s writing that Eisenstein saw how literature was capable of expressing an image even better than visual art:

[I]n Pushkin we find a description of an actual event or phenomenon done with such absolute strictness and precision that it is almost possible to recreate in its entirety the visual image that struck him so concretely. And I do mean ‘struck’, which applies to the dynamic of a literary description, whereas an immobile canvas inevitably fails. Hence it was only with the advent of cinema that the moving picture of Pushkin’s constructions could begin to be sensed so acutely. (Eisenstein, 1995: 464)

Pushkin has such an intense sensibility for visual representation that according to Eisenstein it was possible to ‘arrange a passage by Pushkin for editing as a sequence of shots ... because each step shows how the poet saw and logically showed this or that event’ (Eisenstein, 1995: 464). Cinema would thus be able to *extract* images that were already present in the words of Pushkin and bring them to the surface. We can see here one of the many passages in his theoretical work where Eisenstein’s understanding of the image has nothing to do with a representation or reduplication of something existing in reality: an image is not a blueprint of a portion of reality but an expression of something virtually present

even though not perceivable in the register of spontaneous experience. Images can only surface through the mediation of montage, given that only montage is able to create in the mind of the viewer what exists but is not immediately perceivable as such in a single point of view. That is why the ‘immobile canvas’ can only deal with the immediately visible: an indefinite reproduction of ‘what is there’. In order to go *beyond* the imaginary, it is essential to go beyond the visibility of ‘what is there’ and to rely on a clash between what Eisenstein already in 1923, when he was still a theater director, calls *attractions*:

An attraction (in our diagnosis of theatre) is any aggressive moment in theatre, i.e., any element of it that subjects the audience to emotional or psychological influence, verified by experience and mathematically calculated to produce specific emotional shocks in the spectator in their proper order within the whole. These shocks provide the only opportunity of perceiving the ideological aspect of what is being shown, the final ideological conclusion. (Eisenstein, 1988: 34)

The image is therefore a direct stimulus and shock produced in the mind of the spectator: far from being the copy of something, it is created instead from sensible visual attractions in order to emerge as a bodily evidence in the experience of the viewer. The image is not something that can produce a signification merely by being put into a sequence (as if, borrowing from linguistic terminology, we could consider the image a word, and the montage of several of them a sentence): the image is a corporeal shock; a *resultant* force emerging from the clash of different visual attractions. It is the *production* of a conflict and not the static foundational element upon which a sequence can be constructed. To clarify this point in 1929, in his essay ‘Beyond the Shot’, Eisenstein compares montage to Japanese hieroglyphs, where in one graphic sign two elements coexist:

The combination of two hieroglyphs of the simplest series is regarded not as their sum total but as their product, i.e., as a value of another dimension, another degree: each taken separately corresponds to an object but their combination corresponds to a concept. The combination of two ‘representable’ objects achieves the representation of something that cannot be graphically represented. (Eisenstein, 1988: 139)

We should not be deceived by the term ‘product’ – what Eisenstein means is that the relation between the two hieroglyphs is not of the order of accumulation, but of *difference*. A montage of attractions is a clash between two elements: or, in other words, what is left when the two constituting elements (we should not call them images) are arranged in a relation of opposition. There is a clear resonance here with what just a handful of years before Saussure was developing in the field of linguistics: like language, which is a system based on pure differences without positive terms, also the visual articulation of frames is based on a purely negative relation. There is in Eisenstein an awareness that something productive and constructive can effectively emerge from an act of pure negativity: an image emerges in a gesture of withdrawal from ‘what is there’; a subtraction from the

positivity of the imaginary, which according to Lacan is the realm of positivity par excellence. Against an understanding of the visual field based on presence and empirical perception, Eisenstein seems here to go in a completely different direction, where images are constituted as a shock in the mind of the viewer resulting from a suspension of the imaginary. That is why Eisensteinian theoretical reflection will always be characterized by the oscillation between a conflictual dialectic predicated on a radical idea of negativity and an organicist translation of this ‘conflict of attractions’ into a bodily synthesis (which, starting from Eisenstein’s Mexican years, will progressively assume the connotation of a synthesis of primordial archetypes). As brilliantly articulated by Luka Arsenjuk:

[t]he Eisensteinian dialectic of montage is ... characterized not merely by a historically original recognition of the disintegrative force of nonrelation and negativity (Eisenstein’s insistence on the primacy of the cut and conflict), the corrosive and critical power montage carries into the domain of form, but also by the constant attempts to invent the countertendency of a new type of form invoked by the disintegrative tendency of montage. Eisenstein is as much a filmmaker of montage as he is a thinker of new ways to be done with montage, as much an experimenter with the potentially endless disintegration of form as he is an inventor of new ends for montage’s corrosive force. (Arsenjuk, 2018: 174)

The years of the project on *Capital*, which are also the years of one of his most theoretical films, *The General Line*, are the years when Eisenstein had faith in the possibility of reconciling these two sides: an understanding of the visual as purely subtractive and based on negativity, and a faith in the creation of a new regime of vision emerging positively from the conflicts of montage. It is as if at the peak of negativity (when an image would be nothing other than a pure subtraction between two different constituent elements), something positively synthetic could emerge. The film on *Capital*, in its utopia of bringing together the height of negativity (i.e., abstract thought) with the sensibility of visual images, was exemplary of this theoretical audaciousness. Despite the project being set aside (after *The General Line*, Eisenstein and his two collaborators Aleksandrov and Tissè started a trip around the world in order to study sound cinema), Eisenstein’s insights on the nature of capital’s appearance – understood as sensible (because manifest in experience) but also extrasensory (because of its social mediations continuously disappearing) – surprisingly demonstrate their timeliness. We cannot quite imagine what Eisenstein’s *Capital* would have looked like, but it seems that the most unrealistic and eccentric idea of his notebooks – i.e., a possible reconciliation between art and science, between sensation and abstraction – will paradoxically be the core of what the post-Adornian theorists of the value-form will develop from the late 1960s onwards. What is ‘value’ if not an abstraction that exists only in a sensory form outside of any subjective representation? What are the *perverted [verrückte] forms*⁷ of capitalist reality theorized by Hans-Georg Backhaus if not the deceiving erasure of social mediation enacted by the imaginary?

THE OPAQUE IMAGE OF CAPITALISM

Alberto Toscano and Jeff Kinkle recently came back to reflect on capitalism's peculiar regime of appearance and visual representation. If Eisenstein is right and the commodity form, beyond the fetishism of immediacy, could be grasped in montage only through the negative differences of its social mediations (financial capital, productive capital, merchant capital, etc.) – or, if we want to put it in more appropriate and less Eisensteinian terms, if the only possible image of a commodity is a *non-relation between all its social instances*, and therefore a paradoxical ‘non-imaginary image’⁸ – the question of the appearance of capitalism becomes rather problematic. Capitalism is based on a fundamental unbalance: there is a dissymmetry between the antagonism pertaining to the different moments of the production process, where surplus-value is extracted through the activity of labor-power, and the system of equivalences of the sphere of the market, where commodities are already fully constituted and exchanged with money. The movement from production to circulation is a movement of self-erasure of value's and capital's genetic formation: it is in fact a cancelation of labor exploitation and ultimately of class struggle. The commodity form contains, but at the same time also dissimulates, all these mediations. That is why in Eisenstein the question regarding how to look at capitalism very soon becomes a question regarding how to look at a commodity: ‘opening up’ its hidden social mediations, as in the sequence of the worker's soup. If Marx's *Das Kapital* aimed at unpacking all the different stages of the process of accumulation, a cinematographic reflection on capitalism cannot but begin with the immediacy of commodities in front of our eyes. How is it possible to see them as embodiments of value and products of exploitation, and not as self-sufficient objects? Or to put it another way: how is it possible to *see* commodities for how they do *not* appear from a non-imaginary point of view? Or even better, how is it possible *to see appearance itself*?

Primarily, we can say that there could be two different strategies. First, the unpacking of a commodity as a single instance of the process of accumulation – where does it come from? how it has been made? etc., as Tom Tykwer's short feature shows very well. Second, the widening of our perspective on the world market, considering the global implications of capitalism in the most wide-ranging way possible and analyzing the relations between different branches of capital – for example, how the contemporary manufacturing sector in East Asia is connected with the raw materials industry in South America, and how in order to understand capitalist relations of production it is crucial to keep these two phenomena (along with many others) together (see Mezzadra and Neilson, 2019). Toscano and Kinkle (2015) cleverly open their book with a reference to a short film that could constitute an allegory of the two approaches: Charles and Ray Eames' *Powers of Ten* (1968 and then 1977⁹) is based on the idea of representing the universe first

expanding out from the Earth until the entire universe is encompassed, and then turning inward until a single atom and its quarks are observed. The film begins with a view of a man and woman having a picnic in a park in Chicago. The camera then slowly zooms out to a view 10 meters across and continues at a rate of a power of 10 every 10 seconds: first at 100 meters (10^2 m), then 1 kilometer (10^3 m) (where we see the entirety of Chicago), until arriving at 10^{24} m where we can see the size of the entire observable universe. Then the camera goes back to the picnic and zooms in to the man's hand, to views of negative powers of 10: 10^{-1} m (10 centimeters), 10^{-2} m... until we see the quarks in a proton of a carbon atom at 10^{-16} m. Which point of view should we adopt? How should we look at capitalist relations: from the point of view of the inside of a single commodity or from a God's eye-view of the entire world of global capital?

Marx has already envisioned how in order to grasp the capitalist specificity of the process of accumulation (and its profound, structural instability) it was necessary to keep these two *scales* of analysis together; *Das Kapital* in fact opens with a description of the appearance of a single commodity and then arrives at the end of Volume 3 to incorporate total social capital, the world market, and the banking and financial system. The relation between the two levels though is not based on the idea that the general is a mere sum of particulars, but that each of them can be found inside of the other: the particular is inside the general because, for instance, world-market instabilities reflect the instability and the duality that harbors at the core of every commodity; but the inverse is also true, because a commodity is like a monad containing the universality of global capital – for example, the rate of profit of a single commodity and of a particular branch of industrial capital is determined by the different allocations of investment of the total social capital in different branches of production, which makes the determination of the price of a single commodity directly dependent on every other commodity.¹⁰ Diagnosing a tendency in contemporary aesthetics to rely on a God's eye-view to envision the complexity of capitalist relations, Toscano and Kinkle detect a general reluctance to assume the radicality of the concept of capital: which is not a 'thing' composed of a myriad of parts whose place has to be meticulously reconstructed, but a social relation whose dynamism is directly consequential to its structural dissymmetry and antagonism. Capital's ability to valorize and increase its magnitude *is* a consequence of its inner antagonism and contradiction, and the impossibility of reducing it to an object is precisely what makes its image so difficult to grasp, and its appearance so deceiving.

While it might seem that in the age of Google Earth and Big Data the reconstruction of the nexuses and relations that define the global economy would be more easily representable, still this passion for a verticalized view from above is not without problems. As Hito Steyerl has claimed: 'the view from above is a perfect metonymy for a more general verticalization of class relations in the context of an intensified class war from above' (Steyerl, 2012: 26); the idea of relying on drone-like technologies to map the complexity of the social sphere

risks overlooking the structurally antagonistic nature of capital's relation. In other terms, if the problem of the opacity of capital were only due to the multiplicity and complexity of its various actors, an improvement in data recording made possible by AI and Big Data technologies would be sufficient to produce a faithful image of it. The increase in the use of drones and satellite images in contemporary visual arts and cinema demonstrates how the view from above is increasingly becoming the privileged ideological way figuratively to imagine social relations. Still, at the very peak of this alleged transparency it becomes all the more evident how the social crack at the core of capitalist accumulation is nowhere to be found in such images. That is because the visual model of the view from above still relies on the register of the imaginary: it can only detect 'what is there'. But what if the secret of capitalist self-valorization does not belong to the sphere of the imaginary?

Articulating this problem, Toscano and Kinkle construct their argument on the mode of appearance of contemporary capitalism around the Jamesonian concept of 'cognitive mapping' (Jameson, 1988: 347–60).¹¹ Developed at the intersection between Althusser's notion of ideology and the urbanist Kevin Lynch's concept of 'the image of the city', 'cognitive mapping' is a term through which Fredric Jameson articulates the particular relationship that subjects entertain with capitalist relations, which determine their position while remaining deeply opaque to them. There is therefore a separation between the way in which social relationships are organized and the way in which they are subjectivized (or imagined, or better 'imagarized') by the actors involved. Through 'cognitive mapping' a subject tries, albeit always uncertainly and provisionally, figuratively to imagine a relationship between their own particular situatedness and global capitalist relations (or what Jameson usually calls, in Lukacsian way, a 'totality'). Jameson made clear though that 'cognitive mapping will be a matter of form', and not so much a question of rendering fully intelligible the entirety of capital's social relations, as if they were an object waiting to be reconstituted and represented. The problem would be rather to determine what is the impossibility around which this form will constitute itself. What prevents the totality of social relations from becoming fully visible, even when we have at our disposal satellites, drones, and data-driven platforms? What is missing in the imaginary picture of capitalism? Why, even when capital seemed to have reached the peak of its transparency, does it still remain elusive and opaque?

EXCURSUS: THE PROBLEM OF THE LOCALIZATION OF VALUE

To answer this question, we have to abandon the perspective of the God's eye-view and the illusion that the totality of capitalist relations is an imaginary object ready to be appropriated and visually grasped, and turn our analysis instead to that particular element that crooks (but also makes possible) the process of

accumulation and whose localization is always problematic. (Surplus-)value, or abstract labor,¹² is the name of that element, and its process of constitution in capital's self-valorization is what will help us to determine the impossibility around which the imaginary appearance of capitalism is formed.

For instance, the value of a capitalistically produced commodity can be looked at from two different and incompatible points of view: profit and surplus-value (see Heinrich, 2012: 143–4). When the factors of production – means of production and labor-power – are assembled in the production process, their different roles are not immediately apparent and they seem to be directly comparable. According to the capitalist, they are on the same level: it was he who bought the machinery and the labor-power (i.e., he ‘buys’ the labor expenditure of the worker) on the market, and what results from their encounter, if everything goes well and commodities are sold, is an increase in respect to what he spent. For the capitalist there is no difference between the contributions of the two types of capital, constant capital and variable capital: both are essential to the production, and therefore the surplus generated must come from both. If the quantity of money that a capitalist receives when a commodity is sold on the market is *more* than what he previously spent when he bought the factors of production, that ‘more’ is called profit. The problem is that this argument, according to Marx, mystifies the essential contribution of living labor:

In surplus-value, the relationship between capital and labor is laid bare. In the relationship between capital and profit, i.e., between capital and surplus-value as it appears on the one hand as an excess over the cost price of commodity realized in the circulation process and on the other hand as an excess determined more precisely by its relationship to the total capital, *capital* appears as a *relationship to itself*, a relationship in which it is distinguished, as an original sum of value, from another new value that it posits. It is in consciousness that capital generates this new value in the course of its movement through the production and circulation processes. But how this happens is now mystified, and seems to derive from hidden qualities that are inherent in capital itself. (Marx, 1991: 144)

The mystification is double. First, there is the illusion that both factors of production can equally contribute to the creation of a ‘surplus’, while in fact the entire value of constant capital is transferred to the value of the newly produced commodity, so that the surplus must have been generated somewhere else (i.e., from the living labor of labor-power). Second, there is the presumption that the wage would be a fair compensation for the living labor extracted in the production process. But there is effectively no compensation for having used the creativity and human potentiality of the workers for the self-valorization of capital.¹³ So, would it just be a matter of deconstructing the illusion and reaffirming how things effectively are?

The answer is no. The perspectival illusion that makes the capitalist look at this process from the point of view of profit, while the labor-power (when organized in a struggle) develops the point of view of the extraction of surplus-value, cannot be sorted out in terms of rights and wrongs. Marx's argument is not that the

perspective of the working class is right and that of the capitalist is wrong: each of them is right according to its own logic. Their two points of view are both correct, but they are absolutely incommensurable. The antagonism does not pertain to different points of view that look simultaneously but differently at the same object: *the antagonism pertains to the object itself*. Borrowing a Lacanian concept, we can say that the antagonism is in the Real of the gaze, not in the eye of the beholder. Surplus-value is not a substantial object that a positivistic science, such as political economy, can faithfully represent in an unquestionable manner: *surplus-value is nothing but the unbalance of the entire structure of accumulation*. There is no ultimate economic objective reality that can support and legitimate the claims of the working class (or of the capitalists). Surplus-value names the ultimate insurmountability of class struggle and social antagonism. There is no final objectivity: the Althusserian ‘last instance’ is nothing but the Real of the unsurpassable antagonism upon which the structure is based. That is why Marx did not develop a theory of political economy, but a *critique* of the categories of political economy,¹⁴ knowing that a Marxian, revolutionary science could only be a non-positivistic science that posits class struggle as a foundation of capitalist totality.

It was thanks to the research within the *Neue Marx-Lektüre* (Helmut Reichelt (2008), Michael Heinrich (2012), Hans-Georg Backhaus (2016), which I will amend here with the interpretation of their work given by Riccardo Bellofiore (2018a)) that this problem of localization of value and abstract labor has been articulated in a systematic way. First, they criticized a substantialist approach to value, according to which value would be fully constituted in the sphere of production in a single commodity and then only represented, measured, and transformed into money in the sphere of circulation. Such a position would still be indebted to a positivistic understanding of accumulation that would reduce it to a secret to be unveiled in the realm of production. On the contrary, Reichelt, Heinrich, and Backhaus elaborated a processual and dynamic understanding of value, where what is crucial is not so much the *quantity* of units of labor-time that are transformed in prices in the circulation, but the *social form* that they acquire in the process of valorization. Value is like a phantasm that takes possession of different bodies in the cycle of accumulation: it can take the *form* of a commodity as much as the *form* of money. Its status is that of a ‘purely fantastic objectivity’: even though Marx also uses the term ‘spectral’ or ‘ghostly’, to give the idea of a peculiar form of objectivity that is not empirical but rather *phantasmatic*.¹⁵ No different from a sensuous extrasensory commodity, value is *objectively phantasmatic*.

Already at the ‘beginning’ (if such a thing were effectively thinkable) of the process of valorization, commodities are internally split between a concrete labor that created them, and a ghostly ‘abstract’ labor that eventually, under certain conditions, will morph into value. We have to understand abstract labor here as only half-constituted: at the stage of the commodity-before-it-is-sold, its

abstractness is only a wager on something that may eventually emerge from the body of the commodity in the event of a successful exchange with money in the sphere of circulation.

The transformation of abstract-labor-in-potential into abstract-labor-as-money is crucial: contrary to a planned economy where society organizes the production from the beginning of the cycle, capitalism is the first societal organization where labor is organized privately. This means that private entrepreneurs can freely decide what to produce, how to produce it, and in what quantity, without knowing whether society will effectively need their products. The fact that a particular labor expenditure will be recognized as ‘useful’ by society, meeting the needs and the purchasing power of someone, remains uncertain until an exchange with money is effectively made. In the event of an economic crisis, for example, we see that this moment of socialization fails, with detrimental consequences. That is why capitalism is a society where social validation of labor occurs only through the market: valorization is not only the phenomenon through which money ‘magically’ emerged from the body of a commodity (the abstract is generated from the concrete); it is also the moment of recognition of the ‘mediated sociality’ of a particular private expenditure of labor (the concrete is recognized *après-coup* as abstract).

The spectral presence of value is therefore already present at the beginning of the production process: when a capitalist goes to the market to buy machinery and labor-power in order to organize production in the hope of its eventual profitability, he acts on the basis of the future metamorphoses of commodities into money (and therefore plans all his actions with such an outcome in mind). No matter if he is aware of it or not, what guides his actions is value-in-potential. The ‘sensuous extrasensory properties’ that Marx believed were ‘fetishistically’ projected into commodities are not a deceit (*schein*) that have to be deconstructed; they are the organizational principle underlying the capitalist world. As Hans-Georg Backhaus said, ‘when we speak of the commodity [...] we are also obliged to think about the absurd condition according to which a supersensible quality inheres in sensuous things, so that, it is reasonable to talk about an economic dimension like the natural dimensions of distance, weight, temperature, etc.’ (Backhaus, 2016: 343–404). The problem is that when we look at the commodities, those supersensible qualities are nowhere to be found: which leads to the paradox that, despite how value orchestrates almost everything of our world, if we look at the objects surrounding us, there seems to be no trace of it.

THE APPEARANCE OF CINEMA

Capitalism seems to be based on a profound contradiction: founded on a structural dissymmetry at the level of production – where the potentiality of historical transformation of the labor-power is hijacked by the capitalists in order to

increase the magnitude of their capital – it appears in the realm of circulation as governed by a system of equivalences. As in the case of the incommensurability of profit and surplus-value, capital seems, according to the logic of the profit, to be governed by a self-propelled act of self-valorization, and at the same time, if considered from the point of view of surplus-value, to be parasitically dependent on the living labor of the working class. These two points of view are simultaneously right and incompatible. That is because the antagonism lies *in the object itself*: it is not a matter of adopting an objective God's eye-view perspective, according to which, it would be possible to grant the capitalist and the labor-power their fair share of surplus. At the core of capitalist reality there is the Real of social antagonism. That is why value is a spectral entity that, while governing the entirety of the process of accumulation, is empirically nowhere to be found. That is why, even if we search for the secret of a commodity in the multiple social mediations that made it possible, we will be unable to go beyond a logic of the anecdote (the de-anecdotalization pursued by Eisenstein is impossible if we remain at the level of a single commodity).

It was Isaak Illich Rubin (1973) in the 1920s who underlined how this process of mystification and fetishistic inversion was not a cultural superstructure inessential to represent the functioning of the capitalist mode of production, but a crucial pillar to understand Marx's theory of value. The fact that the extraction of surplus-value is transposed into an objective state of things is not part of a deceit, but is a necessary condition of manifestation of the capitalist exploitation. In Lacanian terms, the fetishism of commodity – i.e., the translation of the relations of domination, from being personal and visible, to being objective (*sachlich*) and naturalized – is the process of *imaginarization* of the capitalist relations. The way through which capitalism appears is the way through which its system of exploitation founded on a social antagonism *necessarily* manifests itself in the realm of sensibility: that is the way through which capitalism is transposed into an image.

The question that we should ask is therefore not how cinema could represent the antagonism of the capitalist mode of production or how could it discover the enigma of the formation of value beyond the commodity form, but *how it could reflect on the necessity of this transfiguration into the imaginary*: cinema as a way to think *appearance itself*; as a *science of appearance*. So, to go back to the problem that was haunting Muley, it will not be so much a matter of asking ourselves who do we shoot, who is to blame, or what is a faithful image of capitalism, but why we were already part of that image in the first place; why, so to speak, capitalism was already shooting (at) us.

Notes

- 1 Among the many possible accounts of the complexity of the different contemporary operations of capital see Mezzadra and Neilson (2019).

- 2 Interview with Oksana Bulgakova from Alexander Kluge's *News from Ideological Antiquity*.
- 3 Eisenstein during those weeks was 'nearly blind, overworked, and living on stimulants in order to finish the film on time, Vogman (2019: 21).
- 4 The quote is taken from Samuel Brody's enthusiastic account of Sergei Eisenstein's lecture titled 'Principles of the New Russian Cinema', which was delivered at the Paris Sorbonne University on 17 February 1930.
- 5 Eisenstein's diaries from 7 April 1928 (Russian State Archive of Literature and Arts, 1923-2-1107: 26, 27) quoted in Vogman (2019: 238); Eisenstein (1976: 10, 17, 25).
- 6 As noted in Heinrich (2012: 72), this would be the right translation and not 'transcends sensuousness' as is translated in the Penguin edition of Volume 1 (Marx, 1976: 163).
- 7 We refer here in particular to Riccardo Bellofiore and Tommaso Redolfi Riva's interpretation of Hans-Georg Backhaus (Bellofiore and Redolfi Riva, 2018).
- 8 We do not have the opportunity here to develop further this point, but a non-imaginary image is what Lacan refers to as the manifestation of the object (a) in the realm of visibility, or gaze. See Bianchi (2017).
- 9 www.youtube.com/watch?v=Ww4gYNrOkkg (last access: 30 April 2020).
- 10 'If different branches offer different rates of profit, then capitalists will try to pull their capital out of branches with low rates of profit and invest their capital in branches with higher rates of profit. If the movement of capital between branches is possible (and not, for example, impeded by legal restrictions), then more and more capital will flow into branches with high rates of profit and out of branches with lower rates of profit. This leads to the amount of available commodities increasing in branches with high rates of profit and decreasing in branches with low rates of profit. Due to the competition between capitalists, the increasing supply in the branches with initially high rates of profit will on the one hand lead to decreasing sales prices and ultimately declining profit rates, whereas, on the other hand, the declining supply in the branches with initially low rates of profit leads to a rise in prices and ultimately increasing rates of profit. The different rates of profit equalize into an average or general rate of profit' (Heinrich, 2012: 146–7).
- 11 For an exhaustive overview of the emergence of the concept of 'cognitive mapping' in Fredric Jameson see Chapter 3 of Wegner (2014).
- 12 We rely here on a processual and dynamic understanding of the constitution of abstract labor in the process accumulation as developed by Bellofiore (2018b).
- 13 As beautifully affirmed in the opening paragraph of Alexander Kluge and Oskar Negt's *History and Obstinacy*: "'Labor" is the human ability to change matter purposefully. [...] It not only consists of commodity production, but also engenders social relations and develops community. It possesses OBSTINACY. Its product is HISTORY' (Kluge and Negt, 2014: 73). What capitalism takes from the workers is not only a quantity of wealth, but also (and maybe even more) the purpose of one's own activities in the world and the form of the labor activity: what do we do with our labor – its qualitative dimension – how do we want to use it, to what end? For a discussion of the notion of purpose in Marx see Bianchi (2010).
- 14 Cf. Redolfi Riva (2018), but the same point has been developed often by Bellofiore as well (lately in Bellofiore, 2020: 143).
- 15 Here the resonances between Marx and Lacan become more evident: for a similar analysis, even though developed on different themes, see Tomšič (2013).

Horror Film

Johanna Isaacson and Annie McClanahan

THE HORRORS OF *CAPITAL* AND CAPITAL

The first examples of ‘Marxist horror’ are in Marx’s own oeuvre, from the ‘specter haunting Europe’ to the blood-sucking capitalists of *Capital Vol. 1*. It was not uncommon to find capitalists represented as vampires in nineteenth-century popular culture; Marx himself enjoyed reading and telling scary stories (Gelder, 2004; Shapiro, 2008; Dienst, 2011). Nonetheless, Marx’s gothic references seem more than mere rhetorical flourish: Mark Neocleous describes *Capital* as a ‘political economy of the dead’, emphasizing especially Marx’s language of ‘living’ and ‘dead’ labor (2003).

If, as David McNally argues in *Monsters of the Market*, Marx’s gothic rhetoric appears most obviously in his treatment of labor, then it is not surprising to find that Marxist critics tend to read the horror film as an allegory for the relation between productive labor and capital (2011). Although Marx typically uses the figure of the vampire to describe the relationship between capital and the proletariat, contemporary critics interested in horror and labor conditions have tended to focus instead on the zombie. Camille Fojas’ *Zombies, Migrants, and Queers* treats zombie narratives as representations of ‘capitalism’s dead labor’ (2017); Evan Calder Williams describes the zombie as a figure for the experience of being an endlessly working body (2011); Annalee Newitz argues that the zombie film attests to the ways that ‘because [we] spend so much time working, [we]

often feel dead ourselves' (2006). John Lutz explores the way zombie films treat 'the sharpening contradictions between capital and labor' (2010) while McNally laments that the 'idea of the zombie as a living-dead laborer' has been replaced by images of the zombie as 'ghoulish consumer' (2011).

McNally's declension narrative also suggests the extent to which critics worry over the horror genre's ideological conservatism. Because horror tends, they suggest, to hide its real political content behind a scrim of surreal fantasy, it is often a means to obtain ideological consent under cover of social catharsis. Thus scholars describe the genre's efforts to 'restore the rational, normative order' (Pinedo, 2016), to 'bring things back to a more stable and constructive state' (King, 1981), to 'alleviate' political and economic anxieties (Kawin, 2004), or to perform a kind of 'social policing' (Fojas, 2017).

The criticism cited above tends, in short, to make three interlocked claims. First, that the primary source of economic horror is the relationship between capital and labor – the productive process wherein, as Marx so evocatively describes it, we enter the 'hidden abode' where living labor works on dead labor. Second, that the primary way for representing this relationship is via an allegorical coding, turning manifest content into latent fantasy. And, finally, that because horror thus depends on the narrative energies of ideology, it tends to confirm it, letting loose a cathartic representation of antagonism only to re-contain that chaos by killing off the monster.

In this essay, by contrast, we follow a tradition in Marxist criticism that attends to race and gender as well as to class, focusing on the ways the ascriptive techniques of racialization and patriarchy enable exploitation within capitalism. In so doing, we excavate a critical history wherein horror film registers the exploitation of reproductive as well as productive labor, the power of the police and of settler colonialism as well as the power of capital, the violence of gender subordination and racialization as well as of labor exploitation, the fate of surplus populations as well as the industrially employed. Scholars like Gaston Gordillo, for instance, take up the zombie's relation to the figure of the slave as a way to register capitalism's treatment of the raced body as bare life (2012). Mark Stevens, similarly, uses the lurid gore of 'splatter' horror to reveal the inherent racialization of the decision Sherryl Vint, in her writing on the zombie, describes as 'who to "make live" or "let die"' (Stevens, 2017; Vint, 2013). Meanwhile, a tradition of feminist psychoanalytic horror criticism – much of it inspired by Julia Kristeva's *Powers of Horror* – has turned a keen political eye on horror's treatment of gender: the work of Barbara Creed and Joan Copjec, for instance, takes up the uncanny horror of the feminine as (in Kristeva's terms) 'a dark revolt of being' (Kristeva, 1982). More explicitly materialist feminist work like Carol J. Clover's (1992) *Men, Women, and Chainsaws*, in turn, seeks to disrupt conventional accounts of the sadistic male gaze by suggesting instead that male viewers identify with horror's 'final girl' in order to deny their complicity in the exploitation of her working-class assailants. Scholars like Robin Wood, likewise, argue that horror negotiates 'patriarchal capitalism' by variously preserving and critiquing the treatment of non-normative sexual (or political) desire as a monstrous 'Other' (1979).

This essay seeks to extend and advance this tradition of Marxist horror film criticism concerned with racialization and gender violence by locating within contemporary horror film itself a set of adjacent concerns. The present historical conjuncture, we argue, is indeed haunted by what Chris Harman terms ‘zombie capitalism’ (2009). Yet, for us, this zombie refers not simply to the ‘zombie’ quality of living labor, but also to something more systemic: what Joshua Clover identifies as the zombie quality of a capitalism for which crisis is now a permanent ‘unnatural natural state’ (2011). This zombie capitalism-in-crisis, we contend, lurches most visibly and most destructively not through the ‘hidden abode of production’ but rather across the sphere of *reproduction*: the sites in which workers reproduce themselves and their labor; the circulation networks through which commodities move and come to rest; the communities wherein housing, health care, food, and education are bought with wages or debt or not at all; the institutions through which bodies are educated, policed, imprisoned. Asad Haider and Salar Mohandesi describe social reproduction with crystalline urgency:

[M]any of today's lines of political contestation are thus being drawn squarely through the terrain of social reproduction – soaring rents, crumbling buildings, underfunded schools, high food prices, crippling debt, police violence, and insufficient access to basic social services like water, transportation, and health care. ...On the terrain of social reproduction it becomes abundantly clear that unemployment precedes employment, the informal economy precedes the formal, and proletarian does not mean wage worker. (2015)

Whether it appears as the spaces where buildings crumble, cops shoot, and unemployment lines form; or as the temporal marking of sluggish GDP, the annual raising of student tuition, and the year-after-year decline in inflation-adjusted wages, the ‘terrain of reproduction’ is today more visible, more exposed, and often more fractious than the ‘hidden abode’.

We argue that contemporary horror film is likewise preoccupied with this ‘terrain of reproduction’. Rather than concerning itself exclusively with the fact that ‘we spend so much time working’, it considers what kind of work we are doing and who is doing it. Rather than using images of land and property to mount a conservative defense of pre-capitalist modes of accumulation, it contends with the link between the past of primitive accumulation and the present of dispossessive accumulation. Rather than assuming that an interest in consumption is apolitical, it yokes the consumption of basic necessities to the processes of social reproduction rendered vulnerable and volatile by debt and falling wages. Rather than invoking a ‘living-dead laborer’ coded as a male industrial worker, it attends to the processes of gender differentiation that shape contemporary work whether it is waged or unwaged, productive or ‘unproductive’, and while also registering the processes of racialization that slice across the spaces of social reproduction.

This essay will take up a few of these processes as they appear in a range of recent horror narratives. That the films we discuss here are largely, though not exclusively, from the USA is partially a symptom of our particular scholarly expertise and location, and partially a symptom of the persistent (though stalling) domination of Hollywood over the film industry. Yet it might also be read in historical

terms: it was American political-economic power that dominated what Giovanni Arrighi famously termed the ‘Long Twentieth Century’ and thus it is also in the USA that the decline of this hegemony – as well as the morbidity of ‘zombie capitalism’ more broadly – has been most strikingly, shockingly felt (1994). In twenty-first-century horror film, we contend, the economic and political content is not as clearly or neatly ‘coded’ as classic accounts of horror’s allegory would have it. Often, the economic content isn’t coded at all: instead, it appears as manifest political content or ambient historical context. In this sense, we depart from the psychoanalytic tradition of feminist horror criticism, insofar as we are interested less in identification and abjection as processes that construct psychic subjects, and more in material dynamics like dispossession, domination, and exploitation understood as categories of political economy. Put most simply, in our analysis the repressed returns from a historical rather than an individual past. Moreover, we suggest, these texts actively resist the psychically and ideologically ameliorative work of allegory. They do so in part by way of their specific concern with figures of women – not just as passive victims but also as villains, demons, witches; not just as excluded, abjected, monstrous others but as those others’ vengeance.

We do not mean to suggest some immediate or natural relationship between the sphere of reproduction and actual biological reproduction. We take the sphere of reproduction to refer to the renewal and sustenance of labor power itself, including not just childbirth and childrearing but also the entire economy of domestic life, from real estate to health care to education – and to the ways this so-called ‘private’ sphere is increasingly and inevitably permeated by capital. We are concerned too with the reproduction of the capital–labor relation itself, a reproduction that takes place in the processes that make wage labor necessary (from historical primitive accumulation to contemporary expropriation); in forms of violence and power beyond wage labor and exploitation (racialization, mass incarceration, and the maintenance and control of surplus populations); and in transformations in workforce composition and organization (precaritization, automation, feminization, and unemployment). None of this is essentially or biologically linked to women or to biological reproduction, and yet we do wish to suggest that the figure of the woman in these films – whether as revenging crone or murderous girl – seems to signify, in compelling and overdetermined ways, this sphere of reproduction broadly understood. And because the women in these films refuse to be vanquished or to die, the films themselves cannot prevent the revolutionary energies they stir up from contaminating the social imagination.

THE HORRORS OF PRIMITIVE ACCUMULATION AND RACIAL CAPITALISM

The fourth chapter of Silvia Federici’s masterful *Caliban and the Witch* begins with a horror story: ‘for more than two centuries, in several European countries’,

she writes, ‘hundreds of thousands of women were tried, tortured, burned alive or hanged, accused of having ... murdered scores of children, sucked their blood, made potions with their flesh, caused the death of their neighbors, destroyed cattle and crops, raised storms, and performed many other abominations’ (2004). This invention of the witch, she famously (and controversially) argues, coincided with the need to control workers’ reproduction; with the privatization and enclosure of land; and with the new division of labor enabled by colonialism and the slave trade – in short, with the emergence of a nascent capitalist mode of production.

While Federici does not embrace the genre elements of this horrific history, Robert Eggers’ 2016 *The Witch* does so with gusto. Subtitled ‘A New England Folktale’, the film opens in 1630, a few decades before Cotton Mather’s 1692 witch trials. A family is cast out of their Puritan enclave for religious apostasy: as they depart, we catch a glimpse of Native Americans, and may think we’re in for a classic horror narrative about the frightening Other. Yet it quickly becomes clear that the danger here is internal rather than external. The very landscape in which the family must survive seems hostile, as the harvest molds and rots. But the threat also comes from within the family. After the baby disappears while being cared for by her sister Thomasin, the family turns against the teenaged girl, accusing her of witchcraft and sexual deviance: ‘Did ye make some unholy bond with that goat?’ her father rages. Associated with the loss of the infant child and the failure of the harvest but also with sexual and reproductive maturation, the pubescent Thomasin is both a threat to and necessary for the colonial project Richard Slotkin terms ‘regeneration by violence’ (1973). Her sexuality must be mastered if a nascent system of capitalism is to control the female body as the source of other laboring bodies; to control male time, attention, and discipline; and to control the right of property and inheritance. Reaching a pitch of hysterical accusation, the family casts Thomasin out of the house, turning her into the ‘rebel body’ Federici argues the witch hunt seeks to destroy. Yet because she is thus saved from the violent fate that awaits her family, Thomasin gets her revenge, joining a coven of orgasmically powerful female witches and thus becoming the very thing she was accused of being: a rebellious body among other rebel bodies.

Whereas *The Witch* powerfully illuminates the way control over women’s productive and reproductive bodies enabled primitive accumulation, hybrid Western-horrors like J. T. Petty’s 2008 *The Burrowers*, Alex Turner’s 2004 *Dead Birds*, and S. Craig Zahler’s 2015 *Bone Tomahawk* recount the ways white supremacy and nativism justified colonial dispossession at the origin of capitalism. These films give the moment of settler colonialism a hallucinatory cast, marking the origin of the colonial project in expropriative violence. In *Bone Tomahawk* and *The Burrowers*, the monsters inhabit an otherness that is both knowable (they are the victims of colonial genocide), and unknowable (they are nocturnal monsters who drug and eat their victims). A similar dynamic is at work in *Dead Birds*, in which Confederate deserters find themselves the victims of monsters,

as the violence of settler colonialism and slavery returns to betray its origins. The theme of cannibalism in *Bone Tomahawk* and *The Burrowers* (and in other recent cannibal-themed films like Jorge Michel Grau's *We Are What We Are* (2010) and Julia Ducournau's *Raw* (2016)) suggests not only the enduring anxieties among imperial subjects about the rebellion of the colonized but also the insurrectionist energies incompletely repressed by colonial regimes of power.

But what makes films like *The Witch* and *Dead Birds* uniquely *contemporary* – what allows a narrative about the seventeenth century to be read in terms of a twenty-first-century crisis of reproduction? Here we draw on David Harvey's immensely influential concept of 'accumulation by dispossession', which Harvey describes as a perduring means for seizing accumulated wealth, a process which involves 'the continuation and proliferation' of violent practices once associated solely with the rise of capitalism (2007). Harvey's notion of accumulation by dispossession reveals the resonances between the *historical* process of land expropriation, enclosure, and control over reproduction described by Federici and *contemporary* practices ranging from the commodification of land and the development of extractive economies to segregation, red lining, gentrification, and other racialized forms of property accumulation. In these films' emphasis on land expropriation, for instance, we might see a terrain shared with more explicitly contemporary narratives of extractive capitalism such as Christophe Gans' *Silent Hill* (2006) and Patricia Rozema's *Into the Forest* (2015), both of which treat toxic masculinity and rape in relation to toxic capitalist accumulation through environmental pillage.¹

In non-US films such as Andrés Muschietti's *Mama* (2013), ongoing expropriative accumulation is also explicitly yoked to the contemporary financial crisis.² Driven insane by the 2008 financial crash, a stockbroker kills his estranged wife and then kidnaps his own daughters. Before he can shoot them, however, he is killed by the witch/ghost Mama, who raises the two girls. When Mama accompanies the girls back to civilization, she becomes a symbol both of the 'outside' of capitalist accumulation and of the feminine excess that must be tamed by patriarchal 'civilization'. Mama thus represents the transgressive fantastic, what Rosemary Jackson calls 'the unsaid and the unseen of culture: that which has been silenced, made invisible, covered over' (1981). The film also develops a feminist critique of primitive accumulation in the figure of the girls' guardian, Annabel, a hip young feminist who seeks to uncover the historical wrongs that cause Mama to haunt the earth. As in other contemporary witch films, including James Wan's *The Conjuring* (2013) and Anna Biller's *The Love Witch* (2016), these wrongs are a historical palimpsest, evoking multiple sites of accumulation by dispossession and a historically disparate set of violent colonial encounters. *Mama* thus represents the persecution of witches as, in Federici's terms, 'a universal process in every phase of capitalist development' (2004).

Finally, we find in contemporary horror films an urgent desire to address what contemporary scholars, following Cedric Robinson's seminal work in

Black Marxism, have termed ‘racial capitalism’ (Robinson, 1983). Jodi Melamed argues that the ‘transparently violent means’ of primitive accumulation reappear in the present of racial capitalism via the logics of ‘loss, disposability, and the unequal differentiation of human value’ (2015). Anna Rose Holmer’s 2015 *The Fits* takes up precisely this mode of uneven human development, treating gender and race as part of what Nancy Fraser calls ‘an ongoing but disavowed moment of expropriation’ (2016). When a dance troupe of African-American girls from a deindustrialized, segregated, and economically depressed part of Cincinnati mysteriously succumbs to a ‘dancing disease’ that throws them into uncontrollable paroxysms, this possession suggests the inextricability of gendered embodiment and racialized space. It also draws our attention to the way the experiences and bodies of some subjects are stolen or starved so that abundance can be maintained elsewhere. In a plot that suggests that such bodily dispossession – allegorized as bodily possession – is as inevitable as sexual maturation, the protagonist’s fear of adulthood functions as both a refusal of standardized femininity and as a rejection of the uncertain future faced by black women in a post-industrial city where neither the Fordist assurances of jobs and family, nor the post-Fordist fantasy projections of a post-work/post-sexist/post-racist world, are available.³

David Robert Mitchell’s *It Follows* (2014) and Jordan Peele’s *Get Out* (2017), likewise, take up dispossessive practices like racialized housing segregation in the context of deindustrialization. *It Follows*, set in Detroit, plays with and within the dispossessed landscape of the post-industrial city. The remorseless, relentless monster – ‘It’ – is an expanding cycle of sexual contagion.⁴ Yet the image of contagion ultimately represents not literal disease but rather what Harvey has described as the Ponzi character of urban asset markets (2012). The staging of initiatory sexual experience in parallel with a ‘fall’ into the futureless world of segregated, abandoned urban space equates fiscal violence – a racialized ‘spatial fix’, to use Harvey’s term – with forms of gendered violence – the use of women’s bodies as a kind of ‘sexual fix’. The ‘It’ of the film’s title is thus the speculative accumulation that plunders the ‘subprime cities’ of a capitalism in crisis.

Horror has long captured the repressed racist fears of those who have abandoned these subprime cities in waves of ‘white flight’, and Peele’s *Get Out* brilliantly manipulates these well-worn horror tropes to expose white fear as white violence. Imagining a world in which white suburbanites use their apparent innocence and liberal good-will to lure and attack black victims, *Get Out* frames the motive behind the vampiric violence of the white villains as expropriative desire for black reproductive labor. As an incubator for white immortality, the black body in *Get Out* is revered as a sign of strength and commodified attractiveness: thus the vampiric theft and enclosure of black bodies and black labor is revealed to continue into the present, from a regime of slavery to an economy of commodified spectacle and exploited affective labor. In its insistence that at the heart of suburban horror is a thinly disguised fear of racial diversification – a fear which has historical roots in the Jim Crow era and mid-century redlining but

which resonates in a present of ‘reverse redlining’ – *Get Out* also raises a set of problems particularly germane to our next section.⁵

THE HORRORS OF REAL ESTATE AND SPECULATION

Beginning in the mid 1990s, the costs of housing, health care, child care, and education began to rise precipitously. As a result, US households were forced into debt as a kind of substitute wage. The most important form of debt in this period was the mortgage, which stabilized the reproduction of working- and middle-class households, making them dependent not only on credit but also on real estate equity. Low federal interest rates encouraged banks to lend to consumers they had previously excluded from formal credit: so-called ‘subprime’ mortgages soared, leading to an era of discrimination by inclusion. Meanwhile, structured financing devices like collateralized mortgage obligations (CMOs) created a secondary marketplace for selling all this risky debt. When markets collapsed in the fall of 2008, those hardest hit were neither the banks nor their investors, but debtors themselves. The crisis was particularly devastating for borrowers of color, creating what Karen McCormack and Iyar Mazar term ‘radical risk’: risk spread unevenly across classes, races, genders, and categories of citizenship (2015). In short, the forms of speculative risk created in and exploited by the securitized credit market were transferred as material precarity to borrowers and renters.

As Maya Gonzalez has argued, all crises of accumulation are reproductive crises since they threaten the capacity of the worker to reproduce herself. Yet, as she also notes, the housing crisis ‘is a crisis of reproduction in a new sense ... because the life of the worker and her reproduction have been increasingly permeated by capital’ (2010). If we want to attend to what is most horrifying and violent about the present, we must thus look not only to the violence capitalism wreaks on the working body but also to the violence it does to our ability to feed and house and care for ourselves; to the particular force with which its ‘permeation’ of daily life affects those already vulnerable; and to the effect of economic forms outside the wage and the workplace. In this section, we thus take up the genre of the ‘post-housing-crisis’ horror film.⁶ The relationship between real estate and horror film has a long history – for instance, the intense popularity of the haunted house film in the late 1970s and early 1980s (*The Amityville Horror* (1979), *The Shining* (1980), *The Hearse* (1980), *Poltergeist* (1982)) can be attributed to the stagflation that followed the Nixon and Volcker Shocks. Renewed interest in the genre after the crisis of 2008, we contend, suggests a return to the genre as a means to explore contemporary economic concerns.

Contemporary real estate is clearly linked to the forms of violent land expropriation described above: as Alyosha Goldstein puts it, there is a correlation ‘between profit derived from financial transactions and profit from territorial

seizure' (2014). Not surprisingly, this correlation also appears in two of the most complex and compelling post-housing-crisis horror films, Darren Lyn Brousman's *Mother's Day* (2010) and Pang Ho-cheung's *Dream Home* (*Wai dor lei ah yut ho*, 2010). *Dream Home* concerns a seemingly meek young woman named Cheng Li-Sheung who is attempting to purchase an expensive luxury flat; one night she goes on a killing spree and brutally murders 11 people in one building. *Dream Home*'s vertiginous visual aesthetic, its disorienting narrative structure, and its abrupt tonal shifts register the sense of irrationality that attends life in a real estate bubble, where the price of a tiny apartment might be raised 50% over mere hours. Indeed, Sheung's violence itself is a form of market *rationality*, since it turns out that she killed those 11 people in order to bring down the price of an apartment in the building: in *Dream Home*, as in *Mama*, the apotheosis of speculation is violence. In Brousman's *Mother's Day*, likewise, a family of bank robbers, the Koffin brothers, try to escape a heist gone bad by hiding at their mother's house, only to discover that she lost the family home to foreclosure: they then torture the current residents (the Sohapis) and try to take the home back. A remake of a 1980 'hillbilly horror' film of the same name, *Mother's Day* makes clear that the Sohapis are complicit in the Koffins' dispossession, having benefited, as so many investors did, from the wave of evictions that happened after the real estate crisis. The film thus makes the same connection between wealth and territorial land-grabs that the earlier genre Carol Clover aptly terms 'urbanoia' suggested – except that now, because of the new spatial logics of accumulation, the sites of dispossession are closer to home (1992).

Yet something else haunts these films too. Both *Dream Home* and *Mother's Day* make reference to the 'stigmatized property': property whose value is affected by past events that took place there. Haunted real estate 'built on Indian burial ground' features in classic films like *Pet Sematary* (1989), *Amityville Horror*, *The Shining*, and *Poltergeist II* (1986) but these more recent references suggest that longer histories of land theft also underwrite modern forms of financial land speculation. In *Dream Home*, for instance, we learn that Sheung's family was forced out of their apartment by property developers. Sheung thus terrorizes the residents of the luxury high-rise not just so that she can get an apartment there, but also to avenge her family's displacement.

Whereas *Dream Home* and *Mother's Day* take up the longer histories of real estate as land expropriation, Sam Raimi's *Drag Me to Hell* (2009) and Adam Robitel's *The Taking of Deborah Logan* (2014) turn their gaze towards domestic space and everyday vulnerability. Both films concern the precarious economic circumstances faced by a household managed by an older woman. *Drag Me to Hell* plays out a complex narrative of credit and revenge: when an older woman, Sylvia Ganush, is denied an extension on her mortgage by an ambitious young loan manager named Christine, Mrs Ganush curses her with possession by a demon called the lamia, as the film yokes the economic act of paying-back to violent acts of payback. Robitel's *The Taking of Deborah Logan* is also about

the problem of housing vulnerability, and especially its effect on the elderly, the ill, and women. The framing context for Robitel's 'found footage horror' is that a team of graduate-student researchers are making a documentary about Alzheimer's and decide to film the daily life of Deborah, an elderly woman suffering from the disease. Deborah was persuaded to participate in the film by her daughter, Sarah, because the film-makers are promising them help with medical payments. 'If you want to keep the house, Mom, you need to sacrifice', Sarah pleads. This framing of the problem the Logans face is almost documentary in its accuracy – according to a 2008 report, following the collapse of the housing market many senior citizens needed to go to assisted-living facilities but could not sell their houses to pay for the care (Healy, 2008).

Deploying the horror genre's unique capacity to, as Tzvetan Todorov (1975) put it, 'take a figurative sense literally', *Deborah Logan* conflates possession as ownership with demonic possession, as Deborah is possessed by the ghost of Henry DesJardins, a child-murdering pediatrician. If, returning to Gonzalez, the very habitus of daily life has been 'increasingly permeated by capital', little wonder this permeation would be figured as a kind of demonic parasitism. *Deborah Logan* is attuned to the gendered division of labor as well as to the uncanniness of ownership. In an early flashback sequence we are told that when Deborah's husband died young, leaving her with no means of financial support, she 'leveraged her house as collateral and went on to start a highly successful switchboard answering service'. The film crew later finds Deborah sitting at the switchboard in a trance state, connecting and reconnecting the line assigned to DesJardins, once one of her clients. This means that Deborah's financial precarity and her demonic possession have the same origin point: in a technology of uncanny social connection. 'I was the nexus of this town. Doctors, lawyers, town hall, everybody', Deborah tells the camera, conflating her identity and her body with the machine with which she labors in ways that recall the link classic Marxist scholarship on the horror film has drawn between the vital body of living labor and the dead labor uncannily embodied by the machine. Yet it is important that the machine here is not an assembly line and the labor isn't 'productive': instead, this is a particular kind of technology (communicative) and a particular kind of labor (connective) historically associated with women. *Deborah Logan*, in other words, concerns not just the link between capital, domestic space, and the vulnerable bodies precariously housed therein, but also the ways in which feminized work – the subject of the next section – might produce its own unique kind of horror.

THE HORRORS OF FEMINIZATION AND AUTOMATION

In 'Feminism, Capitalism, and the Cunning of History', Nancy Fraser recounts the uncanny trajectory whereby Seventies feminism is resurrected into living death under neoliberalism (2009). Second-wave feminism's utopian critique of

the nuclear family and the family wage, she argues, began as a powerful critique of global capitalism as such. However, with the dismantling of leftist movements and the expansion of emotional, flexible, feminized labor, feminist critique slowly and murkily transforms from a utopian dream to that dream's uncanny doppelgänger: a robot Stepford Wife which resembles the original but slavishly serves capitalist patriarchy. Although personal assistants, nannies, and sex workers are by no means new professions, the 'feminization of labor' means that these jobs' qualitative features, especially their precariousness and low pay, now characterize almost all work in the service sector. Women's ascent in this world of work is attributed not to their strength but to their perceived vulnerability, since willingness to adapt to flexibilized, casualized labor is coupled with the demand for affective performance. Such work is becoming the norm for work as such: 80% of the labor force works in 'service' professions and 96% of US net employment gains since 2000 have come from this sector (Smith, 2017). The 'relentless' trend of service-sector precarity is as hair-raising as any horror film: the fastest growth in the service sector has been in the lowest-paying jobs with the worst working conditions, with wages dropping between 15 and 20% from 1984 to 2010 (Benanav, 2015).

In cannily response to a historical epoch in which the feminization of labor thus means not liberation and fulfillment but only vulnerability and precarity, Jennifer Kent's (2014) *The Babadook* bypasses what Gonzalez describes as the moral hierarchy often overlaid onto the 'productive'/'unproductive' distinction (2013).⁷ Instead, Kent's feminist horror registers the everyday horrors of feminized labor. The central character is Amelia, a widowed mother and employee in a nursing home who, crushed by loss, deprivation, and endless work, succumbs to possession by an expressionist storybook monster called 'the Babadook' that threatens to destroy her hyper-dependent son. The first time we see Amelia at work, she is responding to an angry patient: Amelia's gentle patience in her waged job thus mirrors her unwaged care of her son. In contrast to the image of the Babadook, a cartoonish pastiche of Expressionist horror ghouls, we see here an unnamed horror, a kind of foggy half-life or atmosphere of diffused affective care that drowns Amelia's personality by making constant demands on her affect, body, and time. *The Babadook* thus demonstrates how conventional (and conventionally gendered) horror tropes about the laboring body might expand to account for a new economic moment dominated by new kinds of labor. By staging possession as a refusal of both waged and unwaged reproductive labor, *The Babadook* imagines Amelia's demonic monstrosity as a mad 'care strike' against feminization as such: Amelia's possession offers a release not just from the work she does but from the required affective states – 'vulnerability', 'simultaneity', 'post-sexuality', 'unsettledness', 'affective exhaustion' – that go along with that form of work (Berlant, 2011).

The Babadook's depiction of a vicious cycle of repetition between waged and unwaged work reappears in other recent films in which women are driven to

excess and monstrosity by isolated entrapment in their homes: Babak Anvari's 2016 *Under the Shadow*, Lucky McKee's 2002 *May*, Nicolas Pesce's 2016 *The Eyes of My Mother*, and Mike Flanagan's 2016 *Hush*. But *The Babadook* is also unique among these films for its representation of the failure of the feminist struggle for autonomy through formal employment and for its depiction of the more subtle forms of enslavement that characterize late-capitalist 'feminized' labor. Released from the strictures of the nuclear family, Amelia is 'freed' into a more diffused form of paternalism, in which the state makes itself known when she does something wrong (as when social workers show up at her house when her son doesn't go to school) but offers no intimate care or shelter. In this context, the nuclear family becomes a perverse site of nostalgia. As in Stanley Kubrick's *The Shining* (1980), the protagonist's possession is unmasked 'as the ideological project to return to the hard certainties of a more visible and rigid class structure' (Jameson, 1990). By exposing this monstrous, regressive nostalgia, *The Babadook* resists the idealization of both motherhood and waged reproductive labor as forms of unmediated intimacy: if there is a catharsis in this film, it is not in eradicating the monster but in making it visible.

The Babadook – along with other films that connect maternity to violence, including Broussan's *Mother's Day* as well as Julien Maury and Alexandre Bustillo's 2007 *Inside (À l'intérieur)*, a French body-horror film in which a would-be mother rips open her rival's womb – not only represents the refusal of motherhood, it also illustrates the expansion of reproductive work as such. Jen and Sylvia Soska's 2012 *American Mary* extends this critique into the well-worn 'rape revenge' horror narrative. *American Mary* recontextualizes the theme of sexual violence in relation to a reproductive crisis – the high cost of education and the burden of debt, and the parallel trajectories of sex work and prison – and, like *The Fits*, figures the attempted cooptation of insurgent energies against this austerity. *American Mary* is the story of a talented but broke medical student who is diligently studying to become a surgeon. When she is drugged and raped at a party by a bullying teacher, she quits school and goes into the sketchy profession of illegal body modification full time, kidnapping and using her rapist as a living corpse on which to practice her techniques. Drawing on classical horror tropes in which surgical anatomy – the stitches that hold Frankenstein's monster's limbs together – serves as a sign of expropriative class violence, the film emphasizes Mary's refusal to be similarly anatomized by male institutions, hands, and gazes. As Mary dies, her last act is to stitch up her own wound, a moment that marks her autonomy. Mary's death on her own terms rebukes a totalizing regime of debt, imprisonment, and sexual violence. Instead of allowing her 'revenge' and 'empowerment' to be recuperated – as if Mary could gain power only by entrepreneurial success or by perpetuating the violence she initially sought to abolish – *American Mary* imagines a kind of absolute negation that denaturalizes and de-idealizes the sphere of feminized work.

The myth of empowerment through employment is also tied to contemporary fantasies in which technology provides the solution to any residual ‘glitches’ in the near-perfect system of automated capitalism. Automation is today a much greater threat to labor markets in OECD nations than outsourcing: according to a recent study, while a quarter of all US jobs today are at risk of being lost to foreign competition, half are at risk of being lost to automation. The most at-risk professions are those in the lower-income bracket, and thus the authors conclude that automation poses a significant threat to basic household reproduction (Devarah et al., 2017). Of course, the material fact of this threat has been met by ideological disavowals of the most obvious kind: much as capitalism’s originary violence required a theory of developmental convergence as its alibi, automation has produced its own philosophy of history. A range of discourses of techno-optimism, as well as more philosophical theories of ‘accelerationism’, have imagined a frictionless, sped-up capitalism that (as Benjamin Noys puts it) will ‘rupture the limit of capital itself’ and thus herald a new end of history in which all flaws in the system are no more than residual glitches to be resolved with more innovation (2014). Yet, as Jason Smith observes, automation has also coincided with an ongoing crisis of accumulation that makes it unlikely that technology will create the kind of radical shift in labor markets predicted by both techno-optimists and techno-pessimists alike: instead, he notes the continued rise of precarious, low-paid, feminized service work, work which at present seems incapable of being profitably replaced by technology and which thus more closely resembles older, ‘technologically stagnant’ kinds of labor (2017).

Levan Gabriadze’s 2014 *Unfriended* provides a stark refusal of techno-optimist fantasy by imagining the ‘perfect’ social network unraveled by a murderous – and feminized – counterforce.⁸ Laura Barnes, a teen bullied into suicide, returns to cyberspace to haunt the ‘friends’ responsible for her mortal humiliation. The critique of cyber-bullying expands to encompass a critique of technological utopianism: by literalizing the idea that friendship is coterminous with acts of (technological) exchange, the film offers a stark critique of the social alienation that results when humans are more separated than ever even as commodity circulation provides the shadow appearance of community. Laura sabotages the group’s efforts to kill viruses in the network, to shut down applications, or to generally allow the internet to function. And yet the group continues to repress the fact that they are not free users in the ready-made democracy of the internet but rather, as Nick Dyer-Witheford puts it, ‘positions on the vampire food chain’ (2015). Even as they are stalked and killed by *Unfriended*’s cyber-ghost, the film’s protagonists cling to the idea that she/it is a glitch that can be thwarted by collective cyber-literacy, and thus to the delusion of technological optimism as the solution to intractable crises.

Unfriended’s ghost in the machine is a young girl seeking revenge against those who violently and humiliatingly exposed her body – in this sense, her vengeance both points to social fears of female embodiment and to the crisis of

gender itself in a moment of crisis capitalism that (as Gonzalez, Jules Joanne Gleeson, and others have argued) calls for nothing less than gender abolition (Gonzalez, 2011; Gleeson, 2017). The substitution of female embodiment, in all its apparently revolting excess, with a disembodied, androgynous avatar also argues against another myth of techno-triumphal accelerationism: that we have now entered an era of post-feminism in which technical development has evened the playing field and women (and people of color) only need to 'lean in'. Instead, we see the expansion of a feminized underclass from the sphere of unwaged domestic reproduction into the sphere of unwaged, revenue-generating social-media activity. By both networking and murdering a group of teenaged 'friends', the film's blankly monstrous feminized force simultaneously represents revolt from affective labor and exposes the repression of this feminized class position.

In recent horror, we see the ways that the gendered tropes of the horror film – bodily excess, monstrous mothers, rape, and mechanization – have developed to encompass contemporary logics of feminization. Contemporary horror, which we would suggest is particularly well equipped to evade moral, sentimental, and nostalgic ideological modes, thus seems to have a privileged relationship to Marxist-feminist criticality, allowing the experiential terrain of current social forms to be both mapped and estranged.⁹ Film reviews in the liberal press generally rate films for their ability to support accepted visions of the world, with the assumption that there is no alternative. In these liberal models of assessment, naturalistic acting and expression of accepted emotional types define a film of quality. The inbuilt violence, 'trashiness', dream-logic, and stark irrealism of the horror genre puts pressure on this mode of evaluation and instead forces both the films and their viewers to grapple with recurrent forms of dispossession, new forms of class composition, and emerging forms and sites of struggle. Drawing on the unique capacity of genre narrative to register historical change by transforming its own conventions, contemporary horror has reoriented its formal and thematic concerns to account for changes in the contemporary political and economic terrain itself. No longer content to rest easy in a set of increasingly moribund and inadequate critiques of capitalism's violence to the productive, white, male, laboring body – critiques which, we have suggested, mistake both the nature and the vitality of contemporary capitalism – contemporary horror instead attunes us to the particular kinds of violence and the particular forms of crisis becoming newly visible in the present. In what Madeline Lane-McKinley calls its 'negative prefiguration' (2015), this most negative of genres shows its utopian potential, suggesting that if we refuse to be comfortable in the world as it is, we can begin to shape the world as it should be.

Three Debates in Marxist Feminism¹

Cinzia Arruzza

INTRODUCTION

Marxism's interest in the question of women's oppression dates back to Marx and Engels' writings, and its tempestuous relationship with feminism has marked its entire history. Initial attempts to address the relation between women's emancipation, class struggle and the overcoming of capitalism, as well as the effects of capitalist social relations on the conditions of women's lives, in particular women workers, can be traced back to a number of works by Marx (1976: 592–3, 620–1, 2004: 103; Marx and Engels, 1996: 16–17), August Bebel's classic work (1910), the political-organizational writings of Clara Zetkin (2015) and Alessandra Kollontai's work (1980). However, with the notable exception of Engels (1972), these initial Marxist reflections on gender oppression were characterized neither by an attempt to provide a theoretical explanation of the connection between relations of production and sexual hierarchy, nor a distinctly Marxist interpretation of the specific position occupied by women in capitalist society. These early texts were not dissimilar to critiques articulated by a number of utopian socialists or anarchists (Goldman, 1970; Fourier, 1996): they were largely descriptive, and focused their critiques of women's oppression on questions of rights, work and sexual freedom – generally conceptualized as a liberation from the hypocrisy of the bourgeois model of the nuclear family. On a practical, political-organizational level, some of the experiences in the wake of

the Second and Third International stand out as decisively advanced.² However, on a theoretical level, it was only with second-wave feminism and the beginning of a reassessment of Marx's *Capital* that an original and specifically Marxist feminism began.

The strain of Marxist feminism that developed in the global North from the beginning of the 1960s was, from the start, a creative interrogation of Marx's critique of political economy. This lineage of Marxist feminism was not an attempt to provide a philologically accurate interpretation of Marx on the oppression of women, nor an apologetic attempt to reveal Marx's concealed feminism: its aim was, rather, to decipher the complex relation between gender oppression and capitalism and between feminism and class struggle by using and renewing Marxist categories.³ In the global North, Marxist feminism flourished, intensely but briefly: after the publication of a series of pamphlets and essays, both theoretical and political, between the mid Sixties and the beginning of the Eighties, it lost its vitality and lingered in the shadows. The beginning of the twenty-first century, however, has seen a rebirth of interest in the Marxist critique of political economy, along with its potential value in shedding light not only on the nature and mechanisms of gender oppression, but also on the historical dynamics involved in the formation of crystallized sexual identities and the intersection of racial and gender oppression. Additionally, this renewed interest has fostered a rediscovery and reevaluation of the theoretical reflections of preceding decades: a significant example is the 2014 republication of Lise Vogel's long-forgotten work, *Marxism and the Oppression of Women*. Appearing originally in 1983, its republication has revived the debate over a so-called *Unitary Theory* (Vogel, 2014).

Contrary to the somewhat caricatured presentations of Marxist feminism common in the interim between its initial flourishing and its present revival (see, for example, Jackson, 1999), a more careful analysis shows it to be made up of varied and complex debates and theories.

In this chapter I wish to focus on three main debates, each of which contains a number of divergent positions and lines of inquiry. The thematic distinction among these debates that I put forward in this chapter, however, must be taken with a grain of salt, for the issues under investigation and the various approaches to them have often overlapped and entailed each other historically and theoretically, which complicates any hard and fast lines we attempt to draw between them. The first debate involves a reconsideration and development of the Marxist critique of political economy from the point of view of the oppression of women and the role of gender in the production and reproduction of capital. The main threads of this debate have concerned the question of domestic labor, the structural relation between capitalism and patriarchy, and social reproduction (which is connected to debates over domestic labor, but addresses the latter within a broader social context). The second debate centers on the historical, structural and experiential relation between gender, class and race. Finally, and most recently,

the third debate emerged from the innovations of queer theory within feminist theory. Authors involved in this conversation have been particularly concerned with the formation of sexual identities within capitalism starting from the end of the nineteenth century, and with the commodification of LGBTQ+ identities.

THE GENDER OF CAPITAL

The Debate over Domestic Labor

The question of domestic labor was one of the first to be addressed by Marxist feminists in the Sixties, in particular in Canada, France, Italy, the USA and the UK. Setting aside differences in their respective national political contexts and analytical frameworks, their overall intention was two-fold. On the one hand, they sought to expand the concept of labor by taking into account the indispensable role of women's reproductive labor, which was rendered invisible as a result of the separation between family and productive spheres and the consequent privatization of reproductive labor. This was meant to challenge the exclusive priority and focus that Marxist analysis placed upon the sphere of wage labor, particularly factory work. On the other hand, and as a consequence of this, Marxist feminists insisted on a broader concept of class and class struggle, which would give full recognition to the centrality of women's struggles. Despite this shared goal, however, the strategies and theories feminists adopted in order to pursue these issues often diverged.⁴

A reading and reinterpretation of Marx's *Capital* played a decisive role in these debates, which shared several common assumptions. The first shared concern was the historical obfuscation and devaluation of domestic labor. According to theorists of domestic labor, this coincided with the end of agrarian society and consequent separation of the household and the point of production, industrialization and the affirmation of the hegemonic (but not exclusive) model of the heterosexual nuclear family – all of which contributed to the privatization of a large portion of reproductive labor within the domestic sphere. Second, theorists sought to vindicate the fundamental role played by reproductive labor, in all of its forms, in the creation of conditions essential for the production of surplus value, and for the reproduction of capitalist society. Finally, they generally agreed that the privatization of reproductive labor entails considerable advantages for capitalism in terms of costs, forcing women to freely provide a significant part of the labor necessary for the reproduction of labor power.⁵

The question of the productive or unproductive nature of domestic labor, particularly concerning its function *vis a vis* the reproduction of labor power, was a central and important area of contestation. Authors like Maria Rosa Dalla Costa, Selma James, Leopoldina Fortunati and Alisa del Re⁶ pushed beyond the affirmation of the centrality of domestic labor in the reproduction of the conditions of

exploitation, arguing instead that it directly *produces* surplus value.⁷ This thesis was particularly successful among Italian Workerist feminists and represented one of the central tenets of the international campaign *Wages for Housework*.⁸ Ascertaining a serious lack in Marx's treatment of labor power as articulated in *Capital vol. I* was the starting point of this analysis: insofar as Marx maintained that the value of labor power consisted simply in the value of the commodities necessary for its reproduction, he did not account for the reproductive labor performed for free by women within the home. According to Dalla Costa, the exploitative labor contract between the capitalist and the worker (the 'head of household') is equally binding to the other members of the worker's family. At once a labor contract and a 'sexual contract', the wage gives men free access to the bodies of women and their children. By virtue of this contract, what she calls 'unwaged slavery' (the work of housewives and of women who perform domestic labor in general) serves to reproduce the so-called 'wage slavery' of workers. Women must thus be understood as an integral part of the working class, even when they are not directly employed. They suffer capitalist exploitation like their husbands, sons and fathers, because they produce surplus value by producing the commodity labor power and, therefore, produce part of the value crystallized in it. A decade later Fortunati further articulated this thesis (Fortunati, 1981) by introducing a series of new categories intended to echo Marxist categories: 'necessary domestic labor time', 'necessary domestic labor', 'domestic surplus labor time' and 'domestic surplus value'. She similarly proposed to calculate the rate of the exploitation of domestic labor on the basis of the relation between domestic surplus value and necessary domestic labor.

Other feminists considered the notion that domestic labor *directly* produces surplus value to be analytically erroneous. They contested Workerist feminism, claiming that domestic labor creates the necessary *conditions* for the production and the extortion of surplus value, but that it therefore contributes only *indirectly* to it. Marx's categories of value and surplus value express a specific social relation that implies abstract labor, and therefore the socially necessary labor time mediated by the exchange of equivalents on the market. These conditions are absent in the case of unwaged domestic labor (Holmstrom, 1981; Trott, 2012). From this point of view, according to opponents of Workerist feminism, it was necessary to make an analytic distinction between that which creates the conditions for the production and the extraction of surplus value, and that which directly creates surplus value.

This distinction has been recently challenged by post-Workerist feminism, but on the basis of an analysis only partially analogous to the Workerist feminism of the Seventies. In a recent feminist re-elaboration of the work of Hardt and Negri on cognitive capitalism (2001, 2004, 2009), Kathi Weeks criticizes the old debate over domestic labor as excessively narrow and exclusively focused on unpaid reproductive labor performed within the household (Weeks, 2007). At the same time, Weeks notes that it was the Workerists' heterodox position regarding the

productive character of domestic labor that opened the possibility of rethinking the scope of capitalist production and the division between productive and reproductive spheres. Weeks' argument, in effect, is that the specific character of post-Fordist labor and production has created a radical crisis that draws into question the distinctions between what is internal and external to the domestic sphere and the circuits of valorization, as well as the distinction between production and reproduction (Weeks, 2007).

Lastly, others have underlined that within the new horizon of cognitive capitalism and the profound transformation of production and labor it implies, affective labor (understood as labor performed in various cognitive and subjective forms and in disparate social spheres) not only produces surplus value, but is the most advanced point of its extraction (Hardt, 1999; Morini and Fumagalli, 2009; Dowling, Chapter 68, this *Handbook*).

One, Two or Three Systems

Lise Vogel has drawn attention to some 'ambiguous formulations' in Engels' *Origin of the Family, Private Property and the State*, which provide some basis for the dualistic approach of subsequent socialist feminism (Vogel, 2014). Similarly, in her work on Marx's writings on gender and family, Heather Brown (2013) emphasizes that, contrary to Marx, Engels develops a determinist and unilinear interpretative approach to women's oppression. Citing critiques raised against Engels' determinism by a number of feminist authors, Brown implicitly suggests that confusion among feminists over the position of Marx versus that of Engels has contributed to the difficult relation between feminism and Marxism (Brown, 2013). Vogel's and Brown's assessments, while grasping the roots of dualistic thinking in Engels' ambiguous formulations, risk neglecting the productive influence that Engels' historicization of gender oppression and its origin has had within Marxist feminism. While it is true that Engels' ambiguous formulations have provided some ground for dualistic thinking, Engels' intuition in *The Origin of the Family* has often formed the basis of the Marxist feminist critique of de-historicized and essentializing approaches to the question of patriarchy understood as an autonomous system of masculine dominance over women. It is thus worthwhile to take a quick look at Engels' thesis, before further considering how Marxist feminists have critiqued dual systems theory.

The heart of Engels' thesis is to pose a connection between the birth of class society and individual private property on the one hand and the historical affirmation of male dominance on the other. He links the changes in the social conditions of women and their historical 'defeat' to two general processes: the progressive affirmation of individual private property – as opposed to the collective property of the *gens* – and the passage from group marriage to couple marriage. However, the scarcity of material available to Engels and the pioneer

status of anthropological research at the time resulted in a number of factual errors throughout his work. Moreover, he operated under a confusion between the matrilineal and the matriarchal, maintaining that the overthrow of matriarchy and matrilineal lineage was caused by men's desire to ensure their own biological children's inheritance. This necessarily entailed control over the reproductive capacity of women and the rupture of the bond between a woman and her own *gens* (Engels, 1972).

Despite the factual errors made by Engels and his excessive emphasis on the technological components of the transition from one mode of social organization to another, the idea that patriarchy is not a transcendental characteristic of human social relations had fruitful consequences for Marxist feminism. This intuition was successively developed in anthropological and historical research that questioned radical feminism's presupposition of the universality and a-historicity of women's oppression (Federici, 2004; Leacock, 2008; Coontz and Henderson, 2016). These studies generally share a set of tenets. First, the idea that the oppression of women has not always existed, but that its origin is connected to specific processes of social transformation. Second, that these processes of social transformation concern the production, appropriation and distribution of resources and form the context for the emergence of increasingly rigid and hierarchical social stratifications and divisions of labor within communities. These elements, therefore, play a determinant role in women's oppression, which is not to be seen as a mere consequence of biology or psychology.

These insights have also played a role within the debate over the so-called dual systems theory, which emerged at the end of the Seventies and in the early Eighties, largely among Anglo-American Marxist feminists, following the 1979 publication of Heidi Hartmann's (1981) essay *The Unhappy Marriage of Marxism and Feminism*. The article was the object of a number of different critiques from Marxist feminists as well as radical feminists, which were collected in a book of essays edited by Lydia Sargent (1981).

In her essay, Hartmann proposes a systematization of *Dual Systems Theory*, or the theory of two systems: patriarchy and capitalism. The essay begins with a consideration of the failed marriage between Marxism and feminism. Hartmann underlines how Marxism had lost the opportunity to make profound revisions offered by the new wave of feminism, and had instead maintained that gender oppression was an oppression of secondary importance, subordinate to class exploitation. Engels' insight, in *The Origin of the Family*, was that the production and reproduction of immediate life were determining factors of history and consisted of two aspects: the production of the means of existence and the production of human beings themselves. However, neither Engels nor subsequent Marxist theorists further elaborated upon this insight. This contributed to the continued 'sex-blindness' of Marxist categories, which in turn led to the undervaluation of women's oppression in Marxist thought, as well as its incapacity to comprehend the complexity of capitalism. According to Hartmann, capitalism creates

hierarchies within the work force, but its 'laws of motion' are indifferent to sex and race and are thus unable to determine who will be destined to occupy the varying positions within this hierarchy. The question of which social category inside the working class will occupy a subordinate position in the work force is of no concern to these laws of motion. For this reason, the concept of class alone does not have sufficient explanatory power, but should be integrated with the concepts of gender, race, nationality and religion. For Hartmann, it is not the logic of accumulation that permits capitalism to place women in an inferior rank in the internal dynamics of the labor force, but rather that of another system, which, while imbricated with capitalism, enjoys an autonomous life of its own: the patriarchal system. The subordination of women created by this system, the origins of which are pre-capitalist, is used by capitalism for its own ends. Hartmann's definition of patriarchy was attentive to its historicity and transformations. This aligns her work with a series of reflections concerning 'patriarchal capitalism' (Eisenstein, 1979; Mies, 1986) and 'capitalist patriarchy', which thematized, according to different methods and with different results, the relation, interpenetration and reciprocal determination between the two systems.

In *Theorizing Patriarchy*, Sylvia Walby proposes to reformulate dual systems theory by adding race as a third system, and puts forward a conceptualization of patriarchy as a variable system of structural social relations, made of six structures that influence each other, but nonetheless retain their own autonomy. These structures, which can be public as well as private, are the patriarchal mode of production, the patriarchal relations involved in wage or paid work, patriarchal relations in the state, masculine violence, the patriarchal relations of sexuality and the patriarchal relations in cultural institutions (Walby, 1990).

Iris Marion Young's response to Hartmann in the anthology is based on the observation that the historical existence of a form of oppression or social organization before capitalism is not a sufficient basis to prove its persistence within capitalist societies as a structure or a system governed by an independent logic. Young notes, for example, that even if class division and exploitation are antecedent to capitalism and therefore not invented by capitalism, this obviously does not imply that they represent an autonomous structure that changes historically according to the mode of production but still remains autonomous from the mode of production (Young, 1981).⁹ The argument underlying the anti-dualist critique is not that the patriarchy has never existed as a system with an autonomous logic and its own functional mechanisms. It is rather to say that the economic and social bases that were the foundation of the reproduction of the patriarchal system have been swept away by the spread of a capitalist mode of production that, replacing the preceding agrarian society, has coopted, absorbed and profoundly modified the relations of domination between genders.

As both Young (1981) and Vogel (2014) note, *Dual Systems Theory* ultimately re-entrenched the impasse it was attempting to resolve by allowing traditional Marxism to continue to construct its analysis of capitalism and its relations of

production, as well as the process of social transformation, with 'sex-blind' categories, while leaving to feminism the task of analyzing the patriarchal system. Against this dualist approach, both Vogel and Young prefer to maintain a unitary analysis. However, it is mainly Vogel's book that lays out a so-called *Unitary Theory* through an original reading of Marx's *Capital vol. I*. And, contrary to Young, she identifies the key explanatory factor of her unitary framework as the social reproduction of labor power and of the working class, rather than the gendered division of labor within the formal labor market. Vogel is very careful to emphasize that her suggestion of a unitary theory does not explain all the aspects of women's domination within capitalism: she contends, rather, that this theory offers a clearer explanation of the *logic* governing the social horizons within which the diverse manifestations of gender oppression take place. Vogel's book recovers, with the exception of the argument for the productive character of domestic labor, many of the intuitions already elaborated by Workerist feminism in the Seventies. Nevertheless, what characterizes and sets Vogel's work apart is the systematic character of her research on the one hand, and its level of analytical abstraction on the other. Indeed, Vogel's project can be considered one of the first attempts to amend systematically *Capital vol. I* at the same level of logical abstraction as Marx by introducing the largely missing component of the structural articulation between biological reproduction, the generational reproduction of labor power and the reproduction of capitalism. It is this articulation, in Vogel's opinion, that determines the perpetuation and at the same time the constant modification of the relations of domination between genders.

Vogel's call to move *toward* a unitary theory has been taken up in recent years by a growing number of authors occupied with the question of the structural relation between gender oppression and capitalism. Bakker and Gill, for example, have recently confronted the question of rethinking the concept of a capitalist totality, insisting on the necessity of conceiving of capitalism as a unity of different and contradictory *levels*, which should not be understood as reified *structures*. This would allow one to conceptualize, *at the same time*, the social relations of production and their processes of mediation and transformation through human activity, and the intervention of subjectivity, characterized by determinations of class, gender, race and sexuality (Bakker and Gill, 2003a; see also Ferguson, 1999; Arruzza, 2014).

Social Reproduction

The notion of social reproduction, articulated by various Marxist feminists¹⁰ between the Seventies and the Eighties, was meant to offer a non-reductionist description of the relation between gender oppression and capitalism, while avoiding both dualistic explanations and economic interpretations of the functional mechanisms of capitalist society. In fact, although the concept of social reproduction has been successively adopted by feminist theorists belonging to

various currents of thought, within Marxist feminism it was most thoroughly developed in connection with a unitary understanding of the relation between capitalism and gender oppression. The notion of social reproduction emphasizes the fact that mode of production and class structure determine the horizon within which the processes of reproduction and the sustenance of human life take place. The key presupposition, therefore, is that the way social reproduction is organized in a given social formation maintains an intrinsic relationship with the way the production and reproduction of society in its totality are organized, and therefore with class relations. The intent of social reproduction theory is to conceptualize these relations not merely as accidental and contingent intersections, but rather as moments of a unity governed by a specific logic. At the same time, however, analysis of social reproduction also aims to challenge a reified notion of commodity production understood as a structure independent from the everyday reproduction of life: on the contrary, its goal is to stress the fundamental character of human practice of the sphere of production, and its organic relation to the rest of human activity (Ferguson, 1999, 2019). In the definition put forth by Johanna Brenner and Barbara Laslett (1991), social reproduction indicates the entirety of activities, behaviors, emotions and relations that are directly implicated in the maintenance of life on a daily and intergenerational basis: from preparing meals, educating children, caring for the ill and the elderly, all the way to the question of housework and sexuality. The type of labor required by social reproduction can be mental, affective and physical, and the modality of its organization and distribution is variable.¹¹ Additionally, this labor is not always performed in the same way: which part of this labor is offered on the market, provided by the welfare state or occurs within the family is a contingent matter that depends on specific historical dynamics.¹²

Since it includes a wider range of social practices and types of labor, the utilization of the interpretive grid offered by the concept of social reproduction has allowed Marxist feminism to significantly expand its scope with respect to the earlier domestic labor debate. With an understanding of social reproduction, Marxist feminists can also more adequately analyze the relation between life within the household on the one hand and the commodification and sexualization of the division of labor and the policies of the welfare state on the other. In sum, the concept of social reproduction has opened a new avenue for analyses of phenomena such as the relation between the commodification of care labor and the racial division of labor (for example, through repressive immigration policies which lower the cost of migrant labor and force migrants into semi-servile working conditions).

GENDER, RACE, CLASS

The term ‘intersectionality’ has seen a number of different and notable articulations since the late Eighties within feminist theory interested in the interrelations

between gender and race.¹³ Since its inception, intersectional feminist authors have often utilized this framework to criticize radical and essentialist white feminism, accusing the latter of merely articulating an abstraction – ‘Woman’ understood as a universal, or as a mythologized ‘Other’ – which does not take into consideration the hierarchies and different experiences determined by the racialization of groups of women.

Political and historical writings on the interconnection between different forms of oppression, and between these and class exploitation, were published and widely circulated well before Crenshaw coined the term ‘intersectionality’ in her seminal work (Crenshaw, 1989). These writings were the outcome of the specific organizational and political experiences of the Black left. While much of subsequent intersectional literature would develop without maintaining a significant dialogue with Marxism, some of the foundational writings of Black feminism emerged directly in the wake of the Marxist left, or maintained a derivative relationship with Marxism. The origins of this relationship can be traced back to the Twenties and Thirties, decades in which the Workers Party of America decided to make the question of race one of the main issues of the party (McDuffie, 2011). This period produced political articles like Grace Campbell’s on the mass incarceration of African-American women, and Bell Lamb and Maude White’s work on the condition of African-American women workers. Two decades later, in 1949, Claudia Jones, an activist in the American Communist Party, wrote an article considered to be a precursor of intersectional analysis: ‘An End to the Neglect of the Problems of the Negro Woman!’ In this essay Jones emphasizes that African-American working women occupy the lowest position within the social hierarchy. This is the result of both class exploitation – heightened by African-American women’s placement in the division of labor – and the multiple forms of oppression to which they are subjected as women *and* as African-Americans (Jones, 1995). The question of simultaneous forms of oppression was approached by Jones not only from the point of view of the analysis of the objective conditions of Black women, but also from the point of view of the subjective role they played within anti-racist and class struggles at the time. Overall, the article denounced the negligence displayed by both unions and anti-racist organizations with respect to the centrality and radicality of this role. In effect, one can find in Jones’ writing two central themes that would be developed decades later by Black feminists: on the one hand, the idea of the simultaneity, and non-separability, of multiple forms of oppression and of class exploitation, which determine not only the conditions of life, but also specific identities or forms of subjectivity (Brewer, 1999), and, on the other hand, the denunciation of the blindness to the particularity of the position of African-American women displayed on the part of the organizations and movements to which these women brought fundamental contributions (see also Bohrer, Chapter 57, this *Handbook*).

The same critique was leveled against the New Left and the new feminist movement in a text that would become a reference point for American Black

feminism: the 'Combahee River Collective Statement' (1982). This text, initially published in 1977 by a collective of Black feminist and lesbian activists, takes up a series of reflections articulated some years prior by Angela Davis (1972), among others. It stresses the specificity of Black feminism with regard to the rest of feminism, the civil rights movement and Black nationalism, and the workers' movement of that time, to which many activists of the collective originally belonged (Brewer, 2003). The Statement briefly but explicitly addresses the relation with Marxism, and reaffirms the necessity for a re-elaboration of the Marxist critique of political economy that could be applied to the specific economic condition of Black women.

In general, however, the specific theorization of the *structural* relation between gender and racial oppression and capitalist accumulation largely absent from the texts of Black Marxist feminism from the Twenties until the late Seventies. Angela Davis' splendid volume *Women, Race and Class* (1981) represents the most famous text within the Marxist current of Black feminism. Here she offers an illuminating historical discussion of the simultaneity of the three oppressions, the continuity between slavery, segregation and mass imprisonment, and the development of US feminism and its inability to include the specificity represented by Black women.¹⁴ However, even this text does not explicitly theorize the question of the relation between capitalist oppression, racial segregation and gender oppression. A few brief moments of such analysis can be found in Selma James' attempt to expand discussions of the role of domestic labor in the reproduction of labor power and capital to include the specificity of the domestic labor performed by Black women (James, 2012). Many writings have also focused on the redefinition of class in relation to the conditions and specific role of a racialized and gendered labor force; however, these works are generally more empirical-descriptive than theoretical. Instead, the general tendency within Black feminism, whether Marxist or not, has been to emphasize theoretical concerns related to identity and subjectivation. Consequently it has taken a different path than the majority of Marxist feminism. Himani Bannerji identifies this divergence as bound up with Marxist feminism's incapacity actually to integrate the question of the racial division of labor and of racism: according to Bannerji, Marxist feminism was excessively influenced by Althusserian structuralism, and thus lost sight of the subjective dimension of the revolutionary project (Bannerji, 1995).¹⁵

Only recently, a group of authors have started rethinking social reproduction theory in a way that theoretically and epistemologically integrates the role played by the racial division of labor, and its symbolic and political consequences. This re-elaboration includes both empirical work on the different yet interconnected phenomena of migratory processes, neoliberal globalization, the growth of privatization and the commodification of social reproduction work (Gawel and Arruzza, 2020), as well as an attempt to rethink the Marxist method that breaks with the structuralism that has dominated most Marxist feminism (Ferguson, 2008, 2016;

Camfield, 2014; for a defense of Marxist feminism's structuralist approach: Gimenez, 1997). These authors reject the analytic separation between class formations and historical forms of consciousness, social organization and subjectivity – or, to use outdated terminology, between base and superstructure (Bannerji, 1995). They also propose a reevaluation of the concept of praxis in Marx's early work – particularly the *Theses on Feuerbach* and the *1844 Manuscripts*, read through Gramsci and the concept of experience articulated by E. P. Thompson in his work on the formation of the English working class (*Thompson, 1963*; Bakker and Gill, 2003a).

SEXUALITY AND CAPITALISM

Recent years have also seen an increased interest in returning to Marx or addressing the role played by capitalist dynamics in the formation of gender and sexual identities (Duggan, 2002; Cruz-Malavé and Manalansan 2002; Eng et al., 2005). This is evident, for example, in a series of publications that have brought forth both an anti-heteronormative critique of capitalism, and a critique of mainstream gay and lesbian politics focused on the vindication of formal rights within the limits of neoliberalism. While they agree in their critique of the neoliberalization of sexual identities, these authors differ in their assessment of queer theory's role in this critical project and – consequently – in how they conceive of the research program that Marxist thinkers of sexuality should develop moving forward. While some have defended the usefulness of queer theory (Lewis, 2015) and the queer critique of heteronormativity and gay normality (Sears, 2005; Floyd, 2009; Camfield, 2014; Drucker, 2011; 2015, and Chapter 54, this *Handbook*), and in doing so have put forward the possibility of developing a 'Queer Marxism', others have taken a critical stance toward queer theory, insisting on the necessity of a return to Freud and Lacan via a Marxist interpretation (Penney, 2013).

One of the most original lines of theoretical research in the field of Marxist-influenced queer theory concerns the relation between capitalist accumulation and the historical formation of sexual identities. These theories have yielded somewhat divergent interpretations, depending on where they stand in relation to established Marxist thought: some work with the Althusserian concept of overdetermination, while others employ – with significant modifications – the Lukácsian notion of reification. Still others have begun to develop a theory of the construction and regulation of sexual identities within the framework of social reproduction theory. In what follows I focus on this latter – more theoretical – line of inquiry, not only because it represents the most groundbreaking Marxist work in terms of the analysis of sexuality, but also because this line has the closest connection with the Marxist feminist theoretical debates analyzed so far in this chapter. As with these Marxist feminist debates, these theoretical works are

grounded in a creative and anti-dogmatic use and re-elaboration of Marx's critique of political economy.

In *Profit and Pleasure*, Rosemary Hennessy (2000) proposes an articulated approach to the relationship between relations of production and sexuality, which definitively liquidates the base-superstructure model. Against this traditional schema, Hennessy invokes, on the one hand, a conception of capitalism as an organization of human relations, or relations between 'living individuals', and, on the other, the notion of 'experience' elaborated by E. P. Thompson. With this renewed account of social relations and lived experience as well as a critical use of Althusser's concept of overdetermination (Hennessy, 2000), Hennessy analyzes the construction of and relationship between sexual and gender identities in light of the diffusion of commodity production in Europe and the USA at the end of the nineteenth century. Hennessy's argument is that the emergence of reified homosexual and heterosexual identity categories, along with the centrality of sexual preference in the definition of these identities, is the result of the ways in which capitalism and its diffusion of mass consumption dissolves systems of family relations and traditional social ties. This approach is characterized by her attempt to reveal how the creation of sexual identities within the larger process of reproduction in US society is historically determined by the dynamics internal to a certain form of capitalist accumulation. In the historically specific, non-reductionistic and non-functionalist manner with which she attempts to reveal the structural relation between capitalism and the formation of sexual identity, Hennessy's theoretization shares lines of thought with both Marxist feminist unitary theory and social reproduction theory.

Although they differ in method, Kevin Floyd's (2009) *The Reification of Desire* articulates a thesis similar to Hennessy's. Floyd's analysis focuses above all on the construction of masculinity in the USA during the Fordist regime of accumulation. In his view, the performative character of masculinity during Fordism was the product of a series of types and models of consumption prescribed within a leisure time rigidly regulated by the commodity form (Floyd, 2009). Like Hennessy, Floyd emphasizes the necessity of returning, in a Marxist manner, to an epistemological approach and method of social critique that can better allow radical theory to trace causal connections and explain the processes under investigation rather than merely describing them. And, likewise, Floyd identifies in the dynamics proper to a historically specific form of capitalist accumulation the cause and context for the emergence of specific kinds of sexual identity. However, their theoretical approaches diverge in that Floyd makes recourse to two central, albeit critically modified, concepts of Lukács' *History of Class Consciousness* – 'totality' and 'reification' (Floyd, 2009) – as well as recuperating aspects of Marcuse's argument for an eroticized reading of the Lukácsian concept of reification (Marcuse, 1975; Floyd, 2009).

The thesis of a direct and structural connection between specific regimes of accumulation and regimes of sexual regulation has proved fruitful within the

recent emergence of Queer Marxism: it has been further taken up, for example, by Peter Drucker in his important work on sexual identities and neoliberalism. Rather than focus on the emergence of gay sexual identities specifically under Fordism, like Hennessy and Floyd, Drucker articulates the differences and shifts in terms of sexuality among the various regimes of accumulation – classical imperialism, Fordism and neoliberalism (Drucker, 2015).

More recently, Alan Sears has developed a theoretical outline for a social reproduction theory of sexuality (Sears, 2016, 2017), while also addressing Hennessy's, Floyd's and Drucker's insights about the relation between regimes of accumulation and sexuality. Sears' application of social reproduction theory to the sphere of sexuality reinterprets sexuality as part of life-making work and, therefore, as subject to pressures and constraints that must be interpreted in view of the relation between social reproduction and production for profit. In this light, Sears reinterprets the categories of heteronormativity and homonormativity as disciplinary forms regulating sexuality, which are sustained and necessitated by the subordination of social reproduction to production for profit. Sears mobilizes Marx's notion of double freedom in *Capital*, vol. 1 to criticize an understanding of the proliferation and increasing visibility of sexual identities as simply an indicator of increased positive individual freedom. As Marx notes in *Capital*, under capitalism workers are endowed with a paradoxical double freedom: that is, freedom to dispose of their own bodies, but also a negative 'freedom' from the means necessary for the realization of their labor power (i.e., *dispossession*). Being constantly dispossessed of their means of production, they are both free from the bonds that tied them to the land to freely sell their labor power, but they are also *compelled* to sell it in order to survive. Sears proposes to extend this insight to the sphere of sexuality, in order to understand the double character of neoliberal sexual freedom. While people – like the 'free' workers of Marx's *Capital* – formally *own* their own bodies, this freedom of bodily self-determination is necessarily bound up with forms of compulsion, which are structurally connected to the relations of exploitation and oppression characteristic of capitalism.

CONCLUSION

This short discussion of three main debates within Marxist feminism is certainly insufficient to account for a current of thought that, albeit with some fundamental lacunae and accidental detours, has given life to original and fruitful reflections. It is doubtless true that Marxist feminism has often failed to integrate the question of race within its analyses, as well as to articulate a sufficient theory of political subjectivation. If we are to diagnose the cause of these setbacks, it is possible to identify two main factors. The first is that, with a few notable exceptions, the Marxist tradition has failed to integrate on both political-organizational and theoretical levels the centrality of gender oppression in its various articulations, and

this can also be extended to questions of racialization and heteronormativity. In particular, most Marxist theory has not included gender or other oppressions as key elements of a more comprehensive critique of capitalist social relations. In the case of gender, this means that the task of developing an adequate theory of the relation between gender oppression and capitalism, on both a descriptive and a theoretical level, has been met almost entirely by a small number of feminist and queer authors and specialized theorists. The second factor, conversely, is that the question of capitalism and the relation between gender and class has been largely obscured within the development of feminist and queer theory for at least two decades. The variety and complexity of the approaches and reflections briefly synthesized in this essay, however, show how the Marxist feminist re-elaboration of the critique of political economy presents ideas and lines of research of notable potential, which lie waiting to be developed further and more fully.

Notes

- 1 This is a revised and updated version of an article that originally appeared in Italian as 'Il genere del capitale. Introduzione al femminismo marxista', in *Storia del marxismo. Vol 3: Economia, politica, cultura: Marx oggi*, ed. by Stefano Petrucciani (Carocci, 2015). Translation into English by Juniper Alcorn.
- 2 For example, the Soviet Family Code, approved in 1918, guaranteed the recognition of the rights of children born outside of marriage. It abolished both the institution of marital power and the joint ownership of conjugal property, and established consensual divorce, while also providing economic and legal protections for women in the case of divorce. Following another decree in 1920, Soviet Russia was the first country in Europe to legalize abortion, in addition to guaranteeing access to safe and free abortion in public hospitals. These rights and guarantees were progressively eroded during the Stalinist era.
- 3 The first detailed analysis of the related questions of women's oppression, the family and sexual morality has been published only recently by Heather Brown (2013). An intelligent analysis of Marx and Engels' writing on these questions can also be found in the first chapter of Vogel (2014).
- 4 One of these strategies, suggested by Christine Delphy, would become the focus of a new current of materialist feminism. While inspired by different aspects of Marxism, materialist feminism is nonetheless radically distinct, arguing for the consideration of domestic labor as productive labor that is subjected to economic exploitation within a patriarchal mode of production, which it conceptualizes as independent of capitalism (Delphy, 2016). Delphy's theoretical proposal is ultimately based on an idiosyncratic interpretation of the distinction between use value and value, which did not take into account either the distinction – crucial for Marx – between production of commodities and production *tout court*, or his understanding of value as a specific social relation.
- 5 This can be seen in the following texts, among others: Benston (1969/1997); Dalla Costa and James, (1972); Chisté et al. (1979); Fortunati (1981); Holmstrom (1981). For an overview and critical discussion of this debate see also: Molyneux (1979); Vogel (2008) and Weeks (2010: 118–23).
- 6 Del Re has reaffirmed the same position, that domestic labor indirectly produces surplus labor, in a more recent text: Del Re (2008).
- 7 The original version of Dalla Costa and James' text, which would be widely distributed and exercised notable influence within the debate on domestic labor, articulated this thesis in a somewhat ambiguous manner, maintaining in vague terms that domestic labor is essential to the extortion of surplus value (a thesis which, expressed in these simple terms, was shared by most within the domestic labor debate) (Dalla Costa and James, 1972). In a note to the third edition of 1975, however, this ambiguity was definitively resolved: 'Some English readers have remarked that this definition of labor could be

- more precise. What we intended was precisely that domestic labor, as labor, is productive in a Marxist sense, that it is productive of surplus value' (1975: 53, n. 12).
- 8 The campaign developed starting in 1972, and was particularly established in Italy, Germany, Switzerland, the UK, Canada and the USA.
 - 9 Young has criticized Nancy Fraser as putting forward a dualist argument. In her work on justice, Nancy Fraser proposes a 'bifocal' approach, capable of identifying the relative autonomy of two distinct dimensions, which Fraser calls redistribution and recognition, the first pertaining to the economic sphere, with the second relating to social status. According to Fraser, these two dimensions, although relatively independent, are tightly interlaced and both contribute to the reproduction of capitalist society (Fraser, 1996).
 - 10 See for example: Chisté et al. (1979); Fox (1980); Fortunati (1981); Miles and Finn (1982); Hamilton and Barrett (1987).
 - 11 Silvia Federici has recently insisted on the relevance of the physicality of reproductive labor, as opposed to Hardt and Negri's privileging of immaterial labor (Federici, 2012).
 - 12 For studies based on the concept of social reproduction, see: Picchio (1992); Bakker and Gill (2003b); Katz (2004); Bezanson and Luxton (2006); Bhattacharya (2017); Jaffe (2020). See also Fraser (2017) for an account of the contradiction between social reproduction and production for profits as a contradiction of capitalism.
 - 13 For a Marxist feminist critique of the theoretical limitations of intersectionality theory, see Ferguson (2016) and McNally (2017); for a Marxist feminist defense of intersectionality theory, and for a positive engagement with it see Brenner (2000); Bohrer 2018, 2020).
 - 14 The question of the continuity of slavery, Jim Crow, capitalist interests and the effect of the incarceration boom on people of color in the USA is the object of an important study by Ruth Wilson Gilmore (Gilmore, 2007).
 - 15 An exception in Italy is Lidia Cirillo's work on feminist subjectivation (Cirillo, 2001, 2003).

Triple Exploitation, Social Reproduction, and the Agrarian Question in Japan

Wendy Matsumura

INTRODUCTION

In *Communal Luxury*, Kristin Ross traces the attempts of the Communards to think beyond the parameters of ‘the social formation that the bourgeois devotes itself to keeping apart’ (2015: 5). In so doing, she creates a genealogy of the Paris Commune that enables the collective visions that became articulable only in the midst of their struggles to enter ‘vividly into the figurability of the present’ (2015: 2). By centering what she calls the communal imagination that ‘operated on the preferred scale of the local autonomist unit within an internationalist horizon’, Ross recounts not only the way their denunciation of bourgeois notions of ‘who can and cannot afford the luxury of playing with words or images’ (2015: 5) traveled beyond Paris, she argues that this imagination, ‘communal luxury’, reshaped the way that Marx, Kropotkin, and Morris understood the relationship between theory and praxis. In her call to engage the problem of representation as a problem of revolutionary struggle, Ross invokes the work of Walter Benjamin, who in ‘Theses on the Philosophy of History’, clarified the task of historical materialism as a resolutely anti-historicist one that recognizes that ‘there is no document of civilization which is not at the same time a document of barbarism’ (2007: 256). In that text, Benjamin implored historical materialists to not be complicit in reproducing narratives of ‘civilization’ by engaging with its relics uncritically, which, for him, was inextricably linked to the project of

attending to the rich contradictions that imbue the now. He warned that replicating modes of narrativization that reinforce the empty homogenous time of progress would make Marxist historians no better than their bourgeois counterparts. Ross answers this call through her engagement with the writings of the Communards and links their collectively articulated visions of communal luxury to similar struggles being waged in her moment.

Historians of modern Japan have also tackled the problem of historical representation as a means through which to critique the present. Harry Harootunian (2000) analyzed anti-historicist philosophical interventions by thinkers like Tosaka Jun in the 1930s as a means through which to critique the intellectual foundations of area studies projects including those in the field of modern Japanese history. In *Overcome by Modernity*, he argued that the spatio-temporal logic of capital – the conjuncture that enabled him to think about the 1930s and 2000s as linked – created problems of representation and comparability in ways that made modernism and fascism two sides of the same coin. He demonstrated how interwar thinkers confronting crisis could not articulate a collective vision that could imagine otherwise because of their inability to think beyond the ideology of the modern. His criticism of their inability to see contingency in the ever-same and subsumption in the eternal nation-form was directed just as much against his own contemporaries as it was toward folklorists, sociologists, and philosophers who wrote in the interwar period in Japan.

In *The Sublime Perversion of Capital*, Gavin Walker (2016) also engages in a critique of the present. While discussing thinkers who became trapped by the contradictory desires of Marxian approaches to history – to clarify the relationship between the development of productive forces and relations of production and to illuminate a history of class struggle – Walker locates the root of this problem in what he calls a ‘defective moment’ in capital’s logic, whose overcoming relied upon a ‘historicist retelling of its own process of realization’ (2016: 22). In so doing, he clarifies the relationship between historicism as capital’s self-representation and its fundamental impossibility to produce the fount of surplus value, labor power, on its own. Capital overcomes this through representational modes that conceal or deflect the instability that plagues every moment of completion. He, like Harootunian, places Marxist economist Uno Kōzō alongside thinkers like Althusser and Benjamin, each of whom clarified and problematized the link between the reproduction of capitalist social relations and modes of representation that concealed the continuous work that was required to make capitalist relations appear natural. Yutaka Nagahara (2000), Ken Kawashima (2009), and others have also taken seriously Uno’s identification of the ‘impossibility of the commodification of labor power’ as capital’s fundamental contradiction and have emphasized the importance of beginning from an understanding of the incomplete nature of capital’s penetration of any given relation in order to understand the violence that is required to produce its self-representation as eternal and without limits.

Uno grappled with the problem of representation and, therefore, of critique, from the position of thinkers who accepted the premise that the societies they were analyzing did not perfectly fit the classical model of England, their assumed object of Marx's critique of political economy. He did not skirt the question of unevenness (including but not limited to imperialism) and, in fact, placed it at the center of his analysis of Japanese capitalism, which he understood as having been forced into a truncated process of becoming due to Japan's position in the world. In this respect, his work can be placed alongside critiques of Eurocentric historical models of transformation masquerading as Universal History that subaltern studies scholars (and their critics) put forth, as well as with more recent theorizations of racial capitalism that have reinvigorated studies of the relationship between capitalism and slavery that were articulated by scholars like Eric Williams in the 1940s. Like these scholars who pushed back against historicist understandings of the past that misrecognized unevennesses as backwardness, Uno understood the damage that narratives, that deemed some peoples and societies protagonists of revolutionary struggles but not others, could inflict on those who were left out of the frame.

One of the clearest explications of Uno's theory of history that attempted to expand the parameters of anti-capitalist struggle beyond the labor-capital relation is *Crisis Theory* (*Kyōkōron*), which he first presented as a lecture at the University of Tokyo's Faculty of Economics in 1951 and published in book form in 1953 (Uno, 1972). There, he presents an analysis of capitalist crisis that exemplifies his tripartite critique of political economy: principle theory of capitalism (*genriron*), stage theory (*dankairon*), and analysis of the current conjuncture (*genjō bunseki*) (Lange, 2014; Walker and Kawashima, 2018). While he devotes quite a bit of energy to explicating capital's so-called business cycles by moving between scales of analysis and emphasizes that the logic of capital is linked to, but by no means conflatable with, the unfolding of class struggles, Uno's consideration of crisis leads him to invent a new language through which the entirety of social reproduction might be understood, and through which the tension between theory and praxis might be clarified. His insistence that movements from one part of the cycle to the next (boom-excessive prosperity-recession-crisis is the classical form he works with) are not predetermined and that social relations within each moment are imbued with conflicts that stem from the fundamental contradiction of capitalism – that labor power is the one commodity that capital absolutely needs but cannot produce on its own – provides his readers with an understanding of crisis that links business cycles, not only to struggles over the wage, but to struggles over social reproduction that are waged daily in the home, in the fields, in schools, hospitals, or over access to the commons (Uno, 1972: 86). His observation that capital, by necessity, constantly comes up against, overcomes, and conceals its limits – often through the mobilization of state violence – provides labor historians and historians of agrarian struggle committed to writing a history of the present with an analytic that can accommodate a multi-scalar and multi-temporal critique.¹

Read this way, we can understand Uno's critique of political economy as committed to a consciously non-economistic understanding of crisis that predates the rich contributions of theorists like Stuart Hall (1988), who also articulated a theory of crisis that was predicated on the belief that the reproduction of capitalist relations was nothing if not a social process. As Ruth Wilson Gilmore (2007: 54) explains in 'Questions of Theory', which he coauthored with Bill Schwarz, Hall defined crisis in the following manner: 'Crises occur when the social formation can no longer be reproduced on the basis of the pre-existing system of social relations'. Gilmore demonstrates in *Golden Gulag* that the simple definition presented above reflects a complex understanding of capitalism that is dialogic, multi-faceted, and constantly confronting its limits. She argues that, in the text, 'to reproduce' signifies a broad array of political, economic, cultural, and biological capacities that a society uses to renew itself daily, seasonally, generationally (Gilmore, 2007: 54). Marxist feminist interventions by scholars like Lise Vogel (1983) and Tithi Bhattacharya (2017) have proposed a method through which to ask the question: who exactly bears the burdens of absorbing these preconditions of reproduction?

Uno's link to the question of the production of unevenness in social reproduction can be found in his consideration of wages. He explains that, while capital would like to drive the wage down as far as possible by encroaching into the reproductive sphere, it also needed a market for its commodities: '[t]he worker's wage cannot decline to the point that life materials necessary for the reproduction of labor power cannot be guaranteed' (Uno, 1972: 143). The key word here is *necessary*. He elaborates: 'In reality, the limits placed on the reproduction of labor power are historically and socially determined. Fluctuations take place within limits that are proscribed by a set class relationship' (1972: 143). This is not simply a matter of the confrontation between capitalists and workers. Instead, he argues via Marx that it is 'nothing more than the relation between the unpaid and paid labor of the same working population' (1972: 145). For Uno, the lever that kept this ever-present tension in favor of capital was the so-called surplus population, a concept that he gave full consideration to in his writings on the agrarian question that were penned as labor flows within the Japanese empire were accelerating.²

Uno's works, which operate at a variety of scales, allow us to address the problem of historicism as a problem of capital's self-representation as eternal. *Crisis Theory* guides those of us who are interested in critiquing the relationship between exploitation, sexual oppression, and racism as necessary for capital's ability to overcome its limits, all the while preserving the veneer of a limitless relation. For my own work, it has given me valuable analytical tools through which to engage in a non-historicist analysis of the collective visions that people residing in the Japanese empire articulated in the course of their struggles against new forms of exploitation and expropriation as capital sought to reorganize social relations in order to overcome crisis. Unfortunately, in his writings on the

post-World War I agrarian question, Uno did not apply the same level of scrutiny that he devoted to labor power in his writings on crisis to the unit of the small farm household (*shōnō nōka*). I argue that, if he had demystified this category, which the Ministry of Agriculture and Commerce had decided after World War I would be the material and ideological exemplar of the nation, the way that he and his interlocutors in the interwar debates on Japanese capitalism understood the revolutionary potentials of struggles in the agrarian sector would have been markedly different. That is, if Uno had taken his theorizations of crisis seriously in his analysis of the current conjuncture, he would have seen that ongoing social reproduction struggles that exceeded the Japan Farmer's Union (JFU) demands for rent reductions and tenancy rights were just as important in exposing the contradictions of capital as the latter, which he lamented did not go far enough in attacking the foundations of the landlord-tenant relation. As the latter half of this chapter will demonstrate, Uno did not have to look far for examples of the kind of critique that would have exposed the centrality of extra-economic compulsion to reproducing social relations in the metropolitan countryside. People racialized as 'buraku women' in the heart of what was considered the spiritual center of the emperor-nation, the Ise region of Mie prefecture, took central roles in exposing the mystifying function that the category 'small farm household' played in naturalizing both capital and the nation in the Japanese empire as it greatly expanded its territorial scope after World War I.

UNO KŌZŌ ON JAPAN'S AGRARIAN QUESTION (NŌGYŌ MONDAI)

Uno's work on the agrarian question treated the Japanese countryside as the repository of the 'surplus population' that could serve as a lever for containing crisis. In so doing, he intervened in a debate that was being fought within Japanese Marxism in the early 1930s over whether small-scale agricultural production that was dominant in mainland Japan, even as the state became an imperialist power, played a necessary role in capital's ability to overcome its limits or if this form only remained intact because of a political compromise that capital had made with the last vestiges of the feudal regime. Uno dismissed the terms of this debate altogether. He pointed out that nowhere in Marxian theory did it say that non-capitalist relations of production had to disappear for a society to be capitalist. Rather, just two requirements had to be fulfilled. First, 'free labor' had to be created through the systematic dismantling of feudal land-ownership relations. Second, capital had to be given the room that it needed to overcome its inherent limits. These requirements had been fulfilled in the last quarter of the nineteenth century. He explained that Japan's case appeared to diverge from the English model of capitalist development because of historical specificities that were important, but not fundamentally distinct. Because the accumulation process was dominated from the outset by the joint-stock company form in the era

of finance capital, no clear-cut, centralized policy had been needed in agriculture. This meant that 'our country's agriculture was not promoted with clear development objectives in mind, and in many cases, emergency or temporary measures were implemented' (Uno, 1974a: 335). As a consequence, the peasantry continued to engage in self-sufficient petty agricultural production even after they had been given the legal freedom to move and to seek work elsewhere. Those who remained in the countryside toiling under dire conditions had to rely upon hard work and cooperation rather than any kind of coherent agricultural policy formulated by the state. Uno was critical of this condition: 'In our country, which has a lot of agriculture that uses labor-intensive methods, to leave the problem of labor organization to the encouragement of cooperative work (*kyōdō sagyō*) and the ideology of hard work must be evaluated as a fundamental deficiency of agricultural control' (1974a: 338).

The main problem with the passive and makeshift policies that the state implemented in agriculture because it was happy to treat the countryside as a repository of the industrial reserve army was that when class differentiation, the dissolution of former social relations, the fall in prices of agricultural commodities, and other outcomes of capital's penetration into the countryside and extension into the colonies did accelerate, the state had neither the incentive nor the political will to respond with aggressive developmentalist policies or, alternatively, with comprehensive remedies for the impoverished peasantry. Uno called the social relations that resulted from these conditions feudality, not as a system but as 'thought, sentiment and custom'. This had a double meaning *vis a vis* feudalism as a system: on the one hand, the resources and relations that had existed in earlier times that were crucial to the reproduction of village communities like the commons were contracted or dismantled; on the other hand, legal restrictions against movement, against changing occupations, and other measures that had been in place to systematically impede the development of the worker with nothing but their labor power to sell were no longer present.

Uno argued that this specific manifestation of feudality in Japan's countryside ensured that small producers would be forced into an eternal competition for access to more land, which they would use, not to pursue capitalist profit, but to exhaust every last bit of household labor available (Uno, 1974b: 162). This phenomenon had resulted by World War I in a growing percentage of farm households becoming part-owner cultivators (*jikosakunō*) who borrowed and owned land (or aspired to own land) in order to fully expend the labor time of their members (Uno, 1974c: 443). He explained, 'in most cases, part-owner cultivators borrow land not in order to engage in capitalist enterprise, but merely in order to supplement the lands that they already own' (1974c: 443). Their primary aspiration was to acquire more land, convert themselves into parasitic landlords, and enjoy an easy life of collecting rents (Tama, 1994). The latter tendency became pronounced after their position *vis a vis* large landowners *qua* moneylenders

weakened during the World War I boom and worsened during the postwar agricultural crisis (Young, 2013).³

For Uno and other Marxist theorists writing at the time of great transformation in the Japanese empire, the predominance of these part owner-cultivators in metropolitan agrarian villages constituted a stubborn obstacle to the emergence of revolutionary thought and action. Their drive to survive as owner-cultivators even though they had been freed from early modern restrictions against movement made it difficult for Uno and the prewar left to envision the unfolding of the material preconditions for the organic emergence of a revolutionary consciousness.⁴ Uno believed that a true resolution of the agrarian question required a transformation of subjectivities – that they rid themselves of their petit-bourgeois aspirations.⁵ The strata that exemplified the feudality of Japan's agrarian villages, the part-owner cultivator, could only become the protagonists of revolutionary transformation through their acquisition of a capitalist logic in which they too became capitalist farmers or if they shed their petty-bourgeois mentality and joined the ranks of tenant farmers. That is, as long as they remained part owner-cultivating small peasants, they would continue to kill themselves to survive, paying exorbitant rents to landlords and competing with each other for the smallest scraps of land to utilize all of their family labor. The structural conditions and extra-economic compulsions that produced the pure owner-cultivator as an aspirational figure was, in Uno's estimation, an outcome of the structural relationship between industry and agriculture in the metropole.

SUIHEISHA WOMEN'S ARTICULATION OF TRIPLE EXPLOITATION

By arguing that part-owner cultivators could technically go either way but had conservative tendencies, Uno revealed the limits of his own analysis.⁶ His conviction that part owner-cultivators were wedded to their class positionalities was an aporia in his otherwise nuanced and globally situated analysis. His pessimistic assessment of the political possibilities in the countryside was tied to his inability to link the struggles over social reproduction that he outlined in *Crisis Theory* to his writings on Japan's agrarian question. As we will see next, this shortcoming was linked to his acceptance of the farm household as a stable unit of analysis rather than a mechanism that enabled capital to overcome and efface its own limits.

If Uno had extended his analysis into the very constitution of the farm household, not as a manifestation of an already existing feudality whose meaning transformed as a result of the subsumption of the Japanese countryside to capital but as a unit that the state actively reconfigured in order to deal with crisis – a point that women's groups in the labor, peasant, anti-colonial, and Suiheisha-affiliated movements were making in their journals at precisely this moment – he would have recognized two inter-related phenomena: first, this reconfiguration

established clear boundaries between familial and non-familial members and a gendered division of labor within the family that defined some forms of labor like housework non-productive and other forms like agriculture productive for their income-bearing properties. Second, the state's reconfiguration of the farm household in the manner described above was tied to its attempt to complete its enclosure of the commons, a process that it had begun in the late 1890s but had not been able to finish due to strong resistance on the part of local communities (Federici, 2004; Mies, 1999).⁷ The renewed push for the completion of the enclosures was pursued under the misleading banner of the 'unification of village-owned lands' and was designed to place all common-use rights under the management of the administrative village and to encourage the transfer of all 'non-essential' state-owned lands into the hands of people in the village who could demonstrate 'proper lineage' and ability to manage land responsibly (Fujita, 2014). The Ministry of Agriculture and Commerce's renewed commitment to enclosure provided communities that held rights to the commons with a new opportunity to clarify who belonged and who did not. This process relied upon and intensified gendered and racialized assumptions about who could constitute a proper farm household. Marxist theoreticians including Uno writing about the agrarian question did not treat the state's intensified push to complete the enclosure of the commons and the attendant conflict over membership in the community as integral to an analysis of the agrarian question.⁸ As we will see next, aspirations for communal luxury articulated by those who were written out of the community, while not appreciated by Uno and his interlocutors who shaped Marxist critiques of Japanese capitalism during the 1920s and 1930s, exemplified the kind of imaginary that Ross' Communards proposed 50 years prior.

One group that recognized the threat that state-led reconfigurations of the farm household unit and its project to unify the commons posed to their ability to define the terms of their liberation were the Suiheisha (Levelers), a national body formed in 1922 in order to fight against racialized status-based discrimination against the 'burakumin'.⁹ More specifically, a group of people who called themselves 'buraku women' articulated their specific concerns in the Women's Column (*Fujinran*) of the Suiheisha's organ paper, the *Suihei Shimbun*, in the early 1920s. The women who contributed to the column insisted that the entire set of legal codes, accumulation strategies, belief systems, and relations that constituted the grammar of Japanese society had to become the enemy against which the Suiheisha devoted its energies. Their writings reveal their awareness of the gendered and racialized differences that were produced, then naturalized or effaced in order to come up with abstract categories like worker that then became the subject of revolutionary struggle. Even 'woman' did not escape their scrutiny.

An article that appeared in the Women's Column titled 'To My Buraku Sisters' ('Buraku no Shimai e') on July 20, 1924 introduces a story to drive home the point that the problem is not only discrimination but the fact that the alleviation

of the burdens of ‘ordinary women’ and their ability to conform to feminine ideals is directly tied to the exploitation and denigration of ‘buraku women’:

Among my acquaintances there is a bourgeois wife. She has said that though she has been troubled every year over difficulties with a maid, recently she was able to find a good one and is very happy about it. After listening carefully, I realized that she was the daughter of a ‘*tokushumin*’¹⁰ where her husband had previously been stationed as a local bureaucrat. They were so poor that they were not able to afford to raise their daughter and wanted to send her into service in order to have her learn the customs of the farm household, sewing, and manners, but in that region, there were no places that she could go because she was the daughter of a *tokushumin*. Due to these circumstances, her parents had decided to part with their precious only daughter and had sent her into service far away. They told her daughter to keep silent and asked her husband to keep her hometown a secret. (Anonymous, 1924)¹¹

Contrary to her parents’ hopes that this would be an educational experience for their daughter, her employer saw her purely as a housekeeper. Because they were ashamed of having a housekeeper from a ‘buraku’ family, they took great pains to conceal her existence. She was isolated and placed in an extremely vulnerable position within the household. The piece highlights the process through which the attainment of feminine ideals by Japanese women was realized through the hidden labor of poor women from ‘buraku’ communities whose ability to attain those ideals was always and necessarily circumscribed by their place outside of it.

The power of this and other articles that appeared in the Women’s Column of the *Suihei Shimbun* (and reprinted in local organ papers like Mie’s *Aikoku Shimbun*) was their insistence that the triple exploitation that formed the foundations of their critique of Japanese society was not resolvable by simply tacking ‘patriarchy’ or ‘capitalism’ or ‘racism’ as distinct forms of oppression. Rather, the women who wrote these articles explained that their effects took on a specific configuration *vis a vis* those marked as ‘buraku’ women as distinct from the class- and gender-based oppressions of normatively defined Japanese women. Tackling the specificity of their triple exploitation, the authors argued, was central to any liberatory project and could not be contested by a purely distributive struggle over the burdens of social reproduction or by an exclusive focus on discriminatory attitudes and utterances.¹² In short, those who contributed to the Women’s Column during the first half of the 1920s called for the destruction of the entire set of legal codes, accumulation strategies, belief systems, production relations, and intimate spaces that constituted the grammar of Japanese society (Spillers, 2003).¹³ While the Women’s Column disappeared from the pages of the *Suihei Shimbun* after 1924, the mode of critique of their writers, which emphasized the need to fight against bourgeois notions of femininity and idealized notions of the Japanese family that were proposed through a negation of their familial forms and social relationships, left an indelible mark on the *Suiheisha* as their members fought alongside members of the JFU and the labor organization the *Sōdōmei* (Kurokawa, 2016; Suzuki, 1987).

THE FORMATION OF THE ALLIANCE OF THE UNEMPLOYED IN MIE PREFECTURE

Mie prefecture is known as a place where the Suiheisha and JFU worked well together, in large part due to the leadership of Ueda Otoichi, who was also the head of the rickshaw-pullers' association in a neighborhood of Matsusaka city called Hino, which was well known as the prefecture's center of Suiheisha activism. Due to his leadership, as well as the historical specificities of Mie's political economy, the prefecture is seen as a rare example of JFU/Suiheisha cooperation to fight for the interests of 'buraku' communities in rural areas. One of the organizations that he was instrumental in forming was the prefectural branch of the Alliance of the Unemployed (*Shitsugyōsha Dōmei*, hereafter Alliance) in the summer of 1930 (Ōyama, 1977). The category of the unemployed here expressed the interconnectedness of city and country and the inability to delink class exploitation from discrimination. The demands that it, as well as its local branches, made treated social reproduction struggles as central to their liberation as agricultural workers of 'buraku' communities around the same time that Japanese Marxists debated the agrarian question. Their activism, which was driven in large part by the concerns that women raised, highlights the limits of analyses like Uno's that took the unit of the farm household as a stable category from which the agrarian question was theorized and protagonists of revolutionary struggle in the countryside identified.

Following the establishment of a prefectural branch in Matsusaka, local branches formed in areas with substantial 'buraku' populations. Its rapid spread reveals that, for many, challenges they faced in their everyday lives were most urgent and consequential, and were informed by the understanding of triple oppression articulated by women in the *Suihei Shimbun's* Women's Column several years prior. The category of the unemployed that formed the basis of their solidarity expressed their understanding of the interconnectedness of city and country and the impossibility of delinking class exploitation from anti-'buraku' discrimination, the oppression of women, and the plight of impoverished farmers. Their demands were thus wide-ranging and did not align perfectly with the struggles organized by the Sōdōmei, the JFU, their women's divisions, or the Suiheisha, which did not always link discrimination to class exploitation (Ōyama, 1977).

The pamphlets and other publications issued by the Alliance reveal that there was close communication and coordination between groups, in a similar mode to Ross' descriptions of the Communards, which focused on local autonomy but maintained an internationalist perspective. At times, they worked with local branches of farmers' unions to fight against landlords' efforts to revoke their tenancy rights; to articulate collective demands for access to public works projects; to form consumers' associations to combat high food prices and low wages outside of the formal market; to raise emergency funds to support people whose family members were arrested for participating in tenant disputes; and so on.¹⁴

They named their enemies, learned from the victories of other branches, and imparted information through the handwritten publications that they shared with each other as they attended each other's meetings and convened study groups.¹⁵ They also supported the struggles that communities waged in response to their expulsion from the commons throughout the 1920s and 1930s.

When we take activities of the Alliance seriously, we see that the very units of owner-cultivator, part owner-cultivator, and tenant farmer that Uno and the other participants in the debate on Japanese capitalism took for granted as the starting point of analysis were conceptually possible only by discounting the problem of discrimination against 'buraku' communities that made their extra-class alliances necessary in the first place. They repeatedly engaged in critiques of the prevailing attitude of officials who believed that people from 'buraku' communities were fundamentally inferior, unfit to constitute a proper family, and therefore ineligible for state supports that were indispensable for small peasant households to reproduce themselves daily and generationally. A comprehensive critique of this view can be read in an encounter between village head Suzuki and members of Toyota's 'buraku' community that is narrated in the organ paper of the Alliance, the *Shitsugyōsha Toso Nyūsu no. 2*. The occasion of this meeting was Suzuki's visit to Toyota in response to demands that its Alliance branch made for economic relief. The paper described the negotiations that members of the alliance had with Suzuki over access to unemployment relief in the form of rice rations (Mieken Kōseikai, 1974: 424). Their anger boiled over after Suzuki took just a cursory stroll around the neighborhood before reassuring them that things were not as dire as they thought. After all, he proclaimed, the community had a rope-weaving machine and was comprised of able-bodied people who were capable of working if they wished. This dismissal of their concerns incensed the youth and women's divisions of the Alliance, particularly since he reached his conclusions without ever setting foot inside of their homes. The women's division demanded that he conduct a thorough investigation before making determinations about relief.

What did their insistence that Suzuki enter their homes and examine their kitchens before making evaluations regarding their quality of life signal? Was this a test to see if he could overcome the stereotypical views that mainstream papers and state-sanctioned experts of the so-called 'buraku' problem continued to print about the supposed filth of their living conditions?¹⁶ Alternatively, were they convinced that a full understanding of their impoverishment was impossible without recognizing the intensity of the work that they performed inside of their homes as a result of being excluded from village-based communal resources and opportunities for waged work that were open to non-'buraku' farm households across land-ownership classifications? The former is certainly plausible given the long history of prejudicial narratives cloaked in social-scientific rigor and historical nuance, but we should not discount the possibility that the latter also fueled their collective ire, given that the recessionary conditions in agriculture and the contraction of the commons had especially devastating effects upon 'buraku'

women in farm households who engaged disproportionately in housework, performed home work for piece-rates whenever they had time to spare, who earned extra income by foraging in communally held mountains for leaves and twigs, and who were often sent to work outside of the village in exchange for cash advances that were paid to the head of the household or to earn remittances that the farm household desperately needed to make ends meet.

A report from the branch of the Alliance in Isedera, a village south of Toyota, reveals that the gendered impacts of the recession were well known: 'Isedera has very little in the way of arable fields and paddy land... From day to night, mothers make Ise omote [straw sandals] and cook gruel. The more Ise omote they produce, the heavier their debts become' (Mieken Kōseikai, 1974: 424). This condition, in which women of 'buraku' farm households were required to engage in endless hours of handicraft and housework despite the fact that the economic viability of this work was not guaranteed to them as direct producers, was common to other 'buraku' communities in the prefecture that formed local branches of the Alliance.

The specific demand that the women's division within the Toyota alliance made to Suzuki to set foot inside their homes was not an effort to be recognized as capable of, or in favor of, domestication. Rather, their demands were a version of the Suiheisha Women's Column's insistence that the triple nature of their oppression be the starting point for collective action. This demand was recorded by the prefecture's higher thought police as proof of their lack of assimilatory desires and rejection of existing gender norms. This made them a threat to society:

It should be noted that the buraku women's class consciousness is high. They do not have good feelings toward men who are not engaged in these class-based movement and there is a tendency to expel them. These women are at the helm of the Mie branch of the Japan MOPR (district 1) where they provide relief to the people who sacrifice themselves to the revolutionary movement and to their families. (Mieken Kōseikai, 1974: 588)

The higher police's concern about the sway that ordinary 'buraku' women held in their communities in disseminating gender ideals that pushed men toward activism against the state and capital violently expressed itself in a roundup that the Mie branch orchestrated on March 13, 1933. This counter-revolutionary measure was intended to dull the impact of the years of work that women put into creating new spaces and social relations that could withstand at times, and eventually break down, the metaphysical violence that haunted their lives by virtue of their status as 'buraku women'. This status was inextricably linked to, but could not be conflated with, the land-ownership relation of their farm household.

CONCLUSION

A brief examination of Suiheisha-affiliated struggles by a branch of the Alliance of the Unemployed that took place in Mie's agrarian villages reveals that Marxist

debates on Japanese capitalism, which did not lend a critical eye toward the category ‘small farm household’ could not incorporate the wide variety of anti-capitalist struggles that erupted during the 1920s and 1930s into its theorization of the current conjuncture. This is because their focus on determining which peasant form could be brought to the side of revolutionary action made them incapable of recognizing how the very constitution of the farm household materially and ideologically necessitated an abstraction of the category itself. In much the same way that the white, male, factory worker was conjured in dreams of a proletarian revolution as its protagonist in Euro-American contexts, the small farm household became a potential subject of revolutionary action in interwar Japan despite the fact that its constitution and reproduction required the production of gendered and racialized differences – something that ‘buraku women’ who wrote in the *Suihei Shimbun* and local activists who formed branches of the Alliance understood, wrote about, and fought against. The dismissal of these types of struggles as either precursor or ancillary to the real struggle waged by appropriately revolutionary actors reveals a shared aporia on the part of Marxist theoreticians writing about the agrarian question to the abstraction that enabled the small farm household to emerge as a unit of analysis in the first place. The erasure of their collectively articulated visions of society that threatened the state so much that it responded with swift censure and imprisonment of Alliance organizers is reinforced by acts of writing these collective struggles over social reproduction that ‘buraku’ men and women waged in the interwar period out of histories of revolutionary struggle in Japan. In so doing, they could not dismantle the myth that fundamental change from below in the metropolitan countryside was impossible, nor could they expose the fragility of the nation conception, sustained by a constantly recalibrated Japanese grammar, that required violence to keep intact.

Notes

- 1 This observation is not directly taken up disciplinarily – as historians of agrarian struggle and labor historians have worked in separate realms from economic historians.
- 2 By situating the so-called surplus population within *Crisis Theory*, Uno provides us with an opening to ask who exactly constitutes the industrial reserve army, even though he does not explore the question in depth here nor in his works on the agrarian question.
- 3 The wartime boom transformed the countryside. Some large landowners engaged in speculative activity and were able to use their freed-up capital to transform themselves into moneylenders to their village communities. This in turn led to higher levels of indebtedness amongst small farming households who had to borrow in order to make improvements or, in the case of tenant farmers, to pay the rising costs of food.
- 4 Uno argues that this attitude manifests itself in the tenant disputes. He writes, ‘so-called tenant disputes do not have an external, confrontational relationship founded on the separation of ownership and management’ (Uno, 1974d: 458).
- 5 Of course, he believed that a transformation of subjectivity required a material transformation of relations between agriculture and industry and a shift from the policies of agricultural self-sufficiency

through the creation of an autarkic regional economy (*kōiki keizai*) that capitalist countries including Japan pursued since the 1930s.

- 6 Uno's writings reveal his assumption of an unchanging essence that each category possessed since the state's enactment of private property relations in 1873 provided the formal prerequisites for the development of Japanese capitalism. Relying largely on a national census that was conducted in 1930, he examined the proportion of the working population engaged in agriculture (47.7%); the scale of ownership of arable lands (49.6 % own less than 5 *tan* of land, only 0.1% own over 50 *chō*, and 92.5% own 3 *chō* or less. Of families that own arable land, the average scale of ownership is 1 *chō* 2 *tan*); the average area of borrowed lands of farming families that also owned part of the land they cultivated; the proximity of rented lands to each other (the smaller the scale of tenancy, the more scattered the land was); the degree of self-sufficiency amongst small peasantry; levels of engagement in subsidiary industries; and so on. By analyzing the data provided by this census and additional studies from 1938 and 1941, Uno sought to clarify the key characteristics of Japanese farming households under monopoly capital.
- 7 Silvia Federici and Maria Mies provided the earliest systematic analyses of the relationship between so-called primitive accumulation, violence against women, and colonization.
- 8 This is tied to a common assumption that 'primitive accumulation' was completed by the land tax reforms of 1873 even though scholars acknowledge that the enclosure of the commons remained unfinished business until the 1930s.
- 9 See Kurokawa (2016) for why 'buraku' discrimination is understood through the framework of racism rather than caste-ism.
- 10 This was another common way to refer to 'burakumin' at the time.
- 11 Suzuki Yūko conjectures that the author of this text was Yamakawa Kikue, a prominent socialist feminist who would not have been considered a 'buraku woman'.
- 12 Like Angela Davis, they saw this to be not merely 'inter-sectional' in the way it is commonly understood, but cumulative in a manner where the sum exceeds its parts.
- 13 I use the grammar of Japanese society in reference to Hortense Spillers' text 'Mama's Baby, Papa's Maybe: An American Grammar Book'. It is thus an effort to take seriously her naming of the symbolic order that operates through the family and expresses social realities and metaphors for value that are 'so thoroughly interwoven in their literal and figurative emphases' within that society. She argues that the patriarchal family of the dominant symbolic order is pledged to maintain the superiority of race and notes that this complicated relationship between patriarchy and racism makes it extremely difficult to engage in a gender analysis because the category of woman is always already racialized.
- 14 We see landlords' names quite frequently in these pamphlets. For example, see 'Toyota son Tōsō Nyūsu (Niwanoshō branch)', March 1931. 'Mie Zennō' folder, 1931 at ōhara Shakai Mondai Kenkyūjo, Hitotsubashi University.
- 15 We see, for example, that Sata's Shitsugyōsha dōmei succeeded in obtaining 800 yen worth of construction work by mobilizing at the village assembly meeting in early 1930, and that in Matsusaka Nichōme, Higashi Kishie, and Nishi Kishie, a consumers' association (*shōhi kumiai*) was organized so that members could purchase miso, soy sauce, sugar, and sake from direct producers at approximately half the retail price. They note that they hope to open a storefront in Matsusaka in cooperation with other local branches to make things as accessible as possible for their consumers. These communications are found in the folders titled 'Mie Zennō' that are currently held at Hōsei University's ōhara Shakai Mondai Kenkyūjo, though some of them have been transcribed and republished in the *Mie Kenshi (shiryōhen, kindai)*, Tsu: Mieken, 1987 as well as the Mieken Kōseikai, *Mieken Buraku Shiryōshu (kindai hen)*, Tokyo: Sanichi Shobō, 1974.
- 16 See, for example, a work written by Tanaka Ichirō and reprinted in the Shihō Shiryō 4 of February 1933 titled 'Mie Kannai ni Okeru Suiheisha no Kenkyū'. This is an extensive report on the conditions of 'buraku' communities in the prefecture beginning with population growth figures, wealth and hygiene conditions, occupational roles, descriptions of character mediated by history, and concrete living conditions, all of which ended with the conclusion that, whatever the past, they unfortunately continue to

be wretched and cursed people who, despite being granted their freedom from 'outcaste' designation in 1871, will continue for some time to suffer the depths of despair. There are two sections of the text that are especially relevant to the argument I am advancing here. First, they are barred from entry into the kind of domesticity – the normative Japanese family – that was in the process of creation at exactly this moment elsewhere. Relatedly, the notion that the further beyond the surface one goes – that is, beyond the storefronts of butchers, leather workers, and sellers of specialty goods that might be visible to people who walk around their neighborhoods – through the alleyways and into their living spaces, we find conditions that are unfit for human life. Rather, they live in dwellings that are barely fit for barn animals and livestock. There, they work in the intense heat, often naked, covered in fine scraps of straw that are left over from their sandal-making process, and only slurp gruel as their meager forms of sustenance. The implication here is that they do not live in homes, and there are no kitchens worth even observing. These wretched conditions and behaviors would be bad enough if they were self-contained in those alleys, but unfortunately, they go off to other regions like Nagoya to become prostitutes, polluting these spaces and male bodies in the process. This is what the alliance members were facing when they demanded that Suzuki enter their kitchens. Reprinted in *Mie Kenshi (shiryōhen, kindai)*, 532.

Prostitution and Sex Work

Katie Cruz and Kate Hardy

INTRODUCTION

‘Prostitution’ and ‘sex work’ have come in and out of view within Marxist and Marxian thought over the last two centuries. Marx and Engels’ views are well-known: Marx saw prostitution only as ‘a particular expression of the universal prostitution of the worker’ (Marx, 1932 [1959]: 98) and both understood prostitution and marriage to be just two specific forms (public and private) of the same gendered system upon which capitalism relied. As such, the two authors agreed, both the family and prostitution would wither away in the transition to communism.

In this chapter, we focus on three periods of significant social and economic upheaval in the twentieth and twenty-first centuries that produced theoretical and political perspectives on prostitution and sex work, bringing together, for the first time, an overview of key Marxist feminist thought on this topic. We have selected texts by socialist or Marxist feminists, and thinkers whose thought has clearly been influenced by Marxism. These bodies of thought are historicised by focusing on the early twentieth century, the late 1970s through to the mid 1980s, and contemporary debates. In the first part, we focus on early-twentieth-century writers Alexandra Kollontai and Emma Goldman. We then chart two ‘strands’ of feminism that theorised prostitution and pornography in relation to women’s un/paid (sexual) work during the Women’s Liberation Movement. Finally, we

focus on contemporary Marxist feminist theories that have emerged against the backdrop of Right-leaning governments in recent years. We have identified a number of shared beliefs that have been shaped by the conditions and moments from which they emerged. First, Marxist feminists historicise prostitution and sex work as a product of the social relations of capitalism as it interacts with other social relations and processes, including gender, 'race', sexuality, and the state and law. Second, they emphasise sex workers' agency as workers and as political actors, who act individually and collectively in conditions of constraint. Third, they understand the state and the law as a site of class struggle.

EARLY-TWENTIETH-CENTURY THOUGHT: ALEXANDRA KOLLONTAI AND EMMA GOLDMAN

In the early part of the twentieth century, women who were revolutionary Marxists developed some of the first conceptualisations of prostitution. Drawing from Marx and Engels, anarchist Emma Goldman and Alexandra Kollontai (a member of the early Bolshevik Soviet government) began a process of de-exceptionalising prostitution, conceptualising it as a social issue that connects to wage labour, marriage, and bourgeois sexuality.

Departing from nineteenth-century Victorian orthodoxy, both Goldman (1910) and Kollontai (1921) saw prostitution as a 'social' issue rather than a pathological behaviour. They pointed to the inferior economic position of women and their dependence on the male wage, marriage, and the family, and the fact that prostitutes were drawn from the working- and servant classes. Likewise, Goldman (1910) and Kollontai (1921) saw women's material dependence on men as key to the production of prostitution and marriage in capitalism. Goldman saw the difference between marriage and prostitution as 'merely a question of degree whether she sells herself to one man, in or out of marriage, or to many men' (1910: 230). Citing progressive intellectual Havelock Ellis, Goldman argued that the wife, compared with the prostitute, is the 'true scab', since 'she is paid less, gives much more in return for labour and care, and is absolutely bound to her master' (1910: 241).

Goldman (1910) and Kollontai (1921) compared prostitution to other types of work, including service jobs, recognising that the 'industrial system' (Goldman, 1910) and 'low paid work' (Kollontai, 1921) forced women into prostitution. Capitalist exploitation, Goldman argued, drives women to prostitution to avoid working 'for a few shillings a week in a scullery, eighteen hours a day' (1910: 230). Moreover, Goldman criticised the hypocrisy of condemning systems of labour exploitation in prostitution ('pimping' within the 'cadet system') while leaving aside those which operated in the respectable or formal capitalist economy, asking: 'Why is the cadet system more criminal, or a greater menace to society, than the owners of department stores and factories, who grow fat on the sweat of their victims?' (1910: 248)

Goldman and Kollontai pointed to the hypocrisy of bourgeois sexual mores. This related both to the sanctioning of sexual economic exchange in marriage and its condemnation through prostitution, and also to differing sexual standards between men and women. As Goldman infamously put it, 'to the moralist, prostitution does not consist so much in the fact that the woman sells her body, but that she sells it out of wedlock' (1910: 238). Kollontai concurred with such a critique and went further, arguing that authentic human sexual relationships were undermined whenever '*material bargaining between the sexes is involved, only when worldly calculations are a substitute for mutual attraction*' (1921 [1977]: 271). She continued, 'where passion and attraction begin, prostitution ends. Under communism, prostitution and the contemporary family will disappear. Healthy, joyful and free relationships between the sexes will develop' (1921 [1977]: 271).

Neither Kollontai (1921) nor Goldman (1910) were positive about the role that prostitution played in society, noting that it was as an 'evil' in capitalist society and in the context of the transition to communism in socialist Russia. Prostitution had a deleterious impact on equality between the sexes, sapping life out of both sexes and reducing women to the position of an object (Goldman, 1910). Moreover, Kollontai refers to the 'violence' inherent in prostitution, stating that 'prostitution is terrible because it is an act of violence by the woman upon herself in the name of material gain' (1921 [1977]: 275). Since marriage, the 'inevitable shadow' of prostitution, was also based on the material dependence of women on men, Kollontai (1921 [1977]: 275) saw the abolition of the system of prostitution/marriage as bound up together, the withering away of which formed the basis of her vision of liberated sexuality in future communist society.

In the context of the transition to socialism in Russia, where prostitution persisted due to housing conditions, loneliness, and low wages for women, Kollontai (1921) was critical of prostitution for three reasons. First, it undermined comradeship and solidarity and the class character of the new society. Second, it had a negative impact on the sexual health of the population through the spread of venereal disease. Third and importantly for later debates relating to value theory, Kollontai conceptualised prostitution as 'unproductive labour' (1921 [1977]: 266). Placing prostitution alongside 'speculators, traders and hoarders who live off unearned income' (1921 [1977]: 266), she theorised prostitution as a similar form of 'labour desertion' which diverted energy away from the 'work collective' (a group of workers working together in any one workplace) and the project of building communism. The 'unproductive labour' of the prostitute was theorised as 'a person whose energy is not used for the collective; a person who lives off others, by taking from the rations of others'

We know that we can only overcome chaos and improve industry if we harness the efforts and energies of the workers and if we organise the available labour power of both men and women in the most rational way. Down with the unproductive labour of housework and child-minding! Make way for work that is organised and productive and serves the work collective! (Kollontai, 1921 [1977]: 266)

It is unclear how Kollontai would envisage the organisation of child-minding or childcare, which is necessary in any society. She reinforces this position, however, by condemning not only the prostitute, but also ‘the legal wife who stays at home, she does no useful work for the society’ (1921 [1977]: 267). If prostitution is unproductive, it detracts from the struggle for communism and poses a threat to solidarity amongst workers. In making these arguments, Kollontai’s thought hinted to debates about the nature of value within prostitution that were to follow amongst the Italian autonomist feminists. This cohort of feminists, as we will see in the next part, theorised all un/paid sexual labour as productive.

Both writers were pessimistic about the potential for law to positively address the harms they identify in prostitution and in this way prefigured arguments for decriminalisation. Goldman (1910: 249) (as might be imagined for a self-identified anarchist) referred to the ‘utter futility of legislative methods’ in addressing prostitution and both recognised that ‘in bourgeois capitalist society all attempts at fighting prostitution were a useless waste of energy’ due to private property and women’s dependence on men. Goldman (1910) pointed to the role of legislation against prostitution as placing women ‘absolutely at the mercy of every policeman and miserable detective on the beat’ and the implications of the criminal suppression of indoor prostitution and police persecution in leading to increased control by third parties of prostitutes’ labour.

In the transition to socialism and the Soviets’ attempts to eradicate prostitution, Kollontai similarly rejected criminal and repressive measures to combat the ‘evil’. Arguing that, while material bargaining between the sexes should be abolished (from both marriage and prostitution or any other form), a law against this would be unworkable and would involve sending both the prostitute and the housewife to forced labour camps. Kollontai further raised the issues of using criminal law to curtail the purchase of sex, but posed the important question: ‘How is a client to be defined? Is he someone who buys a woman’s favours? In that case the husbands of many legal wives will be guilty’ (1921 [1977]: 272). In relation to third parties, the Interdepartmental Commission which considered which measures should be taken against prostitution opted to draw up legislative proposals to prosecute any third-party involvement in prostitution, i.e. those who ‘in any way make a business out of prostitution’.

The question of the nature of prostitutes’ labour and whether it created value, the relationship between sexual liberation and prostitution, and the classed pool of labour from which prostitutes were drawn were all themes that were developed, extended, and contested as they resurfaced in the Women’s Movement in the 1970s–1980s.

PROSTITUTION AND PORNOGRAPHY: THE WOMEN’S MOVEMENT, 1970s–1980s

‘Second-wave’ Italian autonomist and British and US socialist feminism in the late 1970s, through the early to mid 1980s, was marked by debates about capitalism

from a feminist standpoint (Dalla Costa and James, 1975; Federici, 1975, 2004, 2020; McIntosh, 1978; Willis, 1979; Walkowitz, 1980a, 1980b, 2016, 2017; McLeod, 1982; James, 1983; Federici and Fortunati, 1984; Mies, 1986; Segal, 1987, 1989, 1993; Dalla Costa, 1988; Fortunati, 1995). One way feminists did this was by placing women's *unwaged* reproductive work in the home in conversation with Marxist political economy. What has come to be known as the 'Domestic Labour Debates' focused on the relationship between unpaid work done by women in the home (mainly domestic labour or housework) and its relationship to capitalism. Feminists did this by expanding the category of work or labour and insisting unwaged reproductive work made productive work possible and was part and parcel of the capitalist mode of production (Weeks, 2011: 24). The focus on unwaged household work included cooking, cleaning, and child-rearing, and did not tend to expand to unwaged sex in the home, let alone waged or paid sex. In contrast, two 'strands' of feminist theory from the Women's Movement were integrating sex within a broader analysis of the unpaid sphere of the home and the paid sphere of the market: Italian autonomist feminism and British and US socialist feminism.

First, we discuss how both strands of feminism understood sex as part of the 'socially reproductive' work that has been performed by women in class-structured societies, in the home, on the street, and in the brothel. Italian autonomist feminists unpacked the history of women's unpaid work, including sexual work, and its connection to their paid labour. To this British and US socialist feminism added rich, historical, and empirical accounts of women's paid sexual labour from the Victorian period into the 1970s and 1980s.

Second, we outline how, when it came to paid sexual labour, autonomist feminism and socialist feminism agreed that the legal regulation of prostitution was the ideological repression and disciplining of female sexuality in line with the productive and reproductive needs of capitalism, and was part of the emergent public health concern with the dangerous and deviant sexual and social lives of the 'unrespectable poor'. While both strands of feminism viewed un/paid sexual labourers as workers, and advocated for decriminalisation, they did not engage in an extensive discussion about employment and labour rights. Rather, recognition and payment of women's un/paid (sexual) work was discussed via the 'Wages for Housework' campaign.

Third, we end this part with the important debate between socialist feminists and radical feminists about sexuality and its relationship to pornography. Socialist feminists rejected radical feminists' core belief that sexism and sexual practices could be explained by a trans-historical desire for male sexual domination of women, instead insisting that sex and sexuality should be understood in relation to women's un/paid work within capitalist societies, and dialectically, as both oppressive *and* pleasurable. While work, gender, and sexuality were key themes during this period, the role of 'race' in mediating un/paid sexual work was not as consistently theorised. Feminists discussed in this part were, however, involved in anti-racist writing and activism during the Women's Movement and beyond.

The Social Factory and Sexual Work

In Italy, during the 1970s, autonomist feminists began to challenge Marxist orthodoxy that the home was merely a site of the production and consumption of use values. The Italian autonomist school (or *Operaismo*) had been inspired by Mario Tronti's (1966) 'Copernican Revolution', in which he turned traditional Marxist theory on its head by subordinating capital-centric analyses to working-class struggle and privileging labour as the agent of social change. Autonomists extended the category of the working class to include *unwaged* workers and labour located outside the formal workplace. The concept of the 'social factory' captures the idea that 'the whole of society lives as a function of the factory' and that the factory (or, capitalist relations of exploitation) had extended its domination to the whole of society (Tronti, 1966). In *The Power of Women and the Subversion of the Community* Dalla Costa and James (1975) used the 'social factory' to refer to the unpaid socially reproductive work – within and beyond the household, stretching to 'the community' – that is the foundation of the reproduction of capitalism.

Dalla Costa and James, along with Mies (1986) and Federici (1975), all included women's *unpaid* sexual work within their definition of unpaid socially reproductive work. Italian autonomist feminists were unorthodox because they viewed socially reproductive labour – including unpaid sexual work – as *integral* to the capitalist mode of production. Women's unpaid labour was seen as the foundation of surplus-value production, but the exploitative and alienating nature of this work was mystified as a 'labour of love' (Dalla Costa and James, 1975; Federici, 1975; Dalla Costa, 1988). It was, however, only Leopoldina Fortunati (1995) that attempted to apply Marx's labour theory of value to housework, including unpaid sexual work, arguing that they were *directly* productive of value itself. Federici hoped that calling unpaid sexual work essential labour and work would demystify and deromanticise it, 'so that eventually we might rediscover what is love and create what will be our sexuality which we have never known' (1975: 20).

Capitalism's dependence on women's unpaid work, including their sexual work, was historicised by Federici and Fortunati (1984) and Federici (2004) in *Caliban and the Witch: Women, the Body, and Primitive Accumulation*. Drawing on and extending Marx's theory of primitive accumulation, Federici argued that it was a bloody struggle over control of the means of production *and reproduction*. Women workers, like men, were divorced from the land and forced to rely on wage labour to survive, but women were also divorced from their previous labours, ways of living, and forms of knowledge and forced *into the home* to raise and nourish a family of current and future workers.

After this, the creeping ideological devaluation of unpaid work done by women in the home from the sixteenth century onwards in Europe affected their standing as workers compelled to sell their labour on the market. In the sixteenth and seventeenth centuries, proletarian women continued to enter the workplace

en masse, but they were restricted to paid work coded as ‘women’s work’, such as domestic work and wet nursing, which was paid at a lower rate. The outcome for women was ‘a condition of chronic poverty, economic dependence, and invisibility as workers’ (Federici, 2004: 75). Federici (2004: 77, 94) argued that against this backdrop of women’s social and economic degradation and increased ‘double’ dependence on men and employers, there was a ‘massification of prostitution’ across Europe.

Federici focused on how paid and unpaid sexual work were reconfigured over the course of the nineteenth century as the needs of capital changed. In the early nineteenth century, women entered factories alongside men, albeit at a lower wage, and continued to participate in prostitution. In the second half of the century ‘the capitalist class ... crafted a new reproduction strategy’, reorganising both work and the family in order to produce a new form of healthier, stronger workforce. This new strategy involved

increasing the male wage, returning proletarian women to the home and, at the same time, increasing the intensity of factory work, which the better-reproduced waged worker would now be capable to perform. (Federici, 2020: 90)

The gender division of labour that had been maturing since the sixteenth century deepened and ossified, generalising the bourgeois Victorian family and the norm of the full-time housewife to working-class women. Women were encouraged to live a life of familial devotion, sexual virtue, maternal love, and self-sacrifice. Federici argued that it is against this backdrop that the late-nineteenth-century organisation of paid sexual work must be understood. Both work and sexual pleasure were ideologically domesticated for women, making paid sexual work – a combination of money and sex outside the home – a double threat. But bourgeois family ideals did not neatly match onto the material reality for women, as Kollontai and Goldman had also pointed out. Economic dependence on men, invisibility as workers, and the devaluation of their labour meant that prostitution continued to be a readily available and relatively well-paid way for women to earn an income.

It should by now be clear that autonomist feminists viewed prostitution – paid sexual work – as *work* and investigated its connection to unpaid sexual work in the home. This perspective had a huge impact on the English Collective of Prostitutes (ECP) (established 1975) and their first spokesperson Selma James. In ‘*Hookers in the House of Lords*’ James argued that ‘women who *work* for the sex industry are *workers*. They have those jobs for the same reasons that other workers have their jobs: to earn a living’ (1983: 111). Women engage in prostitution, James wrote, because it affords ‘higher wages than women are supposed to have, for work they are meant to do for free’ (1983: 112).

Since their inception, the ECP has protested the policing of prostitution. In 1982, the ECP occupied a church in Kings Cross, London, in protest against the growing ‘police illegality and racism’ against sex workers, many of whom were

Black. Women in prostitution, James (1983) wrote, are criminalised for being poor and for trying to earn a wage to look after themselves and their families. Federici (2004, 2020) had earlier traced the criminalisation of, and severe punishment of, women working in prostitution from the sixteenth to the nineteenth centuries. During much of the 1980s the ECP ran the ‘Campaign Against Kerb Crawling Legislation’, which they lost, and in 1985 a kerb-crawling offence was introduced as part of the Sexual Offences Act. The ECP consistently demanded decriminalisation of the laws that criminalised worker and client solicitation for sex and keeping a brothel, so that women could work together without third-party involvement.

Autonomist feminists and socialist feminists agreed that un/paid (sexual) labour was work. But there was less consensus about a campaign that, at least at one level, sought compensation for that work. Wages for Housework was a demand for wages for unpaid (sexual) labour, understood as the precondition for all other productive activity in capitalist societies. Feminists sought payment for this work not as recognition of its dignity and value, but as the first step towards rejecting it (Dalla Costa and James, 1975; Federici, 1975). Whether this demand was a concrete policy proposal or a political perspective and slogan for the movement is an open question (Weeks, 2011). The important point, however, is that the ECP and James campaigned for Wages for Housework alongside ‘Black Women for Wages for Housework’, and saw it as an important way, alongside the provision of nurseries, housing, and education, to further women’s control over their sexual labour, whether paid or unpaid.

Prostitution as Sexual Labour and Survival

Autonomist feminists had in common with socialist feminists a focus on the history of women’s un/paid sexual labour, and were similarly influenced by the housework debates. These debates led Judith Walkowitz ‘to contextualize sex work along the continuum of intimate, emotional labor and sexual and reproductive work performed by women in the household’ (2017: 184). Walkowitz agreed with Italian autonomist feminists that this ‘labor became stigmatized as low status bodily performance when commodified outside the home’. Socialist feminism sets itself apart from the autonomist tradition (with the exception of Federici’s work), however, by virtue of its rich historical and empirical excavation of paid sexual labour. Walkowitz’s social history of prostitution in Victorian England depicted prostitutes

as important historical actors, as women who made their own history, albeit under very restrictive conditions. They were not rootless social outcasts but poor working women trying to survive in towns that offered them few employment opportunities and that were hostile to young women living alone. (Walkowitz, 1980b: 9)

Prostitution was ‘an alternative to proletarianization’ and Walkowitz emphasised the structural influences that shaped women’s entry into prostitution as

working-class women, poor, from unskilled families, or orphans 'operating within the narrow constraints imposed on them by a class-stratified and patriarchal society' (1980b: 31). Women were not free from male domination and violence any more than they were free from the necessity to earn a wage and the effect of sexual and moral norms about proper female conduct. Despite this, Walkowitz warned against reductive interpretations of prostitution as 'an arena of male supremacy, where women were bartered and sold as commodities' (1980b: 31), and emphasised how women controlled the trade, set prices, and individually and collectively defended each other (see also Stansell, 1987).

Socialist feminists considered how the state and legal system structured and defined paid sexual labour. Walkowitz's (1980a) meticulous research into the Contagious Diseases Acts (CDAs) documented that policing of 'common prostitutes' embodied a sexual and familial ideology that limited female sexuality to procreation and at the same time sanctioned male 'vice'. Walkowitz gave additional substance to Federici's (2004, 2020) argument that nineteenth-century prostitution legislation related to an emergent state and industrial concern with the reproduction of a healthier, more disciplined workforce. As Walkowitz put it, the CDAs were part of increasing bourgeois, medico-legal interventions into the health of working-class women and men and 'became openly linked to a tradition of repressive social legislation that tried to enforce a social discipline on the unrespectable poor' (1980b: 78).

Mid-Victorian feminists' disgust at male vice spearheaded a campaign for the repeal of the CDAs. The CDAs, feminists argued, embodied a sexual double standard and treated women in prostitution unfairly. When the CDAs were successfully repealed in 1886, feminists turned their attention to the 'traffic in women' and child prostitution (of which there was scant evidence). Walkowitz argued that middle-class feminists were genuinely appalled at the double standard, but they were also deeply ambivalent about working-class women's use of their sexuality in prostitution. In their campaign against the traffic in women, feminists made alliances with reactionary and religious groups, and portrayed young women in prostitution 'as sexually innocent and passive victims of individual evil men' (1980a: 127). In doing so, they were 'able to assuage middle-class guilt without implicating members of their own class in the sexual oppression of working-class women and girls' (1980a: 127). In failing to see that working-class women were not sexually passive, but were actively negotiating the use of their sexuality in a context of paltry alternatives, Victorian feminists avoided looking at the degradation and exploitation of the working class, nor did they interrogate their desire for working-class women to conform to their own, classed normative view of childhood and proper female sexual conduct.

Socialist-feminist studies of prostitution in late 1970s and 1980s Tory Britain observed strikingly similar dynamics in the lives of working women. Eileen McLeod's (1982) action research project involved interviews with working women and their male clients, facilitated by her activism with the campaign

Programme for Reform of the Law on Soliciting (PROS). PROS was made up of women working in prostitution alongside radical legal and social welfare professionals. The women she interviewed in her 1982 study saw prostitution as a job and sold sex because of unemployment, because it paid far better than other low- or unskilled jobs, and because it fitted around the family and childcare commitments. They sold sex to men they described as 'ordinary'. Men, sometimes but not always violent or abusive, bought sex because they could in a male-dominated society and because it allowed them a 'welcoming break from the conventional sex role of the dominant male' (McLeod, 1982: 69). Echoing the theorists of the early part of the century, McLeod (1982) therefore insisted that prostitution be viewed socially and was critical of the biological and essentialist 'ideology of male sexual need' (see also McIntosh, 1978).

In the late 1970s and early 1980s, PROS, like the ECP, campaigned for the reform of laws relating to prostitution. PROS objected to the sanctions and language used in the Sexual Offences Act 1959, which included imprisonment for soliciting and loitering as a 'common prostitute'. Referring to the social and economic conditions documented in her own empirical research, McLeod argued that prostitution will not 'fade away until they change' and that the historical record indicated 'that at most prostitution can be driven underground and that the determination of its scale is beyond the reach of the law' (1982: 272). McLeod was an early academic advocate for decriminalisation, which, she argued, would make space for the organisation of women in prostitution as *workers*.

There was, then, in the 1980s already a shared consensus amongst autonomist and socialist feminists that un/paid sexual labour was work, that women in prostitution were active agents choosing the best way to earn an income in conditions not of their own choosing, and that prostitution needed to be fully decriminalised and women working in prostitution included as part of the working class. This perspective was, however, not fully shared by their radical feminist sisters.

Prostitution and Pornography: Sexual Domination, Sexual Pleasure

Radical feminists were at the forefront of theorising and challenging prostitution and pornography in the 1970s and 1980s. Carole Pateman and Catharine MacKinnon both engaged with and modified Marxism and class analysis in order to understand women's oppression. For both MacKinnon and Pateman, the sale of sex was the reproduction of male sexual domination at both the level of individual women and women as a class, enabling unfettered access to, and unilateral use of, women's bodies (Pateman, 1988; MacKinnon, 1989). MacKinnon (1989, 1993) viewed the sale of sex as 'forced sex' and commodification of the mind, body, and person of the woman without temporal limit, thus making it sexual slavery. For Pateman (1988), the exchange *is* a contract, but it is a contract that is necessarily embedded in, and reproduced, male sexual domination.

Pateman (1988) recognised that all workers must commodify their labour power under capitalism, but singled out prostitution on the basis that clients demand access to particular bodies and robots cannot replace prostitutes. These nuances aside, MacKinnon and Pateman agreed that prostitution and pornography reproduced the (male) master/(female) slave relation at the interpersonal and symbolic level. As such, women cannot engage in a struggle over *the terms* of the sale of sex with men, and prostitution and pornography are harmful practices to women as a whole.

In the 1970s and 1980s radical feminists and their socialist-feminist sisters debated the regulation of pornography and shared a number of concerns and political practices. All viewed prostitution and pornography as shaped by misogyny and sexism that pervades 'public' and 'private' spheres of life, all agreed that women enter prostitution and pornography in a context of poor or less desirable alternatives, and all rejected the sexual double standard and its legitimation through the regulation of prostitution and pornography. This political perspective was achieved through the common method of consciousness raising. There were also disagreements about female sexuality, commercial sex, and the role of the state and law.

In MacKinnon's words, pornography 'is a form of forced sex ... which [with prostitution] institutionalizes the sexuality of male supremacy' (1989: 197). Socialist feminists agreed that representations of male sexual domination are often deeply reactionary, and could not be isolated from the broader ideological context of patriarchal and racial capitalism. At the same time, socialist feminists argued that domination–submission did not exhaust the representation of sex and sexuality in pornography; representation (fantasy) and reality (in-person sexual relations) do not neatly match up. Socialist feminists insisted, then, that there was a tenuous link between pornography consumption and male sexual violence. Sexuality was a site of both danger *and* pleasure and socialist feminists drew attention to how women's relationship to their own sexuality, and to men, had changed over time. They understood women who performed in pornography much like they viewed women in prostitution, as economically exploited *workers* who negotiated the use of their sexuality at work (Willis, 1979; Walkowitz, 1980b, 2016; Segal, 1987, 1989, 1993).

Socialist feminists, however, rejected radical feminists' attempt to use US civil-rights law as the necessary means for challenging pornography. Dworkin and MacKinnon (1988) argued that the criminal law was insufficient to deal with the harms of pornography, and so crafted a law that would treat it as a practice of sex discrimination that should not be protected by the First Amendment. Socialist feminists disagreed for at least three reasons. First, this legal strategy would miss their target (male violence). Sexism and misogyny pervade society and all institutions and cannot be restricted to overt sexual practices like pornography and prostitution. Second, it would reinforce the binary between 'good' women who do not work in, consume, or feel harmed by pornography, and 'bad' women who

do. Third, the socialist feminists pointed to the history of exemptions from First Amendment protection on the basis of obscenity. What is obscene cannot be covered as free speech and, as Willis (1979) pointed out, what is obscene in law has been what is 'sexually dissident'. Socialist feminists therefore worried that what would be constructed as 'sex discrimination' and not protected as free speech would be women's and non-heteronormative forms of sexual expression.

In summary, Marxist and socialist feminists insisted on historicising paid sexual labour. It can be a job, a contractual exchange, and is connected to other types of female paid labour, and women's unpaid (sexual) labour in the home. They viewed women's participation in prostitution and pornography dialectically, as a *choice* because it afforded better working conditions, and a *constraint* because of the structural necessity to earn a wage, the devaluation of women's labour and resulting low wages, and their economic dependence on men. Similarly, they viewed women's sexuality dialectically, as a *choice* to negotiate its use to access some measure of economic and sexual independence, and a *constraint* because of the structural devaluation of women's sexual labour and the double sexual standards to which women were subjected. As such, autonomist and socialist feminists believed that these contradictions needed to be discussed and debated, and that it would take radical change to material and cultural conditions and ideologies across both 'private' and 'public' spheres of life before women would rethink their participation in prostitution and pornography.

Marxist feminists were doing some important work in the intervening years, but the terrain of the debate had shifted, at least in the British and US academy. As we discuss below, during the 1990s and early 2000s, the dominant framing of debates in feminist theory about prostitution and sex work was an increasingly divided and binary debate between radical feminism (structure) versus sex-positivist or liberal feminism (agency).

SEX WORK IS WORK: CONTEMPORARY DEBATES

In 1987 Carol Leigh coined the term 'sex work' to emphasise that sexual labour is something that people 'do', rather than a fundamental status or feature of their identity. 'Sex work' subsequently became the accepted term for referring to the work of 'prostitution' and other forms of sexual labour amongst sex-positive feminists, liberal feminists, and Marxist feminists alike. Sex-positive feminists, like Leigh, viewed the repression of sex workers as a result of sexual deviancy from moral sexual codes, but also argued that sex work could be potentially liberating and a space to explore workers' own sexuality (Rubin, 1984; Guillaumin, 1995; Pheterson, 1996). Accounts emphasising choice, consent, and autonomy amongst sex workers in selling sexual services were, in the 1990s and early 2000s, the dominant discourse alongside radical feminism (Barry, 1995; Jeffreys, 2008).

Contemporaneously with these debates, Julia O'Connell Davidson's Marxist analysis of prostitution insisted (somewhat unfashionably) that it was labour power that is sold in the prostitution contract. In other words, she argued *against* the liberal fiction of 'property in the person' and *for* the Marxist position that 'since property in the persona cannot be separated from the person, the wage labour contract actually involves a transfer of powers of command over the person' (2002:85). For O'Connell Davidson (1998, 2002), then, what is exchanged in the prostitution contract is cash for the client's power over the prostitute in order to meet his (socially constructed) desires. However, *both* the employment contract and the prostitution contract require the sale of embodied labour power and for the seller to surrender aspects of their will.

This contribution has frequently been co-opted (and misunderstood) by radical feminists as proof that prostitution involves a unique transfer of power to the client, or disregarded in favour of a liberal conceptualisation of sex work as the sale of detachable sexual services. O'Connell Davidson is more sympathetic to Pateman's argument (above) that all labour power is exploited and alienated under capitalism, but disagreed that prostitution is worse than other forms of wage labour because it is the specific body of the sex workers to which access is granted. O'Connell Davidson (1998, 2002) argued, *contra* Pateman, that all labour power is embodied, particularly types of work where the service *is* the product, making prostitution no exception. As we discuss below, O'Connell Davidson credited Pateman with the novel insight that the prostitution contract is *gendered*, and has explored how both *gender* and '*race*' structure and are produced in the exchange for the sex workers' embodied labour power. O'Connell Davidson's Marxist, gendered, and racialised critique of the prostitution contract, and her insistence on taking prostitution seriously as a form of labour, has set the tone for much of the recent Marxist feminist research discussed in this part. Overall, contemporary research and activism has been marked by attempts, on the one hand, to de-exceptionalise sex work, and on the other, to centre sex work within more traditional disciplinary debates and topics, namely employment relations, labour law, and unionisation (O'Connell Davidson, 1998; Hardy, 2010, 2013; Cruz, 2013, 2018, 2020; Hardy and Sanders, 2015; Berg, 2016; Barbagallo and Cruz, forthcoming).

De-Exceptionalising Sex Work

Marxist feminist research has continued to de-exceptionalise sex work and locates it firmly within work and employment studies (Hardy, 2010, 2013; Hardy and Sanders, 2015) and labour law (Cruz, 2013, 2018, 2020). By way of her nuanced critique of Pateman, O'Connell Davidson (1998, 2014) posited that prostitution has much continuity with other forms of embodied and emotional labour, and paved the way for a wealth of work on the labour processes of sex work. Hardy (2013), extending previous contributions made by Judith

Walkowitz (1980a, 1980b) and inspired by Carol Wolkowitz (2006), has troubled the idea that sex work is simply an expression of a more universal position of the worker by theorising the particular (aesthetic, emotional, affective) embodiment in sex work.

The economic exploitation and alienation that occurs in the sexual labour process has also been an important theme. First, Hardy and Cruz (2018) point out that sex work often takes place outside of standard employment relations, usually as independent and informal work (see also O'Connell Davidson, 1998; Cruz, 2013; Cruz et al., 2019). There are, however, conditions in which relations of dependence and economic exploitation do exist, such as brothel-based prostitution (Cruz, 2018), strip clubs (Barbagallo and Cruz, forthcoming), and the production of porn by workers for a production company. Berg argues that in such conditions, 'workers are savvy about making porn work' for the production company, but that 'when they succeed at this it is in spite of management's efforts to extract as much as they can for as little as possible' (2016: 162).

Second, research has focused on how workers seek greater control and reduce their exploitation by third parties. For example, porn workers 'describe their pursuit of alternative income streams as a way to command greater control – and ownership – over scenes and other products' (Berg, 2016: 182). Historical and contemporary research indicates that sex workers prefer the autonomy and freedom of working alone than for a third party. Whereas a third party offers protection at a large financial cost, working alone offers freedom but often at a cost to workers' safety (Cruz et al., 2019). Third, authors have sought to develop their understanding of economic exploitation and relations of dependency within sex work, across a wide range of sex work settings, from lap dancing clubs in the UK (Cruz et al., 2016; Barbagallo and Cruz, forthcoming) and pornography in the USA (Berg, 2016) to tourism settings, including Jamaica (Cruz et al., 2019).

Fourth, O'Connell Davidson argues that the product sold in prostitution cannot be separated from the personality and emotions of the worker. Drawing on Hochschild and others, she insists that this does not distinguish prostitution from other forms of emotional, post-industrial service jobs, such as airline hostesses, domestic workers, and nursery workers. However, the fact that the product being sold in these forms of work is wrapped up with the personality and emotions of the worker comes at a human cost. All workers are, under capitalism, alienated from their 'true' self, the product they make, and from society, but sex work *and* other forms of emotional, service-based work are particularly alienating because what is produced involves more of the self than, for example, the production of goods in a factory (Hochschild, 1983; O'Connell Davidson, 2002, 2014; Cruz, 2020; see Holmstrom, 2014 for the Marxist feminist view that sex work is *more* alienating than other forms of emotional service-based work).

In addition to this expanded focus on paid sex as a form of employment, contemporary feminists continue to research the paid and unpaid socially reproductive labour of sex workers. Reminiscent of the autonomist feminist focus on

un/paid sexual work, they locate the paid work of 'sex work' on a continuum of paid to unpaid socially reproductive work. For example, Hardy (2016) has documented how Argentinian sex workers' paid and unpaid reproductive labour (in sex work, the home, and within their own movements) provides subsidies to both the state and capital (see also O'Connell Davidson, 1998; Merteuil, 2015).

UnFreedom, 'Trafficking', and the Law

'Race' has increasingly been recognised as structuring the sale of sexual labour power (O'Connell Davidson, 1998, 2014, 2015; Hardy, 2016; Cruz, 2018, 2020; Cruz et al., 2019). Berg (2014a: 163) has pointed out how race and gender structure access to, and rewards in, porn work. O'Connell Davidson (2014) has explored how clients and third parties in sex work want particularly gendered and racialised bodies, but is careful to point out that this does not distinguish sex work from other labour markets. As Cruz (2018: 65) has pointed out, all labour power, including sexual labour power, is gendered, racialised, and shaped by the law. For example, then, racial 'othering' operates through UK immigration law and popular media discourses to help secure migrant sex workers' precarious position vis a vis clients and bosses (Cruz, 2018). Indeed, the racialisation of sex work is a theme that has been picked up and developed more significantly in the contemporary period, often through the lens of migration and sex tourism, including female sex tourism (O'Connell Davidson, 1996; Sanchez-Taylor, 2006; Cruz et al., 2019).

In the early 2000s, a renewed interest in the 'traffic in women', now called 'sex trafficking', became the dominant societal framing of sex work, migration, and consent. This was reflected in policy and legislative changes in countries as disparate as the Republic of Ireland, Argentina, Jamaica, the USA, Sweden, and the UK, who all sought, in varying ways, to further criminalise the purchase of sex, from women choosing to sell sex (the Swedish Model) through to women forced or 'trafficked' into sexual exploitation (e.g. the UK). This occurred, in part, as a result of the institutionalisation of liberal and radical feminism. Much like their Victorian feminist sisters, the anxieties of liberal and radical middle-class feminists have been projected onto the figure of the 'trafficking victim' as the exemplar of patriarchal subjugation. This has exceptionalised all sex workers as victims of individual 'bad men' rather than active agents contesting exploitative and oppressive social and legal relations, including immigration law. Liberal and radical feminists have framed UK anti-trafficking laws as protective of 'sexually exploited' women and as 'worker protective'. However, Cruz (2018, 2020) has argued that UK anti-trafficking laws intersect with immigration law to increase the 'labour unfreedom' of sex workers, particularly migrants.

Marxist feminists have turned their attention to the assumptions about consent, freedom, and slavery contained in contemporary feminist panic about trafficking for sexual exploitation in order to provide more nuanced accounts

of the sale of sexual labour power under capitalism. Once again, this is a critique of *both* the radical feminist insistence that prostitution is sexual slavery and trafficking, *and* the liberal feminist position that distinguishes trafficking from ‘freely chosen’ sex work. Drawing from Marxist feminist literature that rejects the force/choice binary (O’Connell Davidson, 2009, 2010, 2015; Strauss, 2012), Cruz places the most extreme forms of labour exploitation in the sex industry (such as confinement and physical and sexual violence) on a *continuum of ‘unfreedom’*

At one end, ‘freedom’ signifies the relative ability to control one’s labour in favourable working and living conditions... At the opposite end, unfreedom signifies the inability to control one’s labour in favourable working and living conditions. (Cruz, 2018: 67)

This analysis suggests that ‘unfree labour practices are *not* limited to the most extreme forms’ (Cruz, 2018: 66) and that all sex workers are living and working in differing degrees of unfreedom. Freedom in this approach, then, must be understood in the context of capitalist social relations in which workers are never fully in control of our labour – our ‘living sensuous activity’ (Marx and Engels, 1968). Importantly, this Marxist feminist approach insists that the continuum of labour unfreedom is ‘constituted by, and constitutive of, broader macro forces and relations’ (Cruz, 2018: 72), namely the structural compulsion to exploit and alienate gendered and racialised labour power in order to turn a profit.

In order to increase the *relative* freedom of sex workers under capitalism, contemporary Marxist feminist writers have rejected legal approaches to trafficking because these tend to increase the social and legal vulnerability of (migrant) sex workers, including to criminalisation and even deportation (O’Connell Davidson, 2015; Cruz, 2018). More broadly, and in line with the rejection of criminal law as a method for addressing prostitution by Goldman, Kollontai, and Women’s Liberation thinkers, there is now a firm consensus that decriminalisation is the most appropriate legal framework for prostitution. Furthermore, there is an emerging consensus that the ‘disavowal of sex work as a form of legitimate work’ (Hardy and Cruz, 2018: 4) leaves sex workers outside of the protection of labour law, and has consequences for the ability of sex workers to collectively defend their interests and claim resources from the state (Hardy, 2010, 2016; Cruz, 2013, 2018, 2020; Barbagallo and Cruz, forthcoming).

While support for decriminalisation is also the position of liberal feminists, what has been notable within Marxist feminist work is an insistence that is a necessary but insufficient condition for improving sex workers’ lives, and must therefore be accompanied by ‘the extension of labour law protections’ (Cruz, 2020: 192). Sex workers themselves have added to these demands the redistribution of resources via the state (Hardy, 2016). Cruz (2013) has continued the conversation about Wages for Housework and discussed whether a basic income could function as a useful political demand and concrete policy proposal for the sex workers’ rights movement. Importantly, these authors have, like the feminists

discussed earlier, located sex work within a broader critique of the organisation of our labour power under capitalist social relations (Berg, 2014b; O'Connell Davidson, 2014; Weeks, 2011; Cruz, 2020).

Workers, Organisers, and Political Actors

In order to achieve decriminalisation and social justice, it is necessary that sex workers are understood as workers and active political agents. As early as 1845, Marx and Engels (1975) had attested to the prostitute being able to 'vindicate her rights and put up a fight'. In contrast to Kollontai – who saw no place for sex workers as comrades in struggle or in the transition to communism – autonomist, socialist, and Marxist feminists have insisted that sex workers are part of the working class and historical actors exercising agency and resistance within constraints (Walkowitz, 1980b, 2016; Hardy, 2010; Hardy and Cruz, 2018).

A key focus of Marxist feminists has been the political and class consciousness amongst sex workers across the world (Hardy, 2010; Hardy and Rivers-Moore, 2018; Cruz et al., 2019; Barbagallo and Cruz, forthcoming). This included the radical resistance by sex workers embodying a working-class identity from Argentina in 1922, where sex workers chased soldiers out from their brothel who were crushing a workers' rebellion (Hardy, 2010), to the turn of twentieth-century France, when a group of young women arrested for prostitution and vagrancy were transferred from jail to jail in an attempt to crush their collective harmonising of *The Internationale*. Goldman Kollontai referred somewhat approvingly to the self-organisation of prostitutes in the Middle Ages, who organised strikes through their guild 'as a medium of improving their condition and keeping a standard price' (1917 [1969]:184). What is novel, however, are more formal attempts to institutionalise sex workers' struggle into unions, which Hardy (2010) has noted as a 'third wave' of sex worker organising. The growth of sex worker unionisation and institutionalisation in the UK, India, Guatemala, and Colombia is testament to the radical potential of sex workers as political agents and working-class organisers (Ghosh, 2004; Hardy and Rivers-Moore, 2018; Barbagallo and Cruz, forthcoming).

In parallel to its demarginalisation within traditional (and masculinised) academic disciplines such as industrial relations and law, sex workers have also found a more hospitable home within more mainstream feminist activism. Walkowitz argued that 'prostitution remained an issue very low on the agenda of women's liberation' (2016: 190) during the 1970s. In contrast, today, prostitution and sex work are high up the feminist agenda, alongside issues such as gender identity and trans rights. Young feminists increasingly have a material understanding of inequality and gender, and thus recognise the commonality of interests and the necessity of a unitary struggle with their sex worker sisters. While remaining somewhat contested, Marxist-inspired feminists of today have (Olufemi, 2020) pushed sex workers' rights high up the feminist agenda, advocating for working

with and supporting sex workers to improve conditions in their sector. The diversification, destigmatisation, and expansion of the sex industry has led to an emerging degree of acceptance. It is also possible that the material conditions of austerity and mainstreaming of 'gig work' have helped people recognise why people do sex work. The reasons are remarkably constant and simple: we must work to survive within gendered and racialised capitalism and prostitution and sex work is often the best choice from a bad bunch of options.

CONCLUSION

Reading Marxist feminist accounts of prostitution and sex work across the three epochs has revealed a number of core themes. First is an insistence on *historicising prostitution and sex work as a product of the social relations of capitalism as it interacts with other social relations and processes, including gender, 'race', sexuality, and the state and law*. From the early twentieth century onwards, authors have emphasised that women's engagement in prostitution, and other forms of sex work, needs to be understood in the context of their un/paid sexual labour as it is organised under capitalism. Theorists from the Women's Liberation Movement in the 1970s and contemporary Marxist feminists insist that prostitution and sex work cannot be explained by a universal and unchanging male demand for female sexual domination. Sexuality is relevant to the exchange but, as socialist feminists in the 1970s were at pains to point out in the context of pornography, it does not essentially involve, nor depict, sexual domination. Sexuality must, they argued, be approached as it interacts with capitalism, and as a site of both danger *and* pleasure. The interaction between 'race' and capitalism has received increasing attention within contemporary work, often through the lens of 'trafficking', migration, and sex tourism. Future lines of inquiry for Marxist feminist research and activism include the relationship between disability and sex work.

Second, they emphasise sex workers' agency as workers and as political actors, who act individually and collectively in conditions of constraint. Diverging from Kollontai's early pessimism, Marxist feminists from the 1970s onwards have positioned sex workers as social actors with agency as workers and political capacity. Marxist feminists of the Women's Liberation Movement emphasised the dialectics of constraint and choice in shaping women's decisions about selling their labour power in the sex industry. Contemporary theorists have placed more emphasis on sex workers' role as social and political actors, collectively transforming their own working conditions, participating in attempts to transform the social relations of capitalism, and engaging with unions, the state, and the law.

Third, these feminists have *viewed the state and the law as a site of class struggle*. Marxist feminists have been unanimous in their support for decriminalisation, which is now attached to the demand for labour rights and more specific

social and economic reforms are being discussed, including basic income and the redistribution of wealth. Accessing labour and social welfare protections is necessary because it will improve sex workers' lives and labour conditions in the here and now. Marxist feminists are at the forefront of exploring the possibilities of labour law for sex workers, while also paying attention to its limitations. Marxist feminists and activists recognise that true freedom entails moving beyond labour–capital relations, where labour includes all of the un/paid (sexual) labour necessary for capital accumulation. If class struggle is, as we believe, the motor of history, the inclusion of sex workers as part of working-class struggle for freedom is essential. Like AMMAR, the sex workers' union of Argentina, we dream

[t]hat one day there are no more women that exercise this work for necessity. However, as we are not owners of the truth we leave open the discussion as to whether, in the future that we dream of, there will be women that all the same want to do this work. (Hardy, 2010)

Work

Jamie Woodcock

INTRODUCTION

Work is the activity that most of us will spend the majority of our time doing. It shapes how we interact with the world and each other, and structures our relationship to resources, money, and capital. Work is a particularly important concept for Marxists, as ‘every form of society has been based ... on the antagonism of oppressing and oppressed classes’, and the ‘condition for capital is wage-labour’ (Marx and Engels, 2016 [1848]: 19). Work therefore provides the antagonism upon which capitalism develops. In the process, work formed a ‘class of labourers, who live only so long as they find work, and who find work only so long as their labour increases capital’ (Marx and Engels, 2016 [1848]: 14). Before moving on to discuss the different ways in which Marxists have analysed work, it is an important reminder that ‘the first premise of all human existence and, therefore, of all history, [is that humans] must be in a position to live in order to be able to “make history”’ (Marx and Engels, 1970 [1845]: 48). The basic needs of people, along with the not-so-basic, must be met before anything else is possible. Therefore, Marx and Engels continued to argue that ‘the first historical act is thus the production of the means to satisfy these needs, the production of material life itself’. No matter how complex society becomes or how unassailable capitalism may appear, the meeting of these needs ‘today, as thousands of years ago, must daily and hourly be fulfilled merely in order to sustain human life’.

Work is clearly important for understanding the contradiction between labour and capital that drives and shapes the economy, society, and politics. However, work itself is not a static phenomenon, changing with the ‘constant revolutionising of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation’ that capitalism creates (Marx and Engels, 2016 [1848]: 11). Therefore, research on work is not a finished topic and is an area that Marxist theory needs to continue to focus on, drawing out both continuity and change, tracing the historical development, along with possible future directions. This is not simply for the sake of knowledge, but because workers hold the potential to be agents of revolutionary change, tying the question of knowledge creation here with organisation.

In this chapter, the topic of work will be taken up in relation to Marxist thought. The first part will examine the conceptual difference between labour and work, explaining why this chapter focuses on work and what is meant by this emphasis. The next part moves to discuss the labour process at work, introducing labour process theory and conflict at work, tracing this back to the fundamental problem of management: the indeterminacy of labour. The chapter then summarises the changes in contemporary work, indicating key areas in which new theory is being developed, including in relation to new kinds of labour. The chapter then moves to introduce the approach of workers’ inquiry to research and organisation at work, particularly drawing attention to the concept of class composition. The final part of the chapter discusses alternatives to work, focusing on anti-work politics. This conclusion ties the theorisations of these chapters to the revolutionary project of Marxism: an alternative society without work.

LABOUR AND WORK

Before getting into the discussion of work, it is first necessary to make a distinction between labour and work, two similar terms that nevertheless hold an important difference. In German, both work and labour can be translated into *arbeit*, while in English the two terms are different. The etymological roots of the terms in English are for work, ‘*wyrcan*’ meaning creating and ‘*wircan*’, to affect something, whereas for labour, it is ‘*laborem*’ meaning ‘toil, hardship, and pain’. However, language is subject to change, so unlike Fuchs’ (2016: 29) definition that builds on these roots, this chapter takes a different approach. For Marx, labour ‘is, in the first place, a process in which both man and Nature participate, and in which man of his own accord starts, regulates, and controls the material re-actions between himself and Nature’ (1990 [1867]: 283).

The definition of labour taken here is of that process of interaction between humans and their environment, which takes many different forms. The analysis of labour is a starting point for understanding how society is made and constantly remade. It is also important to highlight the dialectical character of this

relationship, that ‘by thus acting on the external world and changing it’, people ‘at the same time change’ their ‘own nature’ (Marx, 1990 [1867]: 283). This interaction with nature (in the broadest sense) is captured by the term ‘labour process’ when labour:

[e]ffects an alteration, designed from the commencement, in the material worked upon. The process disappears in the product, the latter is a use-value, Nature’s material adapted by a change of form to the wants of man. Labour has incorporated itself with its subject: the former is materialised, the latter transformed. (Marx, 1990 [1867]: 287)

When this is combined with social relationships involving other people, this cumulative experience and practice allows intensive specialisation. The tools and technologies involved are an important part of this process, as rarely do people directly interact with nature in an unmediated way. Moving from the basic practices of collecting food and building shelter, through which an imagined Robinson Crusoe-type figure could meet their basic needs on their own, today it is possible to find people with such specialised knowledge like designing and flying of planes, yet despite these lofty heights, would be entirely stranded if left on their own.

This capacity of labour, the ability to change nature in order to produce use-values, is the foundation upon which capitalism is based. As Hannah Arendt has argued, ‘labor is the activity which corresponds to the biological process of the human body ... the human condition of labor is life itself’ (1998:7). Whereas, ‘work is the activity which corresponds to the unnaturalness of human existence’. Today work is required to meet the basic needs of everyone in society, along with creating a vast range of commodities. No matter how complex the operation of the plane, the pilot, engineers, technicians, cabin crew, air traffic control staff, and so on all require food, clothing, and shelter to undertake their tasks. The key to understanding this is the process by which capitalists purchase labour power (the capacity of people to labour) and transform it into work. Rather than people having the freedom to choose how to labour, which tools to use, or what to make, capitalism is based upon the private ownership of the means of production, the tools and machinery put to work with human labour. As Marx (1990 [1867]: 272) jokingly remarks, workers are ‘free in a double sense’ under capitalism: free in the sense that they can choose who to sell their labour power to, but also freed from any other way to meet their needs than by selling their labour. It is in this transaction – between the worker selling labour power and the capitalist purchasing it – that labour is transformed into work.

At first glance, the sale and purchase of labour power appears as a straightforward transaction, like exchanging money for a commodity – buying a cup of coffee for a set price, for example. However, unlike buying other commodities, the purchase of labour power entails buying a potential. As Marx (1990 [1867]: 291) explains, there are two important features of this process. First, the worker (the seller of labour power) ‘works under the control of the capitalist to whom his labour belongs; the capitalist taking good care that the work is done in a proper

manner'. Second, that the results of the labour process: 'the product' is 'the property of the capitalist and not that of the labourer, its immediate producer'. In the transaction, the capitalist (the purchaser of the labour power) has bought a commodity, along with the right to use it for the period of time paid for. As Marx explains: 'by the purchase of labour-power, the capitalist incorporates labour, as a living agent of fermentation, into the lifeless constituents of the product' (1990 [1867]: 291). The purchase of labour power, and then the directing of it, transforms labour into work. Work, rather than retaining its etymological roots, becomes a negative term, imbued with the understanding of exploitation. For example, *work* is the activity dreaded at the end of the weekend, knowing that labour power has been purchased by someone else, whereas labour captures the other activities that people engage in – both while at work and more generally. This is also why work is central to understanding of class (Toscano and Woodcock, 2015).

LABOUR PROCESS THEORY

Marx's insight about the labour process provides an important starting point for exploring and critiquing work under capitalism. The labour process itself involves three aspects: first, the 'purposeful activity, that is the work itself' that is being completed; second, 'the subject of that work' and the materials being worked upon; and third, 'the instruments involved', from the basic tools to the most advanced technologies (Marx, 1990 [1867]: 284). Focusing on these different aspects provides a way to analyse work, moving from that simple transaction between the worker and capitalist, metaphorically following the worker 'into the hidden abode of production', as it is here that Marx argues 'the secret of profit-making must at last be laid bare' (1990 [1867]: 280). The important point to note here is that unlike other commodities, what is being purchased with labour power is a potential, something that can only be realised once it is put to work in the process of production. Therefore, once a capitalist has bought labour power, the problem of extracting the maximum use from it begins. As Richard Edwards has argued, this means that in the workplace:

[c]onflict exists because the interests of worker and those of employers collide ... control is rendered problematic because unlike the other commodities involved in production, labor power is always embodied in people, who have their own interests and needs and who retain their power to resist being treated like a commodity. (Edwards, 1979: 12)

This feature of work, the difference between the potential of labour power and what capitalists are actually able to extract from labour, has been termed the 'indeterminacy' of the labour process (Edwards, 1979: 15). This indeterminacy is the root of the fundamental problem of management at work, something which remains an intractable problem for capital today.

The questions that this poses for work have been extensively researched in labour process theory. Arguably, the most important book in this area is Harry Braverman's (1999) *Labor and Monopoly Capitalism*. The book traces the development of management initiatives and how they have shaped work. This focus on work is positioned as an updating and refreshing of Marxist theory that considers the transformations of mass production:

The extraordinary fact is that Marxists have added little to his body of work in this respect. Neither the changes in productive processes throughout this century of capitalism and monopoly capitalism, nor the changes in the occupational structure of the working population have been subjected to any comprehensive Marxist analysis since Marx's death. (Braverman, 1999: 7)

As Littler (1982) has argued, 'Braverman's major contribution was to smash through the academic barriers and offer the potential for the birth of a new, integrated approach to the study and history of work'. The book involves a thorough-going critique of management, particularly that of Taylor's (1967) 'scientific theory of management'. Taylor, as Braverman (1999: 63) explains, took 'the step, extraordinary for anyone of his class, of starting a craft apprenticeship in a firm whose owners were social acquaintances of his parents'. He spent time working on the machine lathes and other machinery, taking on the task he saw for management 'of gathering together all of the traditional knowledge which in the past has been possessed by the workmen and then of classifying, tabulating, and reducing this knowledge to rules, laws, and formulae' (Taylor, 1967: 36). The intention behind this was to understand what Taylor believed to be a continuing feature of work, what he called 'soldiering', the deliberate slowing down of work, or the problem of the indeterminacy of labour power. Thus, the scientific theory of management was an attempt to overcome this in the workplace.

Taylorism – the school of management thought that Taylor gave rise to – is often typified in the image of the white-coated technician, ready with a stopwatch to precisely time workers. In Braverman's critique, he argues that behind this image 'lies a theory which is nothing less than the explicit verbalization of the capitalist mode of production' (1999: 60). The core components of this can be broken down into three parts: first, 'the gathering and development of knowledge of the labour process', something that Taylor attempted by working on the factory floor at first, but could also come from supervisors and technicians; second, 'the concentration of this knowledge as the exclusive province of management'; and third, the 'use of this monopoly over knowledge to control each step of the labor process and its mode of execution' (Braverman, 1999: 82). After going through this process of knowledge theft, mental labour is separated from manual labour and 'is then itself subdivided rigorously according to the same rule'. The purpose of this division is 'to cheapen the worker by decreasing his training and enlarging his output' (Braverman, 1999: 79, 81). Thus, Braverman's key argument is that there is a tendency for work under capitalism to become degraded.

This degrading, analogous to Marx's notion of alienation, is a continuous process led by management. However, the role of resistance and workers' struggles are mainly absent from the book.

Following on from this, labour process theory focuses on control at work. This entails examining how effective management of the labour process is attempted through three component parts that form the 'system of control', or 'the social relations of production within the firm'. The first is 'direction', setting out how tasks will be completed by workers; the second is 'evaluation', assessing how workers are conducting tasks and supervising their performance; and the third is 'discipline', devising methods to 'elicit cooperation and enforce compliance with the capitalist's direction of the labour process' (Edwards, 1979: 18). These theoretical developments stem mainly from the analysis of manufacturing and assembly line work. For Thompson, 'complications arise when attempts are made to specify how control is acquired and maintained' (1989:123). He cites Friedman's definition of control, that the term could be used in 'an absolute sense, to identify those "in control", and in a relative sense, to signify the degree of power people have to direct work' (1977:45). This dynamic understanding of workplace struggle became a hallmark of labour process analysis, captured in Goodrich's (1975) concept of the 'frontier of control' in the workplace, for example. This focus on control shaped the formation of industrial relations as an academic field of study (Hyman, 1975), insisting on a conflict model of relationships at work.

THE CHANGING NATURE OF WORK

The labour process theory perspective has been broadened out in various ways to consider how management operates. For example, Burawoy (1979) puts forward an argument about the importance of 'consent' and how it is 'manufactured' at work, and noted that in the process 'we were active accomplices in our own exploitation' (Burawoy, 1985: 10). However, the most significant area of debate has been on resistance and of technology at work. Returning to Marx's threefold understanding of the labour process, the 'instruments', or technologies, are important to consider in the analysis of work. Technology is applied to the labour process in order to achieve two objectives for capital: in the longer run, technology increases what Marx called 'relative surplus value', or the reduction in labour-time needed to produce the equivalent of the wage. In the short run, it also allows capital to increase 'absolute surplus value', or the lengthening of productive time (Marx, 1990 [1867]: 643).

This understanding of technology at work is useful, particularly for understanding how technological change is used to increase profits for capital, but it also misses another aspect. Marx signals this, when he suggests that 'it would be possible to write a whole history of the inventions made since 1830 for the sole purpose of providing capital with weapons against working-class revolt' (1990 [1867]: 563).

Braverman points out the ways in which efficiency is programmed into technology, as from the moment 'the process takes shape in the minds of engineers, the labor configuration to operate it takes shape simultaneously in the minds of its designers, and in part shapes the design itself' (1999: 137). However, Burawoy argues that in Braverman's work it is not only a question of increasing surplus value, but there is also 'another view, based on the Babbage principle, according to which control is inseparable from the pursuit of efficiency' (1985: 47). Therefore, technology also offers another way to address the problem of the indeterminacy of labour power: 'machinery offers to management the opportunity to do by wholly mechanical means that which it had previously attempted to do by organizational and disciplinary means' (Braverman, 1999: 134).

These questions have been taken up in detail through the example of call centres, leading to some important debates. In particular, the existence of technologies of surveillance and control – for example, recording all phone calls and timing activities to the second – sparked a debate between labour process theorists and analysis inspired by Foucault (1991). For example, Fernie and Metcalf (1997: 3) have argued that these methods represent an 'electronic panopticon', drawing on Foucault's (1991) discussion of the architectural model of the surveillance prison. The debate centred on the role of control and resistance, which from the labour process theory side involved an argument that 'the factory and the office are neither prison nor asylum, their social architectures never those of the total institution' (McKinlay and Taylor, 1998: 175). Moreover, at the time, Taylor and Bain argued that the Foucauldian approach could 'disavow the possibilities for collective organisation and resistance' (1999: 103). However, since the 1990s, the kinds of technologies tested and developed in call centres have become much more widespread in workplaces more generally, with electronic monitoring and control now relatively commonplace. In this new light, it is possible to synthesise the strengths of both sides of these older debates (Woodcock, 2017).

The dynamic nature of capitalism leads to a constantly changing nature of work. The older debates give a sense of a continuing conversation on how work is organised, and this continues today. However, there is a risk of becoming caught between debates that 'nothing has really changed' – simply asserting that Marxism still understands work – and that 'everything has changed' – and that Marxism can no longer comprehend the new realities of work. In part this kind of debate has been encouraged by the defensiveness of some Marxists going through a period of academic hostility from postmodern theorists (cf. Anderson, 1998), and various calls that the working class no longer exists, or is no longer important (Gorz, 1987). Echoes of this can still be found in contemporary debates about precarity – the rise of insecure employment – and the proposed creation of a 'precariat' (Standing, 2011) and the critiques that claim precariousness is not a widespread issue (Doogan, 2009).

A more sober Marxist analysis does need to come to terms with changes in work and the workplace. The contemporary landscape of work has undoubtedly

changed (Woodcock, 2018c), much like in the previous waves a transformation that capitalism has wrought. The shifting global labour arbitrage – the way in which labour is divided and distributed across the world – is perhaps the most important to examine today. The key dynamics that this has introduced are deindustrialisation in the global north, with an increase in manufacturing in the global south, with logistics operations on a transnational basis becoming more important for capital. This change in work is drawing new layers of people into workplaces, for example huge numbers of people moving from the countryside in China and into factories. It is also creating new forms of work in countries that are deindustrialising. Attempts to understand this have introduced a range of competing and overlapping terms, including ‘immaterial labour’ (Lazzarato, 1996), ‘emotional labour’ (Hochschild, 2012), ‘affective labour’ (Hardt and Negri, 2000), ‘free labour’ (Terranova, 2004), and ‘cognitive labour’ (Boutang, 2011). Similarly, the rise of digital work platforms and the gig economy is reshaping precarious work (Graham and Woodcock, 2018). There is significant crossover between many of these, but for the purposes of understanding the dynamics of contemporary work – much of which has been subjected to digitalisation – digital technology is having an increasing effect on work. This may involve new methods of surveillance or practices of ‘gamification’ in the workplace (Woodcock and Johnson, 2018).

The challenge here is identifying exactly what is meant by digital labour in work. The confusion in part stems from the nature of digitalisation. The ubiquitous rise of computers has a twofold impact on labour: first, new labour processes are created that depend mainly on the use of computers, while the second involves the application or integration of computers to pre-existing labour processes in new ways. It would be very difficult to identify a form of work (although there are examples of labour processes that do not directly involve computers) that has not been influenced by digitalisation. Despite the use of new technology, workers find ways to resist and organise. New forms of resistance emerge on the call centre floor (Woodcock, 2017), with precarious workers teaching and cleaning universities (Woodcock, 2014a, 2018a), and in the technology (Woodcock, 2018b) and videogames industry (Woodcock, 2016). A key reason for this is that the labour process remains a point of contestation. New technology may aid management in the attempt to control workers, but the contradiction between labour and capital remains unresolved. Whether this is workers finding ways to refuse work on the call centre floor or digital works developing new tools for organising, work still remains a site of conflict.

WORKERS' INQUIRY

These previous debates provide a theoretical grounding for understanding the changes in work, but the actual voices of workers can be somewhat absent from the analysis. While work may seem to be an important focus for Marxists, given

Marx's interest in workers, it has received comparatively less attention than one might expect, as noted earlier by Braverman. One explanation for this is the emphasis in Marx's (1990 [1867]) *Capital*. It takes until Chapter 10 – the chapter on the working day – for Marx, as David Harvey writes, to 'finally, after 344 pages ... get to the idea of class struggle' (2010: 137). In this chapter, Marx (1990 [1867]: 397) draws on evidence from factory inspectors to details of the exploitation of factory workers and the process by which the working day is extended. However, despite this illuminating chapter, *Capital* is mainly about capital, rather than investigating work. If a Marxist analysis proceeds from readings of *Capital*, it is necessary to note what Lebowitz (2009: 314) has called the 'silences of Capital' about workers. This is not to critique *Capital*, but rather that the development of subsequent theory – particularly about work – needs to take this into account. In a sense, Marx (1880) himself signalled one direction to this in his proposed workers' inquiry. This large questionnaire was intended to be circulated to workers, so they could participate in a process of constructing knowledge about their conditions – and hopefully into communication with Marx too. Unfortunately, there is no record of whether this had any success. However, this idea from Marx that these kinds of surveys could be used by those who 'must wish for an exact and positive knowledge of the conditions in which the working class – the class to whom the future belongs – works and moves' (1880: 379), provides an important starting point for a radical and critical analysis of work (Woodcock, 2014b). As Haider and Mohandesi (2013) have argued, Marx's proposed survey 'established a fundamental epistemological challenge', but did not clarify the 'relationship between the workers' knowledge of their exploitation, and the scientific analysis of the "laws of motion" of capitalist society' found in *Capital*.

The first group to take up this kind of new investigation of work was the Johnson-Forest Tendency in the USA. The group engaged in a project of refreshing Marx's analysis in relation to mass production in the USA. This 'grew out of studies and contacts with factory workers' that 'was the hallmark of the political tendency' (Cleaver, 1979: 62). This perspective can be seen clearly in *The American Worker*, a pamphlet co-written between two members of the group, one of whom worked in a car factory. It is introduced as 'a social document describing in essence the real existence of the hundreds of millions who constitute the basis of our society'. In rich detail, it provides an account of work from the perspective of the worker, followed up with critical analysis. The pamphlet, like the further inquiries, *Indignant Heart* (Denby, 1989) and *A Women's Place* (Brant and Santori, 1953), were intended as political interventions. The methodological approach they articulated was an attempt to follow in the footsteps of Marx by focusing on 'the actual life of workers' while 'never' losing 'sight of the revolution which would transform labor into human activity' (Stone, 1947: 32). In practice, this meant using the 'full fountain pen' approach, in which 'members of the group interview workers and then allowing these workers to edit their

comments for publication' (Worcester, 1995: 125). Similar attempts to understand work were undertaken by *Socialisme ou Barbarie*, following the reprinting of *The American Worker* in the first issue of the journal (Romano, 1949). This included attempts at inquiries in factories (Carrier, 1949; Vivier, 1952) and an insurance company (Mothé, 1954).

This approach of studying work with workers themselves was then taken up by the Italian *Operaismo*, or Workerists. The most famous example is the inquiry at the FIAT car factory in Turin, which was an investigation into worker subjectivity. It was not limited to developing an understanding of work, but rather took up Marx's challenge of the workers' inquiry, seeking to use it as an organising tool. In this sense, it is possible to consider two kinds of inquiry: 'from above', using more traditional methods and starting from outside, or 'from below', involving a co-research process that breaks down the division between subject and researcher (Rieser, 2001: 4). The impetus for this kind of project is to try to make sense of what happens to the worker, selling their labour power in order to survive. Through the experience of work, workers are changed, and 'have to put their head together ... as a class' in response to the demands of capital. This entails what Tronti (1966: 202) argues is 'a political leap', and 'it is the leap that the passage through production provokes in what we can call the composition of the working class or even the composition of the class of workers' (quoted in Haider and Mohandesi, 2013). Workers' inquiry is therefore not limited to an academic method, but became a central part of a political project – to understand work, and through that capitalism, in order to change it.

Class composition, a concept signalled in Tronti's quote, provides a powerful framework for analysing work. It takes a perspective of, as Tronti argues, starting 'from the beginning – and the beginning is working-class struggle' (1971: 89). This strongly emphasises the role of struggle, understood through the two part understanding of class composition. The first aspect is the technical composition, which involves the 'analysis of the labour process, of the technology, not in sociological terms but rather as sanctions of the relations of force between classes' (Matheron, 1999). This can be approached in a similar way to the labour process theory analysis discussed before, albeit imbued with a partisan understanding of struggle at work, something which should be expected when taking a Marxist starting point. It therefore involves focusing on the workplace and interrogating the details of work, how it is organised, and the use of different management techniques. As Matheron (1999) points out, if trying to 'understand what "class struggle" means: there has never been more Marxist "evidence"'. The second aspect is the political composition, as Cleaver has indicated, while capital seeks to 'incorporate the working class within itself as simply labour power', the 'working class affirms itself as an independent class-for-itself only through struggles which rupture capital's self reproduction' (Cleaver, 1979: 66). Thus, the political aspect is constituted as workers are 'continually immersed in the process of political recomposition' (Matheron, 1999), with different forms and relations

of struggles that emerge. The two are related and connected in various ways, but the latter is not determined directly by the former. This two part concept provides a framework for inquiring into work, drawing attention to the actual activities of workers in, and beyond, the workplaces as a site of struggle. Examples of contemporary projects situated within this framework can be found with *Notes from Below*¹ and *Viewpoint Magazine*.²

ALTERNATIVES TO WORK

To return to the definition discussed at the beginning of the chapter, it would not make sense to talk of an anti-labour politics (otherwise how would our needs be met?), yet an anti-work politics is something that could resonate with people ‘doubly free’ to work under conditions they cannot choose. However, as Weeks notes, there is a ‘sometimes explicit, sometimes tacit pro-work (2011: 152)’ position that can be found in some traditions of Marxist thought. In particular, Taylor situates this within what he calls ‘Soviet-style Marxism’ that ‘foreclosed any critique of work’ (2014: 7). The other Marxist traditions discussed in this chapter, for example those involved in workers’ inquiry, involved projects ‘within and against an intellectual and institutional context in which Marxism was effectively redefined as a theory of distribution’ (Taylor, 2014: 7), distortions that came from Stalinism, and so-called state socialism. An example of this different perspective can be found in Paul Lafargue’s (1883) *The Right to Be Lazy*, in which he argues:

[t]he proletariat, the great class embracing all the producers of civilized nations, the class which in freeing itself will free humanity from servile toil and will make of the human animal a free being, – the proletariat, betraying its instincts, despising its historic mission, has let itself be perverted by the dogma of work. Rude and terrible has been its punishment. All its individual and social woes are born of its passion for work. (Lafargue, 1883)

The possibilities of non-work, of others pursuing other activities of labour (or even leisure!) has, as Taylor argues, a ‘precedent in Karl Marx’s own writing’ (2014: 1), particularly in *Grundrisse* (Marx, 1993 [1939]). The refusal of work, discussed by Marx in the context of freed slaves in the Caribbean, shows an alternative perspective and a critique of work.

This anti-work politics is closely tied to Marx’s original project: the revolutionary overthrow of capitalism and the building of communism. The refusal of work forms a crucial component of how that alternative can be conceived, with radical democracy running throughout society, particularly centred on work. If capitalism rests on the basis of exploitation at work, now complicated over global supply chains and highly specialised tasks, then work remains a key battleground. Marxists should therefore be concerned with how work is conducted, organised, and struggled against. However, as Marx and Engels previously argued,

‘the Communists everywhere support every revolutionary movement against the existing social and political order of things’ (2016 [1848]: 39). The formal workplace is not the only place in which exploitation is organised today, neither is it the only institution through which power is exerted. Unpaid work, particularly relating to social reproduction, is another key site of struggle – as are a range of other struggles against oppression, both within work and more broadly. However, as this chapter is focused on work, it necessarily emphasises the importance of struggles *at work*. This chapter should, of course, be read alongside the others in this volume that cover these areas. The corrective to a lack of focus on work in Marxist thought is not giving it primacy over all others.

What this chapter has aimed to do is provide ideas and conceptual tools to critically analyse work, along with stressing a partisan approach and tying this to struggles for change. Research can play an important role here, particularly if tied into an organisational project through the workers’ inquiry approach. A critical Marxist tradition can be refreshed and updated through the ‘examination of workers’ actual struggles: their content, how they have developed, and where they are headed’ (Clever, 1979: 58). This begins with the micro-practices of resistance found in all workplaces, from arguments over the length of breaks to finding ways to avoid aspects of work, and up to open struggles in the form of strikes, demonstrations, and the seizure of workplaces. The key here is searching for ways to connect this resistance and struggles to new forms of organisation, something that the conceptual framework of class composition can support. Through these struggles an embryo of an alternative is formed, as we are reminded by Marx (1875) is that ‘the emancipation of the working class must be the act of the workers themselves.’ This is the basis of an alternative future:

In a higher phase of communist society, after the enslaving subordination of the individual to the division of labor, and therewith also the antithesis between mental and physical labor, has vanished; after labor has become not only a means of life but life’s prime want; after the productive forces have also increased with the all-around development of the individual, and all the springs of co-operative wealth flow more abundantly – only then can the narrow horizon of bourgeois right be crossed in its entirety and society inscribe on its banners: From each according to his ability, to each according to his needs! (Marx, 1875)

Domestic Labour and the Production of Labour-Power¹

Rohini Hensman

INTRODUCTION

At the heart of the class struggle under capitalism is the fact that, for capital, labour-power (the capacity to labour) is merely an element of production and source of profit, whereas, for workers, it is inseparable from themselves as living human beings. Struggles over wages, the duration and conditions of wage-work and control over it have been recognised by Marxists as important aspects of class struggle, yet the relations and conditions under which labour-power is produced have received far less attention, except from Marxist feminists and feminist Marxists. Given the centrality of labour-power to capitalism – since as the only commodity that can produce surplus value over and above its own value, and therefore profit, it is the *sine qua non* of accumulation – it is somewhat surprising that Marx nowhere describes its production. Engels recognised the existence of domestic labour and the gendered relations within it, but did not take the analysis further. The domestic labour debate of the 1970s was an attempt to fill this gap, but left many of the crucial issues unresolved.

MARX AND ENGELS ON DOMESTIC LABOUR

Marx comes closest to describing the production of labour-power in the chapter on 'The Sale and Purchase of Labour-power' in *Capital Volume 1*:

Given the existence of the individual, the production of labour-power consists in his reproduction of himself or his maintenance. For his maintenance he requires a certain quantity of the means of subsistence. Therefore the labour-time necessary for the production of labour-power is the same as that necessary for the production of those means of subsistence... If the owner of labour-power works today, tomorrow he must again be able to repeat the same process in the same conditions as regards health and strength. His means of subsistence must therefore be sufficient to maintain him in his normal state as a working individual... The owner of labour-power is mortal. If then his appearance in the market is to be continuous, and the continuous transformation of money into capital assumes this, the seller of labour-power must perpetuate himself 'in the way that every living individual perpetuates himself, by procreation'... Hence the sum of means of subsistence necessary for the production of labour-power must include the means necessary for the worker's replacements, i.e. his children... The costs of education vary according to the degree of complexity of the labour-power required. These expenses (exceedingly small in the case of ordinary labour-power) form a part of the total value spent in producing it. The value of labour-power can be resolved into the value of a definite quantity of the means of subsistence. (Marx, 1976: 274–6)

Marx gives examples of means of subsistence like food and fuel, which need to be replaced daily, while others like clothes and furniture can be purchased at longer intervals. But that is all. Unlike his detailed descriptions of the production of other commodities, here there is no description of a labour process or mention of instruments of production (such as a stove, pots and pans, broom, bucket and mop). Just raw materials – means of subsistence – and the finished product: labour-power. He assumes that all that is required to convert those means of subsistence into labour-power is a process of individual consumption. Yet the worker would not be maintained in his or her 'normal state as a working individual', nor be replaced when he or she died, unless somebody carried the raw materials and instruments of production home from the market or shops, cooked the food and washed up after the meal; dusted, swept, mopped floors and washed clothes; fed the baby, changed it, gave it a bath and so on and so forth.

The home is therefore a site of individual consumption but also of production;² *both* are necessary for the production of labour-power. In fact, Marx's confusion of production with individual consumption leads to bizarre contradictions. For example, he writes of domestic labour that:

[t]he largest part of society, that is to say the working class, must incidentally perform this kind of labour for itself; but it is only able to perform it when it has laboured 'productively'. It can only cook meat for itself when it has produced a wage with which to pay for the meat. (Marx, 1963: 161)

If we generalise this proposition to all commodities, it would state that, until a commodity has been sold, it cannot be produced. But commodities are usually

sold only after they have been produced, and this is especially true of labour-power, which cannot be sold for the first time until many hundreds of hours of labour-time have been spent on its production, as Marx recognises elsewhere: 'Its exchange value, like that of every other commodity, is determined *before it goes into circulation*, since it is sold as a capacity, a power, and a specific amount of labour-time was required to produce this capacity, this power' (1976: 1066, emphasis added).

Under capitalism, according to Marx, labour is either productive – in the sense that it directly produces surplus value – or unproductive, in the sense that it is exchanged with capitalists' revenue or workers' wages, and does not produce surplus value (Marx, 1976: 1038–9). According to this definition, domestic labour is unproductive. However, when analysing luxury production, Marx implicitly makes a distinction between socially useful reproductive labour producing means of production and labour-power, which re-enter capitalist production, and unproductive labour, producing products which do not re-enter production (Marx, 1976: 1045–6). Seen from this standpoint, domestic labour is socially useful reproductive labour. (Marx is here referring to social, not biological, reproduction, although biological reproduction, without which there would be no new workers to replace those who die, is a necessary element of social reproduction.)

Engels not only recognised the existence of domestic work and the gender division of labour within it, but even observed that the reversal of gender roles during the industrial revolution, and the distress caused by it, occurred 'because the sexes have been placed in a false position from the beginning' (1975: 439). He did not carry the analysis further, however.

THE DEBATE OF THE 1970s

The intensive debate around domestic labour (i.e. housework and childcare) that erupted in the 1970s developed the analysis considerably. Let us look at the issues taken up which throw light on the production of labour-power. Most participants in the debate agreed that domestic labour is socially useful – i.e. it is useful not just to other members of the family, but to society as a whole – and that it *transfers* the (exchange)-value of the commodities bought with the wage to the end product, labour-power. But does it also *create* value?

According to Margaret Coulson, Branka Magas and Hilary Wainwright (1975), domestic labour does not create value because only wage-labour produces (exchange)-value, but this would mean that the labour of millions of petty commodity producers (farmers, artisans, etc.) produces no value, and would contradict the whole starting-point of Marx's analysis of capital, namely the determination of the value of the commodity by all the labour-time socially necessary for its production (Marx, 1976: 129, 294). For Margaret Benston (1969), Jean Gardiner, Susan Himmelweit and Maureen Mackintosh (1975), Susan

Himmelweit and Simon Mohun (1977) and Lise Vogel (2013: 23), 'domestic labour in capitalist societies does not take the social form of value-producing labour'. Vogel argues convincingly that unwaged domestic labour is necessary for the production of labour-power (2013: 149, 158–9), yet following Paul Smith (1978: 211) reiterates that 'as concrete, useful labour, [it] simply transfers the value of the commodities purchased with the wage to the labour-power borne by the worker' (2013: 164); in other words, it is not abstract value-producing labour, despite the fact that the labour-power which it has contributed to producing is then sold as a commodity to capitalists.

The assumption here is that, unlike every other commodity, the value of labour-power is determined not by the labour-time socially necessary for its production but by the value of the commodities that enter into its production. If this were true, it would follow that the labour-power of the worker who gets her washing done at a laundry has a higher value than that of another worker doing the same job at the same workplace for the same wage who does her own washing at home; and that the labour-power of a worker who hires a housekeeper to wash, clean, cook and do the washing-up has a much higher value than the labour-power of a worker doing the same job at the same workplace for the same wage, whose wife performs all these tasks. Marx often makes this mistake (Hensman, 1977), but he corrects himself when he asserts that 'the value of each commodity is determined by... the labour-time socially necessary to produce it...' (1976: 293) and '[t]he value of labour-power is determined, as in the case of every other commodity, by the labour-time necessary for the production, and consequently also the reproduction, of this specific article' (1976: 274).

Not everything that is done in the home contributes to the production of labour-power: the assumption that it does leads to the opposite error. But to the extent that domestic labour is a necessary part of the production process of labour-power, a commodity sold on the (labour) market, it must produce part of the value of labour-power, and this is reproductive labour in the sense that it makes an essential contribution to social reproduction. Thus the labour-power of the worker who hires a housekeeper to perform domestic tasks and that of the worker whose wife performs the same tasks have the same value; in effect, the wages of both men are sufficient to pay for another person to do all this work, and it makes no difference whether this person is a housekeeper whom he pays or a wife whom he supports (Secombe, 1973: 10).

Once we acknowledge that domestic labour contributes to the value of labour-power, the neat division of the working day in the workplace into necessary labour, which reproduces labour-power, and surplus labour, which is appropriated by the capitalist, collapses. The equation becomes even more complex if the generational reproduction of labour-power and the contribution of state education and healthcare are brought into the picture. The rate of surplus value would then have to be calculated taking into account all the necessary labour (in the workplace as well as the home) done by members of the household that is the unit of

production of labour-power, and all the payments made by the capitalist, not only by way of wages, but also in contributions to services such as state education and healthcare.

Founding members of the Wages for Housework campaign Mariarosa Dalla Costa and Selma James (1972), Silvia Federici (1975) and Leopoldina Fortunati (1981/1995) argue that domestic labour produces not only value but also surplus value. Does it? A housewife is not paid wages, but her labour is paid for out of her husband's wage, so his employer pays her indirectly. If the amount paid for her labour is the same as or more than what her husband would have to pay to buy the services she performs on the market, then she is not contributing to surplus value. (However, if her husband keeps for himself part of the amount paid by the employer for her labour, *he* would be exploiting her.) If the amount paid for her labour by her husband's employer is *less* than the value of the services she performs, that means the employer is keeping part of what he would otherwise have had to pay out as wages, and her labour is therefore contributing indirectly to his surplus value.

Therefore, although domestic labour does not directly produce surplus value, it is true that when its duration is extended unduly, it allows extra surplus value to be appropriated by subsidising the production of labour-power. The Bolivian women's leader and miner's wife Domitila Barrios de Chungara made a precise calculation of this, comparing the work performed in the home with the cost of the same services bought on the market:

One day I got the idea of making a chart. We put as an example the price of washing clothes per dozen pieces and we figured out how many dozens of items we washed per month. Then the cook's wage, the babysitter's, the servant's... Adding it all up, the wage needed to pay us for what we do in the home... was much higher than what the men earned in the mine for a month. (Barrios de Chungara with Viezzer, 1978: 35)

Thus, if a miner's wife died and the man was compelled to buy on the market the services that she had performed, his wage would not have been sufficient, showing that it was less than the value of labour-power. The women's surplus labour allowed the mine owner to appropriate more surplus value than he would otherwise have been able to; more generally, discounting the value produced by domestic labour helps capitalists to reduce the price of labour-power below its value. But it is impossible to see this effect so long as the production of labour-power (and its value) is seen solely as the activity of waged workers. Only if it is seen as the collective product of the unit of production of labour-power – the working-class household – is it possible to calculate the real rate of surplus value.

The worker sells his or her labour-power for a specified period of time, just as the rent for a flat is for a specified period of time. If a tenant can rent one flat for two weeks with a certain amount of money, but can rent another flat for three weeks with the same amount of money, the latter rent is only two-thirds of the

former. Similarly, if one capitalist pays a certain wage for an eight-hour working day while another pays the same wage for a 12-hour working day, the latter wage is only two-thirds of the former. If working hours are extended beyond a certain point, the price of labour-power falls below its value even if the wage is kept constant (Marx, 1976: 343). This calculation cannot be accurate unless all the hours worked by all the members of the family in order to produce labour-power are taken into account.

Labour-power is not a purely physiological entity. 'In contrast... with the case of other commodities, the determination of the value of labour-power contains a historical and moral element' (Marx, 1976: 275). Wages must enable the working class to live at an acceptable standard of living. Ensuring that the price of labour-power does not fall below its value, and setting this value at an acceptable level, are both products of working-class struggle. The 'historical and moral' element would differ from one society to another, but it seems reasonable to set the minimum value at a level where income covers basic requirements of food, water, clothing, shelter, healthcare and education; where the minimum age for employment complies with the International Labour Organization norm of 15 years; and where adults get at least 11 or 12 hours per working day for sleep and recreation, plus paid weekly days off, annual leave and holidays.

MULTIPLE WAGE-EARNERS

What happens when there are two or more wage-earners in the family? We can examine this by looking at a family consisting of a man, a woman and their three children: a girl and boy who are school-going and a toddler. In situation A, the man is able to support his wife and children with his wage. The woman does the housework and cares for the toddler; she is at home when the other children come home from school, and can spend time with them even while she does other chores. In situation B, wages are lower, and the man and woman both need to engage in wage-labour in order to make ends meet. The woman may become a homemaker, or the toddler may be left with grandparents while she is out at work, in which case the grandparents' labour too would contribute to the value of the family's labour-power. The woman would have to do domestic labour as well as wage-labour, so her working hours would be extended, and if wages go down further, they would be extended even more: Amrita Chhachhi (2005: 247–9) showed that in response to a cut in real wages between 1994–95 and 1999–2000, the total time expended on wage-labour and domestic labour by women workers in Delhi increased from 13–14 hours to 16–17 hours a day, as they spent more time shopping around for the cheapest goods, queuing up at the ration shop and cleaning inferior rice. The family's standard of living may not have fallen, but the price of their labour-power had fallen, because they now had to work more hours collectively in order to reproduce it.

In situation C, the girl is taken out of school to do the housework and care for the toddler while her parents are out at work. In this case, not only has the price of labour-power fallen due to the longer hours worked collectively in order to reproduce it, but the standard of living has fallen too, because the girl is not getting an education. Finally, in situation D, the boy may be taken out of school and sent out to work to supplement the family income: yet another fall in the standard of living and in the price of labour-power, which is by now well below its value. At each of these stages, the capitalist class as a whole extracts more surplus value out of this household, embodied in the additional surplus value extracted by the employers of the man, the woman and the boy, and the reduction in payments for the education of the two older children.

Situation D was the predominant one when Marx was analysing capital in the nineteenth century: 'everywhere, except in the metallurgical industries, young persons (under 18), women and children form by far the most preponderant element in the factory personnel' (1976: 577); even a steel and iron works 'employs 500 boys under 18, and of these about a third, or 170, are under the age of 13' (1976: 371). Left to itself, capital's 'werewolf-like hunger for surplus value' (1976: 353) pushed wages down so low that all members of the family, excluding only the smallest children, worked long hours in wage-labour simply in order to survive. If at any time it needed to retrench workers, it dismissed men rather than women and children. The state, acting in the interests of capital, used legislation to force reluctant workers to labour long hours; it was only when capitalists extended these hours to such an extent that it 'produces the premature exhaustion and death of this labour-power itself' (Marx, 1976: 376) – in other words, when the supply of labour-power for capital was threatened – that the state stepped in again to limit working hours and ensure that labour-power was not 'maintained and developed only in a *crippled state*'; in such a situation, the price of labour-power is below its value, since 'the value of every commodity is determined by the labour-time required to provide it in its *normal quality*' (Marx, 1976: 277, emphasis added).

In the twenty-first century, studies in the USA and OECD countries show that the majority of families with minor children are dual-earner ones, and the employment of married women is increasing (OECD, 2011: 38; Pew Research Center, 2015). The employment of mothers is not necessarily a consequence of falling real wages: many women, especially once their children go to school, prefer going out to work rather than staying at home and being dependent on a partner's wage. However, in most cases a second wage is needed to maintain the standard of living, and neoliberalism has increased the total number of hours that have to be worked in order to reproduce labour-power by extending working hours, slashing social security and welfare benefits and raising the retirement age.

In Third World countries, with informalisation and neoliberalism attacking the living standards even of the small section of the working class which had earlier

won decent wages, the crisis in the reproduction of labour-power is dire. Child labour is rampant, and hundreds of millions of migrants, both within and between countries, split families apart. Men may migrate, leaving their families behind; although their remittances contribute to the production of labour-power, their wives and other relatives must contribute not just domestic labour but also, often, agricultural labour. Women who migrate to work in other parts of the country or abroad are often verbally, physically and sexually abused; such cases are reported occasionally, but most are unreported, and serious crimes go unpunished. Women migrant workers in foreign countries are especially vulnerable because they may not speak the language of the country where they work or know anyone to whom they can turn for help, may be illegal immigrants or on visas that allow them to work only for a specified employer, and may have had their passports confiscated by employers (Heyzer et al., 1992; Young, 2000; Ehrenreich and Hochschild, 2003). Finally, there are cases where both parents migrate, leaving children with grandparents or other carers. The impact of parental migration on children is mixed. Remittances, especially from fathers working abroad, help to feed and educate children. However, the migration of mothers or both parents may have adverse effects on the children's education, health and emotional well-being; it may expose children, especially girls, to physical or sexual abuse by fathers or other male relatives, or neglect by fathers or grandparents, with some cases of girls dropping out of school to take up the domestic labour formerly performed by their mothers (Jayasuriya and Opeskin, 2015: 608–16).

Unaccompanied migrant children, who are fleeing an abusive home or violent conflict or have been recruited by an 'employment agency' which may in fact be engaged in trafficking, are at greatest risk of ending up as industrial, domestic or sex workers in slave-like and extremely abusive conditions (Van de Glind and Kou, 2013). Children are less likely to face abuse when they migrate for work along with their parents, but may then be subjected to long working hours and hazardous working conditions. We can identify a situation E, where the girl who was staying at home to do the housework and look after the toddler is now additionally engaged in wage-labour. This can result in horrific accidents, like the case where a 10-year-old brick-kiln worker ran to catch her little sister, who had stepped onto the weak plastic lid of the furnace; both girls fell in and were burnt alive (Banerjee, 2016). Living in shacks or tents that barely protect them from the elements, without running water, sanitation, electricity, or access to healthcare, these families are exposed to serious health risks. For some working children this is forced labour, for others their contribution to the survival of their family is a labour of love, and for many it is a combination of the two, but in all cases it is performed at a heavy cost to themselves.

In India at the beginning of the twenty-first century, malnutrition and ill health among informal workers resulted in a maternal mortality rate of 540 per 100,000 live births. Maternal malnutrition resulted in 30% of infants with 'low birth weight', creating health risks that would last the rest of their lives. The infant mortality rate was 67 and under-five mortality rate 93; 47% of

under-five-year-olds were severely or moderately malnourished, resulting in a large number of children dying or becoming disabled as a result of contracting preventable and curable diseases (UNICEF, 2004: tables 1, 2, 5 and 8; Pelletier et al., 1995; Krishnakumar, 2004). In other words, exceedingly low wages, long working hours and unhealthy working conditions resulted in the production of labour-power in a crippled state.

THE WORKING-CLASS FAMILY

Most contributors to the domestic labour debate explained women's full-time domestic labour in working-class families by its usefulness to capital: Dalla Costa and James (1972), Federici (1975) and Fortunati (1981/1995) argued that it produces surplus value; Veronica Beechey (1977, 1978) that housewives constitute a reserve army of cheap labour; and Zillah Eisenstein (1978) that capitalism needs patriarchy in order to operate efficiently. Yet if capital needs women's full-time domestic labour, why would it undermine the working-class family so grievously during the industrial revolution? Why is it that in the twenty-first century, with technology vastly reducing the demand for labour-power while globalisation and migration guarantee a plentiful supply of it, neoliberal attacks on the working-class family are so rampant? Jane Humphries argues that 'the endurance of the family reflects a struggle by the working class for popular ways of meeting the needs of non-labouring comrades within a capitalist environment' (1977: 250). It was *workers* who, through their struggles for a family wage, abolition of child labour and restriction of working hours, won back time and space for the family, including fictive kin.

So was the reconstitution of the working-class family a victory or defeat for women in particular? For the working class as a whole? The answer to these questions, unsatisfactory though it may seem, is 'both'. It is indisputable that 'the retreat of certain family members from the labour force, in conjunction with an organized attempt to secure a "family wage"' (Humphries, 1977: 252), resulted in a very welcome rise in the standard of living. Men might have taken the lead in this struggle, and one of their objectives might have been to eliminate competition for jobs from women; but some women workers too were happy to escape from heavy labour and have more time to spend on home-making, like the woman miner who was glad she had left her job because she did not have to come home exhausted from a day's wage-labour before doing domestic work (Pinchbeck, 1930: 269). While children often want to help with domestic work, and both girls and boys should be encouraged to do so, the withdrawal of children from the labour market is an unmixed blessing, not only securing for them adequate time for rest, play and education, but also democratising the family and increasing the bargaining power of adult male and female workers (Hensman, 2011: 194–201).

Humphries (1977: 254–6) also points to cases where family ties can promote class solidarity and class struggles. These are gains.

Yet the development of the male bread-winner/family-wage norm was also a defeat for working-class women, and thus for the working class as a whole. Women had entered the capitalist labour market as cheap labour due to patriarchy in the pre-capitalist family, and being pushed out of employment by male-dominated unions and classified as dependants or supplementary wage-earners reinforced this position. For large numbers of women-headed households, the acute shortage of decently paid employment for women means there is no alternative to poverty. Moreover, even when husband and wife are earning, there is no basis for the assumption that his wage pays for basic subsistence while hers is supplementary: indeed, in such situations, as Diane Elson (1995: 183–4) and Sepali Kottegoda (2004: 137–55) point out, women's wages are usually spent entirely in ensuring family survival, while a variable portion of men's wages is spent on alcohol, tobacco, gambling and other activities. So there is a negative element in the way that the demand for a 'family wage' has been posed, fought for and won, as Michele Barrett and Mary MacIntosh (1980) and Heidi Hartmann (1981: 20–1) argue: it is oppressive to women, and also disadvantageous to their dependants if they have any (Barrett, 1980: 26–7).

CAPITALISM AND 'PATRIARCHY'

Ann Ferguson and Nancy Folbre (1981: 321–3) explain that the patriarchal family prevailed in pre-capitalist agricultural societies, where having a large number of children was an asset, child mortality was high and women breast-fed each child for a year or more; given that they would spend up to 20 years of their lives child-bearing and breast-feeding, it was more efficient for them to do other household tasks as well. But these relations are revolutionised by capitalism. Even in many Third World countries, family-planning programmes have reduced the birth rate; child mortality, while still high, is being reduced; and a combination of these two developments means that women need not spend more than two or three years of their lives child-bearing and breast-feeding. In this context, as Barrett (1980: 16) points out, 'patriarchy' comes to mean something different, namely male domination rather than relations of production.³ Once working-class struggles have won space and time for family life and used it to re-establish male-dominated families, capital makes use of this division, as it makes use of other divisions in the working class, to designate some workers (in this case women) as cheap labour, and to undermine solidarity.

Interviews with pharmaceutical women workers in Bombay in the 1980s revealed a complex dialectic between capital and labour over the constitution of the working-class family. Single young women were recruited in large numbers to work on the packing lines from the 1940s onward. They played an active role

in the employees' unions in these factories, fighting alongside male workers to win struggles against the marriage bar and for equal pay, maternity benefits and workplace childcare. Management retaliated by automating their work, introducing round-the-clock shift-working and replacing women with men when they retired. It appears that capitalists prefer to employ women when their labour-power is cheaper than men's, but prefer men once women win rights that make their labour-power more expensive: a pursuit of profit that is typical of capitalist exploitation. On the other hand, many women workers found that after marriage they had difficulty participating actively in the union due to domestic labour commitments, objections from husbands and prejudice from men in the workplace: typical forms of male domination. Most women wanted both their jobs and family life, including protection from night work, as well as shorter working hours and equality (Hensman, 2011: 214–17, 233–4).

Feminist Marxists who argue that the oppression of women in capitalist society is rooted in capitalism alone are known as 'unitary' theorists. In a systematic analysis of this kind, Vogel argues that socialist feminists must answer the questions, 'What is the root of women's oppression? How can its cross-class and transhistorical character be understood theoretically?' (2013: 7). Yet her suggestion that it is women's 'differential role in the reproduction of labour-power that lies at the root of their oppression in class-society' (2013: 150) applies only to the labouring classes, and her proposal that the struggle for equal rights can bring together women from different classes and sectors applies only to capitalist society (2013: 174–6). She never explains how cross-class and transhistorical forms of oppression like violence against women, including sexual assault and femicide, can be rooted in capitalism.

On the other side, Marxist feminists who believe that women's oppression under capitalism stems from *both* capitalist relations of production *and* gender relations, which they call 'patriarchal', have been characterised as 'dual-systems' theorists, although in principle their framework can be extended to include other systems of institutionalised oppression like race and caste. Batya Weinbaum (1978: 43, 29–30) attributed Marx's failure to identify and analyse domestic labour as a process of production to his 'patriarchal position', and argued that working-class women would benefit, along with other women, from a 'feminist revolution' against domestic violence and sexual assault and for equal rights and control over their fertility and sexuality; however, they would find themselves fighting alongside working-class men and against more wealthy women in the struggle for higher wages, better working conditions, shorter hours and welfare benefits that require higher taxes to be levied on the rich. This class division was highlighted by the Buenos Aires Housewives' Movement, according to which 'a housewife isn't a wealthy woman who doesn't work inside or outside the house, but only orders another woman to do it', and the Chilean working-class Movement of Women Pobladoras, which resented middle-class feminists who 'pay their domestic

employees a miserable wage while they're having their chats about equality' (Fisher, 1993: 148, 197).

Perhaps the position of working-class women is best captured by the notion of 'intersectionality' between different relations of oppression, first developed by African-American feminists, which would suggest that the oppression of working-class women is distinct from that of both working-class men and upper- or middle-class women.⁴ The production of labour-power entails both class and gender oppression. How can these be addressed?

MECHANISATION, COMMERCIALISATION, STATE CONTRIBUTIONS AND SOCIALISATION

Moving towards a resolution of this issue requires us to take a closer look at the work performed in the home. It can be divided into work which results in a product that is distinct from a person (like cooking a meal or washing clothes), and work whose product is inseparable from a person (like childcare).

The first kind of production can be mechanised by using labour-saving devices, or taken over by capitalism, thus reducing the workload in the home. (Cleaning is a special case. There is not much scope for mass-production techniques here; it is labour-intensive work even with modern appliances. However, it *can* be taken over by capitalism, as shown by the rise of cleaning firms.) These processes have probably gone as far as they can go in developed countries and possibly even too far, substituting not only ready-made for home-baked bread and frozen vegetables for fresh ones, but also fast foods of doubtful nutritional value for more nutritious cooked meals. The same cannot be said for developing countries. In India, refrigerators are common among better-paid employees and washing machines somewhat less common, but neither are an option for millions of proletarian households in rural areas and urban shanty-towns which have no regular power supply. Many women spend hours each day collecting water. They sometimes also collect fuel for cooking on primitive stoves, the smoke from which causes respiratory problems in the ill-ventilated shacks they inhabit. Lack of sanitation further undermines the reproduction of labour-power by causing widespread illness and death from gastrointestinal diseases.

This is an area where working-class struggles should force the state to provide such families with housing, electricity, potable running water, sanitation and modern stoves, which would enormously reduce the time and effort spent on domestic labour as well as avoidable sickness and death. As for reducing domestic labour by buying on-the-market products formerly made in the home, in many Third World countries the abject poverty of most working-class families prevents them from doing so; but the fact that even in these countries such products are accessible to unionised workers in the formal sector demonstrates the possibility of reducing domestic labour by fighting for higher wages. Campaigns for

increased taxation of the rich and corporations in order to provide more resources for the reproduction of labour-power, and against military spending and wars of aggression which slash these resources and destroy the human beings who embody labour-power, are also important.

The demand that *the value produced by domestic labour* be recognised – for example, in statistics such as GDP, settlements on divorce and allocating pensions to women – is an important one, helping to make this vast amount of labour visible. Counting the time spent in domestic labour as part of the working day would make it clear that women workers in particular have an inordinately long working day. Shortening wage-labour hours to allow for domestic labour would simultaneously improve productivity and expand employment.

The second kind of domestic labour is caring work, where mechanisation is not an option: caring is by its nature labour-intensive. Although the majority of people needing care are children (since everyone begins life as a child), there are also adults who need it. Help with childcare and care of sick, disabled and old people is essential if the burden of domestic labour is to be reduced; sick people need specialised treatment, children need an education and people with disabilities need support. Provision of these services by the state should make it possible for workers performing them to have decent employment conditions without making the services unaffordable for working-class households.

Radical attempts to socialise housework after the Russian and Chinese revolutions were welcomed by women; in fact, in China, women themselves took the initiative in organising community kitchens, laundries, crèches, cleaning services and repair workshops, thus socialising many of the tasks performed in the home and reducing domestic labour. However, in the Soviet Union, attempts to replace individual homes with communal buildings were unsuccessful because their inhabitants carved out of them spaces for individual families. A more cautious approach in China left families with individual homes (Broyelle, 1977: 46–55).

A solution to the problem of childcare proposed by Lilina Zinoviev shortly after the Russian revolution was state-run child-rearing:

‘Our task now is to oblige the mother to give her children to us – to the Soviet State.’ The idea was taken up in Kollontai’s formulation: ‘Children are the State’s concern’. She added: ‘The social obligation of motherhood consists primarily in producing a healthy and fit-for-life child... Her second obligation is to feed the baby at her own breast’. (Broyelle, 1977: 71)

In a similar vein, Simone de Beauvoir suggested that ‘it would... be desirable for the child to be left to his parents infinitely less than at present, and for his studies and his diversions to be carried on... under the direction of adults whose bonds with him would be impersonal and pure’ (1997: 539), and Shulamith Firestone (1970) argued that women’s liberation requires the application of modern technology to the production of children in order to free women from child-bearing and breast-feeding. In the view of Bolshevik theorists, who shared the capitalist devaluation of the skills involved in domestic labour, ‘the problems posed by

children appeared almost identical to those of housework. Their solutions therefore were roughly the same' (Goldman, 1993: 11–12).

However, the application of mass-production techniques to childcare, unlike their application to cooking and laundering, had drawbacks. Sheila Rowbotham (1974: 168) reports that small children left in full-time nurseries in Russia were found to be more backward than those looked after at home. Another problem, where day-and-night nurseries were tried out in Russia and China, was that women themselves wanted more contact with their children (Rowbotham, 1974: 196; Dunayevskaya, 2019: 73–4). These observations suggest that although psychiatrists like John Bowlby (1965) have been criticised for promoting the model of a nuclear family with a rigid gender division of labour, this does not invalidate the evidence they present that the intellectual, emotional and social development of children suffers unless they receive sustained attention from caregivers who love them. A loving family – defined as a relatively small unit, not necessarily based on biological relations or heterosexual marriage – may have a necessary place in the production of human beings. This does not mean that childcare cannot be socialised at all. However, good-quality socialised care requires a high ratio of caregivers to children being cared for, which makes it expensive. Eli Zaretsky (1982) suggests this is why under capitalism it is not provided without a struggle by both feminists and the labour movement.

THE PERSISTENCE OF THE GENDER DIVISION OF LABOUR

The fact that caring and nurturing continue to be undervalued and seen as 'women's work' despite decades of feminism and centuries of the labour movement needs to be explained. One strand of the explanation is constituted by attempts within working-class movements to eliminate competition between women and men by reinforcing relationships of domination over women by men. Although Marx did not advocate such domination, he helped to create the basis for it by ignoring the socially necessary caring work traditionally done by women.

The other strand is what Linda Gordon describes as 'a great intellectual and cultural ambivalence within feminism', in that it 'represented both the highest development of liberal individualism and also a critique of liberal individualism' (1982: 45). The bourgeois ideology of individualism is often confused with the development of individuality, but individualism is as destructive of the full development of individuality as authoritarianism and patriarchy, which crush individuality in a more obvious way. Individuality can develop in a child only if (s)he is surrounded by the loving attention of other human beings; children completely deprived of this – wolf children, for example – fail to develop their human potentialities, while the development of children who are deprived of adequate interaction of this type is severely retarded. Yet providing unstinted love and attention inevitably puts the giver at a disadvantage in a competitive market, and would therefore be ruled out in a purely market-driven economy.

This contradiction within bourgeois ideology – the fact that taken to its logical conclusion it threatens bourgeois society with extinction, and therefore the reproduction of competitive individualism depends on its opposite: the reproduction of self-sacrificing women – is what leads to the right-wing insistence on the family as a separate realm from which the logic of capital is excluded (Thorne, 1982: 19). Carol Gilligan (1993: 164–5) describes how the division is ensured by socialising boys into an ethic of justice based on individual rights, and girls into an ethic of care based on providing for the needs of others, and this happens in working-class as well as bourgeois families. Feminists correctly insist on claiming equal rights for women as individuals, but even among Marxist feminists this is often at the cost of devaluing caring and nurturing; what is necessary, rather, is to see an ethic of rights and justice as complementary to an ethic of compassion and care, and to socialise girls as well as boys using both moral ideologies (Gilligan, 1993). After all, from the standpoint of socialist principles, freely performed caring conforms to Marx's ideal of work that is simultaneously an expression of oneself and directly for the satisfaction of another's need (Marx, 1975: 277–8); therefore, recognising its importance is crucial to the struggle against bourgeois ideology.

The gender division of labour stunts both those involved in round-the-clock caring work, who never get a chance to exercise other skills and abilities, and those who do not engage in it at all, who never develop what Sara Ruddick (1982) characterises as the skills and intelligence required for this work; what is needed, therefore, is an understanding within the labour movement of the value of caring work and the skills and intelligence required for it, and an acknowledgement that these need to be fostered in all human beings. The practical outcome would be movement towards an equal sharing of nurturing between men and women, and a struggle for conditions which would make that possible.

CONCLUSION

What, then, can be done to solve the problems for the working-class struggle posed by domestic labour under capitalism? Socialist feminists like Gardiner et al. (1975) have suggested that the working-class family helps to subordinate the working class to capital, and this is indeed true if it is male-dominated. Therefore, eliminating violent and authoritarian relationships between men and women, adults and children in working-class families is essential if they are to become part of the struggle against capitalism. Without this, the labour movement will continue to be subordinated to capital, since, as Domitila Barrios de Chungara puts it:

the first battle to be won is to let the woman, the man, the children participate in the struggle of the working class, so that the home can become a stronghold that the enemy can't overcome. Because if you have the enemy inside your own house, then it's just one more

weapon that our common enemy can use toward a dangerous end. (Barrios de Chungara with Viezzer, 1978: 36)

The struggle for women to control their fertility and sexuality dictates a need for healthcare that ensures safe pregnancy and childbirth, as well as access to safe and effective contraception and medical termination of unwanted pregnancies, which would enable women to have babies only if they want them; this would also help to ensure that children are loved and wanted.

The struggle against the gender division of labour is crucial. The only biological basis for it is the fact that women are capable of child-bearing and breast-feeding whereas men are not. As for other aspects of the gender division of labour, there is no evidence that they have any biological basis, since all the tasks can be performed by either men or women, and competence depends not on gender but on inclination and acquired skills.

Socialising some caring work helps to reduce the huge burden now carried mainly by women within the family, but does not by itself eliminate the gender division of labour, since it is quite possible that carers in the socialised facilities are mainly women, nurturing which continues to be done in the home is done by women, and women continue to be treated as cheap labour. A study of employed men's participation in housework and childcare between 1965 and 2003 in 20 countries found an average increase of six hours per week over this period, yet globally women continued to perform 2 to 10 times more caregiving and domestic work than men (Levtov et al., 2015: 17–18).

Changing this situation would require challenging the gender division of labour practically and ideologically. Practical measures would include eliminating the gender division of labour in employment; equal pay and protection from night work for both women and men, as Sheila Lewenhak (1977: 287) proposes; the equal sharing of domestic labour between men and women, and leave provisions that allow for this; provision of spaces for collective childcare, and crèches and nurseries for children whose parents need help with childcare; sheltered accommodation or home care for adults who need it; shorter working hours; and regular part-time jobs with pro-rata benefits – if possible with flexible working hours to suit the needs of employees – for both men and women who have caring responsibilities (cf. Molyneux, 1979: 27). It would also require demanding that a much larger proportion of social labour-time be allocated to this work, which in a capitalist society means state funding, and a reversal of neoliberal assaults on working-class living standards. State support for community kitchens serving cheap, nutritious and tasty food, especially in Third World countries, would help to alleviate widespread malnutrition while also reducing the burden of domestic labour.

However, the ideological struggle in a sense has priority, because without winning that, the practical struggle will not be won. This would entail combating the liberal individualist devaluation of caring and nurturing, and affirming that such

work should be shared by women and men. Hartmann points out that women have an advantage in this struggle, to the extent that they recognise 'both human needs for nurturance, sharing and growth, and the potential for meeting those needs in a non-hierarchical, nonpatriarchal society' (1981: 33), but it can only be won by the working class as a whole.

Given the centrality of labour-power to the accumulation of capital, struggles to transform the production of labour-power as a commodity into the production of physically and psychologically healthy, anti-authoritarian, egalitarian, loving, caring human beings is an absolutely vital part of the class struggle against capitalism. Myriads of such struggles are taking place around the world, and researching, documenting and analysing them so that others can learn from their successes and failures would be an extremely useful contribution to the debate on domestic labour as well as to the struggles themselves.

Notes

- 1 This is an analysis of domestic labour and the production of labour-power, and of the workers in which it is embodied, under capitalism. It does not include domestic labour in other classes or other modes of production, nor does it aim to explain the oppression of women.
- 2 One way of demonstrating this would be to ask: is it possible for someone else to substitute for a person in this activity or not? If someone else *eats* all my meals for me, I would die of starvation, whereas if someone else *cooks* all my meals for me, I would not. Thus, in general, if it is possible to substitute one person for another in some activity, it is a process of production, while, if that is not possible, it is a process of individual consumption.
- 3 The closest Marx comes to describing patriarchal production relations is when he characterises the 'mode of production' of 'small-holding peasants' in France, isolated from one another as well as from the rest of society, as akin to the way in which 'potatoes in a sack form a sack of potatoes' (Marx, 1852: 62). Obviously 'patriarchy' in the working-class family means something radically different.
- 4 Kimberlé Crenshaw (1989) was the first to coin the term 'intersectionality', but the notion of the intersection of multiple, simultaneous oppressions had already been articulated by the Combahee River Collective (1983) and Angela Davis (1983).

Logistics

Charmaine Chua

The world's fastest-growing retail companies barely produce commodities. Instead, what they sell is efficiency and ease: the convenience of one-stop online purchasing, express product delivery, the prediction of purchasing patterns and consumer wants, and the ability to choose from a seemingly endless inventory of low-priced products. The rise of e-commerce markets, led by transnational companies such as Amazon and Walmart, have so reshaped the growth of consumer culture that 2017 was witness to the shuttering of over 8,600 retail stores, the worst year on record.¹ The impacts of online retailing not only attest to a shift in the way commodities are physically distributed and produced through global supply chains, but also reflect a reconfiguration toward a logic of accumulation centered on accelerating the circuit of commodity capital. Today, logistics is essential to the global expansion of markets, shaping and mediating the ways in which we consume, produce, and circulate daily means of life, from clothes and technology to the food we eat. How have global supply chains come to exercise such power over our daily lives?

In its more capacious connotations, logistics broadly refers to the ubiquitous and banal forms of calculation and organization that structure daily decision-making. Beginning in the 1960s, however, capitalist imperatives to speed and expand the capacity for goods to circulate, and for capital to reproduce itself across the global supply chain, elicited a fundamental transformation in

the structure of capitalist production and circulation. Logistics rose to prominence in business management as a method that revolutionized the calculation of profit and the business of goods transportation. This transformation has been termed ‘the logistics revolution’ (Bonacich and Wilson, 2008), a period spanning the 1960s and 1970s that applied the newly developed business science of logistics management to the total circuit of production and consumption.

Critical scholars have recently begun to pay attention to these developments, seeking to understand how logistical systems function to coordinate, capture, and control the vicissitudes of daily life (Bernes, 2013; Chua et al., 2018; Cowen, 2014; Danyluk, 2017; Rossiter, 2016; Toscano, 2014). Pulling logistics out of business schools, such work has sought to understand logistics beyond the technicalities of supply chain management, contextualizing it as ‘a set of practices that makes worlds’ (Neilson and Rossiter, 2014: 5). This chapter builds on a growing body of literature on logistics with an emphasis on the structural conditions that gave rise to its growth, particularly its role in the expanded reproduction of capital. By reading the rise of logistics alongside Marx’s treatment of the sphere of circulation in *Capital* Volume II (Marx, 1978), we shall examine how the circulation of commodities from their point of production to realization sells a ‘change in location’ that enfolds systems of distribution into the production process itself. By directly integrating systems of production, transportation, and consumption through cybernetic systems of data management, logistics enmeshes transport infrastructure, ecological systems, commercial and military goods, and labor within an extensive system of tracking and tracing, enfolding enlarging circles of territory and society into the extractive machine of supply chain capitalism. Along the way, the organization of capital accumulation through logistical systems has required a corresponding political shift, pushing states to expand the space for capital’s operation both territorially and technologically. In the process, the rise of logistics has expanded its logics of distributive efficiency into spaces and modes of everyday life, organizing the subjectification, dispossession, and exploitation of poor and working people in terms of their relationship to economies of supply.

As we shall see, then, logistics not only refers to the material practice of supply chain management but also to the expansion of logics of distributive efficiency into expanding realms of social life. This chapter approaches logistics as both a material practice and as a heuristic. If we understand the function of logistics to be a process of transformation that seeks to lubricate, flatten, connect, and smooth out the irregularities of capitalist operations across space and time, then a critical Marxian reading seeks to uncover the effects of such fantasies of control. It also interrogates how systems of movement are both produced by capital’s imperative to circulate, and in turn work to reproduce, promote, and protect the neoliberal conditions for goods to move without the friction caused by rebellion, uprising, and resistance.

THE ROOTS OF LOGISTICS

Logistics began its life as a science of calculation. In ancient Greece, *logistikē* referred to processes of calculation, the applied field of counting that dealt with sensible objects, distinct from the theoretical number theory of *arithmētikē* (Klein, 1968). ‘Logistics’ did not refer to the management of supply chains until the nineteenth century, when it was applied to the challenges of organizing troop movement and battle supply during the Napoleonic Wars (Cowen, 2014; De Landa, 1991; Jomini, 2009). The Napoleonic Wars presented military strategies with a qualitatively and quantitatively different problem: they pulled millions of soldiers onto roads, so that along with mass numbers of soldiers came the problem of their subsistence, munitions supplies, and transportation. Identifying this problem, military strategist Antoine-Henri Jomini identified *logistique* as the work of deploying troops, provisions, and facilities – ‘men and material’ – to the front lines. Jomini proposed that practical organization should be elevated from the banal mechanics of movement and ‘a science of detail’, to a foundational military strategy: a ‘general science, forming one of the most essential parts of war’ (2009 [1961]: 230). What won wars was not ‘great strategic genius’, but plain hard work and cold calculation (Van Creveld, 2004: 1) involving quantitative assessments of how long and how far wars could be fought without exhausting the supply.² The rise of industrial warfare generated a renewed concern with ensuring a constant flow of fuel in order to lubricate the machinery of war, resulting in the formation of the Office of Naval Research, the Marine Corps, and other state entities charged with forecasting bulk fuel requirements for the battlefield (De Landa, 1991; Van Creveld, 2004).

This legacy has stretched into the contemporary operations of war. The scale and scope of growth in military logistics contracting is evident in the fact that the majority of individuals employed by the US occupation in Iraq and Afghanistan are not soldiers, but workers for US corporations like Kellogg, Brown & Root that provide logistical support services for the military, from food service to military base and equipment maintenance, and supply chain management.³ In this sense, as Paul Virilio argued, by stretching supply routes to the maximum, ‘war is no longer in its execution, but in its preparation’ (Virilio and Lotringer, 2008: 104). Indeed, this history precedes the era of industrial warfare: as David Graeber (2011) has shown, the need to feed standing armies of 50,000 men over 5,000 years ago led to the development of the promissory note and, in turn, the credit system and long-distance trade central to the development of our current logistical systems. The Royal British Navy grew in hand with maritime commerce to support imperial trade, while a network of intercontinental commodity chains grew out of the Atlantic slave trade and became a precursor to later forms of large-scale industrial capitalism (Blackburn, 1997; Harney and Moten, 2013). Logistics has long been central to the circulation of colonial rule.

The logistical underpinnings of warfare underscore entanglements between its business, military, and imperial histories (Cowen, 2014). The Vietnam War, in fact, was a triumph for supply chain logistics. The shipping container, a civilian innovation, proved the most efficient solution to the problem of distributing war material from Oakland to Cam Ranh Bay, a region largely inaccessible to US troops. This logistical success not only demonstrated the container's unitized efficiency but also showed that by stocking outbound containers returning to the USA with goods from East Asia, high-capacity containerization could be utilized to reduce costs and create profitability. In a parallel development, the Ford executive-turned-Secretary of Defense Robert McNamara founded the Logistics Management Institute in 1961, consolidating logistics functions and employing them in the escalation of the Vietnam War. The Institute has since expanded its scope into acquisition, financial management, and infrastructure management in sectors ranging from military defense to healthcare. Infrastructures of distribution and logistical calculation expanded not in tandem with military imperialism, but because of it.

THE RISE OF BUSINESS LOGISTICS

Buoyed by its success in the military realm, logistics found its footing in business management practices in the 1960s and 1970s. According to supply chain management textbooks of the era, creative innovations in the business world prompted a turn to logistics. Up until the 1950s, Taylorist methods of management applied to factory floors had led to considerable gains in manufacturing productivity, but transportation and warehousing practices remained undeveloped: the cost of distribution represented between 10 and 30% of total costs. La Londe et al. suggest that by the end of World War II, distribution was 'one of the last remaining frontiers for significant cost savings' (1970: 45). Firms in the USA began to experiment with rescaling and disaggregating components of the production process, raising total profits by quickening the turnover time for goods to be produced and purchased. In US boardrooms, companies examined the complex cost interrelations among various business activities in order to optimize them as a unified system (Allen, 1997; Bonacich and Wilson, 2008; Smykay et al., 1961).

Prior to these developments, the term commonly employed was 'physical distribution management', managing outbound goods movement after production was complete. In the 1960s, however, the concept of 'integrated business logistics' began to gain popularity, encompassing the entire supply chain from raw materials through finished goods. An early definition cast logistics as:

A total approach to the management of all activities involved in physically acquiring, moving and storing raw materials, in-process inventory, and finished goods inventory from the point of origin to the point of use or consumption. (La Londe et al., 1970: 44)

The concept of integrated logistics broadened executive responsibility for the movement of materials from ‘end-to-end’. The idea that coordinating movement across the entire supply chain could significantly reduce costs proved alluring. This ‘systems perspective’ (Cowen, 2014: 35) prompted firms to regard logistics as a strategic function, on par with finance, production, and marketing.

Logistics not only reshaped the corporation but also the spatiality of capital’s operations. Rather than producer-driven chains acting as the primary economic agents who establish backward linkages with component suppliers and forward linkages into distribution and retailing (Gereffi, 1996), logistical models involved ‘finding the right combination of inventory, length of production run, level of customer service, and so forth to maximize the profit of the firm as an entity: that is, a systems approach’ (Allen, 1997: 110). Whereas in Taylorist-Fordist configurations, space is primarily understood in static endowments of stocks and resources, in logistical assessments, production and consumption are not territorially confined. What matters is how efficiently supply chains are configured to link low costs, innovation, and the speed of the sale together (Veltz, 1997: 79). Absolute distances between mines, factories, and marketplaces are less relevant in a ‘total cost analysis’, which accounts for the actual cost of distribution *across* components, from raw materials to the final product, rather than transportation costs alone (Cowen, 2014: 35). This approach enabled rapid comparisons of changing freight rates, as well as allowing firms to model route choices, facility locations, and order quantities.

In this way, business logistics sought to systematize the supply chain. Functions previously handled by separate departments and often separate companies – from purchasing and manufacturing to transportation and warehousing – were gradually merged under the frame of integrated logistics, which shouldered responsibility for entire systems of production and distribution (Cowen, 2010). In a field-defining critical assessment of this business history, Deborah Cowen argues that these newly configured rationalities of the distributive system marked a shift from ‘cost minimization *after production*’ to profit maximization as ‘value added *across circulatory systems*’ (2014: 24), thereby according logistics a central role in the restructuring of capital accumulation.

Logistical experiments gave rise to ‘precision management’ models which utilize algorithmic and inventory calculations to optimize operations, eliminate actions deemed wasteful, and ensure efficient resource utilization. One critical doctrine in this model is just-in-time (JIT) management. Pioneered by Japanese automakers, logisticians grafted JIT methods onto other supply chains. JIT models aim to deliver components exactly when they are required: manufacturers no longer ‘push’ products onto retailers or consumers, but retailers ‘pull’ production to warehouses, cutting back on inventory and replenishing supply constantly. JIT is positioned in contrast to a just-in-case model, where companies create buffers and hold large stock inventories, leading to shelves filled with standing stock. In contrast, JIT uses ‘lean’ methods that meet demands at short notice, integrating

information on fluctuations in inventory capacities and markets with cybernetic data banks, increasing the scope over which JIT operates (Dyer-Witthoford, 2015: 53). Such management techniques seek to reduce interfaces between operations and keep processes flowing, so that circulation continues in a seamless motion.

Logistics has thus served to intensify processes of monitoring and surveillance, from the scrutiny of point-of-sales data and inventory to worker routines (Kanngieser, 2013; Neilson and Rossiter, 2010), weather and traffic patterns, and many other variables in a quest to find the 'cheapest and fastest path to making and distribution products' (Leonard in Birtchnell et al., 2015: 4). Firms that have adopted these new technologies and methods of logistics management have gained an edge over their competitors, prompting an explosion of these practices throughout the world economy. Across the USA as a whole, for example, transportation and logistics costs fell from about 16% of GDP in 1980 to less than 8% in 2009 (Larkin in Danyluk, 2017: 8).

HISTORICAL CONDITIONS FOR THE RISE OF LOGISTICS

What business textbooks do not tell us is that shifts in corporate strategy were also informed by structural changes in the dynamics of capital accumulation as a whole, as well as by state and worker action. To account for these factors, we examine the historical conjunctures and structural mechanisms by which logistics offered a response to the profitability crises associated with overproduction that began in the 1960s in the Global North.

In the 1960s, traditional mass manufacturing sectors in the advanced industrialized countries declined due to a combination of factors that included intensified international competition, accelerated technological change, and market saturation (Brenner, 2004: 164). To optimize costs, capital turned to newer industrial sectors grounded in flexible production systems, as large firms mobilized three intertwined strategies to enhance efficiency, sustain value accumulation, and increase their market share. Structurally speaking, one explanation for logistics' rise is that supply chain innovations were a necessary response to a tendency toward overproduction inherent to the logic of capital.⁴

Robert Brenner's *The Economics of Global Turbulence* (2006) provides such a theory. Brenner argues that the arc of accumulation reached its climax in the 1960s with a crisis of overproduction in the industrialized North. As competition from other industrialized countries compelled US firms to increase productivity, big corporations replaced labor with more efficient machines and managerial labor processes. This tendency for the rate of profit to fall is inherent to commodity capital: competition impels producers to adopt advanced technologies that increase labor productivity and drive down prices. However, as low prices place producers under the pressure to adopt more new technology, the cycle becomes iterative. The increased ratio of machines (dead labor) to living

labor eventually becomes a problem as investments become tied to fixed capital contained in machinery. According to Brenner, in the 1970s this resulted in ‘the long downturn’, an extended period of declining profitability which led to ‘over-capacity and over-production [that] were perpetuated and exacerbated throughout the advanced capitalist world’, initiating systemic turbulence from which the global economy had to find ways to recover (Brenner, 2006: 38).

As the ‘mixed blessing’ of fixed capital led to the slow decline of US manufacturing strength, hope for profit could no longer be located in the production process. Firms in the Global North began to experiment with shifting their investments toward the speedier realization of value. The foremost among these shifts took the form of finance, which sought to accelerate and increase the realization of value by accumulating profit through claims on future value. But the credit system also played an essential role in moving production to underdeveloped countries in the Global South. This allowed them to capture returns on the average profit rate in three ways. They: a) subcontracted, i.e. expanded social divisions of labor at the inter-firm level by subcontracting productive functions to other supplier networks (Brenner, 2004; Tsing, 2009); b) offshored, i.e. internationalized and outsourced the supply chain by pushing low-cost production facilities to places where labor costs were cheapest; and c) consolidated command and control of supply chains at major headquarters, enabled by tracking technologies, flexible organization, and the dispersal of distribution, financial, and service functions across local networks (Amin and Thrift, 1994; Harvey, 1990: 188–97; Sassen, 1993).

THE ROLE OF THE STATE

While Brenner’s account highlights inter-capitalist competition as the source of the profitability crisis, this version of the story tends to attribute the development of logistics to inexorable and innate processes of capitalist development, making advances effected by state and worker action less visible. In fact, state and worker action are central in the story of logistics’ rise.⁵ Accounts by David Harvey (2007) and Henri Lefebvre (2009 [1980]) allow us to chart such a path. For Harvey, state action changed the global economic landscape that fostered the conditions for the logistics revolution. US intervention in the Global South, coupled with structural adjustment programs imposed by multilateral institutions based in the Global North, bred a coercive structure that pushed developmentalist states toward neoliberal strategies that fostered climates for foreign direct investment and free trade agreements. Under this model, states sought to remove barriers to the free mobility of capital, opened markets to global exchange, and coordinated structures for international agreements without which the rise of the logistics industry would not have been possible.⁶

Logistics’ rise is owed not only to structural changes in the logic of capital but also to state action that responded to capital’s demands for place-specific

regulatory, institutional, and infrastructural arrangements that could enlarge capital's space of operation (Colas, 2017; Easterling, 2016). As competitiveness among regions, cities, and nations becomes increasingly dependent on their ability to facilitate circulation, states compete by creating zones of exclusion that facilitate export-and import processing without the heavy burdens of surveillance and taxation. From export-processing zones to free-port areas and logistics corridors (Grappi, 2018), such spaces of 'extrastatecraft' (Easterling, 2016) seek to enhance market competition while limiting state intervention. States seek a balance between the deregulation of labor laws and re-regulation of national transport industries, generating spaces of exception that allow supply chains to flourish and expand.

States thus play a key role in pursuing top-down political strategies of standardization and fragmentation, integrating policy frameworks, and creating institutionalized frameworks that facilitate flexible accumulation regimes (Grappi, 2018; Harvey, 2007: 67). For example, as Neilson et al. (2018) recently examine, China's Belt and Road Initiative is a massive state-led project to establish new trade routes from China to Europe and beyond, involving the buildup of extensive networks of satellites, warehouses, ports, railroads, and highways across transnational territory. In a domestic context, Walmart's meteoric expansion in the USA relied on land-use and zoning laws that favored big box stores on the basis of the sales tax revenues they generated for states and municipalities (Lichtenstein, 2009: 207).

The logistical character of state management of space is usefully illuminated by Henri Lefebvre's (2009 [1980]) concept of the 'state mode of production'. The state mode of production emerges as states produce institutional realignments for the construction and reproduction of the political, economic, and territorial conditions for capital accumulation over the twentieth century. Since capital accumulation must be defined in space, states seek to mobilize space as a productive force through spatial planning and the construction of financial and legal mechanisms for facilitating accumulation. Lefebvre argues that 'only the state is capable of taking charge of the management of space "on a grand scale"', because only the state 'has at its disposal the appropriate resources, techniques, and "conceptual" capacity' to take charge of growth in this way (2009 [1980]: 90). The concept of the state mode of production reveals how the state and capital both work to create temporal and spatial equivalences across the world market, homogenizing diverse spaces to service the needs of logistical accumulation.

As this homogenization happens, however, states are also differentiated through their ability to reproduce the relations of production by optimizing logistics and transport outputs.

One example of this tendency is the World Bank's Logistics Performance Index, a benchmarking tool created in 2007 to assess states' capacities to facilitate trade, whose measures – from logistics competence to infrastructure and timeliness – privilege efficiency and deregulation. Underdeveloped nations and urban spaces

compete to prioritize commercial capital flows over people, often sacrificing the welfare of its people in the process. State efforts to develop logistics efficiencies undergird a culture of consumerism in the Global North, instrumental in fostering consent to the existing social order. In the Global South, logistical development projects facilitate the growth of consumptive practices that tend to support regimes quiescent to US-led global capitalism, while fueling the production and circulation of cheap consumer goods – and the exploitation of labor essential to keeping them cheap – essential to the reproduction of capital. As Deborah Cowen argues, the rise of logistics facilitates a shift of the state's role in classical liberalism 'tethered to the security of national and individual property' toward a neoliberal state that shapes markets in accordance with universalizing principles of competition (2014: 61). The rise of logistics was not just a process of business innovation, but was fundamentally assisted by political strategies that positioned national and subnational economic spaces within global circuits of accumulation.

THE ROLE OF LABOR

Logistics' role in structuring the post-1960s neoliberal order has also been consequential for global shifts in the power of labor. The hypermobility of productive capital, aided by containerization and cheapening transportation costs, created downward pressure on labor's bargaining power by creating a single labor market in which all workers are pitted against each other in an international 'race to the bottom'. This thesis posits that as states pursued deregulation, they failed to protect the wages and working conditions of their citizens, while multinational corporations seeking the highest returns settled in locations with a cheaper, less organized, and reserve army of labor to contract into the wage relation. Meanwhile, neoliberal governments also mounted an assault on the organized working class in the Global North (McNally, 2010). From the UK to the USA, postwar gains by organized labor were reversed by the Thatcher and Reagan governments, resulting in restructured labor contracts, the suppression of labor struggles, and the reduction of union power. By enabling capital's hypermobility, logistics helped create a system 'necessarily hostile to all forms of social solidarity that put restraints on capital accumulation' (Harvey, 2007: 73).⁷

As optimization models prompted firms to subcontract and disaggregate their production and transportation systems, logistics helped to create new systems of 'flexible production' which eroded the stability of working classes, replacing them with networks of temporary labor. Arguments about the precaritizing effect of the flexibilization of labor are well known, but seldom emphasized is the crucial role that logistics systems played in the structural disaggregation of the industrialized working class, particularly in cheapening the costs of transportation that allowed industrial capital to move to low-wage areas. As Markus Hesse explains, 'to a certain extent, it was the system of material circulation that

allowed for the transition from use-value to exchange value, which made the large-scale capitalization of commodities possible' (2016: 31).

The postwar profit squeeze that Brenner suggests is an inexorable fact of inter-capitalist competition might thus alternatively be read, as Giovanni Arrighi suggests, as a response 'to the effective resistance of workers against attempts to make them bear the costs of that competition; and to the difficulties which capitalists encountered in outflanking that resistance' (2003: 32; see also Silver, 2003: 125–31). Similarly, Timothy Mitchell (2013) argued that the greatest victories of the modern labor movement centered around narrow chokepoints at which coal miners could constrict the flow of the high-energy coal on which states depended, and whose points of leverage were subsequently dissipated in the shift from coal to oil during the postwar period. We might thus read the rise of global supply chains and the logistics industry as a dialectical counter-movement by capital to labor's mid-century advances. The tremendous growth of big box stores, online retailers, and Amazon did not happen simply because of business innovations and technological optimization. They were also the consequences of conservative political victories that generated the terrain on which logistics companies would flourish, including the disintegration of labor law, the undermining of working-class power, and the growth of a free trade regime that became extremely beneficial to the fast flow of retail commodities across global space.

LOGISTICS AS THE TEMPORALIZATION AND SPATIALIZATION OF THE SUPPLY CHAIN

Viewed in this light, corporations' attempts to reshape supply chains into 'lean', 'agile', and 'flexible' networks made logistics a powerful tool for reproducing capitalist power relations through the reorganization of spatio-temporal circuits of the supply chain. While logistics is celebrated in business literatures as a form of technological progress, in the remainder of this chapter we explore the contradictions and tensions involved in pursuing efficiency-enhancing logistics systems. Rather than seeing logistics as a merely technical object, examining the political implications of its growth helps us understand how it has organized the social relations of production and distribution. This chapter cannot comprehensively review the political and social implications of logistics' growth. Instead, we focus on two aspects of its role in the reproduction of capital: first, the politicization of temporalities of exchange that discipline working bodies, and second, the spatial and material expansion of infrastructures of uneven development through which logistics systems expand.

The speed-up of the supply chain is not new: Taylorist-Fordist mass production organized the production process around the temporal logics of productivity and efficiency to intensify the workday and increase relative surplus value. The

logistics revolution, however, globalized temporal precision by organizing supply chain systems around ‘an obsessive concern with reducing the time in which goods are tied up unproductively either in inventory or waiting around for further processing’ (Schoenberger, 2000: 324). As firms seek to competitively accelerate the rate and mass of commodity circulation, workers along the supply chain are subjected to the temporal demands of productivity and efficiency through algorithmic processing. For example, firms employ tracking and monitoring software to trace movements in real-time, not only on boxes and containers but also on working bodies (Kanngieser, 2013). Warehouse pickers are assessed for their on-job performance through ‘flow rates’ and speed, where labor time is treated as a resource i.e. ‘measured and manipulated in the interest of organizational efficiency and effectiveness’ (Bluedorn and Denhard in Hepworth, 2014: 1131). Amazon warehouse pickers, for example, are set targets of 9 seconds per item and 300 items per hour, driving workers to such exhaustion that ambulances have been called to aid workers collapsing from exhaustion (Selby, 2017). As Kate Hepworth has argued, logistics has replaced the ‘clock time of industrial production’ with ‘real-time performance measurements’ (2014: 1130), substituting uniform units of labor time with rates – the number of tasks completed in a set period.

Whereas E. P. Thompson (1967) famously linked the strict imposition of the linear temporal measure to industrial discipline, logistical discipline substitutes linearity with flexibility. Flexibility adds another temporal dimension to productivity and efficiency by adjudicating labor productivity through the measurement of performance rates, lean production, and optimization. In addition to labor processes that increase relative surplus value by intensifying work rhythms, flexibility ‘[removes] the normatively regulated temporal boundary, replacing it with individually negotiated agreements between individual workers and employers’ (Everingham, 2002: 346). What is cast as ‘adaptability’ in corporate discourses allows logisticians to control the supply of temporary labor, altering work shifts in response to demand. This results in employers’ increasing demand for flexibility, lowered wages and benefit costs, and efforts to shift risks onto third parties (Abraham and Taylor, 1993; Theodore and Peck, 2002). As Beth Gutelius (2015: 56) has shown, flexible accumulation has deeply impacted logistics industries, where temp employment has increased particularly in the ‘flyover states’ and logistical hubs of the US Midwest, and in manufacturing and warehousing industries.

Demands for flexible labor also blur the temporal boundaries between personal and family life, creating populations of logistics workers who remain on call without guaranteed shifts, are given only 24 hours’ notice before they have to show up to work, and are ‘benched’ while waiting to re-enter the logistics workforce (Gutelius, 2015; Hepworth, 2014; Mezzadra and Neilson, 2013). In this sense, flexibility changes the relationship between temporal measure and work, moving from a linear model of industrial discipline to ‘asynchronous,

fragmented, and elongated experiences of time' (Mezzadra and Neilson, 2013: 158). Labor discipline occurs both through temporal speed-up (assessing workers on performance rates) and withdrawal (subjecting workers to unpredictable schedules and long periods of waiting for their next shift). By sustaining and expanding accumulation through temporal precision and flexible management, firms displace risk onto workers: workers absorb the frictions and risks associated with JIT supply chains by bearing the costs of the fragmentation of their temporal boundaries of work.

Thus, logistical processes seek to control the temporality of accumulation, but simultaneously fragment and slow the availability of stable work, while intensifying demands for efficiency from those who are unstably working. This impetus reflects a process by which, as Postone has argued: 'Time expenditure is transformed from a result of activity into a normative measure for activity' – a process by which time governs human activity and becomes 'intrinsic to the process of alienated social constitution' (1996: 214). Large logistics corporations such as Amazon and Walmart exploit the evisceration of labor law, keeping not only their direct employees but their logistics systems non-union (see Lichtenstein, 2009). Along the way, logistical modes of management become not simply a tool for organizing the movement of goods alone, but also a biopolitical technology of control through which the state–capital nexus orders and surveys populations, subjecting lives and livelihoods to increasing forms of logistical domination. Logistical systems in this way reproduce relations of production and distribution through the calculative politicization of rhythms and tempos of exchange.

SPATIAL EXPANSION AND THE SUPPLY CHAIN

The temporal flexibility underlying logistical systems would not be possible without a radical reshaping of the spatial relations of production and consumption. The intensification of exploitation through attempts to make logistical labor more generative of value exists dialectically alongside its 'extensification' – the spatial expansion of relations of exploitation. Because forms and degrees of exploitation are always the result of the state of class struggle against exploitation, as resistance to labor intensification becomes greater, spatial extensification becomes important for sustaining value accumulation. Indeed, Marx stresses that 'the tendency to create the world market is directly given in the concept of capital itself', where spatial expansion is inherent to the accumulation of capital since 'every limit appears as a barrier to be overcome' (1973: 408).

To understand this relation between intensification and extensification, it is helpful to look at Marx's (1978) writings on the concept of circulation in *Capital* Volume II. There, Marx suggests that although capitalism's crises are inextricably linked to the production process, maintaining or accelerating the circulation

of capital is equally important for ensuring conditions for accumulation. While Marx centers his analysis on the process of commodity production in Volume I, he also argues in the *Grundrisse* that capital can only be understood as a ‘unity of production and realization’ (1973: 407). In Volume II, then, Marx accounts for the centrality of processes of realization to the accumulation of capital, and shows how commodities must first circulate and their value be realized on the market before the amount of social labor expended in their production can be properly recognized.⁸ Logistics systems are thus a crucial component of ensuring the health of the total social circuit of capital, since the physical conditions of circulation play a central role in ensuring the continued reproduction of capitalist relations.

Marx emphasizes the need for the total social circuit of capital to be in continuous movement. If a commodity is not sold on the market, it cannot realize the value of the labor embodied in it. Obstacles that slow or halt the circulation and consumption of commodities therefore pose a threat to capitalism’s stability. Marx argues that since, ‘for the whole period of its journey to the market, capital is confined to the state of commodity capital’, it cannot transition to the money form and into productive capital. To speed up this process, capitalists strive to reduce turnover times (Marx, 1978: 327). As transportation technologies improve, they not only enable geographical expansion but also the expansion of the mass of commodities produced, leading to the expansion of megaships, truckyards, and computer systems to handle large masses of commodities being transported ashore at any time. Material infrastructure must be located strategically in a way that facilitates an accelerating economy – the position of ports in relation to distribution nodes like highways and railways, or the distance from warehouses to delivery sites, thus become crucial aspects of accelerating the circuit of total social capital.

In this way, expanding the circulation of capital requires developing quicker and cheaper means of transportation on a large scale to overcome spatial distance, while the credit system provides the promissory note for the ‘annihilation of space by time’. Here, transportation is not simply secondary, but is enfolded into the production process itself. Since the ability to reproduce the total social capital requires that capital expand its ability to reproduce itself – the ‘reproduction of the means of production’ – logistical systems develop conditions for the further accumulation of capital. For Marx, this means that transportation is not subsidiary to production:

The transport industry forms on the one hand an independent branch of production, and hence a particular sphere for the investment of productive capital. On the other hand it is distinguished by its appearance as the continuation of a production process *within* the circulation process and *for* the circulation process. (Marx, 1978: 228–9)

By emphasizing that the transport industry plays a role in continuing the production process, Marx situates the mode of circulation in two senses: as the turnover

of money and realization of capital (1973: 186). In selling a change in location – moving commodities’ ‘actual course in space’ (Marx, 1978: 229) – transportation processes actually produce surplus value, since ‘the product is really finished only when it is on the market’. Thus, ‘economically considered, the spatial condition, the bringing of the product to market, belongs to the production process itself’ (Marx, 1973: 533–4). Transportation processes are not simply important because they reduce the *faux frais* of production, i.e. the incidental overhead costs which detract from total surplus value (Bernes, 2013). Since a change in location closes the circuit of capital through the sale of the commodity, it plays a crucial role in capital’s ability to reinvest surplus value into the production process, beginning the cycle of accumulation over again.

Thus, while economic geographers and sociologists such as Edna Bonacich and Jake Wilson (2008) and Thomas Reifer (2004) have largely conflated logistics with the role of transportation, it should be noted that logistics systems organize the means of transportation and communication as *productive* forces in the expansion of logistical management over entire transnational networks of supply chains. Logistics systems do not just reduce or cheapen the costs of transportation; they seek to alter the spatial and managerial ordering of production, distribution, and consumption within the total circuit of commercial capital. In this way, logistics should be understood as a distinctive realm of movement (both material and financial) that expands the capacity of capital to reproduce itself.

CONCLUSION

Logistics has become an organizing logic and practice for expanding the domination of capital over the world market. However, it is important to stress at the close of this chapter that the image of seamless global circulation that logistics aspires to is largely just that: aspirational. Logistics seeks to be a system of omnipotent control and a governing strategy, but in practice, it is also constituted by a coordinated yet dispersed set of regulations, calculative arrangements, and technical procedures. The explosion of logistical infrastructures has also created an overstretched and brittle supply chain whose vulnerabilities regularly surface. While logistics is responsible for intensifying exploitation and various other social and environmental consequences associated with the reproduction of capitalist relations, it has also consolidated supply chains as entities that connect seemingly disparate industrial and commercial workforces more than before. In fact, some scholars have asked whether the rise of logistics has increased the economically based structural power of workers through the strategic occupation of bottlenecks, nodes, and long supply chains (Bonacich and Wilson, 2008; Clover, 2016; Silver, 2003). Although some claim that the logistics revolution has weakened unions, increased contingency, and lowered labor standards, it has also created vulnerabilities within the global capitalist system that can be used

as a basis for organizing the logistics sector and wider communities to build resistance against the circulation of capital. Kim Moody (2017: 59–70) argues for instance that logistics is in fact at the forefront of labor struggles, since industries continue to be reliant on ‘the ties that bind’ the production of goods and services, making it possible that the concentration of workers in key ‘nodes’ and linkages create clusters that renew the potential for mass labor struggles.⁹

Writing of the strategic importance of logistics workers, Bonacich and Wilson argue that ‘the global transportation and warehousing sector is absolutely vital to the success of global capitalism as we know it’ (2008: 249). Because JIT systems depend on uninterrupted commodity flows across long distances, logistics workers have the potential power to coordinate nationally and internationally, broadening their conception of logistics labor beyond individual docks and warehouses to encompass clerical, warehouse, trucking, rail, and longshore work across transnational supply chains. Likewise, Nick Dyer-Witthford (2013) has argued that it was not always inevitable that computer systems and big-data optimization schemes privileged capitalist strategies of accumulation. Instead, tracing a line from Soviet and Chilean cybernetics to current labor-time algorithms, he explores the possibility of shaping logistical systems toward decentralized participatory planning that could provide mass-scale capacities for communist resource allocation.

In this way, we may also see logistics as a critical site for seizing distribution systems, in line with those who see logistical nodes as potential sites for building non-capitalist futures (Bernes, 2013; Degenerate Communism, 2014; The Invisible Committee, 2009; Toscano, 2014). Such thinkers posit that antagonism has shifted from the withdrawal of labor power at sites of production to disruptive blockades, sabotage, and other disruptive action at points within the circulatory system. The Invisible Committee, for example, suggests that exploiting the vulnerabilities of technical systems can build emancipatory struggle by ‘reappropriating and reinventing the ways of interrupting [capitalist] networks’ (2009: 77). More recently, Jasper Bernes (2013), Joshua Clover (2016), and Alberto Toscano (2014) also debate the possibility that logistical systems – and the sphere of circulation more generally – provide opportunities for reconfiguring contemporary capital accumulation by reappropriating the means of production and circulation to communist ends.

Logistics’ aspiration to omnipotence remains, at least for now, only a ‘corporate *fantasy*’ of a self-imaged ‘ordering of chaos’ (Cowen, 2014: 203). Despite its gargantuan architecture and powerful imperial reach, the world of logistics is constantly undermined by its own contingencies and contradictions: precisely because of its aspirations toward omnipotence, logistics is itself a deeply vulnerable entity, ultimately an ‘ideology (and fantasy)’ of ‘full visibility as integral flexibility’ (Toscano, 2014). It is the deep anxiety over protecting its fragility that has promoted the grand experiments with regulating trade flows. In this sense, a Marxist approach to logistics requires that we both take stock of the growing

power of contemporary logistics systems while pushing back on the dominant view of logistical regimes as perfectly efficient and rational innovations. Rather, in facilitating new forms of connectivity and interdependency among places, insinuating itself into everyday lives, and forcibly seizing land and enforcing border imperialisms, logistics has exacerbated antagonisms not only between capital and workers directly associated with logistical chains, but all those targeted by or caught in its arc of accumulation. To refuse the image of logistics as a fully successful hegemonic force demands that we pay attention to ongoing refusals to accept the conditions of its violence.

Notes

- 1 There are, however, distinct differences between Amazon and Walmart's business models. Amazon's online retail growth has surpassed that of Walmart's traditional retail model. Logistical systems are put to work in the latter by delivering Walmart products directly to their stores for retail purchase, while Amazon's e-commerce model is built on warehouse storage and just-in-time home delivery. Although Walmart's revenue is still five times larger than Amazon's, growth has been stagnant in recent years at 2.8% between 2013 and 2015, while Amazon's revenue grew 20% in the same period.
- 2 In contrast, Carl Von Clausewitz does not see logistics as central to warfare. In a familiar formulation, Clausewitz argues that war is a 'continuation of political intercourse, carried on with other means' (1976: 87) and, as such, provisioning is only a secondary matter. In certain situations, however, logistics becomes critical: if a state of equilibrium sets in, 'subsistence is likely to become a principal concern. In that case, the quarter-master-general becomes the supreme commander'. For Clausewitz then, 'the conduct of war consists of organizing the wagon trains', and is a qualitatively different *form* of warfare, overseen and managed by logistical operations, but largely an anomaly in the conduct of war policy. It is worth considering how this famous definition of war has shifted under the perpetual war of our times. See also Paul Virilio and Sylvere Lotringer (2008).
- 3 As Adam Moore (2015) has shown, military logistics contracting is not new, but has increased greatly in scale. In World War II, the ratio of contractors to military personnel was about 1:7; in the first Gulf War it was 1:60 (Fontaine and Nagl in Moore, 2015: 9); in wars in Iraq and Afghanistan the number of contractors has been either equal to or greater than the number of uniformed personnel (Schwartz in Moore, 2015: 9).
- 4 For one such explanation, see Danyluk (2017).
- 5 I am grateful to the anonymous external reviewer for their suggestion to add a section focusing on state and worker interventions.
- 6 See Harvey (2007), especially chapters 3 and 4.
- 7 For an important re-evaluation of the 'race to the bottom' thesis, see Beverly Silver (2003: chapters 1 and 2) and Katy Fox-Hodess (2020).
- 8 It is important to note that logistics is not a sphere of industry that corresponds only to the realization of capital. The sphere of circulation is not separate from the social character of labor in the sphere of production. We know from *Capital Volume I* that production is impossible without labor that is fundamentally social: labor not as individual activity but as a social class of mass numbers cooperating in the production of commodities. However, because production under the capitalist mode is based on the private appropriation of wealth, labor is not immediately recognized as social, since the exchange of wages takes place as a private contractual relationship between worker and owner. In this sense, the social character of the labor relation can only be realized in the sale of the commodity: only after

entering the sphere of circulation and realizing the value of the commodity does the capitalist gain their profit, thereby appropriating a portion of the total surplus value created by workers in their employ. Thus the social character of private labor cannot be immediately established until capital completes the circuit in which the labor expended in production is realized in the sale.

9 For an important critique of Moody's argument, see Katy Fox-Hodess (2018).

Labour Struggles in Logistics

Jeremy Anderson

INTRODUCTION¹

Logistics has become increasingly important to the production and realisation of value in contemporary capitalism (as argued by Chua, Chapter 79, this *Handbook*). Capitalism's logistics' turn has led a range of figures – including academic observers writing in the Marxist and critical theory traditions, leaders of the established trade union movement, and radical activist groups – to argue that organising logistics workers is a strategic priority for the Left. This belief is premised on several factors: the growing number of logistics workers; the amplified disruptive potential of logistics workers due to the increasingly critical role of circulation; and the immobile geography of certain logistical infrastructures, making some logistics workers relatively immune to the threat of capital mobility.

The prospect of heightened structural power (the ability to disrupt production) most excites progressive commentators on logistics workers. For the purposes of this chapter, logistics is defined as both the practices involved in moving goods and the management systems for organising this movement. The logistics turn has resulted in both more complex supply chains and lean management, meaning that many supply chains are doubly vulnerable to industrial action. As a result of greater global trade, supply chains now spread across much greater physical distances and have many more logistics links in the chain.

This chapter argues that assumptions that the logistics turn will automatically convert into structural power are misplaced. Even the question of ‘have logistics workers become more powerful?’ is difficult to answer in a coherent or univocal way because there are major differences between occupations, as well as across countries and regions. However, there is little evidence that the increased importance of logistics to capital accumulation has resulted in greater power for logistics workers themselves. Very few logistics workers have substantially improved their terms and conditions, although there have been modest gains for collective bargaining coverage in some areas. Meanwhile, multiple processes have concurrently eroded working conditions and constrained the ability of logistics workers to organise; the growth of non-standard work, including gig work, zero-hours contracts, informal work (Newsome et al., 2017); the employment of a reserve army of labour that is often racialised and designed to foment race divisions (Alimahomed-Wilson and Ness, 2018b); and the implementation of algorithmic management techniques that has led to digitally enhanced despotism in the workplace (Kanngieser, 2013; Tassinari and Maccarrone, 2020; Woodcock, 2020).²

The central argument of this chapter is that understanding the power of logistics workers requires a nuanced framework that combines analysis of logistical economic structures and the multiple power resources that workers need to mobilise. Structural power can be brought into being but must be co-constituted with other forms of power, notably associational, symbolic, and institutional power. This requires detailed understanding of industry structures (and relations between capitals), as well as developing worker organising strategies that can ultimately supersede them, by moving beyond the corporate form to organise on a broader class basis.

The remainder of this chapter builds this argument over four sections. First, I interrogate theories of logistics workers’ power through a discussion of the power resources approach, which has become the dominant analytical framework in global labour studies. Although not an explicitly Marxist framework, I argue that the power resources framework has key Marxist elements. Moreover, its broad scope reflects the overdetermined nature of workers’ power. Second, I discuss the development of the logistics sector, including patterns of corporate organisation and profit extraction as these have an important bearing on the ability of workers to organise and build power. Third, I analyse the organising strategy of the International Transport Workers’ Federation (ITF) as a case study of efforts to build power in the sector. I show that the ITF has sought to mobilise logistics workers’ structural power organising campaigns in multinational corporations (MNCs), and that concerns over the subordinate role of logistics employers led the ITF to move up the supply chain to target lead firms. Building on Marxist perspectives on trade unions, I argue that mirroring the corporate form too closely is a trap for trade unions and that broader strategies are needed. Fourth, I outline a broader class strategy for logistics workers organising, which involves mobilising on a greater numeric scale, and activating different forms of

power, notably market-wide power and the relational power of place. Last-mile delivery drivers and warehouse workers stand out as two expanding sectors with major organising potential.³

UNDERSTANDING LOGISTICS WORKERS' POWER

Disruptive potential is the most common starting point for discussions about the power of logistics workers. By disruptive potential I mean the impact that work stoppages by logistics workers have on their immediate workplace, the supply chains linked to them, and the wider economy.

John Womack (2005) and Erik Olin Wright (2000), two writers in the Marxist tradition, both offer versions of disruptive potential. Womack argues that every occupation has different strategic positions, understood in terms of the amount of other work in the labour process that is dependent on that particular group of workers. In a port, for example, if crane drivers strike when a ship is in port, straddle carriers have no containers to shift, port truckers have no loads to pick up, and ships cannot sail until they unload their cargoes. The extent of the disruption will depend on a range of factors, such as the length of the strike, constraints on replacing striking workers, and the ability of employers to use capacity elsewhere in the system (such as other ports). At the other extreme, if cleaners went on strike then the port may be able to continue functioning at least in the short term (strategic position is specific to certain workplaces, other workplaces such as hospitals cannot continue functioning if cleaners stopped working).

Wright's (2000) notion of structural power is similar to strategic position. Whereas Womack sees strategic position, and therefore economic location, as the fundamental determination of workers' and trade union power, Wright argues the basis of workers' power is multidimensional and contingent on context. Wright contrasts structural power with associational power, i.e. 'the various forms of power that result from the formation of the collective organisation of workers' (2000: 962), which can develop either in the workplace, sectoral, or political spheres. Associational power can be observed when workers are able to mobilise power through collective action and is particularly evident where workers do not appear to have high levels of structural power (although the two are not mutually exclusive). For example, various histories of worker mobilisation in the twentieth century point to the Fordist system of large factories as a crucial nexus for fostering worker collective action, thereby highlighting the importance of associational power implicitly or explicitly. Mike Davis' (1986) study of worker organisation in the US steel and automotive industries during the 1930s tells the story of how a labour regime that was designed to explicitly weaken the power of craft labour through deskilling, ultimately resulted in a wave of labour radicalism and mass collective action. This period in US labour history has echoes throughout the subsequent history of capitalist industrialisation, including South Africa during the

1970s (Cole, 2018), Brazil and Korea during the 1980s and 1990s (Anner, 2011; Moody, 2001), and China in the 1990s and 2000s (Lee, 2007).

Associational power, however, is relevant beyond traditional conceptions of (largely) male manufacturing workers. Rina Agarwala's (2013) study of bidi cigarette rollers in India, an entirely female, informal workforce, shows the concept's wider relevance. As informal workers who work from home, bidi cigarette rollers have limited potential to take effective strike action. Instead, actions such as sit-ins at town squares while continuing their cigarette rolling work bring their work into the public space, and make highly visible demands on the state for welfare entitlements.

Debates over the relationship between structural power and associational power coalesced in debates about the power resources approach (PRA) (Schmalz et al., 2018; Silver, 2003), arguably now the dominant framework in global labour studies (McCallum and Brookes, 2017). Although drawing on the work of Marxist scholars such as Erik Olin Wright and Beverly Silver, the PRA is not explicitly Marxist. The PRA disaggregates social and political relations into three categories: associational power, institutional power, and societal power (Schmalz et al., 2018). Institutional power derives from the institutional structures that are created by worker struggles, either directly or indirectly, which form the basis for workers' power even in the absence of other forms of power being mobilised. Institutional power can range from rights enshrined in law, to agreements between workers and capital (that may or may not be backed up by legal frameworks). For example, the ITF has a unique system of international collective bargaining for seafarers, which has evolved over a period of more than 70 years, and which has continued to endure despite widespread attacks on the institutional power of maritime workers more generally (Johnsson, 1996; Lillie, 2006).

Societal power has multiple components. It includes symbolic power, which has been used to explain campaigns around garment sweatshops in export processing zones, where generating moral outrage among the general public as opposed to worker mobilisation is the primary tactic (Ross, 2004). It also includes coalitional or relational power to describe the power of alliances. For example, in recent decades in the West, a key campaign tactic for low-wage workers has been living wage campaigns that draw extensively on support from faith groups (Jamoul and Wills, 2008; Luce, 2004).

The power resources framework has both continuities and discontinuities with Marxist approaches and debates. The concept of structural power has an explicit Marxist lineage and addresses the classic Marxist concern with how workers can resist capital at the point of production (Davis, 1986). However, even within Marxist debates, attempts to argue that occupations or industries make workers more militant and/or revolutionary runs into conceptual and political difficulties. As numerous contemporary and historical studies have shown, worker militancy and unrest can break out among any group of workers regardless of gender, race,

formal work status, occupational group, or proximity or distance from the supposed commanding heights of the capitalist order or imperialist system (Cowie, 2001; Featherstone, 2008; Hyman, 2005; Khalili, 2020; Lee, 2007; Schwartz, 2019; Silver, 2003). The point here is not to merely widen the parameters of contingency. Rather, following Althusser, structural power and other ‘power resources’ can also be understood as structuring forces that are overdetermined in specific conjunctures.

However, there is a tension between Marxist approaches and the PRA over what power is and what it is for. In the form proposed by Schmalz et al. (2018), the PRA is both an analytical framework that explains the power that workers have and a manual for how to build trade union power. It explicitly adopts a Weberian concept of power as ‘power to’, as in, power to win better terms and conditions through collective agreements. Although the PRA shares with Marxism the goal of being both an analytical framework and a theory of praxis, historically the unproblematic promotion of trade union power would have led to tensions with the Marxist approach. Marxist debates on trade unions during the 1960s and 1970s, a time of significant labour unrest in the West and parts of the Global South, tended to focus on the fundamental limitations of trade unions for building workers’ power and socialism (Eidlin, 2020). These arguments ranged from macro-level arguments about how the imbrication of trade unions in the structures and processes of capitalism makes them incapable of generating meaningful resistance to it (Anderson, 1967), to meso-level arguments and the innate conservatism of trade union bureaucracy and its role in moderating worker struggles (Hyman, 1975), to the Italian debates around workerism (Wright, 2002). Following four decades of systematic attacks on trade unions, however, Marxist debates have shifted to viewing rebuilding the labour movement as a necessary task (Cohen, 2006; Gindin, 2013; Kelly, 1998; McAlevey, 2015). Consequently, both Marxist and left-liberal writers use the PRA framework to understand the potential for rebuilding workers’ power, although Marxist writers may emphasise structural and associational power more strongly than institutional power. Meanwhile, questions over what this power is for have been deferred.

THE LOGISTICS TURN

In her chapter in this volume (Chua (Chapter 79, this Handbook), charts the development of logistics and its increasing importance to the production and realisation of value, building on and reflecting broader interest in this theme (Alimahomed-Wilson and Ness, 2018a; Bonacich and Wilson, 2008; Campling and Cólás, 2021; Coe, 2014; Cowen, 2014; Fox-Hoddes, 2017; Gutelius, 2015; Hepworth, 2014; Neilson, 2012; Newsome, 2015). The impact of these changes has had contradictory impacts on workers, suggesting both greater structural power for logistics workers while simultaneously eroding working conditions.

Developments in logistics have led to more intense monitoring of both production and labour processes. Point of sale inventory systems, such as those developed by Walmart in the 1980s, enabled more accurate production orders and estimates for stock levels, thereby reducing storage needs. This led to ever greater monitoring of supply chains, including the location of goods at each stage of the supply chain, in order to maximise stability over product supply. The logistics turn, therefore, precipitated the trend towards greater micro-management, centralised monitoring, and disciplining of economic life now associated with platform and surveillance capitalism (Neilson, 2012).

The logistics turn has had a major role in generating surplus value for capital in general; the equalisation of logistics practices has significantly diminished the scope for individual firms to gain an advantage over one another. (Campling, 2021; Campling and Cólás, 2021). For individual companies, it is no longer a major advantage to have a highly sophisticated logistics system; it is a requirement. Crucially, built into these practices is a labour regime where wages are relatively low, and there are systematic efforts by capital to simultaneously micro-manage workers and erode their power resources.

LOGISTICS COMPANIES AND LOGISTICS WORKERS

Logistics is an abstract concept that can refer to a range of practices, including supply chain management, planning physical infrastructure such as ports and road networks, third party operations such as freight forwarding, warehousing and goods finishing, as well as long established transport tasks such as shipping and road transport. There are some important differences across these sectors that have impacts on workers' power. Some are asset heavy: operating a shipping line, or particularly a global ports company, requires a significant investment in fixed capital assets. Some of these tasks are asset light: freight forwarders, sometimes called travel agents for freight, may have few fixed resources other than office space and computer databases.

Another important difference stems from the patterns of corporate organisation and profitability. Some segments of the logistics sector are largely done in-house. This particularly applies to the supply chain management function of MNCs. Dominant lead firms in most sectors have well-resourced supply chain management departments, whether it is a consumer goods giant such as Unilever, mining conglomerate BHP Billiton (for bulk shipping chartering), or an aircraft manufacturer like Airbus. They do not outsource such management to specialised firms, at least not totally or permanently (Hamilton, 2013; Sheffi, 2012). The extent of their involvement, however, is primarily asset light. They do not generally own their own ships, ports, or trucking fleets. Historically vertically integrated sectors such as mining and oil increasingly outsource logistics functions. The important point here is that when it comes to logistics practices, the

lead firm in terms of the locus of decision-making is rarely a Logistics Service Provider (LSP).

Confusingly, not all firms active in logistics are called logistics firms. Neither, due to long standing occupational identities, would all workers involved in logistics practices consider themselves logistics workers. But according to the definition adopted in this chapter, a logistics firm could refer to any of the following: shipping lines, warehouse providers, freight forwarders, courier and package delivery firms, supply chain management specialists, trucking firms, or airline freighters. The logistics sector, however, has distinctive segments.

Multi-modal LSPs occupy the largely asset light end of the industry. This segment is dominated by three MNCs: UPS, Fedex, and Deutsche Post-DHL, who globally had 377,000, 380,000, and 540,000 employees respectively as of 2020 (not including out sourced workers) (GSCi, 2020). These firms all operate similar services: air express, contract logistics, trucking, freight forwarding, and supply chain management, but not asset heavy maritime operations. Maritime firms, for their part, have not made significant inroads into land and air logistics. The logistics operations of Amazon, however, is likely to soon rival them.

The market in which LSPs compete is highly competitive (outside of air express), a dynamic which has put pressure on labour costs. This sector has low barriers to entry and is highly fragmented. DHL is the biggest player in the European trucking market but has less than 1.3% market share, while the top 10 players have less than 10% market share between them (GSCi, 2020). This is typical of the situation across all of warehousing, trucking, and last-mile delivery. Importantly, it means that LSPs have a comparatively weak position compared to their customers, the lead firms in sectors such as retail and consumer goods, manufacturing, and extraction. Although LSPs have persistently sought to gain greater control in the bargaining relationship by seeking to become indispensable providers of supply chain management, lead firms have jealously guarded this strategic function of their logistics practices (Gutelius, 2015; Hamilton, 2013; Sheffi, 2012).

Container ports, in contrast, have more concentrated ownership. Throughout the 1990s, container ports went through a period of considerable expansion and consolidation (Notteboom and Rodrigue, 2012). Four firms emerged that controlled nearly half of global container volumes: Hutchison Port Holdings, controlled by Hong Kong billionaire Li Ka Shing; DP World, majority owned by the Emirate of Dubai; APM Terminals, a subsidiary of AP Moeller-Maersk, the Danish maritime conglomerate; and PSA, owned by the government of Singapore (Drewry, 2020). Since the start of the twenty-first century the 'Big 4' have consolidated their market leading role, at least for non-Chinese ports.

Shipping lines never went through the same wave of consolidation as container ports. The largest, Maersk Line, has never had more than 10% global market share. The other main sectors of shipping, such as dry bulk and tankers, were never consolidated either. Fragmentation would prove very costly for the

industry after the 2008 financial crash. In an environment where demand fell and capacity continued to increase (as ships ordered during the boom years continued to arrive), freight rates routinely fell below the cost of capital (Bologna, 2016). According to one estimate, the fragmentation of the industry resulted in lost income of \$100 billion for container shipping in the first two decades of the twenty-first century (Whelan, 2020). Industry fragmentation, and the apparent inability of executives to address it, has led to the phenomenon of ‘zombie carriers’ that are persistently unprofitable (Bologna, 2016) Only in the past few years has the industry moved towards consolidation (HSN, 2018).

The patchwork of logistics operations described here suggests both are differentiated relations between capitals and also different levels of structural power for different groups of logistics workers. The Big 4 container port operators are distinctive within the logistics landscape for their high profitability. This has not uniformly translated into higher wages for dock workers, however. In fact many have faced attacks on their working conditions. Container port profits differ significantly from port to port, depending on competitive dynamics in the surrounding hinterland. Container ports are ultimately dependent on shipping lines, who themselves have been under major cost pressure. And for different reasons, both shipping lines and LSPs have been operating in highly competitive markets, which has placed major pressure on labour costs. Although the logistics turn means that logistics workers now create increasing quantities of value across the supply chain, in most cases a relatively small proportion of this value is being realised as profit by logistics employers. Nonetheless, the structural power of logistics workers merits further investigation.

LOGISTICS WORKERS’ ORGANISING

If the logistics turn has resulted in greater structural power for logistics workers, we would expect to see it manifested in the ITF, either through the local and/or national-level strategies of ITF affiliates, or through the ITF’s global campaigns. Representing 20 million transport workers in over 150 countries, the ITF is by far the largest organisation of logistics workers (the next largest is the International Dock Workers Council, which claims a membership of 100,000 dock workers). The ITF has 700 affiliated trade unions that use a wide variety of organising and campaigning methods, and whose diverse ideologies span a broad political spectrum. The ITF is, therefore, a laboratory for understanding the structural power of logistics workers and the broader composition of workers’ power in the current moment.

Responding to the logistics turn by mobilising structural power has been an important part of ITF policy for at least two decades. Attacks on ITF unions during the 1990s, such as high-profile lockouts of dockers unions in the UK in 1997 and in Australia in 1998 demonstrated that the historical strength of transport

unions was under threat (ITF, 1998). The UPS strike in 1997, which started in the USA and spread to Europe, indicated the potential for a new wave of international solidarity in growing multinational LSPs. The ITF's 1998 Congress called for a shift towards more proactive campaigning (ITF, 1998), while the 2002 Congress called for specific strategies for unions to mobilise structural power in logistics (ITF, 2002).

In addition to the lure of structural power, organising in logistics had another advantage – the relative immobility of logistics capital. The early 2000s was a time when globalisation was a dominant discourse, and concerns about the tendency of capital mobility to undermine both workers' power and transnational solidarity were at a high point (e.g. Johns, 1998; Munck, 2002; Waterman and Wills, 2001). Logistics, however, was less affected by capital mobility than other sectors. It is important not to overstate this argument too much as this immobility is contingent on other factors. In the case of ports in Europe's 'Northern Range', ship calls can be substituted between a number of English Channel and North Sea ports from France to Germany, but only if capacity is available. Nonetheless, spatial tensions that have historically hindered trade union solidarity in producer MNCs (Olle and Schoeller, 1977) are noticeably less present in logistics MNCs.

By the late 2000s, the ITF's strategy had coalesced around two sectoral campaigns focusing on container ports and LSPs. These campaigns had similar aims and outcomes. Both campaigns focused on organising for union recognition, particularly in the Global South countries where these companies had expanded into non-union spaces. A number of union recognition victories took place, sometimes as the result of bitter disputes. In most cases the ITF established improved dialogue⁴ with global management. Sometimes this has become more formalised, such as in the case of the Global Framework Agreement agreed with DHL in 2016, but for most companies has taken the form of irregular meetings between unions and management either to resolve disputes or to negotiate policies. There has been co-operation on some issues such as a major international study of dockers' health and safety (Walters and Wadsworth, 2020). I have written about some of the key moments of these campaigns elsewhere (Anderson, 2013, 2015). Overall, however, the gains for logistics workers as a result of these campaigns have been incremental rather than transformational. Overall union density in the target companies has improved only slightly. Despite important gains in some areas, there have been no overall improvements in working standards.

What does such slow progress say about the power of logistics workers? Does it mean that theoretical assumptions about the structural power of logistics workers is misplaced?

The DHL Turkey dispute provides important insights into these questions. From 2012 to 2014, the union *Tümtis*, an ITF affiliate in Turkey, waged a campaign for union recognition at DHL Express. DHL responded aggressively, firing at least 32 union members which the ITF alleged was illegal in Turkish law and contravened DHL's commitments to international labour standards (Logan,

2013). Tümtis continued to fight for union recognition. Fired members maintained picket lines outside of DHL's main hub in Istanbul. Tümtis also took legal action against DHL for unfair dismissal. The ITF, along with its sister federation, UNI Global Union, responded with an international solidarity campaign. The ITF held several global action days, in which union members in DHL operations across the world either raised the Turkey dispute with management or demonstrated outside of DHL locations and German embassies (the German government was DHL's largest shareholder). There were regular visits to the picket line from unions around the world. In Germany, the union in DHL's home country raised the issue on both the works council and at company board level. The global union federations (GUFs) also targeted DHL's corporate relationships, putting pressure on shareholders and customers over union rights issues. And finally, the GUFs filed a complaint against DHL under the OECD Guidelines on Multinational Enterprises. This complaint was accepted by the German government, requiring the company to attend mediation with the unions. As a result of such widespread top down and bottom up pressure, and evidence that the union had over 50% membership, Tümtis members won union recognition in April 2014, resulting in a first union contract for 2,000 workers, and pay rises of 32 to 46% (ITF, 2014).

The DHL Turkey dispute illustrates an important dynamic regarding the difficulties of mobilising structural power in the current moment. As union activists were fired early on, it was not possible to take strike action. Although activists did maintain a picket line, this effectively involved mobilising associational not structural power. Internationally, too, these unions mobilised relational power, symbolic power, and institutional power, but they did not exercise structural power through international strike action. This is partly a result of legal restrictions. In most countries it is now illegal for unions to take sympathy strikes in support of unions in other workplaces, nationally or internationally. Unions can autonomously decide to take lawful industrial action around their own issues at the same time but this is rare. The only recent example on a large scale in the logistics sector is the UPS strike in 1997 (Banks and Russo, 1999), although strikes are now emerging in Amazon. Outside of logistics, the transnational strikes in Ryanair during the summer of 2018 are arguably the largest-scale transnational strike in any sector, in terms of the proportion of business impacted (Anderson, 2018). Until we see something comparable in logistics firms like DHL, port operators, or even Amazon, the structural power of logistics workers will be untested.

McAlevey (2015) argues that multi-faceted campaigns will always fall short because they prioritise sophisticated campaign tactics at the expense of worker mobilisation (or associational power aggressively mobilised). In her comparison of dock workers' unions in Chile and Colombia, Fox-Hoddes (2017) argues that ITF affiliated unions in Colombia were predisposed to rely on leverage applied by their ITF allies, as opposed to taking a 'class struggle' (defined as exercising power at the point of production through strike action). The problem with these perspectives is that they ignore cases like DHL Turkey, where worker militancy

is a major factor, but it alone proves insufficient to win basic trade union rights in the face of deep-seated corporate intransigence at the national and international levels. As broader scholarship on logistics workers shows, the DHL Turkey dispute is actually relatively rare in that at least the workers won their goal of a collective agreement. For example, the collection 'Choke Points' (Alimahomed-Wilson and Ness, 2018a) has numerous case studies on logistics workers internationally, and documents episodic outbreaks of logistics workers' militancy in different countries, but has no examples of these struggles translating into even modest institutional gains such as collective agreements.

Another explanation for the difficulties faced by logistics workers is the subordinate role of logistics capital in supply chains. As mentioned earlier, lead firms at the apex of global commodity chains retain considerable power over logistics functions, and are also insulated from worker pressure through layers of subcontracting (Hamilton, 2013; Newsome et al., 2017). One possibility is that even large MNCs like DHL have little power to accede to worker demands due to the discipline of market conditions. It also suggests that trade unions should target lead firms rather than logistics employers in order to win their goals.

The European trucking industry provides an acute example of this dynamic. Market leader DHL has less than 1.3% market share (GSCi, 2020). Low barriers to entry have resulted in a hyper competitive market, and downward pressure on drivers' terms and conditions has been enabled by the lack of government enforcement to ensure drivers from Eastern Europe receive proper pay and conditions. This has resulted in much lower take-home pay and tough working conditions, with many drivers living in their trucks for months at a time (ITF-VNB-IUF, 2020).

Since the start of the 2010s, road transport unions have experimented with an organising model that links drivers and unions from both Western and Eastern Europe. The fragmentation of the industry, however, is a major obstacle. In an attempt to overcome this, unions have targeted lead firms from auto manufacturing to retail, holding them ultimately responsible for trucking labour market conditions. A media exposé on trucking conditions in Ikea in 2017 was one example of this strategy (Conway, 2017), while negotiations with other firms deemed to have a more progressive approach are ongoing. Progress with this strategy so far has also been incremental at best. Even if strong agreements can be reached with lead firms – which have hitherto proved very difficult to achieve – there will still be vast numbers of other employers to organise until the strategy can achieve critical mass. Arguably this strategy has had much greater success when national legislation has placed specific responsibilities on lead firms for their supply chains, such as in Australia and South Korea (KPTU, 2019; Quinlan and Wright, 2008). Legislative opportunities, however, remain limited. And in the sphere of international law, current efforts to enshrine mandatory human rights due diligence principles in a new ILO convention on supply chains are facing intense employer opposition.

The growth of e-commerce firms like Amazon provides a new twist to the story. To some extent Amazon follows the classic path of ‘platform capitalism’ (Srnicsek, 2016), in that it has disrupted the retail market by building control over data. Amazon is also distinct from platform firms in that it has become more directly involved in managing and delivering ‘traditional’ services such as logistics. As with Walmart before it, logistics has been a key part of Amazon’s rise. Amazon’s spend on logistics has steadily increased as a percentage of its overall costs since 2000 (Richter, 2020) and has increasingly brought more of its logistics operations in-house. This vertical integration means that many Amazon warehouse workers are employed by the lead firm, whereas other platform firms take strenuous efforts to avoid formal employment relationships with their workforces (Kenney and Zysman, 2019).

The digital despotism of working conditions in Amazon warehouses has arguably brought workers from all links in the logistics chain into mainstream media narratives for the first time. Less well known is that Amazon warehouses have been subject to repeated international strike action in recent years, with regular strikes in Germany, Italy, France, Spain, and industrial action also beginning to take hold in the USA (Boewe and Schulten, 2019). These strikes are impressive in terms of their scale, and are one of the most concerted examples of logistics workers mobilising their structural power in recent times. As yet, however, they have not managed to shift company behaviour significantly.

The apparently low impact of strikes by Amazon workers may say more about the limitations of organising in MNCs in the short term than it does about the structural power of logistics workers. At the time of writing, the Covid-19 pandemic has made Amazon the world’s most valuable company in terms of stock market capitalisation, meaning management is likely to receive significant support from shareholders. Globally, it has no significant competitor in online retail, and management may feel little pressure to change its long-term anti-union stance. In this context, we need deeper and broader struggles than ‘class struggle at the point of production’, particularly when those struggles are contained within the MNC.

BEYOND MNCs: ORGANISING STRATEGIES FOR LAST-MILE DELIVERY AND WAREHOUSING

A common thread in the challenges discussed in this chapter so far is the relationship of trade union organising to the corporate form. In his classic analysis of trade unions, Perry Anderson (1967) argues that a major limitation of trade unionism is that it passively reflects capitalist structures. Carolyn Vogler (1985) argues that campaigns in MNCs are an example of ‘corporate sectional internationalism’, which puts corporate and occupational boundaries on solidarity. In what follows I reflect on the growing importance of last-mile delivery and

warehouse workers, and the possibilities for organising strategies that go beyond the corporate form.

Last-mile delivery refers to the final stage of delivery, generally to a retail customer or small business, and involving smaller packages. Last-mile drivers have a surprisingly marginal place in discussions around the power of logistics workers. The growth of online retail, and hence home delivery services, has been an important trend in the twenty-first century (Moore and Newsome, 2018), which at the time of writing is being accelerated by the Covid-19 pandemic. Although there is speculation about future automation, autonomous vehicles on a mass scale do not look viable in the next ten years due to technological, legal, and political constraints (ITF, 2020). A factor in the growth of last-mile delivery is a greater emphasis on fast delivery, such as next-day or same-day delivery services.

Growing demand for last-mile delivery places greater pressure on labour costs (Moore and Newsome, 2018). Many of these efforts have focused on increasing the absolute surplus value (the total amount of labour extracted), rather than relative surplus value (productivity of labour). Wage costs have been reduced through bogus self-employment, unpaid overtime, and inadequate health and safety provisions, including lack of access to toilets and unhealthy shift patterns. Drivers are also subject to the digital despotism of algorithmic management, with their working day micro-managed to the level of traffic routes and parcel drop off times. The market is relatively fragmented. In addition to major LSPs, a large number of small firms are active, particularly in the Global South where informal work is also a major factor.

There are several reasons why the challenges faced by last-mile drivers can be transformed into organising strengths. Tapping into these opportunities will require moving beyond an employer-based organising model to more ambitious strategies.

First, the digital despotism faced by last-mile drivers means that they have many grievances in common. Furthermore, they are always online, creating opportunities for digital organising. Recent campaigns illustrate these opportunities. In the Fight for 15 campaign, which mobilised workers in thousands of small fast food restaurants, web advertising provided a new way to identify activists who would then meet to plan strikes (Liacas, 2016). In the ITF's Ryanair campaign, closed Facebook groups run by cabin crew were an important way to create debate among a workforce spread across 86 European cities, and was credited as a key reason for the simultaneous strikes in the summer of 2018 (Anderson, 2018).

Second, there are many opportunities for last-mile drivers to come into contact with unionised workers. When last-mile drivers pick up their parcels from warehouses and depots, they will come into contact with unionised worksites. Workers at these sites can become important organisers for last-mile drivers, building on a long tradition of union organisation migrating along the supply

chain at the point of worker contact (Olney, 2018). For example, when the ITF's Flags of Convenience campaign began in the 1950s, dock workers played a major role supporting unorganised seafarers arriving in their ports (Johnsson, 1996).

Furthermore, the last-mile delivery sector already has a substantial degree of union organisation. Although there are many new firms operating in the sector, there are also many established, long unionised firms. As noted earlier, the expansion of delivery services has put labour costs and particularly union contracts under pressure both directly and indirectly (Moore and Newsome, 2018). To maintain existing terms and conditions, let alone improve standards, it is a priority for unionised workers to organise workers in the wider sector. The existing unionised workforce is also a possible experimentation ground for digital organising models for last-mile drivers.

Third, last-mile drivers are localised within particular spaces. Although they are moving around all day, it is typically only within one city or region. As such, they have much in common with place based platform workers who have made some organising gains in recent years (Johnston, 2020; Tassinari and Maccarrone, 2020; Woodcock, 2020). In addition to digital connections, there are opportunities not only to build face-to-face contact but also to make local alliances. Some of the most successful campaigns for organising low-wage workers in recent years, notably living wage campaigns, have come from the relational power of alliances in local spaces (Holgate, 2015; Wills, 2008). The pandemic has highlighted the important work that last-mile drivers do for other groups in society, taking great risks to keep supplies of essential goods moving during the various lockdowns.

Fourth, legal barriers can lead to creative thinking about organising models. Many last-mile drivers do not have formal employment status. Bogus self-employment, more common in the Global North, creates a legal barrier between workers and employment rights, including collective bargaining in many countries. Informal work, more common in the Global South, is a more complicated matter and often has a more indirect link to the supply chain. For example, in Uganda, *boda boda* motorcycle drivers are a major part of the delivery network, but the precise nature of their links to more formal parts of the supply chain is blurred by intermediaries (Spooner and Whelligan, 2017).

Informal workers in a range of sectors have shown it is possible to organise for improved conditions in the absence of favourable legal frameworks. For example, auto-rickshaw associations in India focus on issues relating to the structure of their work, such as welfare services, fuel taxes, and police harassment. Elsewhere, informal workers focus on welfare services, education services, and other forms of decommodification (Agarwala, 2013). There are many issues that can be organised around even in the absence of a formal employer.

Many of the assumed barriers to organising last-mile drivers can be overcome. The common thread of this argument is the need to think beyond corporate structures such as MNCs and to find ways to mobilise last-mile drivers in larger

numbers. A similar logic applies to warehouse workers. At first glance, MNC-focused organising models may seem appropriate for warehouse workers, particularly given recent gains by workers in Amazon.

Warehousing, however, is a varied and complex sector that extends far beyond retail and also requires a more ambitious organising strategy. Warehousing's importance has been reaffirmed by both the logistics turn and the more recent growth of e-commerce. A wide body of evidence shows that this growing importance has placed downward pressure on workers' terms and conditions, with extensive moves towards precarious labour in many countries. In Global North countries such as the USA and Italy, the employment of migrant labour is widespread, as are management strategies to divide workers by race (Kaoosji, 2018; Newsome, 2015).

A 2016 organising project at DHL warehouses in India offers some insight into the challenges of organising warehouse workers through an MNC campaign model. The ITF and UNI had recently agreed a global framework agreement with DHL, and the ITF saw the agreement as a major opportunity to expand union organisation in the Indian warehousing sector where union membership was low. A research exercise identified a long list of 480 warehouse locations. A team of 22 researchers then visited all of these sites, discreetly collecting information such as workforce size, shift patterns, and key customers by talking to street vendors and workers on breaks. This was the largest field mapping exercise the ITF had ever undertaken.

Four sites were finally identified as organising priorities based on factors such as worker numbers, site accessibility, political conditions at state level, leverage potential of key customers, and organising capacity of local unions. Ultimately, organising capacity would prove decisive. The geography of where there were 'good' organising targets and where unions had either the willingness or capacity to organise simply did not overlap, and none of the organising initiatives succeeded. The failure of the warehouse organising project is partly a cautionary tale of top down targeting. India had been a flashpoint for the ITF's DHL campaign with multiple worker grievances, but all of the focus had been in the smaller Express division (made up of workers in smaller sorting centres and drivers). The attempt to expand the campaign into DHL's broader warehousing operations in India made sense in the ITF London headquarters, but not, on this occasion, for unions in India.

An alternative strategy is to organise warehouse workers on the basis of place rather than employer. Recently some Marxist writers have been attracted to a 'choke point' theory of warehouse worker organising, arguing logistics capital is reliant on a relatively small number of key, geographically immobile hubs, such as those located on scarce land near ports, airports, rail hubs, or key road junctions, and/or with fixed investment in specialised infrastructure, including major LSP hubs. Implicitly, these authors argue that workers could mobilise significant structural power if they organised in such 'choke points' (Allen, 2015; Moody,

2019). The problem with this strategy is that like the DHL India case mentioned above, it involves employer led targeting. For example Allen (2015) identifies FedEx's non-union air hub in Memphis as a key organising priority. Picking targets in terms of what is strategic for capital alone has a high rate of failure.

Defining place based strategies can be a difficult exercise. Analysing a range of strikes by warehouse workers in Italy, Benvegnù and Cuppini (2018) argue that the Po Valley area of Northern Italy can be considered as an 'extended choke point'. However, the diverse locations of the examples they use, which range across the Milan and Turin hinterlands, means this cannot be considered a choke-point in any meaningful geographical sense.

One of the most nuanced examples of place based organising approaches can be found in California's Inland Empire (Allen, 2010; Kaoosji, 2018; Moody, 2019). The Inland Empire organising effort actually first emerged as part of an MNC campaign, specifically an attempt to build a warehouse dimension of the Walmart campaign (De Lara et al., 2016). The campaign quickly realised that Walmart's involvement in the sector was so fragmented that a traditional work-site based approach would not be effective. Instead, the campaign developed a workers' centre (organising workers on the basis of place rather than employer), and mobilised symbolic power through political actions. After the Walmart campaign was scaled down, the effort continued through a combination of welfare services as well as innovative industrial action such as health and safety strikes. As a result, warehouse worker organising has maintained a dynamic presence in the Inland Empire, although not a large-scale one (Kaoosji, 2018). The Inland Empire example highlights the importance of a long-term approach. Labour organisers may be initially attracted to key warehouse clusters because of the potential for structural power. But building and sustaining worker organisation in these clusters requires long-term, multi-faceted organising, and alliance building in place. It is likely, however, that only such long-term efforts will build the necessary scale to mobilise structural power.

CONCLUSION

This chapter interrogates the assumption that capitalism's logistics turn has resulted in more structural power for logistics workers,

I initially addressed this question by reflecting on the organising strategy of the ITF, a large and diverse global union federation representing logistics workers. If logistics workers have become more structurally powerful, we would expect to see this manifested among ITF unions. Based on the ITF's attempts to organise in major MNCs, specifically container port operators and multi-modal LSPs, the evidence is limited at best. There have been a number of union recognition victories in particular places, and more institutional power in the form of a global framework agreement and more regular dialogue with the global management of several MNCs, but overall the gains have been incremental.

Few of these gains are a result of workers exercising their structural power directly. Instead, gains have been made due to the ability of workers to maintain collective organisation in hostile environments (associational power), the ability of unions across MNCs to apply other forms of pressure (associational power), and the ability to target wider relationships in the corporate ecosystem (institutional and symbolic power). Although mobilising these different sources of power has been impactful, arguably it has not had the transformational impacts the strategy set out to achieve.

Before we dismiss the importance of logistics workers' structural power, we need to recognise the efforts that have been made to constrain it. Recent decades have witnessed restrictions on the right to strike. Attempts to bust powerful unions in the logistics sector both politically and technologically, extensive subcontracting, and building redundancy into logistics systems are all examples of how the state and capital fear the structural power of logistics workers, while simultaneously depressing labour costs (Alimahomed-Wilson and Ness, 2018b). These attempts to suppress structural power gives us a strong indication that it exists.

In the final section of this chapter I argued that in order to mobilise structural power, we need to move beyond organising strategies based on the corporate form and develop organising methods that will involve mobilising much larger numbers of workers. Last-mile delivery and warehouse workers are examples of occupational groups who arguably could exercise structural power if they were able to mobilise in sufficient numbers over a long period of time. Workers in both of these sectors are critical for the ongoing functioning of logistics systems and emerging e-commerce sector in particular. This raises two related questions. First, if structural power can only be exercised in conjunction with other power resources, and particularly associational power, does it exist in any meaningful way? And second, if in the final analysis workers' power comes from mobilising in large numbers, to what extent do we even need to understand political economic structures and workers' place within it, as opposed to organising simply for large-scale mobilisations in whichever way possible?

The arguments about last-mile and warehouse workers in the final section of this chapter suggest there needs to be a nuanced formulation that takes into consideration both political economic and associational factors. I argue that it is possible for last-mile drivers to organise, but the way to do this would need to be sensitive to the specific conditions of their industry, the way their work is structured, and the pressures they face. Likewise when it comes to warehouse workers, the key is to understand the meeting point between economic structures, such as warehousing complexes, and the possibilities for building long-term alliances in particular places, and specifically the ability to build alliances on a big enough scale. As discussed earlier in the chapter, targeting lead firms at the apex of supply chains is unlikely to be successful without significant mobilisation. But if such large-scale organisation can be achieved, then it will be most effective if directed at the most economically powerful fractions of capital (such as lead

firms). It is here that corporate targeting and place-or community based organising, two strategic approaches that are somewhat at odds, need to co-develop.

The structural power of logistics workers, therefore, is best understood as contingent. There is no shortcut to it, neither is it easily turned off and on. Rather, it is likely to be brought into being through processes that layer multiple forms of workers' power. We need strategies that can connect workers around broad occupational issues, and place greater emphasis on building relationships and solidarity in particular places. If logistics workers are able to mobilise these different forms of power, including the associational power that comes with mass mobilisation, then it is possible to imagine their transformational potential.

Notes

- 1 Writing in a personal capacity. I would like to thank the editors and also Liam Campling for comments on drafts of this chapter, while the errors remain mine.
- 2 A growing literature analyses algorithmic management, its impact on the labour process and possibilities for worker resistance. Although some logistics workers are heavily imbricated in processes of algorithmic management, the impacts of algorithmic management are not a major focus for this article. As Tassinari and Maccarrone (2020) and Woodcock (2020) demonstrate, algorithmic management is effectively an extension of long standing attempts to control and micro-manage workers in the labour process. It does not, however, fundamentally alter labour's capacity to resist.
- 3 The arguments in this chapter are primarily drawn from my experience working at the International Transport Workers' Federation, where I've worked since 2008 on various global organising campaigns in logistics. Working for the ITF demands an effort to take a global view, a daunting task given that many different national and regional dynamics do not easily fit into consistent global narratives. This chapter, therefore, is intended to provide a contribution to understandings of logistics workers, but is not the final word.
- 4 Dialogue has different meanings in trade union discussions. 'Social dialogue' is a key concept in industrial relations discussions in the European Union and International Labour Organisation (ILO). It involves calling for either dialogue between the 'social partners' i.e. employers and trade, or 'tripartite dialogue' (employers, unions, governments). From a Marxist perspective, social dialogue entrenches the subordinate position of workers as it takes place in the context of uneven power relations. A second meaning arises when workers mobilise structural and associational power to bring employers to the negotiating table. This chapter refers to the second meaning of dialogue.

Welfare

Tine Haubner

INTRODUCTION: WELFARE FROM A MARXIST PERSPECTIVE

From a Marxist perspective, the welfare state can be defined ‘as the use of state power to modify the reproduction of labour power and to maintain the non-working population in capitalist societies’ (Gough, 1979: 45). This means that welfare, on the one hand, aims at reproducing labour power (which is necessary for capital accumulation) and, on the other hand, seeks to maintain non-working groups like children, the elderly, the unemployed or sick (which is necessary for social integration and reproduction). Government social policy therefore mainly deals with the social effects of capital accumulation (Jessop, 1986: 6f.). From a Marxist point of view, as long as children are the future work force, the unemployed are the ‘reserve army of labour’ (Marx, 1887: 442ff.) and the boundaries between working and non-working groups are fluid; none of the elements can be separated from each other. Thus, in addition to the market and the family as institutions of social reproduction¹ based on wage labour and unpaid domestic work, the welfare state intervenes politically in social reproduction in at least three ways (Gough, 1979: 45). First, taxation and the social security systems provide consumption opportunities and benefits for food or housing. Second, the welfare state subsidizes services and goods. And finally, ‘the state directly provides use-values in the form of services’ such as health services or childcare and education (Gough, 1979: 46).

Placing the welfare state in relation to the structure and contradictions of capitalist accumulation is a common feature of Marxist approaches towards welfare. From this perspective, the welfare state necessarily emerges from the material contradictions of capitalist society and operates through and within its contradictions. According to Marx, capital accumulation is a 'moving contradiction' (Marx, 1973: 625), which permanently creates class and economic conflicts, and cannot survive on its own. It rather depends on social structures that compensate the social effects of its contradictions. That does not necessarily mean that the historical development of Western capitalist states into differing welfare regimes can merely be deduced from the logic and contradictions of capital accumulation. Instead, capitalist accumulation and welfare must be considered as co-constitutive against the background of specific national-historical paths of welfare development.

Welfare is always related to capital accumulation because social expenditures depend upon social income and wage-based taxes. Conversely, welfare itself has effects on capital accumulation by redistributing economic surplus. Not coincidentally, Western welfare states, their differences notwithstanding, developed together with industrial capitalism and 'the formation of national states and their transformation into mass democracies after the French Revolution' (Flora and Heidenheimer, 1981: 22) in the late nineteenth century. With the industrial division of labour, namely the separation of producers and the means of production in so-called 'primitive accumulation' (Marx, 1887: 507ff.), new requirements for social reproduction appeared. In capitalist societies, where social reproduction is no longer predominantly organized by extensive subsistence farming and the family but instead organized through the market, wage-dependent people need wage-replacement benefits, i.e., social security in times of unemployment, crisis and general life risks (such as care dependency). On the other side, capital needs exploitable labour power without bearing heavy reproduction costs. As we learn from Marx, capital does not care about the requirements of social reproduction beyond production costs. Thus, by providing social security beyond the market and disciplining the work force with the help of social policy measures, welfare states both enable as well as limit capital accumulation. Welfare has therefore been considered a 'Trojan horse' that can potentially shift barriers between capitalism and socialism (Esping-Andersen, 1990: 11), or at least it is a battle ground pervaded by class conflicts and structural contradictions.

But what kinds of contradictions are meant here? Systems-oriented Marxist approaches towards welfare list many (Offe even listed 17; see Offe, 2005: 149). The following four contradictions are particularly characteristic. First, welfare states are usually both capitalist and democratic and need to protect and redistribute property. Second, welfare moves between the demands for exploitable labour power and its needs of reproduction. Thus, welfare both commodifies and decommodifies, both provides social protection and disciplines the population (Esping-Andersen, 1990).² Third, welfare states are tax states. By means of the redistribution of tax money, they aim at providing social security to guarantee

loyalty, but they also need to avoid over-indebtedness. Lastly, capitalist welfare states are situated in the conflict between international competitiveness and the national population's needs for social security. But before we consider Marxist approaches concerning welfare, let us have a look at Marx's own work.

MARX'S LEGACY

Initially, Marx planned a book about the state within his critique of political economy, but unfortunately he failed to do so in his lifetime. But that is not the only reason why Marx did not focus on welfare that much. Although he commented on social policy (like the factory question and Ten Hours Bill), he lived in a time of only nascent welfare policies and never witnessed the so-called 'Golden Age' of expanding welfare states after the Second World War across the West. Nevertheless, there have been broad Marxist discussions about the state, especially since the 1970s (see Gerstenberger, Chapter 19, this *Handbook*). What we can learn from Marx about welfare, we have to deduce from his theory of the state.

In a nutshell, Marx and Engels' perspective on the state is materialist. They understand the state as the specific political form of all capitalist societies that emerges together with private property, the division of labour and the class struggle between bourgeoisie and proletariat. In the *Critique of Hegel's Philosophy of Right* (1970a) as well as in *The German Ideology* (1968), the state and private property are consequently analysed together. With private property, individuals are emancipated from the social community, competition endangers social integration and the national state appears as a special power beyond civil society. By protecting private property with the help of the monopoly on the use of force, contracts and jurisdiction, the state appears as the institutionalized and legally formalized power of property – beyond competing private interests. It thus prevents a social order based on the struggle of merely subjective arbitrariness (Marx, 1970a: 84ff.). But as a condensed form of capitalist bourgeois society, in which the ruling capitalist class represents its interests, the state is also a class state (Marx, 1968: 31ff.) and usually consists of the most powerful economic ruling class that uses state power to oppress and exploit the underclass (Engels, 2010: 92f.).

Additionally, Marx critically stresses the limits of state and welfare. One central feature of Marxist state criticism is therefore the rejection of the belief that the state can be realized as an independent and neutral institution. In his *Critique of the Gotha Program*, Marx attacks the German social democratic party according to which the state is autonomous and needs to be conquered as a free state by the working class (1970b: 19f.). In Marx's view, to think of the (welfare) state as a neutral institution that only needs to be occupied by the right people is a 'fiction' or 'illusion'. In his writings on the struggle for the normal working day, he makes it clear that the successful battle for the Ten Hours Bill is a concession

rather than an achievement for the working class (Marx, 1887: 184ff.). Instead, legislation in the long run never aims at cutting the freedom of capital at all. Since government is intimidated by the bourgeoisie (organized within ruling parties), it is capital, law and class struggle that ultimately mark the limits of welfare policy. Therefore, success – like a reduction in working hours – is always the result of long, highly contested class struggles and strategic political alliances that often resemble pyrrhic victories for the lower classes and do not aim at changing the whole capitalist game at all (Marx, 1887: 186, 194).

The argument above reveals at least two different Marxist perspectives on welfare. Welfare and social policy do not derive from parliamentarianism and political ideas, as Marx says (1887: 187), but emerge from class struggle and economic requirements.³ Thus, we can differentiate between a more economic-functionalist and a more class-action-based perspective on welfare. These views are not analytically separated but intertwined within Marx's analysis. The first perspective shows that since capital accumulation is contradictory, welfare somehow works both against and in favour of capital accumulation. By lowering working hours and protecting workers from overexploitation, welfare acts against capital's interest of maximally exploiting labour power. On the other side, it thereby prevents capital from exhausting its own resources. The other perspective shows that welfare is a battlefield of conflicting class interests that are fought out by parties, social legislation and parliament decisions. One major issue that separates different Marxist approaches to the welfare state is thus the question of whether welfare is a contingent, open-ended battlefield or if its limits are always marked by the structural requirements of capital accumulation.

DIFFERENT MARXIST APPROACHES TOWARDS WELFARE

While Marxist debates about the state have been quite lively, especially during the 1970s, welfare seems to be a topic of less importance. Only a comparatively small number of Marxist contributions specifically address welfare. One reason for this lack of interest is that welfare within Marxist debates has often been understood 'as a form of ideological mystification' (Gough, 1979: vii).⁴ While Keynesians and social democrats – as the political advocates of the welfare state – consider welfare to be an achievement of the working class, Marxists distance themselves from such perceptions and stress instead the limits of welfare and its repressive function in freezing social conflicts. Differing Marxist approaches regard welfare as a) a vicarious agent of capital accumulation and structurally necessary institution of capitalist societies, b) a structurally self-contradictory subsystem of capitalist society or c) an historically changing battlefield of class struggle in dynamic conditions of social reproduction. In that sense, Marxist perspectives also differ on whether it is the case that the welfare state necessarily emerges from the economic structure of capitalist societies, or that the welfare

state develops on the basis of structural ambivalences between capital accumulation and democratic requirements, or, finally, that the welfare state is a product of inherent class power but also (in the case of Marxist-Feminist approaches) gender relations. We can roughly distinguish between five different Marxist approaches towards welfare. First, form-analytic approaches that explain welfare through the needs of capital accumulation and thereby stress the functional limits of welfare. Second, approaches that stress the repressive and disciplinary purposes of social policy. Third, 'late-capitalist' approaches that emphasize the inner institutional logic of welfare. Fourth, Western-Marxist class and regulation theoretical approaches that stress historically varying class actions and power relations within the state. And finally, Marxist-Feminist perspectives that point to the meaning of unpaid care work for capital accumulation and welfare services.

AGAINST THE 'ILLUSION OF STATE SOCIALISM': FORM-ANALYTIC PERSPECTIVES ON WELFARE

Why the welfare state emerges as a specific political form of late-capitalist societies and why citizens think of it as neutral or even 'social' were central questions of the Marxist 'state-derivation' debates during the 1970s (Gerstenberger, 2007). These debates were initiated in 1970 by German Marxists Wolfgang Müller and Christel Neusüß (Müller and Neusüß, 1971). In their essay 'The Illusion of State Socialism and the Contradiction between Wage Labor and Capital', they criticize the 'revisionist' assumption that the so-called welfare state can be somehow autonomous or independent from capitalist contradictions. This 'illusionary' view is based on the common (false) beliefs that a) the distribution of social surplus by the state is independent from capitalist production and b) that welfare truly aims at the well-being of citizens. Instead of this 'illusion of state socialism', Müller and Neusüß consider the state to be a result of capitalist societies and the contradictions of capital accumulation. Although the welfare state is not identical to capital accumulation and emerges as a separate entity, it is not an independent subject but rather an object of capitalist accumulation.

To sum up, following the form-analytical perspective, Marxist state theory understands the (welfare) state and its ambivalences as necessarily emerging from the contradictions of capital accumulation and it considers existing capitalist society and its limitations as the material foundation of the state. By distributing the social surplus in favour of social equality, the state is not politically independent from capital's interests but highly dependent on economic growth; the state is thus not forcing its political will onto capital. Profits need to be made for wages to be paid – and that in turn means the creation of surplus through exploitation. A minimum level of social equality, stability and security is furthermore understood as a necessary appeasement in order to bolster capital accumulation

without any concern for serious economic redistribution. It follows that the welfare state is neither a suitable terrain nor a loyal companion for working-class struggles against exploitation and oppression.

This critique thus counters the 'revisionist' political view on welfare with an economic perspective that emphasizes the underlying tensions between politics and economy (Müller and Neusüß, 1971: 13). These tensions refer to the different aforementioned Marxist perspectives on the state. On the one side, this approach interprets Marx's analysis of capitalist societies as derived from the category of the commodity. The capital relation thereby appears as 'nature' and the maximum extension of the working day as the 'natural drive of capital' (Müller and Neusüß, 1971: 47). From that standpoint, social policy which, following Marshall, aims at reducing or even eliminating class inequality (Marshall, 1981) – nearly like a natural law — emerges necessarily from capitalist production and its deliberate extensive exploitation of the work force. Because capitalism thereby undermines its own conditions, social policy protects the work force from overexploitation in favour of ongoing capital accumulation. It also follows that the organization of the working class is paradoxically necessary for the survival of capitalism. Nevertheless, Müller and Neusüß do not treat social legislation as a merely functionalist attachment to capital accumulation but as a result of long class struggles and a process of diverse conflicts (Müller and Neusüß, 1971: 54). From this perspective, the state necessarily emerges from the contradictions of capital accumulation as a representative of the whole capitalist class but without being identical to that process of accumulation. Finally, in this tension between an economic-functionalist and a class-action account of welfare lies a central Marxist idea of welfare, namely, that it is contradictory:

In other words it is not the Marxist analysis of the welfare state that is contradictory, but the welfare state itself. The welfare state exhibits positive and negative features within a contradictory unity. [...] It simultaneously embodies tendencies to enhance social welfare, to develop the powers of individuals, to exert social control over the blind play of market forces; and tendencies to repress and control people, to adapt them to the requirements of the capitalist economy. (Gough, 1979: 11f.)

Another structural ambiguity of welfare considered by Marxist state theory, although not in its form-analytic guise, concerns the repressive and educational police function of the welfare state. From this perspective, the welfare state is not a self-sufficient saviour from social misery but instead a set of rules, relations and institutions that also aims at repressing and discriminating against the poor. In contrast to functionalist approaches towards welfare, this perspective understands social policy measures as instruments of social distinction between a reputable working class and the undesirable poor (Gerstenberger, 1981). Thus, welfare more accurately means fighting against the poor instead of fighting against poverty; welfare on this account disciplines the working population through the dissuasive effects of humiliating poor relief (see also Piven and Cloward, 1971; Wagner, 1982). This tension between

support and discipline was clearly expressed by the London Edinburgh Weekend Return Group in 1980:

The ways in which we interact with the state are contradictory – they leave many people confused. We seem to need things from the state, such as child care, houses, medical treatment. But what we are given is often shoddy or penny-pinching, and besides, it comes to us in a way that seems to limit our freedom, reduce the control we have over our lives. (The London Edinburgh Weekend Return Group, 1980: 8)

WELFARE IN 'LATE CAPITALISM'

During the 1970s, several authors characterized the historical phase of capitalist development after the Second World War with the term 'late capitalism'. Accordingly, what marked the end of nineteenth-century liberal competitive capitalism was corporate concentration, the emergence of multi-national corporations, strong trade unions and an interventionist expanding welfare state which increasingly compensated for market failures. As a result, the state replaced market mechanisms more often while creating and improving the conditions for the appropriation of surplus capital. The late-capitalism welfare approach, represented by Jürgen Habermas (1973) and Claus Offe, for example, argues that capitalism is essentially self-contradictory and self-destructive. It differs in at least three points from the form-analytic approach presented above. First, the integration of system-theoretic elements marks a theoretical particularity compared to other approaches of that time. Instead of class struggle as a traditional Marxist starting point of analysis, Offe starts by contradicting functional logics of social subsystems (like economy or democracy). Second and third, he stresses exactly what Müller and Neusüß condemned as a 'state illusion', namely the autonomy of the state and its democratic, legitimizing function. Thus, the welfare state functionally provides conditions not only for capital accumulation but also for democratic legitimacy. From this tension between economic accumulation and political legitimization, there emerges a fundamental ambiguity of the capitalist state. Because capital is considered less and less capable of mediating social integration, the state increasingly protects 'structural elements' that exist beyond accumulation (like housewives or unemployed people) and thereby more often fills the gap of social integration with the help of different compensating mechanisms so as to stabilize the system (Offe, 2006: 63). At the same time, the welfare state depends upon the will of the electorate and needs to satisfy democratic requirements, avoiding the impression of being the mere agent of the capitalist ruling class. Thus, the welfare state – torn between these two functions – is a self-reliant, independent institution that permanently switches between contradictory requirements. Of course, this analysis reflects the situation of the welfare state during the 'Golden Age' of post-war prosperity and the Fordist class compromise. Since the crisis of that era and the transition of welfare to post-Fordism or neoliberalism, things look quite different.

FROM FORDIST TO POST-FORDIST WELFARE STATE

Western Marxist class and regulation theoretical approaches towards welfare focus specifically on class struggle, social power relations and the connection between economic, political and ideological shifts within capitalist development. They thus address changes in the historically specific mode of production as well as the influence of social movements on welfare state policies. Because these approaches focus on historical changes, social action and ruptures (instead of basic structural features or system-logics), they were able to contribute in particular to the question of historical changes of welfare and national disparities between welfare states. According to Jessop, who considers himself a 'plain or nondogmatic Marxist' (2016: 97f.), the welfare state is an element of capitalist societies equally situated within the economic and political system as a 'system of social reproduction' (1986: 5). His focus differs from the two already mentioned perspectives insofar as he asks how the circulation of capital and the modern state together form the terrains of social action and class struggle. His approach is mainly influenced by the French Regulation School and Western Marxists like Gramsci and Poulantzas (for Western Marxism see Anderson, 1987). Following Jessop, the shared interest of these approaches lies in the interaction between structures, strategies and attempts of different social powers to unify strategically hegemonic forms of state and capital in their own interest (Jessop, 1986: 5). To understand the relations between different economic and political stages of capitalist development, he uses, on the one hand, the (more economic) regulation theoretical analysis of capitalist regimes of accumulation and modes of regulation (see Lipietz, 1992: 311), and, on the other hand, the (more political) analysis of Gramsci and Poulantzas, which addresses different political rules and systems within capitalist societies.

Following Jessop, social reproduction marks the starting point of the analysis of welfare. Thus, the battleground of these contingent class and power struggles is the historically changing system of varying national welfare regimes with their changing strategies and conflicts between different social powers around the conditions of social reproduction. While the welfare state emerged in the late nineteenth century, its benefits, institutions, social insurances and services as well as the public usage of the term 'welfare state' really came into full bloom during the post-1945 period (Flora and Heidenheimer, 1981: 19f.). This in turn was accompanied by Fordism, broadly speaking, a model of capital accumulation based upon mass production, the polarization of skills, high productivity growth and mass consumption. Thus, Fordism, or more precisely, the Fordist class compromise, marks the economic and social foundation of the expanding welfare state after the Second World War. This class compromise includes full employment, increasing minimum family wages due to increasing productivity and strong collective bargaining, the development of the welfare state as a protective mechanism for

wages, mass consumption and the rising importance of the state for creating conditions for capital accumulation as well as the reproduction of labour power by means of Keynesian policy (Jessop, 1986: 13; Lipietz, 1992: 312). During the 'Golden Age' of the 1950s to the mid 1970s, this class compromise reduced poverty and led to growing tax incomes and developing welfare services. In turn, the crisis of Fordism was accompanied by a crisis of the Keynesian welfare state.

According to one of the founders of the regulation school, Marxist theoreticians were not prepared for post-Fordist transformations (Lipietz, 1992: 309).⁵ The overaccumulation crisis of Fordism manifested in economic limits, world political upheavals and a growing resistance to Taylorized mass production by the end of the post-war boom. Fordist mass production failed to satisfy new flexibility requirements which were caused by changing consumer behaviour, globalized competition, the growing importance of financial capital and a more flexible labour organization. Further causes include rising wages and welfare standards along with declining productivity growth, rising inflation, increasing unemployment and public debt as well as economic crises (namely the two oil crises of 1973 and 1979) and finally workers' resistance to dull working conditions, putting pressure on falling profits. Continuously rising mass unemployment due to economic crises – from 1979 to 1993, unemployment rates in the EU doubled (Deppe, 2001: 24) – signalled the historic end of full employment and also marked the political defeats of trade unions and social democratic parties. As response, social democratic parties in several European countries adapted to a neoliberal agenda by the end of the 1980s. The price of full employment, namely public debt, high inflation and strict trade and monetary controls, was considered too high. Also, European integration and measures to reduce public and national debts according to the Maastricht Treaty favoured the turn away from a politics of social justice and redistribution. Subsequently, this brought about a 'Schumpeterian competition state' (Jessop, 2003: 95ff.) and structural change of welfare. To take the pressure off of profits and to block the resistance of organized labour, new modes of labour organization and production were developed (like job enrichment or flexible working time organization). Accordingly, the Fordist crisis had put a 'scissor-effect' upon public finance and created a fiscal crisis of the welfare state (Jessop, 1986: 18) that in turn 'placed a question mark over the legitimacy of state-social policies' (Lipietz, 1992: 314). Wage-based tax incomes and corporate contributions to state incomes were reduced. At the same time, expenditures increased due to rising unemployment and declining family wages. The welfare state seemed to be a victim of its own former expansion and inherent growth dynamic since expanding social services created new pressure groups, new services and extended social administration. From a class-theoretical perspective, the 'welfare explosion' (Piven and Cloward, 1971: 184) shifted class power relations in favour of organized labour. Hence, Jessop suggests that the crisis of the Keynesian welfare state provided an historic opportunity for capital to forcibly renew accumulation and social reproduction by shifting class power

relations in its own favour. Accordingly, the old welfare state was considered inflexible, ossified, outdated and no longer affordable.

A NEW ERA OF SEGMENTATION AND EXCLUSION

Due to neoliberal attacks on welfare and the ‘scissor-effect’ since the 1980s and 1990s, social policy has been increasingly subordinated to economic policy and the costs of social reproduction have been lowered with the help of a newly structured welfare state (Jessop, 2003: 152). According to the neoliberal agenda of many European conservative and liberal governments, since the victory of Margaret Thatcher in 1979 in the UK, the main task of politicians has been seen as enhancing efficiency and making labour markets and social policy more flexible (Deppe, 2001: 23). These goals were achieved through increased job insecurity for the sake of a supply-oriented labour market policy and reductions in welfare benefits and job protections, as well as privatization of social security and services. The work-oriented reforms of the 1990s ‘have become the common sense of the age’ (Peck, 2001: 342). These include so-called ‘workfare’ programmes that bind social welfare policy and flexible labour markets together in order to enforce work by increasing the pressure to accept even badly paid jobs.⁶ Turning away from Keynesian welfare policies meant the state’s withdrawal from economic interventions for the sake of social security and equality along with the simultaneous deregulation and flexibilization of industrial relations, labour markets and social policy. This in turn meant accepting increasing insecurity, inequality, unemployment and fiscal burdens on social funds as well as social exclusion. The results included the expansion of low-wage sectors, precariousness, reduced social benefits and more pressure on the work force – especially for socially vulnerable groups like migrants who were hit particularly hard during the welfare transformation and the ‘second phase’ of international migration (Castles and Miller, 1993). While the post-1945 economic boom in Western Europe, North America and Australia was largely pushed forward by migrant workers who had initially been recruited from less-developed countries and the European periphery as a cheap guest work force for low-grade positions, the recruitment stopped in the wake of the 1973 oil crisis: ‘The result was a second phase in international migration, starting in the mid-1970s and gaining momentum in the late 1980s and early 1990s’ (Castles and Miller, 1993: 65). During the following recession, migrant guest workers were the most severely affected by the effects of the post-Fordist restructuring of the labour process and world economy, which led to massive unemployment and deindustrialization.

Besides a worldwide increase in refugee movements due to political suppression or religious persecution since the mid 1970s, the demand for low-skilled work rose again in the course of globalization since the mid 1990s, particularly in the realm of an expanding service sector and growth in part-time and informal

work. Since then, a new international and highly racialized regime of working poor and ‘differentiation of labour forces on the basis of gender, age and ethnicity’ (Castles and Miller, 1993: 77) has arisen with precarious, irregular and circular migration, the expansion of low-paid service jobs and restrictive migration policies in many European countries. Although the social rights of former guest workers have expanded during the last decades in Western Europe, since then the social rights of some groups have also contracted due to economic transformations, welfare restructuring and restrictive immigration policies. Migrants’ rights thus appear as a stratified system wherein different groups of migrants are endowed with different rights due to residence and labour market status. These differing status positions result from contradictory welfare efforts that aim at creating internal markets, recruiting highly qualified workers and restraining poverty migration at the same time (Mohr, 2005).

Immigration policies, labour market policies and social welfare policies together form national migration regimes; by opening or limiting access to labour markets, social benefits and services, these regimes play key roles in the social protection and integration as well as exclusion of migrants (Papadopoulos, 2012: 38). In the wake of the financial crisis, lean welfare states and global refugee movements, one can observe increased exclusion and discrimination of especially poor migrant groups by restrictive migration, labour market and welfare policies. This engenders a socially vulnerable minority status for migrants, which, in turn, acts as a key resource for a highly segmented labour market and welfare regime. Thus, exclusion and segmentation, ‘the differentiation of populations on the basis of ethnicity, origins, and legal status— which we call “racialized ethnicity”’ (Schierup and Castles, 2017: 254), is a central enabling force of neoliberal welfare transformation. Hierarchies are created amongst social groups, with especially vulnerable and exploitable labour forces, such as poverty migrants for example, employed in badly paid service jobs (i.e., cleaning business, care work, logistics) to lower labour and social provision by maintaining a low level of social reproduction. But this in turn causes an international ongoing crisis of social reproduction that again places an enormous burden on welfare policies. In the midst of this crisis, political coping strategies are deployed which aim at exploiting socially vulnerable groups and communities to do badly paid or even unpaid care work in favour of a lean welfare state. In the following, it will turn out that capitalism, as Marxist-Feminist Silvia Federici says, not only promotes an ongoing crisis of social reproduction but rather requires it to limit the costs of labour (Federici, 2012: 67).

‘GENDERING THE WELFARE STATE’, THE CRISIS OF SOCIAL REPRODUCTION AND COMMUNITY CAPITALISM

Feminist approaches to welfare have been strongly influenced by Marxist-Feminist contributions. In the context of the ‘domestic labour debate’ during the

1970s and 1980s, Marxist-Feminists discussed the intersection of capitalism and women's oppression and emphasized the importance of mostly unpaid care work within capitalist societies (Dalla Costa and James, 1972; Molyneux, 1979). By doing so, they worked out a critical political economy of unpaid care work, which has become one of the most innovative developments in Marxist theory. According to that debate and the findings of the ensuing sociology of care (Fine, 2005), care work has a very special political economy. It 'encompasses feeding people, looking after the sick, infants, or elderly workers, keeping warm, feeling safe, maintaining a sustainable environment, or satisfying emotional needs. In short, it comprises all the work that sustains the material and immaterial conditions on which livelihoods depend [...]' (Brown et al., 2012: 78). Because care work can be rationalized only to a limited extent and remains both labour intensive and time intensive, it remains less profitable than the industrial production of goods. It has thus been 'naturalized into nonexistence' (Bhattacharya, 2017: 2) and traditionally been assigned to those most vulnerable groups of the population that, due to their gender, race, age or class background, perform it badly paid or even unpaid. In the aftermath of these debates, feminist approaches have 'gendered' the welfare state, thereby stressing the interaction of social policy, gender relations and the importance of the family as one leg of the 'welfare triangle' (Daly, 2000: 5). Care thus functions as a key concept that systematically binds welfare and gender relations together and can be used as a touchstone for evaluating differing national welfare regimes and standards with consideration to women's living conditions (Daly and Lewis, 1999). From this perspective, the welfare state appears not only as a beneficiary of gratis social services done by housewives, but as an institution that itself strongly shapes gender roles and relations (Daly and Rake, 2003: 36). Hence, taking feminist insights into account, the welfare state also contributes to a patriarchal division of labour and organizes social life as a series of gendered stages and vice versa: 'The traditional division of labor between men as earners and women as carers produces a gender differentiation of social rights and benefit levels' (Sainsbury, 1996: 35).

In the last three decades, social reproduction and the welfare state have undergone significant modifications. First, the world of work has changed with rising women's participation in the labour market along with increasing precariousness and the erosion of family wages. Second, the welfare state itself has undergone significant restructuring and actively withdrawn from former levels of social security. Third, individual and family life forms have changed too. Instead of a breadwinner model, we observe increasing expansion of an adult-worker model and single households. Finally, due to demographic changes, the number of care-dependent people and demands for home care have risen tremendously. Finally, increased labour flexibility, demographic changes, the retrenchment of the welfare state, rising employment of former housewives and, last but not least, the remaining unequal division of domestic labour in private households all leave enormous gaps in care. Altogether, this leads to a crisis of social reproduction

with increasing burn-out rates, insufficient compatibilization of career and child-raising and supply gaps. The central social and political question can now be stated like this: who will fill the growing gaps left by working mums and a lean state? One political answer is something we can call ‘Community Capitalism’.⁷ It marks the continuation of the capitalist mode of social reproduction by new means: care responsibilities are redistributed to social communities beyond family ties at the expense of socially vulnerable, mostly female groups in favour of reducing costs. Community Capitalism is both a kind of continuity and a new step within neoliberal care policy. Under dazzling terms like ‘caring’- or ‘compassionate communities’, it tries to obligate civil society and social communities to do more informal care work instead of expanding benefits or developing better conditions for professional and well-paid care workers. One example of this ongoing exploitation of caring communities is the elder care crisis in Germany and the way it is managed by social policy.

CONCLUSION: A CONSERVATIVE CARE REGIME IN TROUBLE

According to feminist approaches, welfare states differ based on whether they strengthen or weaken the care function of the family (Appelt, 2014: 106). In this sense, Germany’s welfare state has been classified as ‘conservative’ (Esping-Andersen, 1990), ‘typified by a lack of day care and family services, the exclusion of non-working wives from social insurance schemes, and the principle of subsidiarity which limits state interference to’ when the family’s capacity to service its members is exhausted’ (Sainsbury, 1996: 37). Hence, Germany’s welfare state strengthens the caring function of the family by delegating much of its welfare production to private households and the unpaid care work of mostly female relatives. Additionally, this welfare state is mainly characterized by social insurances that Ewald (1989) once considered the real core of modern societies and that are centred on employment. The level of entitlements for social benefits depends on contributions that in turn derive from employment. In regard to gender relations, this earnings-related benefits system conservatively maintains status preservation of insured persons – and thus the preservation of gender inequalities.

In Germany, gender, welfare and care arrangements have undergone fundamental structural changes since the so-called ‘growth-security alliance’ (Offe, 1983) came to an end in the early 1970s. Germany’s welfare state turned into a ‘social investment state’ within the context of a crisis of employment and public benefits; this took place after the reunification of the two German states in 1989, and was mainly due to changing conditions of social reproduction brought about by an ageing population, changing family and household structures, an expanding service sector, rising employment rates of women, declining wages and the erosion of the breadwinner model. Flexibility becomes the new universal value in

terms of working conditions, prices and even flexible citizens (Lessenich, 2008: 74). This is shown by the mobilization of a marginalized labour supply, the rising integration of women in often badly paid part-time jobs, workfare programmes, higher retirement ages and a social policy that prioritizes individual self-responsibility of citizens instead of expanding public services. Thus, in the heart of the 'enabling' welfare state now stands the transition from state provision to self-care, from public to individual risk management (Lessenich, 2008: 82).

This whole development also has effects on Germany's elder care regime, which has always delegated the bulk of its elder care obligations onto private households, families, wives and daughters. This arrangement is now being challenged not only because more and more women are employed, but also because of neoliberal measures of restructuring and a crisis of social reproduction. Due to shrinking family wages, rising labour market participation of women, remaining patriarchal household division of labour, lack of professional care workers and the decreasing capacities of relatives to provide care, Germany's conservative care regime comes under increasing pressure while care supply gaps grow larger. To maintain cost reduction in times of growing demands for elder care, a double movement of privatization takes place. On the one side, Germany's welfare state delegates the bulk of elder care to private households because long-term care insurance (introduced in 1995) only covers a proportion of the costs and leaves the further costs to private households and social benefits. Half of all care work is thus still performed unpaid, mostly by female relatives. On the other side, long-term care insurance has also opened the care market to private providers and has thus initiated a process of economic privatization. Together with rising demands for job mobility, flexibility and insufficient public services, this double privatization has put a lot of pressure on households, especially women who try hard to combine employment and elder care obligations. The crisis can be seen in many ways: caring relatives are disproportionately affected by depression and medicine dependency, there are periodical elder care scandals, nurses are striking and there is an increasing exploitation of migrant care workers in private households.

Since social reproduction is changing and getting harder, the central pillars of Germany's care regime – families, wives and working mums – are breaking down. Social policy now tries hard to close care gaps by following its tradition as a conservative care regime – but in a new way. Because the caring capacities of female relatives and families are declining, the welfare state now aims to mobilize care work beyond family boundaries. For this purpose, the state sets up cash for care programmes; strengthens support for the elderly with the help of monetized volunteer work; legalizes domestic work done by eastern European migrants within the eastward enlargement of the EU; and sets up workfare programmes for long-term unemployed and low-skilled workers to care for the elderly, underpaid. One consequence of this new division of care are highly gendered and racialized 'global care chains' (Hochschild, 2001) where female migrant domestic workers from poor countries fill care gaps on expanding shadow markets with slave-like

working conditions. As shown in the case of migrant workers, neoliberal welfare states use social vulnerability based on gender, race and global inequality as a resource to fill the gaps and cut costs within times of care crisis. Hence, the exploited cornerstone of a lean welfare state consists in a ‘care reserve army’ of mostly female and socially vulnerable groups like relatives, volunteers, migrant domestic workers, neighbours, friends, refugees, retired persons or unemployed people (Haubner, 2020). Against the backdrop of the state withdrawal from public care and an increasing demand for cheap care, the importance of unpaid or badly paid care rises. Research has found that the decline of public care services correlates internationally with the expansion of grey markets for informal, precarious, badly paid or even slave-like unpaid care work (Anderson, 2000). Insofar as care remains the hidden condition of capital accumulation and welfare, the changes, crises and new demands of care work will decide the future of welfare policies. Along with the contradictions of welfare named at the beginning, another central contradiction of welfare currently appears: Community Capitalism as a new step of social reproduction depends on the ‘lifeblood’ (Dowling and Harvie, 2014: 882) and exploitation of unpaid or underpaid care work done by vulnerable social communities. At the same time, neoliberal welfare policies, as can be seen especially in times of austerity, aim at lowering the costs of social reproduction, thereby downgrading social security and aggravating impositions for making a living. The limits and struggles of ‘caring communities’ – which can already be observed within the context of worsening social-distribution conflicts around the globe – will thus become a key question not only for the future of welfare but for capitalist societies in general. These limits, struggles and contradictions can best be understood and explored with the help of (Feminist-Marxist) social reproduction theory (Bhattacharya, 2017).

Notes

- 1 ‘Overall, social reproduction refers to all the labor processes that go into re-creating life. In capital’s terms, social reproduction designates the replenishment of labor in the abstract. Consequently, the term’s definition has a dual character pertaining to the reproduction of labor power *and* the reproduction of life’ (Brown et al., 2012: 78).
- 2 ‘Stripping society of the institutional layers that guaranteed social reproduction outside the labor contract meant that people were commodified. In turn, the introduction of modern social rights implies a loosening of the pure commodity status. De-commodification occurs when a service is rendered as a matter of right, and when a person can maintain a livelihood without reliance on the market’ (Esping-Andersen, 1990: 21f.).
- 3 Franz Xaver Kaufmann and other authors have shown that this assumption doesn’t hold true in this strict sense. Welfare and social policy are instead highly influenced by competing political parties and normative political ideas such as ‘social security’ or ‘equality’ (Ewald, 1989; Flora and Heidenheimer, 1981: 25; Kaufmann, 2003).
- 4 ‘The concept of the welfare state as a humane response to need has performed an invaluable ideological function in the control and discipline of working-class populations, for in the name of “welfare” much can be achieved which would be impossible by more direct methods of repression’ (Gough, 1979: vii).

- 5 'Too often, they [the Marxists; T. H.] had considered their object (capitalist economies) to be characterised by a set of eternal laws and behavioural rules. [...] The history of capitalism is much more complex. Capitalist socio-economic relations underwent greater changes in the years from 1848 to the present than any socialist of that earlier era would have ever thought possible' (Lipietz, 1992: 309).
- 6 '[...] workfare strategies are becoming normalized as a means of enforcing labor-market participation in a climate dominated by underemployment, low pay, work insecurity, and low-grade service employment' (Peck, 2001: 342).
- 7 The term 'Community Capitalism', although originally used by the American Assembly (1997), has been sociologically coined as a new care paradigm in discussions with Silke van Dyk and Emma Dowling at the Friedrich-Schiller-University in Jena (see also Dyk, 2018; Dyk/Haubner 2021).

The Urban

Ståle Holgersen

Capital relates to cities in all kinds of ways.¹ Cities can both represent capitalism in its most virtuous state, or be the site of its rapid degeneration. As sites for massive volumes of capital accumulation as well as centres of concentrated poverty and hotspots of resistance, it should come as no surprise that Marxist studies of urban processes have come in various forms. But what unites them is that they exist within a tension between the ‘urban’ and the political economy at large.

In this respect, there are two positions that are equally misleading. One ignores the particularities of the urban and materiality of the city, while the other exaggerates its importance. From the first position, the city is annihilated by the wider capitalist economy; in the second the city lights blind us from seeing capitalism altogether. More aligned with the first position, we arguably find Friedrich Engels, who – according to Merrifield – looked at the city and ‘saw little apart from capitalist modernization’ (2002: 65). Closer to the latter we arguably find Henri Lefebvre, where ‘the urban’ – according to Smith – became ‘the motive force of historical change’ (2003: xvi).

Tensions between spatial forms and social relations, between the spheres of the urban and the wider economy, have followed urban Marxism for decades, and will follow us through the paper. I second Sharon Zukin, who argues that cities appear to be ‘one of those social creations that tease the limits of autonomy’ (2006: 105), both reflecting underlying social structures as well as shaping them in various ways. Grasping the *exact* connections and relations between ‘the urban’ and the wider economy is a difficult, if not impossible, task. The city should rather be

regarded as a vantage point from which to capture some 'salient features in the social processes operating in society as a whole' (Harvey, 1973: 16).²

One obvious starting point for this chapter is to see what Marx and Engels had to say. But their work on the urban was fairly weak and scattered, although it tended to point towards the importance of the subject. In *The Communist Manifesto*, Marx and Engels argued that the 'bourgeoisie has subjected the country to the rule of the towns', 'created enormous cities' and 'increased the urban population as compared with the rural' (2004: 8–9). In *The German Ideology*, Marx and Engels argue that the greatest division of material and mental labour 'is the separation of town and country'. They further elaborate how the existence of towns implies the 'necessity of administration, policies, taxes, etc., in short of ... politics in general' (1974: 68–9). And in volume one of *Capital* we read: 'One might well say that the whole economic history of society is summed up in the movement of this antithesis [i.e. the separation of town and country]. However, for the moment we shall not go into this' (Marx, 1976: 472). Although this had huge implications, for example for enclosure, metabolic rifts and the division of labour, Marx's moment for going further into the urban question never really came.³

Friedrich Engels wrote more directly on the urban, particularly in his relatively descriptive analysis of urban poverty in *The Condition of the Working Class in England*, published in 1845 (Engels, 2013), and the more analytical discussions on housing taken up in *The Housing Question* almost 30 years later (Engels, 1942). *The Housing Question* in particular contains arguments and passages – as will be seen below – that have inspired later Marxists enormously.

After the publication of *The Housing Question* in 1872, almost one century would pass until Marxist theory really picked up urban questions again.⁴ When Marxist scholars got involved in urban thinking from the 1960s onwards, the conventional thinking around the urban was defined by measures of size, density and transport that were largely descriptive and relied more on empirical generalisations than theory per se (Smith, 2003). This was mixed with positivist approaches to urban planning and policy of the time, wherein planners aimed for neutral objectives in the effort to maximise the benefits the city could bring to everyone (Harvey, 1973; Holt-Jensen, 1999).

Positivists could map poverty and segregation, but they could not explain the underlying causes of poverty, and certainly not point towards any meaningful actions to fight poverty.⁵ The Marxist approach was very different. But as it was insufficient to simply elaborate on what Marx had said, Marxists needed to employ and further develop an entire Marxian toolkit and start thinking critically.

The French philosopher and sociologist Henri Lefebvre is often seen as the pioneer in the world of urban Marxism, even though he was followed not much later by David Harvey and Manuel Castells in the early 1970s. Then, within a few years, the 1970s Marxist (-inspired) urban scholars appeared, within sociology

(e.g. Chris Pickvance, Michael Harloe), human geography (e.g. Doreen Massey, Neil Smith), urban planning (e.g. Allen J. Scott and Shoukry T. Roweis), urban history (e.g. Richard Foglesong) and political science (e.g. Ira Katznelson).

By now cities had become landscapes of power. Where Marx aimed at revealing the fetishism of the commodity, arguing that it was not only a thing but also process and social relation, urban scholars wanted to reveal spatial fetishism and encourage us to stop mistaking social relations for spatial ones. Marxists began investigating how social relations, (class) conflicts and contradictions constituted both the built environment and urban phenomena more generally. Beyond the buildings, castles and slums, the offices and factories, there were processes and people that *produced* spaces. Lefebvre sought to *demystify* and trace the inner dynamics of social space, and explicitly urged Marxists to ‘analyse not things in space but space itself, with a view to uncovering the social relationships embedded in it’ (1991: 89). His call was heard.

ANALYSING SINGLE ASPECTS OF THE CITY, WITHIN GENERAL MARXIAN FRAMEWORKS

The most common way of ‘urbanising’ Marx is, arguably, to take a relatively confined (‘urban’) area of research and work with it within a broader Marxian theoretical apparatus. In this section, I will reconstruct some of these discourses and investigate how they cannot avoid tensions between urban processes and those within the wider economy.

Planning and Urban Policy

In the *Grundrisse* (1973) Marx mentions that every form of production creates its own legal relations and form of government. We can add to this: its own ways of organising and planning space. If we look at contemporary discussions within the major journals of *planning theory*, Marxism is, with a few exceptions, pretty non-existent. The exceptions, like Tom Angotti, Michael Edwards and Libby Porter, as well as Samuel Stein, Linda Fox-Rogers, Berna Grist and Enda Murphy, neither constitute a trend nor a tendency – at least not yet!

This was different in the late 1970s and early 1980s. The main task for Marxists takes on planning at the time was to scrutinise, criticise and reveal power relations. Marxists challenged an understanding of planning as either a purely descriptive or purely normative activity, and also confronted the idea of planning as simply a tool for everyday policy-making (Scott and Roweis, 1977). According to Roweis: ‘[P]lanners tend to vacillate between utopianism and technical pragmatism. The former robs their practice of its potential effectiveness and their theory of its practical significance. The latter reduces practice to an aimless management of day-to-day bottlenecks and theory to a technical instrumentality of shortsighted

“problem-solving” (1981: 159). This was written almost 40 years ago, but the exact same things could be argued today.

Among the Marxists concerned with spatial planning, there were different approaches. Lamarche related urban planning to the *circulation* of capital, and property development in particular (1976), Castells focused on (collective) *consumption*, but also (1977[1972]) on planning’s relations to ideology and politics, Harvey (1973) showed how the built environment was used by capital as a *means of production* (cf. Foglesong, 1986: ch. 1). Dear and Scott (1981), Scott and Roweis (1977) and Cockburn (1977) related urban planning under capitalism to the problem of ‘collective control’ and the local state, and Stone (1975) and Marcuse (1980) discussed planning and urban policy in relation to housing (see also Dear and Scott, 1981; Foglesong, 1986; Harvey, 1985; Pickvance, 1976).

The Marxists cited above were criticised by liberal authors like Susan and Norman Fainstein (1979) and Peter Hall (1988), for not presenting alternatives and for creating a too-large distance between planning theory and practice.⁶ I think this critique actually has some validity (although the exact same critique can be directed towards non-Marxist planning theory). The Marxian discussions on planning lacked ideas for how urban planning and policy could be mobilised in a socialist strategy. This is more than ever an unfulfilled task (Holgersen, 2020).

Housing and Gentrification

Housing is arguably the area of research where urban Marxists can draw most explicitly on its founders, particularly on Engels’ polemic towards Proudhon in the 1870s. This brings us directly to one of the key questions in this chapter: can housing and the urban be grasped independently of larger processes of capitalism (Proudhon) or not (Engels)? This discussion lives on, and is also articulated as Marxists versus Weberians (see Smith, 1996 versus Saunders, 1979). Engels was rather pessimistic about struggles over housing, as housing shortage was considered ‘one of the numerous, *smaller*, secondary evils which results from the present-day capitalist mode of production’ (1942: 22, emphasis in original). For Engels, the solution to housing problems was found not in the housing struggle, but in no less than the ‘abolition of the capitalist mode of production and the appropriation of all the means of life and labour by the working class itself’ (1942: 77).

Engels (1942) argued something crucial in *The Housing Question*:

In reality the bourgeoisie has only one method of solving the housing question after its fashion – that is to say, of solving it in a such a way that the solution continually reproduces the question anew. This method is called “Hausmann”. (1942: 74)

And three pages later:

The breeding places of disease, the infamous holes and cellars in which the capitalist mode of production confines our workers night after night are not abolished; they are merely *shifted elsewhere*. (1942: 77, emphasis in original)

These two quotes have had a huge impact on housing studies in general, and on studies of gentrification in particular. One prominent process in cities all around the globe over the last decades has been that large investments in former working-class and poor areas have brought about changes that give the place a new and 'upgraded' class character. These processes of gentrification directly concern Engels' quote, as politicians have 'solved' problems of poverty in these particular places through forcing the poor and workers to go elsewhere.

Debates about gentrification over the past years have been divided between two camps, where one is considered more Marxist, and the other more liberal or 'Weberian'. The key author on the Marxian side has been Neil Smith. His main emphasis was the role and logic of capital accumulation, where capitalists can spot and mobilise differences between actual and potential rents (i.e. a rent gap). This approach is frequently called a supply-side explanation to gentrification, and is often contrasted with what is called demand-side explanation, where the focus is on 'young gentrifiers' and hipsters, and differences in taste and culture between groups defined as 'working class' and 'middle class'.⁷ Such a demand-side explanation is often related to a Weberian approach, and often builds upon clear distinctions between the economic and the political (and legal) spheres, which are considered 'autonomous rather than relatively autonomous' (Harloe, 1977: 8).

Where more Marxist-oriented researchers have argued that gentrification is a class project, where displacement of people is crucial (see also Peter Marcuse, Tom Slater), more liberal authors stress the potential benefits that gentrification can bring to 'the city' (David Ley). And terminology becomes a political battle: are we talking about 'displacement' or 'replacement' (see Slater, 2009 versus Hamnett, 2003)? Such differences depend very much on how one conceptualises class.

Class and the City

Engels warns against seeing the landlord–tenant relation as an equivalent to worker and capitalist, as the landlord–tenant relation is a 'quite ordinary commodity transaction between two citizens' (1942: 25). According to Engels, tenants can be cheated in this transaction, but we do not find the same form of exploitation in housing as in the workplace. But this does not mean that housing or cities don't have class characters. Cynthia Cockburn argued that it 'is sometimes forgotten that the respective positions of landlord and tenant, the observance of electoral democracy, the individual's client-relationship to the state are just as much capitalist relations as those between employer and employed' (1977: 368). One could add relations between debtor and creditor, and class struggles over ownership of streets, buildings and public spaces, or other public goods, etc. For radical human geographers it is crucial that pre-existing classes are not simply added on in spatial analysis: class relations and

class struggle not only take place in space, but class struggle uses and produces spaces: class and capital accumulation is spatial (see e.g. Harvey, 1999, Smith, 2008). And just as production and reproduction of class is intertwined with politics in all kinds of ways, we can also see that urban policies always have their class character.⁸

There are different ways of analytically systematising ‘class in the city’, and through making different abstractions and levels of generalisations we can better understand the concept. For example, Harvey (1985) discusses (factions of capitalist) classes in relation to the built environment; Edwards (1995) divides up *class functions* in urban development; Katznelson (1992) articulates four ‘layers’ in the city;⁹ and Bridge (1995), when investigating the relation between class and residence, combines three levels of abstraction – mode of production, social formation and conjuncture – with three ‘critical moments of the realization of class relations’.¹⁰

Class has also been discussed in a variety of ways in relation to different subjects, like the segregation and dual cities (Peter Marcuse), the local state (Cynthia Cockburn), gentrification (Neil Smith, Eric Clark, Tom Slater and Elvin Wyly), housing (Michael Stone), real-estate developments (Francois Lamarche, Michael Edwards), economic geography (Richard Walker, Doreen Massey), landscapes (Don Mitchell), social exclusion (Jamie Gough), urban policies (Ståle Holgersen), planning (Richard Foglesong, Allen J. Scott, Michael Dear), gentrification (Gary Bridge) and even architecture (Bill Risebero).

Class struggles within every one of these fields are related to, but not totally determined by, other fields, including, of course, class conflicts at workplaces. Even though they are significant political struggles in their own right, from a Marxist perspective it is crucial to remember that there are some particularities at play in the labour process in workplaces that we do not find elsewhere. This is the particular form of exploitation that produces surplus value, and thus growth, which is not present anywhere else.¹¹

That humankind reproduces itself is crucial to capital, but also to us as human beings, obviously. In the city, questions concerning the family, community institutions, physical and social infrastructure and cultural activities immediately come to mind. One does not need a PhD in gender studies to see how gendered the references have been in this chapter so far, and critical feminists have criticised much of ‘urban Marxism’ for the lack in interest in gender issues (see e.g. Katz, 2006; Massey, 1991).

Although more work is obviously needed in this respect, much research has also been done at the intersection of Marxism/socialism and feminism: both in terms of gentrification (Rose, 1984), the geography of fear (Listerborn, 2002), spatial economic restructuring (Massey, 1995) and the (urban) geography of work (Mackenzie, 1999; McDowell, 2009), in relation to housing and racism (Molina, 1997), as well as examining the relationship between production and reproduction (Rose, 1993).¹²

According to Suzanne Mackenzie, neither changes in women's roles nor feminist analysis are phenomena that can simply be added on existing frameworks as another empirical case study: 'These changes and this analysis required a fundamental questioning of the basic concepts and methods of disciplines, and the development of new concepts and methods' (1999: 418). Therefore, we are also already in the section of this chapter where we investigate how the foundational apparatus of Marxism also can be altered.

BRINGING THE CITY INTO THE GENERAL APPARATUS OF MARXISM

Urban Marxism is not only about placing the city/urban within a Marxist framework; there are also analyses where urban questions interact with and even alter the very Marxian theoretical apparatus.¹³ This also broadens the scope for what a Marxist analysis can be altogether. Lefebvre (1976) argued that capitalism couldn't survive without constantly producing new spaces. But as it is often unclear how this actually happens, both Castells and Harvey have worked to concretise this thesis.

Castells' focus was on the city as the 'spatial specificity of the processes of reproduction of labor-power and the processes of reproduction of the means of production' (1977: 443). In *The Urban Question*, the city is understood as a site of *collective consumption*: goods and services necessary for the working class, as living labour, to reproduce itself, and thus necessary for production. It is affordable housing, transit systems, (public) schools and hospitals, sewage and garbage facilities, playgrounds and parks, even clear air. It is a sophisticated and revisited version of Engels' analysis (Merrifield, 2002: 120).

This analysis perhaps made more sense in the Keynesian–Fordist post-war urban economy (*The Urban Question* was published in 1972), and less so some decades later when all kinds of services and activities had been privatised. Today we must also see how urban aspects – like housing, the built environment, privatisation of public space, etc. – play a part in capital accumulation and are also sites for class struggle. That is where Harvey wants to take us.

Where Castells was inspired by Althusserian Marxism, Harvey went directly to Marx. In *Grundrisse* Marx describes how capital, through its physically fixed and immovable parts, like 'houses, railway etc.' needs to establish its 'residence on the land itself, and the seemingly solid presuppositions given by nature, themselves [appear], in landed property, as merely posited by industry' (1973: 740). Harvey builds on this when arguing that capital 'must represent itself in the form of a physical landscape created in its own image, as use-values created through human labour and embedded in the land to facilitate the further accumulation of capital' (1985: 43). And as capitalism is a revolutionary mode of production – constantly changing and developing due to compound growth, competition,

crisis and class conflicts – things that were once fixed parts that facilitated capital accumulation can easily become barriers at a later point in time. Capital perpetually produces landscapes in its own image, requisite to its own needs, only to undermine, disrupt and destroy this very landscape at a later point in time. What were at one point the symbols of the future become ‘the crowning glory of past capitalist development’ (Harvey, 1985: 43).

The built form becomes a crucial and constitutive aspect of capital accumulation in the sense that we simply cannot think about capitalism without it. The next step is then to conceptualise relations between investments in, for example, real estate versus investments in industrial production. Harvey (1999) attempts to grasp this by building on Lefebvre’s (2003) terminology: distinguishing between the *primary circuit of capital* (capital circulating in manufacturing and industrial production), and the *secondary circuit of capital* (in finance, housing, real estate, consumption fund formation and the built environment).¹⁴ One reading of Lefebvre is that he took this analysis ‘too far’, and claimed that the secondary circuit was going to *replace* the primary as the most important for historical development. Such a claim would obviously be a fallacy, and remind us to be nuanced and careful when handling the distinctions between the urban and rest of the economy.

Historically, ‘switching’ capital and investments between the two circuits has been difficult for some minor and medium-size businesses that operate in one or the other, which has opened up roles of finance and fund managers (Christophers, 2011). Such ‘switching’ has vast implications, not least when capital tries to avoid – but also, unintentionally, creates – crises.

Crisis

The fact that the 2008 crisis was triggered by the US housing sector surely made many urban scholars enthusiastic: finally the world can see how important housing is! There is a danger in losing the crucial sensitivity between capital accumulation and built environment when simply surfing on this momentum.

Cities are also affected by crisis management. Urban Marxists have pointed out, since 2010, that austerity also has an urban character, as cities are ‘disproportionately reliant on public services’, and hence are the preferred political targets of austerity programs – basically, cities are ‘where austerity bites’ (Peck, 2012: 629).

Concerning crisis theory, most urban Marxists ascribe to Marx’s thesis on overproduction (Holgerson, 2015). It is hard to say exactly why this is so, but two points are worth pointing out. One is how influential Harvey – who has defended this theory, although emphasised overaccumulation rather than overproduction – has been from the 1970s onwards. The other is how the theory of overaccumulation has direct implications for the built environment. In overproduction/overaccumulation, crises are constituted by the contradictory unity between production

and realisation. When capital cannot find profitable investment opportunities in the 'primary' circuit of capital, it goes into the 'secondary' in attempts to be realised. This contributes to massive investments in the built environment, and thus all kinds of bubbles and crises in finance, real estate and housing.¹⁵

The other major theory that Marxists have used to explain the 2008 crisis is the *law of the tendency of the rate of profit to fall*. This theory does not have similar immediate implications for urbanisation (although the rising organic composition of capital obviously also has its geography). But it is crucial to remember that lacking such immediate urban connections does *not* make it less significant *per se*.

Cities also play into attempts to solve crises in a different way. The built environment is normally crucial for Keynesian-inspired countercyclical investment. We discussed above how politicians, planners and capital can 'solve' urban problems by *shifting* them elsewhere. Harvey has implemented this logic on a higher level of generalisation, and discusses how capitalism also can 'solve' its crises by shifting them elsewhere. Through the concept of 'spatial fix' we see how economic problems at large can be 'solved' through tearing down old urban landscapes and spatial structures and creating new ones. The moving of industry to countries with lower wages and crushing of labour unions became crucial parts of solving the 1970s crisis: but so was the establishment of the post-Fordist/post-industrial/entrepreneurial/neoliberal city (dear child has many names). But, inspired by Engels and following Harvey, this did not solve any crisis permanently, but merely shifted contradiction and problems around in time and space. Neoliberal urban landscapes from the 1980s onwards contributed to economic growth through speculation, bubbles, making the working class poorer and increasing housing prices – all factors that in various ways and degrees contributed to the 2008 crisis.

TAKING CONCEPTS FROM MARX INTO NEW PLACES

Another way urban theorists have 'used' Marx is by drawing inspiration from single aspects of Marxism's foundation, and then theorising further out from there than (I predict) Marx and Engels would have ever dreamed of.

One such discourse comprises Marxists' understandings of 'urban culture': since modern cities are so densely packed with symbols, signs and (in)visible representations, there is no wonder Marxists like Walter Benjamin, Raymond Williams, Guy Debord and Marshall Berman have conducted wider analysis of culture under capitalism.

One concept that is obviously inspired by Marx's abstract labour is Lefebvre's notion of *abstract space*: where abstract labour denies true concrete labour and thus fully developed individuality, abstract space denies concrete qualitative and *differential* space. Lefebvre also – rudely but excellently – used the concepts of

use-value and exchange-value in an innovative way. For Marx, these are two phenomenal forms of a commodity, but for Lefebvre they are also two different ways of relating to space. This particular distinction becomes useful in revealing class conflicts in the city: while some people have a use-value relation to space where the city is used for joy and reproduction, others have an exchange-value relation to space, where the city is used as a means to accumulate capital (Lefebvre, 1975, 2003, see also Smith, 1991).

Those that definitely took concepts from Marx (and Marxists) to new places were the situationists. By drawing heavily on Marx's theories in general, and alienation and fetishism in particular, Guy Debord saw the urban and the city as parts of a capitalist-bureaucratic *spectacle*, and his concept of *falling rate of use-value*, for example, is certainly a reference to Marx, but surely not a theory from Marx (Debord, 2002). In a keynote lecture on 19 June 2017 Don Mitchell asked nonetheless if this could be an interesting approach to start thinking about why our cities and everyday lives are constantly being filled up with ever more *useless* things.¹⁶

Holgersen and Baeten (2017) take Marx into urban policy. Inspired by Marx's introduction to *Grundrisse*, they make a distinction between *production of the city* and *distribution in the city*. In contrast to the much discussed sphere of distribution – social programmes, redistribution, welfare policies, etc. – the production of the city – major urban investments, the main focus for urban policy, etc. have during neoliberalism remained more taken for granted and less discussed. The lack of alternatives on the production side shows how strong the hegemony has been. But, and again drawing upon Marx's introduction to *Grundrisse*, the real distribution of power is found within the sphere of production.

One discourse that has become popular in contemporary critical urban theory is *planetary urbanism*. This draws more upon Lefebvre than Marx, and especially Lefebvre's hypothesis that starts *The Urban Revolution*: society has been completely urbanized (2003: 1). According to well-read Marxists like Andy Merrifield, Neil Brenner and Christian Schmid, the old distinctions between global North and South, inner city and suburb, city and countryside, are 'redundant, chaotic conceptions, requiring an upgrade and a rethink' (Merrifield, 2014: x). The 'urban' conquers the whole globe: 'from transoceanic shipping lanes, transcontinental highway and railway networks, and worldwide communications infrastructures to alpine and coastal tourist enclaves, "nature" parks, offshore financial centres, agro-industrial catchment zones and erstwhile "natural" spaces such as the world's oceans, deserts, jungles, mountain ranges, tundra, and atmosphere', have all become 'integral parts of the worldwide urban fabric' (Brenner and Schmid, 2011: 12).

The concept has also been met by critique (see Mitchell, 2014; Walker, 2015).¹⁷ It is worth adding that how one understands 'planetary urbanism' depends heavily upon how one defines *urbanism*. But I will also add that regardless of how one defines the concept, it does necessarily bring a spatial connotation with it,

which can be problematic if the aim is to describe processes that could be better discussed in terms of capital accumulation, labour and capital, growth, infrastructure and so on. I argued earlier in the text that one aim of Marxist studies of cities/urban is to reveal spatial fetishism. It is therefore worth asking whether the concept of planetary urbanism is not adding *another* layer of spatial fetishism. Does the concept blur rather than reveal various social relations?

I also claimed above that urban processes and cities are social creations that tease the limits of autonomy. We have seen how urban Marxists have been operating in the unclear territory between a Marxian framework of capital accumulation and the physical built forms of cities – with Lefebvre going far in one direction, Castells far in the other. The concept of planetary urbanism, as also its critiques display, definitely highlights the need for geographical and sociological sensitivity when discussing issues of urbanisation, the built environment, class and capital accumulation, nature and materialism.

CITIES AS PLACES FOR RESISTANCE, ACTIVISM AND CLASS CONFLICTS

I argued in the introduction that almost a century passed after the publication of *The Housing Question* in 1872 before Marxists – with exceptions – picked up urban questions again. This regards Marxist *theory*. In *practice*, on the other hand, urban issues have been part of resistance to capitalism and to socialist struggles.

Struggles over work and labour are often considered the core of socialist tactics. But in reality this is far more complex. That housing has always been an important part of class conflicts was again seen after the tragic Grenfell Tower fire in London, 2017. The vast implications housing might have for politics and class struggle, far beyond the four walls of a dwelling, came to the surface. The coexisting phenomena of homelessness and empty buildings are also a particular capitalist phenomenon. Globally there are currently 330 million households – comprising more than one billion people – who are unable to find a decent and affordable home (Madden and Marcuse, 2016). This is not only a political struggle in itself; it also helps us reveal contradictions in capitalism.¹⁸

Struggles at workplaces *do* of course remain crucial for socialist strategy. But the history of resistance to capitalism and socialist struggle can absolutely not be written without also including things like housing and various forms of rent strikes (from New York to Buenos Aires already a century ago), urban rebellions (like Paris 1848 and 1871), squatting (in both the global South and global North), demands for building and planning for the working class (from Red Vienna to post-World War II Sweden), struggles for autonomous spaces (from labour union hall to anarchist-inspired squatting), ghetto uprisings (like in the USA, 1960s) and other kinds of riots (not least related to foodstuffs), and alternative ways of

organising social reproduction, as well as more recent *Right to the City* movements. Such myriads of activities and actions have been organised in various ways, from more spontaneous to more well organised, by various actors – from autonomous neighbourhood groups to socialist parties and labour unions and social and urban movements (Cattaneo and Martínez, 2014; Davis, 2018; Harloe, 1995; Harvey, 1983; Madden and Marcuse, 2016; Mayer et al., 2016; Merrifield, 2002).

While the obvious conclusion to draw from reading volume one of *Capital* is that class conflicts take place at the workplace, the obvious conclusion to draw from observing social struggles since the publication of *Capital* is that they also take place outside of workplaces.

Also in this fourth and final ‘take’ on urban Marxism we see similar tensions that have followed us through the chapter: between making too much or too little of a particular perspective. Again, Lefebvre was arguably making too much out of it. In some of his writing, ‘urban struggle’ and not class struggle became the motor of history. We find a similar approach in the tradition of *Communitarianism*, a theory/alternative developed by Murray Bookchin, where the basic idea is that the anti-capitalist alternative should be based on independent communities, organised in federations (there are obvious connections to utopian socialism of the nineteenth century, but also anarchism). There is a danger in urban studies of over-emphasising the role of local struggles and not least symbolic places for resistance. Claims are often made in urban theory that ‘*every revolution has its Agora*’, which is normally true. It should come as no surprise that events like Occupy, 15-M Movement, Syntagma-square and Gezi-park around 2011–2013 were very much highlighted in the literature (see e.g. Merrifield, 2014). There is a danger here that crucial aspects might be ignored, from politics and class struggles on national and international scales, to vital relations to countryside and alliance with farmers.

CONCLUSION

Marxists have much to learn from engaging more with ‘urban’ questions. Resistance against capitalism and oppression, and struggle for socialism and freedom, can never be reduced to work place conflicts or purely abstract analysis of capitalism. Likewise, many urban scholars do definitely have a lot to learn from Marxists’ analysis. In both theory and practice we need to grasp relations between struggles in the sphere of production (labour process) and the urban (housing, resisting gentrification, right to spaces, etc.). Not least today, with increasing segregation (fuelled by racism) and social polarisation, and as capital in many countries continues to be poured into the built environment and housing bubbles.

The spheres of work and ‘community’ are related, both through capital accumulation and through our daily lives. We therefore have no choice but to also

unite them in socialist struggles. It is not sufficient to have worker-owned companies if the spheres of reproduction and consumption are organised around capitalist principles, and vice versa. In other words: socialism in one sphere alone is not possible.

ACKNOWLEDGEMENT

I would sincerely like to thank Kanishka Goonewardena, Miguel Martínez, Don Mitchell and Ismael Yrigoy for their feedback and comments on early versions of the paper.

Notes

- 1 I will not in this chapter discuss various definitions of 'city' and 'urban'. For simplicity, I treat the former as the built form, and the latter as a process. Neither do I discuss racism/colonialism, nor consciousness, urban culture or 'the everyday' of urban life. I also only superficially discuss questions of gender. This does not mean that these topics are not absolutely crucial aspects for understanding cities and urban processes more broadly.
- 2 See also Ellen Meiksins Wood's claim that we should not perpetuate 'the rigid conceptual separation of the "economic" and the "political" which has served *bourgeois* ideology so well ever since the classical economists discovered the "economy" in the abstract and began emptying capitalism of its social and political content' (1981: 66, emphasis in original).
- 3 Marx (1981: 1025) also notes in passing that the composition of class structures is more complex in towns than in the countryside. Merrifield argues that Marx welcomed 'capitalist urbanization as a Faustian force – creative yet destructive, civilizing yet barbaric, alive yet unstable' (2002: 177).
- 4 There are obviously exceptions to the rule, one being Walter Benjamin: a Marxist with highly creative and stimulating things to say about cities, urbanism and Paris in particular. But with a very different take on Marxist analysis of capitalism than those we see from the 1960s and onwards (Benjamin, 1999).
- 5 Katznelson argued that 'it was a striking reversal [...] had it not been for the recent contributions of Marxist urbanists, the field of urban studies would have had little definition or theoretical trust' (1992: 31).
- 6 Although not many Marxists elaborated on the potential opportunities that planning could provide, it was only Lefebvre – as far as I know – that was firmly against planning.
- 7 Although Smith (1996) argued both sides were important.
- 8 Consider class in relation to these questions: for/with which class do we plan, build and develop the cities? In which areas do we locate new buildings when densifying? Where and into what do we invest public money? etc.
- 9 These are i) within the structures of capitalist development, ii) the organisation of social existence; or, how 'actual people live', iii) how people represent their lived experiences and constitute a normative guide to action, and iv) that of collective action.
- 10 These are i) between speculator-developers and inner-urban residents, ii) petit-bourgeois entrepreneurial and rentier activity within the social formation, and iii) – and exceptionally – between middle-class and working-class residents.
- 11 'No matter how much the landlord may overreach the tenant it is still only a transfer of already existing, previously produced value, and the total sum of values possessed by the landlord and the tenant together remains the same after as it was before' (Engels, 1942: 24).

- 12 I think that one reason why interactions between feminism and Marxism are often filled with tensions is due to a common fallacy, where both camps see 'value-production' as a virtue. While some not-so-feminist Marxists might end up ignoring the sphere of reproduction because it does not produce value (in a Marxian sense), some not-so-Marxist feminists might argue, for example, that housework is highly important and *therefore* produces value (and thus also mixing Marxian and other understandings of value). Where the former is out of touch with how social change actually happens, the latter pulls the theoretical apparatus of Marx to pieces. The way forward is to first reject that 'productive labour' is a virtue, and second to stop believing that resistance and especially establishing alternatives is merely about capital-labour relations at the workplace. In fact, socialism is a project that transcends capitalism, and must thus go beyond the law of value. Labour theory of value is crucial when analysing and understanding capitalism; less useful when establishing actual alternatives.
- 13 There are some important discourses I cannot outline further here. But it's worth mentioning the crucial studies of industrial location and global geographies (Massey, 1995), studies of urban uneven development (Smith, 1991) and questions on rent (Harvey, 1999; see Sayer, 2015).
- 14 The term 'circuit' is used here somewhat differently from both the way Marx (1978) uses it, as well as other works of Harvey – where we can disaggregate overall circulation into 'circuit of money', 'circuit of productive capital' and 'circuit of commodity capital'. I agree with Christophers (2011: 1361) that this might bring about complications.
- 15 Christophers (2011) shows that there was 'capital switching' to the property sector in the UK prior to the 2008 crisis, which supports Harvey's thesis. But, as Christophers also acknowledges, this does not necessarily mean this is due to overaccumulation (as outlined by Harvey). It could also be due to other underlying tendencies, or combinations of these.
- 16 Don Mitchell, keynote lecture at Nordic Geographers Meeting, 18–21 June 2017, Stockholm, Sweden.
- 17 Walker argues that Brenner and Schmid failed to advance the cause of urban studies very far 'through a combination of over-attention to first principles in social theory, reiteration of familiar themes in urban research, and neglect of important historical and geographical knowledge about cities' (2015: 183).
- 18 I will not go into urban (planning) in the so-called existing socialist cities in this paper. But it is worth remembering that socialist revolutions have normally happened in the relatively less-urbanised societies. Ira Katznelson (1992: 30) has even argued there was an 'anti-urban tinge' in the Second and Third International, but Davis (2018) argued that the Second International did have 'urban' discussions. According to Neil Smith, the post-war Stalinism of the communist parties was 'openly hostile to the proposal of an identifiable urban regime, arguing instead that the urban represented a super-structural apurtenance rooted in the basal social and economic forces and relations of production' (2003: x).

Cognitive Capitalism

David Harvie and Ben Trott

Carlo Vercellone defines ‘the hypothesis of cognitive capitalism’ as having developed out of ‘a critique of the political economy of the new liberal theories of the knowledge-based economy’ (2007: 14). His is certainly not the only – nor the definitive – account of cognitive capitalism, but his breakdown of its two composite terms provides a helpful point of departure. The ‘enduring element’ here, of course, is ‘capitalism’; ‘in particular, the driving role of profit and the wage relation or, more precisely, the different forms of dependent labour on which the extraction of surplus labour is founded’ (Vercellone, 2007: 14). The ‘cognitive’ component, to which we will shortly return, describes ‘the new nature of the conflictual relation of capital and labour, and of the forms of property on which the accumulation of capital rests’ today (Vercellone, 2007: 14). The notion was developed to provide an alternative, more fully sufficient account of the transition beyond the era of Fordist accumulation.

In what follows we first situate this notion of cognitive capitalism (primarily associated with the Italian Marxian tradition of *operaismo*) within these accounts of transition. Second, we address *operaismo*’s attention, from the early 1990s – prior to its theorisation of cognitive capitalism itself – to the role played by knowledge, communication, and information in post-Fordism. Thereafter we examine the ways in which accounts of cognitive capitalism have been caught up with those around shifts in the global political economy, including the increased blurring of work- and non-work time, the rise of globalisation, precarious working and living conditions, financialisation, and a putting to work of language,

ideas, and affects amid the emergence of new, 'immaterial' forms of labour. Then we attend to perhaps the fullest presentation of the cognitive capitalism hypothesis, namely that found in the work of Yann Moulier Boutang, followed by the setting out of how the forms of immaterial labour and 'mass intellectuality' – so often emphasised in accounts of cognitive capitalism – have also been understood as involving a 'biopolitics' that mobilises and shapes bodies, including through what has been called 'pharmacopornographic' production and control. The penultimate section turns to (the primarily feminist analyses of) the relationship between cognitive labour and processes of 'feminisation' in post-Fordism, before we then conclude by setting out some of the key critiques that have been made of the cognitive capitalism hypothesis.

AFTER FORDISM

In *The Condition of Postmodernity*, David Harvey (1990: 141–2) dates the origins of Fordism's crisis to the mid-1960s, later deepening with the global revolts of 1968 and in the years that immediately followed. His was one of many works published in the early 1990s that sought to make sense of the political-economic, social, cultural, and subjective transformations that had taken place in the interceding decades. Harvey himself described a shift from the rigidities of Fordism/Keynesianism towards an era of '*flexible accumulation*'. Flexibility was now said to characterise the 'labor processes, labor markets, products, and patterns of consumption' amid the rise of new means for financial service provision, new productive sectors, and an intensification of innovation (Harvey, 1990: 147).

What has been called the 'post-Fordist debate' focused on 'the putative transition' from one (post-WWII) period of capitalist development to another 'based on very different economic, societal and political norms' (Amin, 1994: 3). Ash Amin (1994) surveys its three key theoretical positions in his introduction to *Post-Fordism: A Reader*. First, the *regulation* approach, which originally stressed the 'generalized crisis of the institutional forms that had come to guide the post-war economy', seeing the stagnation of the mid-1970s as 'much more than a cyclical lull' (Amin, 1994: 7). Regulation scholars sought to explain what they saw as the coherence and stability of various phases of capitalist development as partly defined by a particular *regime of accumulation* and *mode of regulation*, with the crisis of Fordism defined by the breakdown of both (Amin, 1994: 8). The second major theoretical position was that of the *neo-Schumpeterians*. This approach shares a great deal with regulationism, albeit placing greater emphasis on the role of 'technology and technological standards' in setting in motion and sustaining what they call – with reference to the work of Nikolai Kondratiev – long waves or cycles of stable economic development (Amin, 1994: 11).

The third major position, *flexible specialisation*, sees 'two industrial paradigms' as having existed since the 1800s: mass production, on the one hand,

and flexible specialisation, on the other. Neither is seen as having been able to exhibit a *definitive* 'technological superiority' or 'inevitable dominance' in terms of economic efficiency (Amin, 1994: 14). Nevertheless, adherents of the tradition such as Michael Piore and Charles Sabel tend to see the early twentieth century as having been marked by the dominance of mass production over specialised (and somewhat more flexible) craft production. The period following the crisis of the early 1970s instead is seen as marked by, 'an open choice ... between mass production and flexible specialization', with the latter offering the greater opportunities for prosperity (Amin, 1994: 15). John Holloway argues the 'flexibility' of flexible specialisation 'means essentially the removal of barriers to management's right to tell the workers what to do, where to do it and at what speed. The workers should no longer insist on job demarcations: they must be "flexible" enough to move from one job to another' (1987: 150).

At around the same time as these debates were playing out, a number of theorists developed accounts of the 'post-industrial' nature of post-Fordism and the emergence of what they called an 'information age' or 'society'. In *The End of Work*, Jeremy Rifkin argued we had entered 'a third great industrial revolution'. Services, manufacturing, and agriculture all promised 'an economy of near automated production by the mid-decades of the twenty-first century' (2004 [1996]: xlv). New technologies, and particularly information and telecommunication technologies, would thus either 'free us for a life of increasing leisure or result in massive unemployment and a potential global depression' (2004 [1996]: xlviii). Meanwhile, the sociologist Manuel Castells (2000 [1996]) was describing the emergence of a New Economy, since the mid-1970s, that was *informational* (dependent on the efficient generation, processing, and application of 'knowledge-based information'), *global* (in terms of 'the core activities of production, consumption, and circulation'), and *networked* (with productivity and competition now generated through 'a global network of interaction between business networks') (Castells, 2000: 77). It was the 'information technology revolution', then, that was providing 'the indisputable, material basis' for this emergent new era (Castells, 2000: 77).

Saskia Sassen (1996: 14) has been among those to critique the dominant narratives of both the 'information economy' and globalisation itself (key aspects of her critique could no doubt also be applied to some, although perhaps not all, of the notions of cognitive capitalism discussed later in this chapter). She argued that they have tended to neutralise 'place and distance', emphasising 'hypermobility' and global communication networks as well as privileging the capacity for 'global transmission' and 'information outputs', while overlooking both 'the material infrastructure that makes [this] transmission possible' and 'the workers producing those outputs' (Sassen, 1996: 15–16). As such, these narratives have often addressed 'the upper circuits of capital, not the lower ones' and 'the hypermobility of capital rather than place-bound capital' – including the physical infrastructural facilities concentrated within strategic nodes like Tokyo, New

York, and London (Sassen, 1996: 16). She stressed, in contrast, the role of these ‘global cities’ as ‘strategic sites for the valorization of leading components of capital and for the coordination of economic processes’ (Sassen, 1996: 14).

A further distinctive contribution to these debates – and the focus of this chapter – came from the primarily Italian Marxian tradition of *operaismo* or ‘workerism’ (with Vercellone and many of the other theorists discussed here sometimes described as ‘post-workerists’).¹ In his introduction to Christian Marazzi’s book, *Capital and Language*, discussed later, Michael Hardt describes the contribution of ‘post-workerists’ like Marazzi as including the perspective that ‘workers’ struggles precede and prefigure the successive restructurings of capital, and those restructurings provide new possibilities for worker power’ (2008: 8), a restatement of Mario Tronti’s famous ‘Copernican inversion’ of Marxism.

KNOWLEDGE, LANGUAGE, AND PRODUCTION

In his critical engagement with Vercellone (2007) and other scholars of ‘cognitive capitalism’, George Caffentzis (2013: 100) identifies the first uses of the term around 2000–1, in a series of conference papers, articles, and books. These drew heavily, however, on post-workerists’ earlier attention to questions of knowledge, communication, and information – and the degree to which they marked a new period of capitalist accumulation – that dates back at least to the early 1990s. Marazzi was one of the first within the tradition to address these issues in a 1994 book, later translated into English as *Capital and Affects* (2011 [1994]). His claim was that language and linguistic ability were becoming more central to capital accumulation than physical work.

Like many others, Marazzi saw post-Fordism and the age of globalisation as marked by both *lean production*, with labour costs cut in private and public sectors alike, and a radical rise in *outsourcing*. These shifts have partly been understood by post-workerists (e.g. Marazzi, 2010: 31) – and by many others (e.g. Boltanski and Chiapello, 2005 [1999]: 218 and Silver, 2003: 42) – as a result of attempts to reduce the power of workers’ movements, following the mass uprisings of the 1960s and 1970s. Major corporations were reorganised with new technologies introduced to accommodate ‘just-in-time’ production processes that allowed for quicker responses to changes in customer demand (Marazzi, 2011: 19). This enabled ‘low-cost inputs and flexibility from the lower rungs of the supply network’ but also created new possibilities for worker power, including by ‘[increasing] the vulnerability of capital to disruptions in the flow of production’ (Silver, 2003: 42). First developed by Toyota in Japan, these processes were introduced in the West amid the 1974–5 recession and the period of neoliberal economic reform that took place the following decade (Marazzi, 2011: 25). The result was to bring ‘communication, or the flow of information, directly into the production process’ (Marazzi, 2011: 20). If communication and production

were ‘juxtaposed’ in Fordism, they ‘overlap’ in ‘the new mode of production’ (Marazzi, 2011: 20). In Fordism, productivity gains derived from economies of scale, where unit price falls with output, but the post-Fordist factory is ‘minimalist’, geared towards ‘the elimination of redundancy with respect to the demand’ (Marazzi, 2011: 21). As such, Marazzi argues that ‘communication’ has become ‘the grease that insures the smooth running of the entire production process, from the sale and distribution to the production stage’ (2011: 21). The technologies used in the “speaking”, “communicating” production process’ function as what he calls ‘linguistic machines’, focused on facilitating and accelerating data circulation (Marazzi, 2011: 23).

As ‘communication has entered into production’, Marazzi argues it has created a crisis in the political forms inherited from Fordism, with the figure of ‘the entrepreneur’ emerging as ‘a politician, a subject of governance’ in a manner that blurs the distinction ‘between economic and political spheres typical of representative democracies’ (Marazzi, 2011: 41). ‘Everyone tends to represent solely him or herself’ (Marazzi, 2011: 41). This is a phenomenon, moreover, that has occurred amid the demise of various ‘representative mediations’, from political parties and trade unions to social, class, and other forms of group identification (Marazzi, 2011: 41). In the process, post-Fordism has become marked by a ‘passage from security to precariousness’ (Marazzi, 2011: 44).²

Alongside this passage towards precariousness, another phenomenon Marazzi stresses is central to communicative, post-Fordist production is ‘the increasing “servility” of productive labor’, which applies to both ‘industrial and service employment’ (2011: 44). Indeed, in ‘post-Fordist societies’, it is ‘impossible to distinguish’ between the two types of labour, precisely because of the ‘neo-servile work relations’ that each entail. The trend towards such neo-servility is driven by transformations in the wage form: *salaries*, for instance, have been replaced by *incomes* that are individualised through ‘a vast array of merit-based remunerations’, rather than ‘collective contractual agreement’ (Marazzi, 2011: 47–9).

Marazzi argues that ‘devotion and obedience’ among workers is crucial when ‘contingency reigns’ and ‘the marketing of goods is in charge’, imposing ‘quantity and quality in real time (just-in-time)’ (2011: 45). The labour market today, then, is ‘the place of the absence of universal rights’ (Marazzi, 2011: 45). And the role of ‘linguistic-communicative mediation’ has itself been central to the production of this servility (Marazzi, 2011: 53). It has involved, for instance, an appeal to the universal human capacity to communicate, leading paradoxically to ‘increasingly personalized, privatized and therefore servile hierarchies in the working environment’ (Marazzi, 2011: 53). And there has been a simultaneous requirement for *co-operation* on the one hand – nobody can communicate alone! – yet, on the other, an effort to *re-divide*, or to ‘create hierarchies, segment and privatize the public – because common to all – resource of communicative action’ (Marazzi, 2011: 53).

LANGUAGE, COMMUNICATION, AND FINANCE

In his later work, *Capital and Language*, Marazzi (2008 [2002]) extends the argument and analysis set out in *Capital and Affect*. He argues that, in the New Economy of post-Fordism, where ‘labor ... is increasingly *cognitive*’ (2008: 50), communication and language are ‘structurally and contemporaneously present’ in, first, the sphere ‘of the distribution of goods and services’ and, second, in the realm of finance (2008: 14). As such, ‘changes in the world of work and modifications in the financial markets must be seen as two sides of the same coin’ (Marazzi, 2008: 14). He situates his arguments and observations in relation to those of other scholars, such as Luc Boltanski and Ève Chiapello. In their *The New Spirit of Capitalism*, Boltanski and Chiapello (2005 [1999]) famously argued that, from the 1970s onwards, capital demonstrated a capacity to ‘recuperate’ (or incorporate) into a reinvigorated capitalism many of the artistic, counter-cultural, and left-wing critiques of the 1960s. For Marazzi, post-Fordism was able to emerge ‘out of the metabolizing of the social and cultural critique’ of Fordism precisely because it involved putting ‘language, communicative-relational action’ (2008: 41) to work. And one of the results was an expansion in the time of work. Quite unlike Rifkin’s (2004) end-of-work hypothesis, then – where working time is reduced through technology-driven productivity gains – Marazzi (2008: 41–2) argues that post-Fordism has added *new* ‘blocks of social time’ to ‘work time’: ‘relational-communication time, time for reflection, learning time’, and so on. In other words, the rise of ‘reflective, cognitive, and communicative work’, which ‘led to an increase in the time dedicated to work’, was itself part of the New Economy’s efforts to ‘overcome the resistance and the protest against Fordist-Taylorist work’ by granting workers greater ‘autonomy and responsibility’ (Marazzi, 2008: 140–1).

Marazzi’s distinctive account of ‘the global and financial dimension of post-Fordism’ involves conceding that, as others have pointed out, in some ways: ‘globalization is nothing particularly new’ (2008: 57). There is an echo here with the likes of Paul Hirst and Graeme Thompson who, in their influential book, *Globalization in Question*, argued that, ‘in some respects, the current international economy is *less* open and integrated than the regime that prevailed from 1870 to 1914’ (1999: 2).³ Marazzi insists, however, that processes like ‘the financialization of household economies’ (2008: 58), where savings are diverted to global security markets in the hope of receiving greater returns, is nevertheless unprecedented. Financialisation is said to be ‘centered on the concept of liquidity’ (Marazzi, 2008: 62). This is what allows for the securities that savings have been invested in to be ‘rapidly exchangeable’ and ‘negotiable’ (Marazzi, 2008: 24). And this exchangeability and negotiability requires a ‘reference value’ capable of indicating their price (Marazzi, 2008: 24). And it is here that Marazzi identifies one of the key ways communication is fundamental to financialisation. He quotes the French economist André Orléan as writing: ‘the financial market organizes the confrontation

between the personal opinions of investors in such a way as to produce a collective judgement that has the status of a reference value' (Orléan, quoted in Marazzi, 2008: 24). Communication plays a role in financial markets in the sense, furthermore, that 'speculative behaviour is *rational* because markets are *self-referential*' (Marazzi, 2008: 26). Investors respond less on the basis of 'information' and rather on the basis of what they 'believe will be the reaction of the other investors in the face of that information' (Marazzi, 2008: 26). An investor may not themselves be convinced by, say, warnings from the Chairman of the Federal Reserve about the dangers of inflation, but they will need to respond to how they believe others will react (Marazzi, 2008: 25). Financialisation requires 'mass communication', then, because it 'depends on *mimetic rationality*, a kind of herd behaviour based on the information deficit of individual investors' (Marazzi, 2008: 21).

What is novel here is not the understanding of financial investors' behaviour. After all, in his *General Theory of Employment, Interest, and Money*, John Maynard Keynes (1997 [1936]: 156) famously likened the financial markets to a game in which the contestants have to predict what 'average opinion' is. The novelty is instead found in the sweeping reach of financial markets and the financialisation of household economies, mentioned earlier. Just as the economist Yann Moulier Boutang (2011 [2007]: 48) describes financialisation as an expression of the 'remodelling' and 'reformatting, of material [industrial] production' taking place in cognitive capitalism, this process can also be described as a *financialisation of social reproduction*, or what Randy Martin (2002) called a 'financialization of daily life', such that an apparently ever-larger proportion of human activities are drawn into the 'logic of finance' and subjected to financial discipline.

IMMATERIAL LABOUR AND MASS INTELLECTUALITY

Around the same time as Marazzi was addressing the role of communication, cognition, and language in production, others associated with *operaismo*, like Maurizio Lazzarato (1996), began theorising what they called *immaterial labour*. This was said to be caught up with a 'post-Taylorist' mode of production, and with 'processes of social communication' that themselves involved 'the production of subjectivity', particularly in industries like 'advertising, fashion, marketing, television, cybernetics, and so forth' (Lazzarato, 1996: 143). For Lazzarato, there are two components to the concept of immaterial labour. It refers, first, to the *informational* content of commodities, so that the skills required of the workforce in the tertiary *and* industrial sectors are those of 'cybernetics and computer control', as well as 'communication' – both horizontal and vertical (Lazzarato, 1996: 133). Second, the concept refers to commodities' *cultural* content. Immaterial labour, in other words, involves 'a series of activities that are not normally recognised as "work"' (Lazzarato, 1996: 133). It includes, for instance, those activities entailed in 'defining and fixing cultural

and artistic standards, fashions, tastes, consumer norms and, more strategically, public opinion' (Lazzarato, 1996: 133). Moulier Boutang (2011: 32) draws on this crucial aspect of immaterial labour in particular when describing the political-economic transformations that are occurring amid the emergence of cognitive capitalism (although it should be noted that Lazzarato (2013) has himself been quite critical of some aspects of the cognitive capitalism hypothesis). While these sorts of labouring practices have long existed, they are no longer 'the privileged domain of the bourgeoisie and its children' (Lazzarato, 1996: 133–4). Since the 1970s, Lazzarato argues, manual labour itself has increasingly come to entail intellectual procedures, so that the distinctions between manual and mental, material, and immaterial labour have blurred.

Paolo Virno has similarly insisted that, as 'a depository of cognitive and communicative skills', *all post-Fordist labour-power is intellectual*. He describes such labour-power as the 'intellectuality of the masses', or the form that is today taken by 'the *general intellect*' (Virno, 2004: 107–8). This latter term has been central to *operaist* accounts of immaterial, cognitive, and intellectual labour. It is borrowed from a passage in Marx's *Grundrisse* (1973: 706), where it is used just once to point to the way that 'general social knowledge' could become 'a *direct force of production*'. Fixed capital, Marx argued – machines, railways, electricity telegraphs, and so on – can express 'the power of knowledge, objectified' (1973: 706). For Virno (2004: 108), the general intellect in fact represents that which 'cannot be objectified within the system of machines', namely living labour.⁴ This is said to increasingly take the form of 'linguistic services', so that Jürgen Habermas's well-known distinction between *labour* and *interaction*, or between *instrumental* and *communicative* action, no longer holds (Virno, 2004: 106–7). The labour process (where waged labour is set to work in order to produce surplus-value) itself involves interaction. And communicative action – and 'the dialogical world' – has become instrumental, 'seated at the very heart of capitalistic production' (Virno, 2004: 107).

For Lazzarato (1996: 137), immaterial forms of labour are 'immediately collective' and constituted in networks, while operating outside the confines of the factory and 'at a territorial level'. The associated production cycle is often invisible, capable of coming into operation when required and then dissolving 'into the networks and flows that make possible the reproduction and enrichments of its productive capacities' as soon as the task has been completed (Lazzarato, 1996: 137). As a result, leisure and work time become indistinguishable, and 'life becomes inseparable from work' (Lazzarato, 1996: 138).

COGNITIVE CAPITALISM

The concept of cognitive capitalism features explicitly in the work of numerous *operaist* theorists, some of whom we have encountered earlier. Examples include

Fumagalli (2010: 61), Marazzi (2010: 59), Negri (2008 [2003]: 64), and Vercellone (2007: 14). Others, like Berardi (2009: 105) in *The Soul At Work* allude to the concept with talk of a *cognitariat*, cognitive work, and cognitive labour, but do not use the term cognitive capitalism itself. These analyses, along with those of mass intellectuality, immaterial labour, and biopolitical production (addressed later), also resonate in important ways with others developed outside the post-workerist tradition. For instance, in her crucial 1985 text, *A Cyborg Manifesto* – translated and published by the post-workerist journal *Futur Antérieur* in 1992 – Donna Haraway discussed the reconfiguration of ‘social relations tied to science and technology’ amid the move from what she described as ‘an organic, industrial society to a polymorphous, information system’ (2016 [1985]: 28). Her goal was partly to rethink socialist feminism in light of women’s ‘integration/exploitation into a world system of production/reproduction and communication’ which she called ‘the informatics of domination’ (Haraway, 2016 [1985]: 33). This was a process that, she emphasised, entailed ‘a massive intensification of insecurity and impoverishment, with common failure of subsistence networks for the most vulnerable’ (Haraway, 2016 [1985]: 49–50).

Perhaps the most extended *explicit* presentation of the cognitive capitalism hypothesis currently available in the anglophone world is that of Moulier Boutang in his book *Cognitive Capitalism* (2011 [2007]). For Moulier Boutang, cognitive capitalism is ‘a mode of accumulation in which the object of accumulation consists mainly of knowledge, which becomes the basic source of value, as well as the principal location of the process of valorisation’ (2011 [2007]: 57). He distinguishes his own account from a number of other analyses of capitalism’s recent transformations, each of which is seen as falling short in different ways. He argues, for instance, that theories of the *knowledge-based economy* tend to understand ‘knowledge production’ as a discrete sector, rather than a phenomenon that is transforming the economy as a whole, ‘[destroying] the very “manufacturing” notion of single driving sectors’. Indeed, the transformations he identifies are said to extend beyond ‘the economy’, perceived as ‘just one instance of society’, and to be occurring throughout ‘capitalism as a whole’ (Moulier Boutang, 2011: 39).

Analyses of the *information society* are said to often reduce knowledge to information. Cognitive capitalism does not just valorise information, which had already occurred in the age of ‘mass industrial capitalism’, rather, it puts to work ‘intelligence and innovation’ (Moulier Boutang, 2011: 41). Accounts of *technological capitalism* might recognise the role of innovation, in that they explain growth through the emergence of highly productive sectors enabled by new information technologies, as in the neo-Schumpeterian approach discussed earlier. But for Moulier Boutang (2011: 42), these analyses tend to be too deterministic, failing to recognise the central role of ‘the social uses’ played by technology and reducing knowledge ‘to an automatic accompaniment of technology’.

Industrial capitalism is said to have been typified by bodily work carried out by manual labourers processing raw materials within large factories, breaking substantially with an earlier *merchant* capitalism (Moulier Boutang, 2011: 47–8). And today, a new, third – *cognitive* – capitalism is said to be emerging at the global level. Here Moulier Boutang’s argument resonates with Hardt and Negri’s as well as Paul B. Preciado’s descriptions of the *qualitative* hegemony of biopolitical or pharmacopornographic production (addressed later). Cognitive capitalism ‘re-arranges’ and ‘reorganises’ ‘material industrial production’, rather than eliminating it. And ‘financialisation is the expression of this remodelling, of this reformatting, of material production’ (Moulier Boutang, 2011: 48).

Moulier Boutang argues that any adequate definition of cognitive capitalism needs to define its *system of accumulation*, its *mode of production*, and the specific *type of exploitation* it entails. Its system of accumulation is said to be based on forms of what he calls ‘immaterial investment’, with the generation of profits largely deriving from a capacity to capture ‘gains arising from knowledge and innovation’ (Moulier Boutang, 2011: 56–7). Where knowledge functions as a ‘basic source of value’ and as ‘the principal location of the process of valorisation’, questions of positioning within networks, alliances, and property rights are said to be rendered ‘major institutional and organisational factors’. Energy and labour are still expended in processes of ‘mechanical transformation’, of course. But the centrality of industrial systems of accumulation recedes amid ‘a cooperation of brains in the production of the living by means of living, via the new information technologies’ (Moulier Boutang, 2011: 57).

Cognitive capitalism’s mode of production – which entails ‘the production of material goods, services, signs and symbols’ – is rooted, then, in ‘the cooperative labour of human brains joined together in networks by means of computers’ (Moulier Boutang, 2011: 57). As such education, research, technological development, communication systems, information flow, and innovation have all become crucial. And social and property rights have been redefined, and new institutional rules developed, particularly in relation to the capture of ‘positive externalities’, and especially those that are knowledge-based.⁵ One result, Moulier Boutang argues, is that ‘human capital and the quality of the population have now become crucial factors in defining the new wealth of nations’ (2011: 58).

Within cognitive capitalism’s ‘specific *form of exploitation*’, surplus-value – the production of value over and above the costs of reproducing the workforce – is said to entail splitting living labour in two (Moulier Boutang, 2011: 92–3). One part of this living labour is consumed by capital. It becomes accumulated capital or dead labour crystallised in, for instance, machinery. Yet there is another part of living labour that is not ‘destroyed as an intermediate consumption’ and it ‘continues to exist as a means of production throughout the cycle’ (Moulier Boutang, 2011: 93). This second part is certainly ‘consumed as bodily energy’, then, ‘but it also develops as a means of production of living as living labour. It builds itself as a skill, as a know-how resistant to its reduction to pure human

capital that can be objectified' (Moulier Boutang, 2011: 93). Cognitive capitalism produces, then, what Moulier Boutang calls, 'living labour by means of living labour' and 'knowledge by means of knowledge' so that what is produced is not just accumulated capital as dead labour but also 'the *living capital* of the enterprise' (2011: 93).

The production of surplus-value in merchant and industrial capitalism required the consumption of living labour-power. It was purchased and set in motion, with a distinction drawn, in Marx's (1990 [1867]: 340–1) formulation, between the 'necessary labour' entailed in producing the quantity of value required to replenish the labour-power that had been consumed, and the 'surplus labour' that produced value over and above this sum. As such, Moulier Boutang explains, while necessary labour is transformed into 'a wage dedicated to the reconstitution of the biological and cultural potential of the workforce', surplus labour is transformed into 'profits that could be accounted for in the next cycle, as new machines' (2011: 94). Cognitive capitalism, in contrast, resists 'this perfect objectification (reification or alienation) of invention power in the work process or in the product' (Moulier Boutang, 2011: 94). This is not to say, however, that cognitive capitalism does not entail exploitation. It does! Indeed, by increasing working hours and reducing wages, on the one hand, and by investing in technologies that increase the productivity of labour, on the other, it is said to combine the extraction of both *absolute* as well as *relative surplus-value* (Moulier Boutang, 2011: 95, 206).⁶

BIOPOLITICAL PRODUCTION

Much like Lazzarato's account, Michael Hardt and Antonio Negri's theorisation of immaterial labour also identifies a blurring of life and labour. Nowhere is this clearer than in their development of the notion of immaterial labour as a form of *biopolitical production* (which explicitly draws on the post-workerist analyses of mass intellectuality, the general intellect, and cognitive capitalism, e.g. Hardt and Negri, 2001: 28–30, 422, 2004: 107–8, 2017: 28, while, at the same time, attempting to move beyond certain perceived limits).

The term 'biopolitics' derives from Michel Foucault's (1979 [1976]: 143) discussion of 'biopower', which he describes, in volume one of *History of Sexuality*, as taking charge of life more than it threatens death. For Foucault, this situation emerged in the nineteenth century, as two poles of power – distinct yet not antithetical – began to operate in concert. The first 'centered on the body as a machine', increasing both its utility and docility, while the second 'focused on the species body, the body imbued with the mechanics of life and serving as the basis of the biological process', supervising the health of the population, its birth and mortality rates, and so on (Foucault, 1979 [1976]: 139). Foucault uses the terms *biopower* and *biopolitics* relatively interchangeably. The former names the

mechanism by which power comes to focus on the production and management of life, and the latter describes the actual enacting of relationships within which the former exists. For Hardt and Negri, however, the distinction is substantial. ‘Biopower’, on the one hand, ‘stands above society, transcendent, as a sovereign authority and imposes its order’ (Hardt and Negri, 2004: 94). While ‘biopolitical production is’, on the other, ‘immanent to society and creates social relationships and forms through collaborative labor’ (Hardt and Negri, 2004: 94–5).

Hardt and Negri (2001: 23–4) emphasise the distinction Gilles Deleuze (1995) drew in his own discussion of Foucault’s work, between *disciplinary* and *control* societies. The former are said to have emerged with the ‘first phase of capitalist accumulation (in Europe and elsewhere)’, structuring ‘the parameters and limits of thought and practice, sanctioning and prescribing normal and/or deviant behaviors’ (Hardt and Negri, 2001: 23). The latter developed ‘at the far edge of modernity and opens toward the postmodern’, with increasingly ‘democratic’ forms of command becoming ‘ever more immanent to the social field, distributed throughout the brains and bodies of the citizens’ (Hardt and Negri, 2001: 23). It is in control societies, then, that production becomes biopolitical. ‘Life is made to work for production and production is made to work for life’ (Hardt and Negri, 2001: 32). For Hardt and Negri, immaterial labour is labour ‘of the head and heart’, deploying both cognition and affect in the process of producing ‘images, information, knowledge, affects, codes, and social relationships’ (2009: 132). In the sense that this labour also generates and shapes social relationships, minds, bodies, and needs (Hardt and Negri, 2001: 32), the *object* of production becomes, in many ways, the *subject* itself (Hardt and Negri, 2009: 133).

In *Testo Junkie*, Paul B. Preciado (2013: 36, 40) engages directly with post-workerist theories of cognitive capitalism and biopolitical production, picking up in particular on part of Hardt and Negri’s argument, namely that Marx’s recognition of the importance of industrial labour in the nineteenth and twentieth centuries had not been due to its *quantitative* dominance (in fact, it was less significant in this regard) but rather a *qualitative* hegemony. In other words, it was important because it demonstrated a capacity to transform agricultural and other forms of production – as well as society itself – in its own image. For Hardt and Negri (2004: 107), immaterial labour occupies the position today that industrial labour did in Marx’s day. Preciado’s argument is that the ‘new age of political world economy’ is in fact better understood through the lens of *pharmacopornographic* production and control; it is what represents ‘the model of all other forms of production’, infiltrating and dominating ‘the entire flow of capital, from agrarian biotechnology to high-tech industries of communication’ (2013: 40).

The pharmacopornographic regime is defined as ‘postindustrial, global, and mediatic’, and names ‘the processes of biomolecular (pharmaco) and semiotic-technical (pornographic) government of sexual subjectivity’ (Preciado, 2013: 33–4). ‘Technoscience’ is said to have transformed a series of ‘concepts’ – from *the psyche* and *libido*, over *femininity* and *masculinity*, through to *hetero-*, *homo-*,

inter-, and *trans-sexuality* – into ‘tangible realities’ which manifest themselves in ‘commercial chemical substances and molecules, biotype bodies, and fungible technological goods managed by multinationals’ (Preciado, 2013: 34). The pharmaceutical industry is said to represent one of the key ‘load-bearing’ branches of ‘post-Fordist capitalism’, along with ‘the industry of war’ and ‘the pornographic industry’ – with the latter described as ‘the great mainspring of our cyber economy’ (Preciado, 2013: 37–9).⁷ Here, ‘amateur portals’, rather than sites owned by multinationals like Playboy, are said to be ‘the truly emerging market’, offering a profit maximisation model for the cybernetic market ‘comparable only to financial speculation: minimum investment, direct sales of the product in real time in a unique fashion, the production of instant satisfaction for the customer’ (Preciado, 2013: 38–9). Preciado writes: ‘If the financial analysts who direct Google, eBay, or Facebook are attentively following the fluctuations of the cyberporn market, it’s because the sex industry furnishes an economic model of the cybernetic market as a whole’ (2013: 39).

COGNITIVE LABOUR AND FEMINISATION

Some of the authors whose work has already been mentioned – Haraway (2016: 38–41), for instance – have described, amid their accounts of post-industrial transformations in labour and life, processes of labour’s ‘feminisation’. The term often refers, first, to an increase in the number and proportion of women within the waged workforce. In her critical engagement with *operaist* accounts of post-Fordist production, Angela McRobbie points towards an expansion in opportunities and in the aspirations of young women, ‘from the late 1970s onwards’, largely due to ‘the impact of feminism and the sexual revolution providing birth control’. As such, she argues, ‘we can begin to see a close correlation between women’s increasing independence and the growth of post-Fordist production processes’ (McRobbie, 2010: 67). Second, feminisation frequently describes the ways ‘qualities that have traditionally been associated with “women’s work”, such as affective, emotional, and relationship tasks, are becoming increasingly central in all sectors of labor, albeit in different forms in different parts of the world’ (Hardt and Negri, 2009: 133). And third, a growing number of jobs are acquiring ‘characteristics associated with women’s historical pattern of labour force participation’ (Standing, 1999: 583). For instance, in her study of major financial centres, as agglomerations of telecommunication and information technology industries, Sassen notes that while more women than men are employed in ‘part-time, temporary, and seasonal jobs’, ‘all the evidence points to a significant increase of such jobs among men over the last decade’ (2001: 289). Any moves towards greater equality appear to take the form, in other words, of a levelling *down* (Standing, 1999: 583). Indeed, Sassen argues that even high-earning ‘professional and managerial employees’ based in

‘new specialized services and financial firms’ – the labour aristocracy of cognitive capitalism if ever there was one – are ‘more vulnerable to dismissal’ with ‘fewer claims on their employers than was the case with their equivalents in the large commercial banks and insurance houses’ (2001: 289).

Several scholars of feminised post-Fordist labour have also stressed the blurring of distinctions between ‘production’ and ‘reproduction’ today, so that ‘when we say “work” in cognitive capitalism we mean less and less a precise and circumscribed part of life’ (Morini, 2007: 44).⁸ The implication of the realm of reproduction in the production of surplus-value, either directly or indirectly, has of course long been emphasised by many feminists (e.g. Malos, 1980). And Haraway (2016: 39) described the integration of ‘factory, home, and market’ on a new scale in her *Cyborg Manifesto*. She identified in particular the emergence of a ‘homework economy’ – involving ‘a restructuring of work that broadly has the characteristics formerly ascribed to female jobs, jobs literally done by women’ – as a ‘world capitalist organizational structure’ (Haraway, 2016: 39). While technology was not causing this phenomenon, it was what was making it possible. Communication technologies enabled, for instance, the control of labour at a time in which it was becoming increasingly decentralised and dispersed, and in a way that eventually allowed for the decimation of ‘relatively privileged, mostly white, men’s unionized jobs’ (Haraway, 2016: 39).

There is a recognition here, then, of the differentiated processes and degrees of feminisation (including as a form of precarisation). She observes for instance that, while new technologies had led to the loss of ‘the family (male) wage’ by those (few) who had ever known it (Haraway, 2016: 39), black women in the USA had of course ‘long known’ both the experience of black men’s structural underemployment, ‘as well as their own highly vulnerable position in the wage economy’ (Haraway, 2016: 41). Meanwhile, she observed: ‘as robotics and related technologies put men out of work in “developed” countries and exacerbate failure to generate male jobs in Third World “development”, and as the automated office becomes the rule even in labor-surplus countries, the feminization of work continues’ (Haraway, 2016: 41).

Preciado critiques the notions of work’s ‘feminisation’, and the idea of ‘the “becoming-woman of work”’, as this appears in the writings of Marazzi, Lazzarato, and Negri, insisting that there is nothing ‘more “feminine”’ in post-Fordist work than there was in the industrial era (Preciado, 2013: 288–9). He points out that women have worked as slaves in cotton fields, packed sardines on assembly lines, toiled in the textile industry, and in the manufacture of ‘smart cards’ (Preciado, 2013: 289). (In her own discussion of cognitive capitalism, Morini similarly insists, ‘women have always worked’ (2007: 55). The conflation of ‘*sure, stable, and permanent*’ with ‘industrial and male’ and ‘*flexible, changeable, mobile, and precarious*’ with ‘postindustrial and female’ reveals, for Preciado, a ‘presupposed heterocentricity’ and an unsustainable ‘metaphysics of sexual difference’ (2013: 289). In fact, the criteria that are commonly seen

as characterising the feminisation of work – ‘such as flexibility, total availability, high level adaptability, vulnerability, talent for improvisation’ – are said to be better understood as those of *sex work* (Preciado, 2013: 295). In other words, post-Fordism is increasingly characterised by ‘lack of security, sale of corporeal and affective services at a low price, social devaluation of the body that performs the work, exclusion from the right to residency’ (Preciado, 2013: 295–6). These features were of course ‘always there, but their character is becoming more structural and explicit’ (Preciado, 2013: 296).

CRITIQUES OF THE COGNITIVE CAPITALISM HYPOTHESIS

A range of criticisms has been made of the cognitive capitalism hypothesis. Hardt and Negri, for instance, suggest that many theories of mass intellectuality, immaterial labour, and the general intellect that have emerged out of Italian workerism tend to examine ‘the new labouring practices in biopolitical society *only* in their intellectual and incorporeal aspects’, neglecting ‘the productivity of bodies and the value of affect’ (2001: 30). And just as corporeal components are present in the (waged) realm of intellectual production – as anybody who has spent long hours in front of a computer screen, in a laboratory, or working as an interpreter will tell you – unwaged reproductive and care work also come with immaterial, affective, and cognitive elements with their material component. Cleaning up a toilet-untrained child, for instance, is of course material, but the ability to anticipate such a child’s bowel movements – thus minimising the unsavoury work – requires developed communicative and cognitive skills. To the extent that capital has *always* been dependent on reproductive labour, labour and capitalism have always been at least partly cognitive.

McRobbie argues that *operaismo*’s accounts of post-Fordist production, including its discussions of immaterial labour and cognitive capitalism, have failed ‘to foreground gender, or indeed to knit gender and ethnicity into prevailing concerns with class and class struggle’ (2010: 60). She suggests that, while recognising the lack of a clear dividing line ‘between working life and everyday life including leisure’, there remains an implicit emphasis on ‘the workplace’ as the site for ‘a new radical politics’ (McRobbie, 2010: 74). ‘They do not disavow the political importance of everyday life and other social institutions, but the movement of their analysis follows a line from the workplace outwards to the “social factory”’, a term that itself suggests, for McRobbie, ‘a hierarchy and a pre-eminent place for wage labour and class politics’ (2010: 75).

In *Postcapitalism: A Guide to Our Future*, Paul Mason argues the theorists of cognitive capitalism are too ready to present it as ‘a fully functioning system’ – newer and more coherent than is in fact the case. ‘This is a technique common in European speculative thought: to invent a category and apply it to everything, thus reclassifying all existing things as sub-categories of your new

idea. It saves you the trouble of analysing complex and contradictory realities' (Mason, 2015: 140). The importance of 'the rise of old-style industrial production' in Brazil, Russia, India, or China is underestimated, for instance (Mason, 2015: 141). We could say something similar about 'repeasantisation', a process – described by Walden Bello in *The Food Wars* – whereby 'entrepreneurial farmers abandon capitalist farming and increasing numbers of urbanites take up small-scale agriculture' (2009: 148). Yet while the claims made by the theorists of cognitive capitalism are indeed bold in their tone and content, such contradictions and counter-tendencies are often acknowledged. Moulier Boutang, for instance, concedes that the make-up of cognitive labour is 'varied', repeating in some ways 'the old cleavages' between, say, 'the poor, the lumpenproletariat, the proletarians and the working class' (2011: 98).

Caffentzis has also pointed towards a number of problems with the notion of cognitive capitalism 'and its cognates', such as 'informational capitalism' and 'the knowledge economy' (2013: 95). First, he argues the terminology used by institutions such as the OECD and the World Bank to define knowledge-based industries involves 'extraordinary fuzziness' (Caffentzis, 2013: 100). 'Are non-knowledge-based industries ignorance-based?' he asks (Caffentzis, 2013: 100). And he finds a similar 'lack of reflection on the meaning of "knowledge"' in the work of Vercellone (2007) and others (Caffentzis, 2013: 108). Just as contemporary 'immaterial' labour involves a corporeal component, then, the labour of both craft workers and the Fordist mass worker was never purely material. As Gerald Hanlon (2015) shows, appropriating to capital the knowledge of the craft worker was the political project of Friedrich Taylor and the other pioneers of 'scientific management'.⁹ Indeed, we can only explain the effectiveness of the 'work-to-rule' as a tactic of struggle in the Fordist era if we recognise the cognitive and communicative element of 'mass work'.

Second, and citing the example of derivatives dealers, Caffentzis argues that it is misleading to describe many of the forms of labour-power set to work in 'Intellectual Property-Intensive Industries (IPIIs)' as 'knowledge work' or 'living knowledge' (2013: 111). This is an issue Berardi also recognises. He argues that, in 'becoming an economic necessity', the 'labor of communication' – which he defines as central to 'cognitive labor' – 'loses its character of gratuitous, pleasurable and erotic contact' (Berardi, 2009: 86–7). He makes a distinction within 'mental labor' between those involved in the (quantitatively dominant) kind of repetitive work experienced in much the same way as industrial labour, and what he calls 'properly cognitive labor, where intellectual energies are engaged in a constant creative deterritorialization' (Berardi, 2009: 87).

Third, various theorists of cognitive capitalism and immaterial labour have stressed that, where knowledge production is at stake, 'the traditional opposition between labour and non-labour loses any foundation' (Vercellone, 2007: 30). As Hardt and Negri explain: 'an idea or an image comes to you not only in the office but also in the shower or in your dreams' (2004: 111–12). Moreover, both

within firms and in society in general, cognitive capitalism involves ‘the mobilisation and the co-operation of collective knowledges’ in the form of the general intellect (Vercellone, 2007: 33). As such, while labour is said to remain the source of value and the creation of wealth, ‘it can no longer be measured on the basis of labour time directly dedicated to production’ (Vercellone, 2007: 30).¹⁰ Caffentzis suggests, however, that the value produced by labour continues to be determined by the labour-time expended in production in the sense that ‘clock-time production’ has *always* had a ‘tangential’ relation to commodity value, which is determined by the average ‘socially necessary labour-time’ (Caffentzis, 2013: 112). In other words, ‘the labour-time required to produce any use-value under the conditions of production normal for a given society and with the average degree of skill and intensity of labor prevalent in that society’ (Marx, cited in Caffentzis, 2013: 112).

Moreover, he points out that the process of producing immaterial goods and their transformation into intellectual property ‘is a process in time that can be (*and is*) measured’, with those working within IPIIs ‘routinely given task-specific contracts with temporal deadlines’ (Caffentzis, 2013: 111). And while theorists of cognitive capitalism and immaterial labour have often stressed the post-Taylorist nature of contemporary production (e.g. Lazzarato, 1996: 138; Moulier Boutang, 2011: 52), a growing body of literature emphasises the prevalence of (neo-)Taylorist forms of management – from the surveillance, standardisation, and quantification of academic labour in the UK’s higher education sector (De Angelis and Harvie, 2009), to the ‘highly alienated, fragmented, individualised and algorithmically standardised work of micro-tasking’ that makes up what Moriz Altenried (2016: 40) calls ‘the new digital Taylorism’.¹¹

Cognitive capitalism is, then, an enormously suggestive concept that seems to capture some important characteristics that distinguish the capitalism of the past few decades from earlier forms. But – as with many suggestive concepts – it needs to be treated with care, lest it obscures and elides as much as it illuminates.

Notes

- 1 Various distinctions have been drawn between ‘workerism’ and ‘post-workerism’, although for the purposes of this chapter they will be treated as synonymous.
- 2 Others have made similar claims about a passage to greater precariousness. Examples include Pierre Bourdieu (1998 [1997]), Guy Standing (2011), and Judith Butler (2015). Ronaldo Munck has argued that, from a global perspective, Fordism and the welfare state have been the exception, rather than precariousness; and that the current global increase in precarity should be understood ‘as part of the broader process of dispossession and the generation of new “surplus populations”’ (2013: 757).
- 3 De Angelis and Harvie (2008) argue that Hirst and Thompson’s thesis is only sustainable when international financial flows (trade and investment) are denominated in US dollars. When measured in terms of command over labour (taking account of exchange rates and wage rates) it becomes clear that countries of the global South are more fully integrated into capital’s circuits of accumulation than Hirst and Thompson allow.
- 4 This argument is echoed in Moulier Boutang’s (2011: 54) own discussion of cognitive capitalism.

- 5 'Positive externalities' include, for instance, knowledge gained by workers from formal education as well as informal encounters and exchanges, and from which a firm benefits at no (direct) cost.
- 6 On absolute and relative surplus-value, see Marx (1990: 643–54).
- 7 Marazzi (2008: 145–57) also discusses the relationship between war and the New Economy.
- 8 In her critical engagement with theories of affective and immaterial labour, Silvia Federici has argued that failing to distinguish between production and reproduction, waged and unwaged work, risks obscuring the degree to which capital accumulation is fed by 'an immense amount of unpaid labor' and 'the systematic devaluation of reproductive work' (2011: 71).
- 9 Kevin Floyd describes Taylorism as having 'expropriated what had been fully corporeal knowledges from the labouring body' (2009: 100).
- 10 Hardt and Negri (2004: 144–51) as well as Virno (2004: 100) have argued something similar.

Bio-Cognitive Capitalism

Andrea Fumagalli

WHY BIO-COGNITIVE CAPITALISM?

The aim of this chapter is twofold. On the one hand, it is an attempt to systematize a series of reflections and concepts elaborated by a number of studies in the 2010s. The chapter engages with scholars from different disciplines, but all identify, despite their internal differences, with a method of analysis rooted in Italian workerist thought of the 1960s. It discusses an issue that has provoked much debate in the last few years, especially in the field of what is called ‘Autonomous Marxism’, that is to say, the analysis of the salient characteristics of the current state of capitalism.¹

In the last 30 years, the process of capitalist accumulation and valorization has assumed different names: the most common of these, post-Fordism, is also the oldest. The term post-Fordism became popular during the 1990s, especially through the French *école de la régulation*.² The term ‘post-Fordism’ refers to the period from the 1975 crisis to the early 1990s crisis, during which the process of accumulation and valorization were no longer based on the centrality of Fordist material production: the vertically integrated large factory. At the same time, we do not yet possess an alternative paradigm in this period. Unsurprisingly, in the prefix ‘post-’ we express what is no longer there, without underlining what actually appears in the present. The post-Fordist stage is in fact characterized by the complementary presence of more and other productive models: from the

Japanese Toyotist model of 'just in time' production derived from Taylorism³ to the industrial district model of small enterprises⁴ and the development of hierarchical productive lines that tend to become international.⁵ Among these models, it is still impossible to identify a hegemonic paradigm.

After the first Gulf War (1991), innovations in the fields of transportation, language and information communication technology (ICT) began to gather around a new single paradigm of accumulation and valorization. The new capitalist configuration tended to identify *knowledge* and *space* (geographic and virtual) as commodities in the new foundation for dynamic accumulation. Consequently, two new dynamic economies of scale were formed, which were the basis for growth in productivity (or the source of surplus value): learning economies and network economies. The former is connected to the process of knowledge creation and distribution (based on new systems of communication and information technologies); the latter derive from the organizational modalities of each district (territorial networks or system areas), which are no longer used for production and distribution only, but increasingly as a vehicle of diffusion (and control) of knowledge and technological progress. We name this new paradigm of accumulation *cognitive capitalism*.⁶

The term capitalism designates the permanence, though metamorphic, of the fundamental variables of the capitalistic system: the leading role of profit, and the wage system in particular, or more precisely, the different forms of employed labour from which surplus value is extracted. The attribute 'cognitive' evidences the new nature of labour, the sources of valorization and property structure on which the process of accumulation is founded and the contradictions that this mutation generates.⁷

The centrality of learning and network economies, typical of cognitive capitalism, was brought into question at the beginning of the new millennium, following the bursting of the internet economy bubble and its speculations in March 2000. The new cognitive paradigm alone was unable to protect the socio-economic system from the structural instability that characterized it. Since capitalism requires that new liquidity constantly be directed into the financial markets, the ability of financial markets to generate 'value' is tied to the development of 'conventions' (speculative bubbles). These conventions can often create somewhat homogeneous expectations, thereby pushing the main financial operators to support certain types of financial activities.⁸ The internet economy bubble of the 1990s was followed in the 2000s by the great attraction to developments in Asian markets (China entered the WTO in December 2001) and real-estate markets. Independently of the dominant convention, contemporary capitalism is always in search of new social and vital circles to absorb and commodify, involving more and more the bare vital faculties of human beings. It is for this reason that in the last few years we have been hearing about bioeconomy and biocapitalism.⁹

At this point, the reader should clearly understand that the lemma *bio-cognitive capitalism* is nothing more than the contraction of cognitive capitalism and

bio-economy: bio-cognitive capitalism is thus the term that defines contemporary capitalism, as far as overall western countries are concerned. It is important to underline that here, the term ‘life’ refers to the ancient Greek concept of *bios* and not of *zoé*. More in particular, ζωή (*zoé*) means the principle, the essence of life that belongs in common, indiscriminately, to the universality of all living beings and which has the opposite concept of non-life (different from ‘death’); βίος (*bíos*), instead, indicates the conditions of possibility, the ways in which our life takes place.

It is this second meaning, *bios*, which interests us. Not *life* from a biological perspective but *life* from a social point of view, as an expression of human relationships. In this context, the works of Foucault are particularly relevant.¹⁰ With the advent of capitalism, in the nineteenth century, there is an important change: the passage from the ‘sovereign’ power that acted from above, with the sword, exercising the right ‘to kill or let live’ his subjects, to a power that instead wants to organize, order, direct the population and therefore manage life, not death! Paradoxically, death does not come out of the landscape at all, but is exploited as an instrument to obtain ‘more’ life.

In the emergence of a bio-political practice, a new way of understanding the concept of population is created: as a compact body governed by specific and precise laws. These laws should therefore be studied, analysed and known in order to bend them towards our own interests as rulers and for the maintenance of the body itself, through certain devices such as demography and statistics, or with the classification into certain organisms such as an army and/or a school. Foucault’s analysis proceeds by identifying the important and indissoluble link between bio-politics and capitalism: the new techniques of power act, especially at the level of economic processes, to concurrently allow growth and docility, or the governability of the population.

Starting from this analysis, the evolution of capitalism from Fordism to bio-cognitive capitalism fits well with the passage from materialistic production to intangible services, which are more and more involved in the management of social relations, bodies, subjectivities, that is, life, today at the foundation of capitalistic accumulation. In other words, we can say that the accumulation of capital today is primarily defined by the accumulation of the human conceived of as capital.

THE MAIN CHARACTERISTICS OF BIO-COGNITIVE CAPITALISM

Financial markets are the pulsating heart; *knowledge* is the brain; *relational activities and social re/production* are the nervous system. Bio-cognitive capitalism is a single body, inside of which the ‘real’ sphere cannot be separated from the ‘financial’; neither can the productive sphere be separated from the unproductive, work-time from life-time or production from reproduction and

consumption. We can state that in bio-cognitive capitalism, financial markets directly affect the process of accumulation and valorization. In a broader sense, financialization marks the definitive passage from commodity money to sign money.¹¹ With the complete dematerialization of money (after the Bretton Woods crash of 1971, marking the end of the convertibility of the dollar to gold), financial markets defined the social and hierarchic conventions which were able to secure short-term monetary value. At the same time, they left open the relations of debit and credit, provided sufficient trust was generated in the operators. From this viewpoint, financial markets lubricated the process of accumulation. In the capitalistic system, in fact, there is no accumulation without debt. It is not a case that, from the 1990s onwards, financial markets have more and more played the role of financing investment activity by firms: the liquidity drawn by financial markets rewards the restructuring of production aimed at exploiting knowledge and the control of spaces external to the enterprise.

Secondly, in the presence of surplus value, financial markets have the same role in the current economic system that the Keynesian multiplier (activated by deficit spending) had in industrial-Fordist capitalism. However, unlike the classic Keynesian multiplier, the new financial multiplier leads to a distorted distribution of revenues. For such a multiplier to be operative,¹² the financial basis (that is, the extension of financial markets) must be constantly growing, and the capital gain must be, on average, higher than the median salary loss. The polarization of revenues increases the risk of debt insolvency, which is the very basis of the growth of the financial foundation, and reduces the median salary. Thirdly, financial markets, by channelling an ever growing portion of work revenues (such as severance indemnity and social security, as well as earnings that, through the social state, turn into institutions for public health and education), in this way substitute the public welfare state. From this point of view, financial markets represent the privatization of the reproductive sphere of life (social re/production).¹³ Finally, financial markets are the place where capitalistic valorization takes place today, that is, the place where the exploitation of social cooperation and of the general intellect are measured via the dynamics of stock market values. As a consequence, profit transforms into rent¹⁴ and financial markets become the place where labour value is determined and transformed into finance value. The latter is nothing other than the subjective expression of the expectation of future profits articulated by financial markets, which in this way secure a rent.¹⁵ Financial markets thus exercise *bio-power*.¹⁶

The competitiveness of a company is largely dependent not on internal economies but on external ones; that is to say: on the ability to capture productive surpluses that come from the cognitive resources of a territory. Capital, then, benefits freely from the collective knowledge of society as if it were a 'gift of nature'. From this point of view, the becoming-rent of profit takes the form of a privatization of what is *commonwealth*, gaining revenues from the creation of an artificial scarcity of resources. It is the commonwealth that links together, in

a single logic, the rent coming from real-estate speculation and financial rent – which, since the beginning of the 1980s, played a major role in fiscal crises and the dismantling of welfare state institutions, as a result of the privatization of currency and public debt. The (partial) becoming-rent of profit¹⁷ derives, then, from the attempt at privatizing knowledge and life (bios). This is achieved through politics promoting the reinforcement of intellectual property rights so that the cost of numerous commodities is kept artificially high, although their reproduction costs are extremely low or even close to zero.

However, it should be remembered that in bio-cognitive capitalism we are also in the presence of elements of ‘real subsumption’ of labour to capital resulting from the intensification of labour and production, thanks to the introduction of linguistic and communication technologies, able to involve directly and indirectly the lives of individuals.¹⁸

Productive activity is increasingly based on immaterial elements, that is to say, on intangible ‘raw materials’ which are very hard to measure and quantify, and which come directly from the utilization of the relational, sentimental and cerebral faculties of human beings. The process of valorization loses, in this way, the measuring unit usually connected to material production. This measure used to be somewhat defined according to the necessary amount of labour needed for the production of commodities, measurable on the basis of the tangibility of production and the time necessary for production. With the advent of bio-cognitive capitalism, valorization tends to graft itself onto different forms of labour, which go beyond the official *work-time* and coincide more and more with the whole *life-time*. Today, the value of labour at the basis of bio-cognitive accumulation is also the value of knowledge, of affects, social re/production and relationships; it is the value of the imaginary and the symbolic.

The activity of production is carried out with different organizational modes, which are characterized by a network structure, thanks to the development of technologies for communication and transportation. What follows is a disruption of the traditional and unilateral hierarchic form typical of the factory. This is substituted by hierarchic structures activated on the territory along sub-supply production chains and characterized by relations of cooperation and/or control. In bio-cognitive capitalism, the division of labour itself takes on cognitive characteristics, and therefore is based on the differential access and use of different forms of knowledge.

Knowledge can be divided into four levels: *information*, *codified knowledge*, *tacit knowledge* and *culture* (or *systemic knowledge*), characterized by unilateral relations of dependence. *Information* is the basic level of knowledge that is more and more incorporated into the machine element. *Codified knowledge* is a specialized knowledge (*know how*) that derives from tacit knowledge but that is transmitted through standardized procedures, with machines as intermediary, as a consequence of which its bearer can be substituted at any moment, having no contractual power. *Tacit knowledge* can derive from personal learning

processes or from specific investments in R&D (thanks to intellectual property rights); furthermore, at least until codified, it can only be transmitted through a human being, thus possibly generating forms of enclosures. Those who possess tacit knowledge, which is relevant for the productive process, therefore have a high contractual power and define the hierarchical structure of labour and production. However, tacit knowledge, if relevant, is destined to transform into codified knowledge, sooner or later, and thus loses value. Lastly, *culture* is the set of knowledge that allows us to use the intellectual function, that is to say, the ability to think and act critically and creatively, not immediately subsumed to the logic of bio-cognitive valorization.

As a consequence, culture is a threat to the reproducibility of the socio-economic system, and it also constitutes a surplus that exceeds control.

In bio-cognitive capitalism, the condition of the labour force goes hand in hand with mobility and the predominance of individual contracting (precariousness). This derives from the fact that nomadic individuals are put to work, and the primacy of private rights over workers' rights brings about a transformation of the contribution of individuals, especially if characterized by cognitive, relational and affective activities, into contractual individualism. Labour relations based on precarious conditions, that is to say, the temporal limit and spatial mobility of labour, are the basic paradigm in which the relationship between capital and labour takes place. Precariousness then becomes a structural, existential and generalized condition.¹⁹

An essential character of bio-cognitive capitalism is the dematerialization of fixed capital, and the transfer of its productive and organizational functions to the living body of labour-power. This process lies at the origin of one of the paradoxes of new capitalism: the contradiction between the rise in importance of cognitive work as a lever for the production of wealth and, at the same time, the devaluation of that work as far as salary and the profession are concerned. This paradox is inherent in Marazzi's definition of 'the anthropogenetic character of contemporary capitalistic production', underlined in one of his essays.²⁰ In bio-cognitive capitalism, the living being contains within itself the functions of both fixed and variable capital, that is, of both the material and machinery forms of labour belonging to the past and of the living labour of the present: bios.

In bio-cognitive capitalism, the separation between abstract labour and concrete labour is not as clear as it was in industrial-Fordist capitalism. In bio-cognitive capitalism, life itself is valorized. The theory of labour value becomes the theory of life value.²¹ This is accomplished through the valorization of the differences that each individual brings. These are those differences, in their individuality, that are able to empower the relational activities (the differences enrich) which underlie the social cooperation that produces *general intellect*. Beyond the differences of race, gender, nationality or other socio-economic characteristics, are the differences themselves, regardless of the anthropological characteristics that define them, to be valorized. The division of labour is characterized by new

elements linked to the different access to knowledge – in other words, of a ‘cognitive division of labour’. In fact, the spatial and biological differences, primarily gender, geography and race in the first place, are used more as immediate discipline tools of the social body. But the emerging trend goes towards the constitution of a human subjectivity characterized by adversarial conflict between creativity in doing and brain control: a sort of *bionic being*, able to handle the anthropogenetic production process, a world where it is denied individuality but exalted for its individualism. The bio-cognitive capitalism is bio-economic production, is bio-economy.

The traditional binary dichotomies inherited from industrial-Fordist capitalism are no longer applicable. We are witnessing the overcoming of the separation between life-time and labour-time.²² As soon as labour activities use the vital faculties of individuals, it becomes impossible to define a temporal barrier between labour- and non-labour-time. Even if this distinction can nominally continue to exist on a formal-juridical level, the difference between life and labour no longer exists in reality, and this is also due to the new language and communication technologies. Life appears mostly (but not totally) subsumed to labour.²³ We are also witnessing the overcoming of the separation between workplace and life-space. The multiple forms of bio-labour are in fact nomadic labour, where mobility is a primary requisite. This phenomenon leads to the definition of non-places of work, as opposed to classic forms of domestication.

We are also witnessing the overcoming of the separation between production and reproduction. This is the first consequence of life becoming labour. When we talk about life, we do not only mean it as directly finalized to productive activity, but also to the *social reproduction*²⁴ of life itself – a clear example of which is the almost exclusively female caretaking work. Having said this, we can state that the erasure of this distinction implies the partial overcoming of the specific gender difference. In conclusion, we are witnessing the overcoming of the separation between production, circulation and consumption. In bio-cognitive capitalism, the act of consumption is, at the same time, a participation of public opinion, an act of communication and self-marketing.

In bio-cognitive capitalism, value creation is based primarily on the process of expropriation of the general intellect for private accumulation. The general intellect is the outcome of basic social cooperation: it allows the passage from tacit knowledge to codified knowledge as social knowledge. This passage is regulated by the evolution of the juridical forms of intellectual property rights. Such property is thereby added to that of the means of production, giving private property the control of the process of generation (intellectual property) and diffusion of knowledge (ownership of the means of production). Since the exploitation of the general intellect implies the valorization of the very existence of individuals, the process of value creation is no longer limited to the workday, but extends to include the entirety of an individual’s existence. This means that the measure of exploitation is not really the time of the workday generating surplus labour, but

rather that part of the life span that is necessary to generate tacit knowledge – and hence social knowledge – which will be then expropriated through the process of accumulation.

The effective and direct forms with which the expropriation of the general intellect creates value can be different. Among these, the valorization of commodities through the branding process is particularly significant.²⁵ The value of commodities increases together with the increase in their symbolic meaning and their ability to create an imaginary which is shared by consumers. Even in this case, surplus value originates from totally immaterial elements created by behavioural conventions and by shared relational activities, just as happens in financial markets. If private ownership of the means of production implies partly stealing the workday and allowing for the generation of surplus work, private intellectual property is then the theft of social knowledge understood as commonwealth. In bio-cognitive capitalism, the creation of value happens through the expropriation of the *commonwealth*.²⁶

In bio-cognitive capitalism, basic income is the remuneration for human activity, that human and productive activity which is not certified as labour by industrial relations and juridical status. The idea of basic income is centred on the concept of ‘compensation’ or ‘remuneration’ and not on that of ‘assistance’ (subsidies, transfer payments, etc.). It is a primary income.²⁷ The logic that justifies its existence is then completely opposed to the current interpretation, that is, a tool to guarantee a continuity of revenue in a temporary, conditional way.²⁸ In the present context of bio-cognitive capitalism, wealth is divided between those whose life becomes value (all residents regardless of citizenship, etc.), all those (much fewer) who create value from the private appropriation of common goods (exploitation of intellectual property rights, of the territory, of financial flux, etc.), and those who profit from or work in productive and service activities. As a consequence, basic income is by definition unconditional and perpetual (for the duration of one’s life). In other words, basic income is nothing other, today, than the equivalent of a salary in Fordist times. It is a primary income,²⁹ that is the result of the income distribution and not tool of income redistribution, inside a social security framework.

In bio-cognitive capitalism, the most adequate structure of welfare is the *commonfare*, or welfare of the common.³⁰ The welfare of the common is based on two main pillars. On the one hand, the guarantee of a continuity of unconditional revenue, disregarding working conditions, professional, social or citizenship status. This is complementary to any other form of direct revenue, as compensation for the productive social cooperation that forms the basis of value creation, currently expropriated for private rent and profit. On the other, access to material and immaterial common goods that allow full participation in social life by way of the free fruition of common natural/environmental goods (water, air, environment) and immaterial common goods (knowledge, mobility, socialization, currency, primary social services).

WHICH KIND OF SUBSUMPTION IN BIO-COGNITIVE CAPITALISM?

The crisis of the Fordist paradigm can be read as the crisis of *the real subsumption* (Saenz de Sicilia, Chapter 33, this *Handbook*) based on material production. In the last decades, as previously argued, we have seen a shift from the production of money by means of commodities: (M-C-M') to the production of money by means of knowledge and relational activities/social reproduction [C(k)]: [M-C(k)-M'], with structural effects on the mode of production and on the valorization process. Thus, we are now in a new phase of *subsumption* of labour to capital, where at the same time *formal subsumption* and *real subsumption* tend to merge and feed off one another. This new situation, almost from a theoretical point of view, needs to be emphasized.

In bio-cognitive capitalism we can still talk of *formal subsumption* of labour to capital when labour activity refers to abilities and to relational learning processes that the individual worker holds on the basis of their life experiences. These skills are partially completed in a period prior to the time of their use for the production of exchange value. The learning and the relationship, initially, arise as use value and, like tools and manual skills of the artisans of the first pre-Tayloristic stage of capitalist, are then 'salarized', *obtorto collo*³¹ and *formally subsumed* in the production of exchange value. The presence, today, of *formal subsumption* is also verified by the structural lengthening of the working day. *Formal subsumption* in bio-cognitive capitalism, therefore, has the effect of broadening the basis of accumulation, including training, care, breeding, consumption, social, cultural, artistic and leisure activities. The concept of human productive activities changes, eroding the distinctions between directly productive work (*labour*), artistic and cultural work (*opus*) and leisure activities (*otium* and *play*) which all tend to converge into labour, a directly and indirectly productive (of surplus value) activity.³²

At the same time, in bio-cognitive capitalism, the *real subsumption* is modified with respect to Taylorism but we believe that it still operates. Now, *real subsumption* has to do with the dead/living labour ratio, as a consequence of the transition from repetitive, mechanical technologies to linguistic, relational ones. Static technologies, at the basis of the growth of productivity and of intensity in labour performance (size scale economies) switch to dynamic technologies able to exploit learning and network economies, by simultaneously combining manual tasks and brain-relational activities. The result has been the rise of new, more flexible forms of labour, in which design and manufacturing stages are no longer perfectly separable but are more and more interdependent and complementary. Even the separation between manufacturing and service production becomes more difficult to grasp. They become inseparable within the production industry. As far as material production is concerned, the introduction of new computerized systems

of production, such as computer aided design (CAD), computer aided manufacturing (CAM) and computer aided engineering (CAE), necessitate professional skills and knowledge that make the relationship between human and machine increasingly inseparable. Now it is the *living labour* that may potentially dominate the *dead labour* of the machine, but inside the new structure of labour organization and social governance. As far as immaterial production is concerned, the hybridization between human and machine is even stronger, affecting the new industries on the technological frontier, whose names are, not by chance, characterized by the prefix bio- (bio-tech, bio-robotics, bio-genetics and so on). The result is that on the production side of services (financialization, R&D, communication, brand, marketing), we are witnessing a predominance of the downstream valorization of material production, today especially in Western countries and, in the future, probably also in China and India.

When life is put to work, the labour-time is not measured in standard measurement units (hours, days). The workday has no limits, except for natural ones. We are in the presence of *formal subsumption* and of the absolute surplus value extraction. When life is put to work because the brain becomes a machine, or 'fixed and variable capital at the same time', the intensification of labour performance reaches its maximum: we are in the presence of *real subsumption* and of relative surplus value extraction.

In conclusion, in bio-cognitive capitalism, *real subsumption* and *formal subsumption* are two sides of the same coin and feed off one another. Together, they create a new form of *subsumption* we can call *life subsumption*. We prefer this term to that of *subsumption of general intellect*, as proposed by Carlo Vercellone,³³ since we do not refer only to the sphere of knowledge and education but also to the sphere of human relations, broadly speaking.

Thus, *life subsumption* is a mixture of expropriation and exploitation and the share of both depends on the type of labour activity. Since we are speaking of *life subsumption*, and life is not uniquely standardized in terms of abstraction (as is the case for the concept of abstract labour), inevitably we must consider the different means by which *life subsumption* occurs. There are mainly four means: dispossession,³⁴ extraction,³⁵ finance subsumption³⁶ and imprinting.³⁷ The first two in fact mainly refer to the idea of *formal subsumption*, albeit in different ways. The third, as defined by Riccardo Bellofiore,³⁸ has to do mainly with real subsumption, while the fourth implies a discussion beyond the concept of subsumption.³⁹ We consider the concept of *life subsumption* a good starting point and incubator to develop further analysis.

SOME CRITICAL POINTS

In their book of 2014,⁴⁰ Melinda Cooper and Catherine Waldby discuss the term 'bioeconomics', by referring to its definition according to the neo-workerist

approach, explicitly quoting the concept of cognitive biocapitalism as proposed by Fumagalli in 2011.⁴¹ Their critique deals with the absence of ‘the analysis of material mechanisms which affect the human bodies in the labour process of post-Fordism’.⁴² The neo-workerist approach, in particular:

[i]ndicates an aporia. It fails to pose the most salient question – what exactly was ‘life itself’ under Fordist conditions of (re)production? What, in other words, were its gendered and racialized divisions of labor? And in what sense does the actual production of bioeconomic value in the knowledge-intensive life science sector reflect or interact with these wider shifts in how the scene of reproduction is organized? In which way is this all related to the production of knowledge in advanced capitalism? (p. 6)⁴³

Actually, it is difficult to see this aporia, if we take into account that the concept of life considered here derives from *bios* (and not from *zoé*), as clarified at the start of the chapter. It follows then that the concept of bio-economics is interested in a range of human activity broader than simple biological existence. Of course, as Cooper and Waldby showed in a magistral way, the enlargement of the base for capitalistic accumulation has increasingly affected the same human bodies and its internal organs. The commodification of life and bodies seems to have no limits.

As recognized by the authors, this trend had already started in the late-Fordist era, where crisis increased the changing role played by both social and individual reproduction. The first one started to be analysed by the feminist movements in the late 1960s and early 1970s, the latter by the first innovative procedures in the manipulation of internal organs (transplants and new surgical techniques, from the new ones able to enlarge the possibilities of procreation to the genome decryption).

However, the relevance of social reproduction as a key factor in the process of valorization of capital started in the 1990s with the feminization of labour, especially of cognitive labour⁴⁴ and was strengthened by the growth not only of care labour but also of all those activities whose core is represented by the ‘body and brain maintenance’.⁴⁵ Education, health and welfare systems are today some of the sectors with greater added value inside a new configuration of accumulation that is more and more based on the expropriation of the social and reproductive ‘commonwealth’.⁴⁶ We referred to this perspective when we introduced the notion of bio-cognitive capitalism as a new mode of production. This is a controversial point compared to other Marxist analyses. Is there real discontinuity between the Fordist process of accumulation and the contemporary one?

The radical changes undergone by capitalism on a global scale have fuelled the theoretical discussion around the new phenomena of globalization and the different organizational patterns of production. Despite these changes, the origins of exploitation always lie in the ‘capital labour’ relationship. This assessment is at the basis of the neo-workerist approach too and is confirmed by the analysis developed in earlier paragraphs. Nevertheless, some Marxist scholars⁴⁷ criticize

the hypothesis of cognitive capitalism (and therefore of bio-cognitive capitalism) because of the abandonment of the labour-value theory. If the labour-value theory continues to be valid, the capitalistic system of production in its structural core is not subject to changes. What does change is the way in which the capital labour ratio is organized at the supra-structural level, but the social and economic laws that govern it remain unchanged. As Jacob Rigi writes:

The hegemonic role of information in contemporary capitalism (Castells 2010/1996; Hardt and Negri 2000) has misled Negri and his associates to declare that the law of value does not govern contemporary 'post-modern capitalism'. This claim is fundamentally wrong; the laws of value and surplus value remain the basic foundations of contemporary capitalism.⁴⁸

Two points need to be made. The first deals with the fact that neo-workerist thought is anything but homogeneous and cohesive. Nevertheless, it is possible to find a common root among the different analyses. This is reflected in the current debate between the various analyses of the concept of subsumption (to the point of fearing the futility of this concept in the current capitalist phase). It is therefore a symptom of superficiality (or worse, prejudice), especially in the critical area, to flatten the whole of neo-workerist thought to a single elaboration. An elaboration, which refers to the positions of some of its most famous exponents, which, precisely because of their calibre and for the teachings and suggestions they were able to give, represent, not by chance, different points of view. In particular, after the success of the books by Antonio Negri and Michael Hardt, the liveliest critics have equated the neo-workerist thought with that of Antonio Negri, so much so as to affirm that:

The post-workerist theses represent in fact the spearhead of the project of co-optation of the so-called cognitive work in the neo-bourgeois social block.⁴⁹

Beyond similar statements, it is necessary to reiterate a simple but banal fact: precisely because the capital-labour conflict is expressed today in many forms and expresses different subjectivities, within the neo-workerist galaxy its interpretation is equally manifold and in any case always aimed at the transformation of the present state of things.

The second point derives from an apparent misunderstanding which hides a relevant theoretical problem. In the neo-workerist approach, what is critically discussed is not the affirmation that human labour is the source of exchange value and therefore of surplus value, but rather the method of its measure. In its abstract formulation, the labour theory of value remains valid. On the contrary, with the advent of cognitive and bio-cognitive capitalism, the subjective theory of value utility, formulated by the neoclassical approach of Karl Menger and Stanley Jevons in 1871 and anticipated by Jeremy Bentham – which states that value and prices depend on the scarcity or abundance of a commodity – loses its meaning. The main reason lies in the fact that the main inputs of production – knowledge, relationships, virtual space, life itself – are not subject to scarcity, neither are they

rival goods; in fact, the more they are spilled, the more they spread and become abundant. This point is confirmed by Michael Hardt, when he affirms:

But let me say some obvious things first. Our thesis on the crisis of the law of value is of course not a way to question that labour is today a source of value. The proposition at the beginning of the first volume of *Capital* is that the exchange value of every commodity is determined in some sense by the quantity of abstract labour that produces them. So the quantity of labour time that goes into making the commodity determines its exchange value. What is being questioned by this thesis on the crisis is not that labour is what produces value, it is rather that capital's ability to quantify and measure labour's contribution is in crisis. This is what I understand from this heterodox stream from the 1970s, including Negri, that the thesis on crisis that they posed was the thesis on the crisis of measure.⁵⁰

This misunderstanding, in any case, hides a different interpretation of Marxist thought and presents a corollary. The above-mentioned rigid Marxist interpretation holds that if there is a crisis in the measure of labour, then the labour theory of value itself is invalidated. This controversy reminds us of the controversy about the transformation of values in prices. If this question could not be solved, the whole Marxian theory of labour value was invalidated. After the Sraffian critique, most Marxists believed they had to abandon the Marxian formulation of labour-value theory as a concrete tool to give a unit of measure to the degree of exploitation.⁵¹ The corollary is that only the economic subjects, whose exploitation can be measured, represent the productive labour and the antagonist core to capitalism. The critical assessment is the following:⁵²

Starting from the cognitive thesis that labour is no longer the basis of the processes of valorisation of capital, since capitalist exploitation pervades all social existence (working or not), the new workerist approach identifies the new revolutionary subject in mass intellectuality, the only subject really antagonistic to the system. For neo-workerism, as well as for the theorists of cognitive capital, the post-Fordist era marks the end of the centrality of factory labour in the production of surplus value, with the consequence that on the social level the working class can no longer be considered a force antagonist to capital. From the mass worker of the Fordist era we move on to the post-Fordist mass intellectuality, all in the sign of the continuity of the mystifying and reformist action of the neo-workerist thinkers. For this approach, in the age of the globalization of capitalism the working class has completely disappeared, giving way to a sort of social magma called widespread intellectuality.⁵³

This critique deals with the ascertainment of a big misunderstanding in the neo-workerist analysis between two levels of capitalist domination. It is one thing to affirm that in the current phase capitalism is so dominant that it controls all social life; it is another thing to affirm that by virtue of this domination, economic exploitation also takes place outside of production. Two concepts are identified which, although both are an expression of the capitalist mode of production, are extremely different from one another:

The economic analysis of capital slips on the terrain of the ideological superstructure, thus losing the necessary scientific rigor.⁵⁴

The neo-workerist approach considers this critique as false and depending on a dogmatic analysis of Marxian thought, especially if we refer to the method of Marx, which recognizes that every social and economic analysis is always an analysis in progress and therefore dynamic. It is the result of a dialectical process in constant metamorphosis. The historicist approach tells us that the understanding of a social dynamic can only be valid within a well-defined and outlined historical and/or spatial context. There are no intrinsic laws in political economy. The ambition to formulate a social analysis (and consequently the identification of the processes of its transformation) which tends to remain unchanged over time, through the definition of basic concepts and social aggregates defined in an 'anti-historical' way, is not part of Marxian tradition.

Another point of discussion regards the degree of global generality of the bio-cognitive capitalism thesis. Can we affirm that bio-cognitive capitalism today affects the whole globe? In the 2010s, the globalization trend reached its peak. From the point of view of capitalistic valorization, we can witness a homogeneity in the dynamics of corporate profit and financial rents all over the world, in the USA, Europe and China. On the contrary, labour conditions have become fragmented. We can say that, today, a unique and homogeneous technical composition of labour, one that is able to provide a dominant social composition of labour as a key factor for the development of class struggle, does not exist. This labour variety does not mean that the capitalistic valorization is at the same time diversified. Even emerging capitalist countries (like the BRICS) now play a role significant enough to be able to redefine the geo-politic assets at the world level inside the same framework of accumulation, increasingly based on learning and network economies. What is different is the degree of penetration of intangible production and the share of cognitive workers. It depends on a new type of international division of labour, strictly related to the cognitive division of labour at the international level. The managerial organizations of big corporations are in fact based on a rhizomatic model, characterized by different subcontractor nodes in a flexible way, where economic power lies in intellectual property rights and in the control of financial flows.

Life subsumption and the new forms of exploitation, on the one side, and precarization and individualization of labour activity, on the other, are accompanied by structural change in the system of remunerations. Are we going beyond the wage society? Of course not! But wages are no longer the unique type of remuneration inside the labour-capital ratio.

Within monetary remuneration, wage as a direct and stable remuneration of labour performance is increasingly accompanied (and sometimes replaced) by non-salary forms of monetary remuneration paid to hetero-directed and self-employed workers.⁵⁵

Further, what is interesting to note is that some other methods of non-monetary remuneration are spreading. The role played by imaginaries within the learning and networking processes in intangible productions favours the diffusion of

symbolic remuneration linked to what we can define as the ‘political economy of the promise’.⁵⁶

This variety of remuneration system is the consequence of the diffusion of precarity and of the pre-eminence of individual bargaining on the collective one, in other words of the social dumping resulting from the imposition of neoliberal policies.

In this context, the proposal of basic income can help to reverse this situation. This point is the object of a large debate within the Marxist analysis. According to Giulio Palermo:

On the theoretical level, basic income, in its ideal version, is defended in particular by Keynesian school economists. According to them, this tool supports aggregate demand, growth and employment. The most radical, those that wink to Marx, add that it also favors emancipation from wage labor ... I argue instead that basic income can not only achieve these goals but actually end up going in the opposite direction: aggravating the crisis, developing liberalism and accelerating the processes of job precarisation and the commodification of society.⁵⁷

The political conclusion reached by Giulio Palermo is not very different from that of Riccardo Bellofiore and Joseph Halevi in an article from 11 July 2006 printed in the ‘communist’ newspaper *Il Manifesto*:⁵⁸

The road to hell is paved with good intentions: the BI [Basic Income] is the shore of social-liberal policies of aggression to labour conditions, dividing it.

Although almost 15 years have passed, the common accusation directed at basic income by a certain type of Marxist thought (what we can call, for simplicity, ‘scientific’) is that of being ancillary to neoliberalism. The reason lies in the fact that basic income is considered as part of the social security system within the redistribution of income. Therefore, it has nothing to do with the exploitation of labour. At most, it can help to lessen this exploitation and, in this way, help to mitigate the potential for class conflict. Moreover, if it is provided in the presence of strong conditions (with regard to individual behaviour and consumption) and forms of employment compulsion, it becomes a powerful tool for social control. This is understandable. But, if we take into consideration the new process of accumulation and valorization we presented at the start of the chapter, in bio-cognitive capitalism, basic income must be considered as a ‘primary income’ which directly affects income distribution.⁵⁹

From this point of view, basic income is already a system of remuneration and, therefore, by definition, must be unconditional. That means that it cannot be considered a tool of social control but of self-determination, with people able to exercise the right to choose work (including the refusal of work). From this point of view, basic income, unlike all the social neo-liberal versions empowering the capitalistic mode of accumulation, can become incompatible with the present social structure and, therefore, a potential instrument of conflict.

Notes

- 1 In the last paragraph, we'll take into account the most relevant critics to this kind of approach.
- 2 As M. Turchetto reminds us: 'The origin of the notion of post-Fordism does not lie neither in orthodox Marxism or in Workerism. These two currents of thought imported the term and its correspondent definition from France, adapting them to their conceptual apparatus. The copyright of postfordism belongs in fact to the French *école de la regulation*'. See M. Turchetto, 'Fordismo e post fordismo. Qualche dubbio su un'analisi un po' troppo consolidata', in A.V. *Oltre il fordismo: Continuità e trasformazioni nel capitalismo contemporaneo*, Unicopli, Milano, 1999. One of the first authors to use the term 'post-Fordism' was the English geographer A. Amin in his *Post-Fordism: A Reader*, Blackwell, Oxford, 1994. Within the French *école de la regulation*, see B. Jessop, *The Regulation Approach: Governance and Post-Fordism, Economy and Society*, Blackwell, Oxford, 1995; A. Lipietz, 'The Post-Fordist World: Labour Relations, International Hierarchy and Global Ecology', *Review of International Political Economy* 4 (1), 1997, pp. 1–41; R. Boyer and J.-P. Durand, *L'après-fordisme*, Syros, Paris, 1998. As far as the Italian debate is concerned, the first text to use the term post-Fordism is S. Bologna and A. Fumagalli (eds.), *Il lavoro autonomo di seconda generazione: Scenari del postfordismo in Italia*, Feltrinelli, Milan, 1997. See also E. Rullani and L. Romano, *Il Postfordismo: Idee per il capitalismo prossimo venturo*, Etas Libri, Milan, 1998 and the already quoted critical text by M. Turchetto.

Intellectual Property

Paul Rekret and Krystian Szadkowski

INTRODUCTION

Conventional justifications of Intellectual Property (IP) are either grounded on the premise that knowledge is simply a natural element of the process of production or on a liberal presumption that the individual subject is authorised to exercise his or her rights over the general stock of human knowledge if only he or she contributes to its improvement. This chapter will show that a Marxist approach offers a far more fecund range of conceptual resources for conceiving IP through a global lens while also demonstrating the lacunae in perspectives that treat IP either as a mere object or as an individual entitlement. In what follows, we trace the genealogy of IP as a social relationship in the origins of capitalism. We look especially to the separation of mental and material production as well as the way in which IP permits capital's control and subsumption of a multiplicity of labour processes. Accordingly, we present IP here as a form of artificially produced scarcity through the appropriation of a 'general intellect' or, in other words, as the individualisation of historically and collectively produced knowledge.

The presentation of these claims is organised into four sections. First, we offer an outline of philosophical justifications for IP. In the process of doing so, we highlight the weaknesses of the modern bourgeois sources usually used to justify rights in IP. Second, we provide an overview of Marxian and contemporary

Marxist approaches to the role of IP. We look in particular at how IP contributes to the ongoing process of accumulation by dispossession, strengthens the division of labour, and helps to form and realise knowledge commodities, as well as how it becomes a basis for extracting rents in the information industry. Third, we give some indication of the historical development of the IP regime, from fifteenth-century Venice to the WTO's recent Trade-Related Intellectual Property (TRIP) agreements. Finally, we situate some contemporary sites of struggle over IP, from the commodification of indigenous forms of knowledge to issues around academic patenting, the capitalist academic publishing industry and its domination of academic labour. A Marxist approach to IP presents the scholar with a novel, and indeed global, grasp of what is at stake in this increasingly prevalent form of private property and, as such, informs struggle against both capitalist appropriation of, and expanding control over, the exercise of life itself.

PHILOSOPHICAL JUSTIFICATIONS OF INTELLECTUAL PROPERTY

Typically, philosophical justifications for IP rights are premised on the attempt to legitimise property as a 'right' enjoyable and transferable by a sovereign individual while extending this beyond mere physical possession, privilege, and ownership to intangible entities such as ideas and inventions. There are some grounds for claiming that Renaissance ideas of individual creativity that circulated around the same time as the earliest patent statutes were emerging in fifteenth-century Venice both informed and reflected the earliest notions of IP in the modern era (Rose, 1993). It is nonetheless fair to say that properly philosophical justifications for the right to IP emerge through the modern European philosophical concept of the 'idea' as the outcome of the mutual constitution of reason and experience (Papaioannou, n.d.).

It is worth noting that some Marxist philosophers have located the conditions for this modern epistemological position in the historical divisions to which capital submits intellectual and manual labour. For instance, Alfred Sohn-Rethel (1978) has posited that the notion of an individuated autonomous intellect is inseparable from the capitalist's desire to assume direct control over the process of production in the form of knowledge entirely independent from manual labour. As Caffentzis (1989, 2008) notes, while René Descartes is usually cited as inaugurating the conception of a consciousness independent of thought and world (including by Sohn-Rethel), insofar as he extends consciousness into the legal and political sphere, and thus relates property and identity, John Locke is more important to historical conceptions of private property as well as contemporary justifications for IP rights (Rekret, 2016: 231–3). It is by looking to Locke's work that an assessment of philosophical defences of IP justly begins.

Locke poses the subject's moral right to the appropriation of that with which they mix their labour; in this sense, he posits the act of enclosure as a moral

obligation insofar as it 'improves' the Earth 'for the benefit of life' (1993: 253). Conversely, Locke deems that land left idle and so without 'improvement' is mere 'waste' (1993: 282). Extending Locke's conception of the right to the products of one's labour to the realm of ideas and inventions is in keeping with this logic insofar as the defence of IP rights tends to rest on the claim that the individual's 'improvement' of the common stock of humanity through the invention of some process or idea justifies their right to its disposal. Such a claim is frequently drawn upon where IP is defended on the grounds that without the right to individually profit from the products of their intellectual labour, there would be no incentive to engage in that labour in the first place, hence no 'improvement'.

Lockean arguments also underlie justifications of the alienation of the products of intellectual labour through processes such as waged knowledge work, wherein capitalists take ownership of their employees' inventions (Waldby and Mitchell, 2006; Boyle, 2008). While Locke posed a 'spoilage' limitation upon the appropriation of the commons, whereby one had to leave 'enough and as good for others', he also argued that the institution of money – a commodity one could trade but which did not spoil – overcame this limit to appropriation (1993: 274). This implies a moral 'freedom' to sell one's intellectual labour and its products for a wage.

A less common justification, especially in the Anglo-American legal tradition that tends to dominate contemporary global IP regimes, is grounded in a Hegelian view of property as tied to the existence of a free individual and their recognition by others (May, 2010). Insofar as individual or intellectual creations can be regarded as inherent to an individual's personality, that individual is argued to have a moral right to their IP. In other words, property ownership functions as an expression of the individual's will and thus distinguishes and protects the individual from the intrusion of others, while also preserving them from absorption by the state. On this view, property is 'the first embodiment of freedom' insofar as it gives the individual a basis to participate in moral and social life (Hegel, 1952: 45). The Hegelian view is often opposed to Lockean justifications on the grounds that property is not founded upon a 'natural' law nor necessarily conditional upon the individual's labour in this instance, but instead grants an unconditional moral right to property on the basis of possession itself. Nevertheless, insofar as both the Lockean and the Hegelian views ground property in ideas upon a metaphysical individualism and view knowledge as the product of the individual, they are not fundamentally opposed (May, 2010: 21).

A third set of arguments defends IP on utilitarian or more broadly, consequentialist, grounds (cf. Landes and Posner, 2004). Here IP is viewed as crucial to the efficient development of useful knowledge beneficial to the greater good. Such claims are often rooted in the Lockean notion of 'improvement' insofar as they are premised upon the idea that individuals will innovate if they are materially rewarded (May, 2010: 32). These arguments are often *ad hoc* in nature, viewing markets in IP as the most 'efficient' means of allocating intellectual or

knowledge resources. But where IP in particular is concerned, such arguments are circular: a market in artificially scarce knowledge goods must first be created for that market to function as an efficient means for distributing those very goods (May, 2010: 56; Johnson Andrews, 2019).

Bourgeois critics of IP rarely question the basic metaphysical frameworks that underlie the concept of parcelling ideas, knowledge, and information into separable and transferable objects analogous to material property. As Johnson Andrews (2019) argues, well known critics of IP such as Lawrence Lessig (2004) or Rosemary Coombe (1998) may question the extent to which expanding terms for patents truly benefits the greater good, but they do not necessarily challenge the notion of knowledge as an inherently valuable ‘resource’ produced by individual mental labour; more broadly, they often fail to question the logic of private property itself. Similarly, recent debates over the control of individual data produced in the use of internet platforms tend to be couched in the narrow terms of privacy and individual rights, while debates over indigenous knowledge are often reduced to questions of individual versus collective IP. These debates are narrow insofar as they fail to challenge the exclusive control of ideas and inventions as such, or the abstraction of ideas from collective sensuous practices that IP presumes. More widely, non-Marxist critics of IP all too often take the economic value of information or knowledge as intrinsic to that knowledge itself (Schiller, 2007). A Marxist assessment, on the contrary, rejects these premises in order to conceive IP as a historically specific social relation involving the emergence of institutions predicated upon the enclosure of collectively produced knowledge and information.

MARX ON INTELLECTUAL PROPERTY

Even though Marx often refers to the role of knowledge and science in capitalist production, he never systematically addresses the issue of IP nor bestows it with any formal theorisation. This is not surprising given the much more prominent role property in knowledge plays for contemporary capitalism, as compared to the nineteenth century. Indeed, Marx views the sector of knowledge or ‘immaterial’ production as marginal to the production of surplus value (Marx, 1963–71). At best, in place of a fully formed account, he formulates scattered observations on IP’s growing importance to capitalism (Heinrich, 2013). We can nevertheless derive at least two central elements from his work that can constitute a point of departure for understanding the role of IP in contemporary capitalist production.

First, the emphasis Marx places on the role of science and knowledge in the expansion of capitalist production is of great importance. This is famously described in the so-called ‘Fragment on Machines’ in the *Grundrisse*. There, Marx (1973: 699) explains how science and knowledge begin to function as ‘productive forces’ in their own right and, in turn, begin to act as destabilising factors

for capitalism. As Marx has it, with the rise of machinery in large scale industry, 'the entire production process appears as not subsumed under the direct skilfulness of the worker, but rather as the technological application of science' and this further entails that direct labour 'is reduced to a mere moment of this process' (Marx, 1973: 701). On this view, the more that capital sets into motion technologically intensive processes, the more the production process as a whole rests on science and its advancement (Marx, 1973: 704–5). As this trend proceeds through the development of industrial capitalism, the scale of human knowledge objectified in fixed capital grows accordingly. Marx coined the phrase 'the general intellect' to describe this process, arguing that 'the development of fixed capital indicates to what degree general social knowledge has become a direct force of production, and to what degree, hence, the conditions of the process of social life itself have come under the control of the general intellect and been transformed in accordance with it' (1973: 706). It's been argued that this account of the 'general intellect' neglects the way in which general social knowledge 'manifests itself as living labor'. That is, by reducing 'general social knowledge' to the category of fixed capital, Marx's account in the *Grundrisse* neglects its presence in wider social, cognitive, and affective relations (Virno, 2007). Marx's notion of the 'general intellect' has nonetheless informed an expansive research programme into more recent transformations of labour and production. In this context, IP can be understood as a tool through which the ongoing acquisition of living knowledge is congealed and objectified in the dead knowledge of capitalist machinery.

The second of Marx's major contributions to our understanding of IP rests with his account of the ways in which capital acquires new knowledge, inventions, or scientific discoveries. According to Marx, capital is not an inventive force in itself and is only capable of appropriating knowledge, ideas, and inventions. In this sense, capital treats knowledge just as it treats nature: as a 'free gift' (Marx, 1992a). Inventions and ideas from the past, as well as those developed in the present, are appropriated and turned into intellectual private property in order to stimulate capital's further self-valorisation. Marx explains this dynamic in *Capital Volume III* when he describes the process of invention by what he calls 'universal labour': 'universal labour is all scientific work, all discovery and invention. It is brought about partly by the cooperation of men now living, but partly also by building on earlier work' (1992b: 199). This implies that where it encloses knowledge and ideas and thus makes access to them an exclusive right, capital merely parasitically feeds upon the achievements of universal labour. It bears emphasising that this parasitic relation rests upon a contradiction where private appropriations congealed in the form of IP are grounded upon the collective intellectual labour of past and present generations (Harvey, 2014). Parenthetically, this is a claim that extends to Research and Development sectors as well, insofar as innovation and the general pool of knowledge is inextricable from the public university system (Mazzucato, 2013; Larivière et al., 2015).

Where scientific endeavour ceases to function as an open and ready resource for capital and ‘becomes a business’ in its own right (Marx, 1973: 704), this has sometimes come to be known as the development of a sector of ‘immaterial production’. Even in this case, however, as Marx points out, capital must cope with the persistent problem of its own non-creativity. Writing from the perspective of the nineteenth century, Marx already saw that, in terms of the self-valorisation of capital, investment in innovation is a pointless endeavour since it initially brings low, if any, returns given that the process required to arrive at new and applicable knowledge or know-how is slow, financially burdensome, and risky. For these reasons, capital tends to situate itself as external to the process of invention; it prefers to arrive at the very end of the innovation process when the invention can be acquired and its (collective) producer simply dispossessed (Marx, 1992b: 199). Moreover, Marx also noted that, given that the costs of reproducing knowledge are low, if not non-existent, this entails the need on the part of capital to artificially introduce scarcity into the sphere of ‘immaterial production’, if the value of the mental labour of innovation is to be realised. As he explained in *Theories of Surplus Value*, ‘the product of mental labour – science – always stands far below its value, because the labour-time needed to reproduce it has no relation at all to the labour-time required for its original production’ (Marx, 1963–71: 353). It is in this sense that there is a contradiction inherent in capital’s relation to inventions: capital wishes to pay nothing for knowledge inputs yet charges high fees for outputs (Jessop, 2007: 127). Accordingly, capital must ceaselessly seek to preserve and advance the protection of IP rights in order to secure the generation of value through monopoly rents (Vercellone, 2007).

In addition to these explicit assessments, Bob Jessop (n.d.) convincingly speculates that Marx’s analytic offers tools to construct a more complete account of the role of IP through the nexus of production/circulation/distribution through which Marx understands the operations of capital. That is to say, in the sphere of circulation IP gives form to intellectual commodities once they enter the market; within the sphere of distribution, IP secures a share of surplus value for rentier capital; and finally, in the sphere of production, it offers a foundation for the extraction of relative surplus value and provides a competitive advantage for individual capitalists.

MARXIST ASSESSMENTS OF IP

Beyond Marx’s own insights, contemporary scholarship has drawn on Marx’s analyses and categories to understand the importance of IP for processes of capital accumulation in the present. In this regard, there are at least four key ways by which Marxist theory understands IP. First, ‘accumulation by dispossession’ is often viewed as a primary source through which capital acquires resources, and this applies to IP as well. In coining this term, David Harvey had in mind the

process of enclosure whereby capital ‘releases a set of assets (including labour power) at very low (and in some instances zero) cost’ (2003: 144). This occurs because capital always requires a non-capitalist outside, a constant source of ‘free’ or cheap assets that can prolong its accumulation. Where no such assets are available, capital must produce them by instituting artificial scarcity (Harvey, 2003: 143). It is on these terms that, drawing on the notion of what in *Capital Volume I* Marx calls ‘primitive accumulation’, Marxist scholarship has understood the dispossession and conversion into private property of traditional forms of knowledge and practices (Harvey, 2003; Prudham, 2007; Zeller, 2008; Peekhaus, 2011). The expansion, enforcement, and stabilisation of IP regimes within the sphere of knowledge production is thus understood in terms of a continuously renewed cycle of accumulation by dispossession (Tyfield, 2008). Furthermore, to view IP in these terms is to understand it as constituting the separation of direct knowledge producers from their products, thereby granting sole control over knowledge produced to capital, and in turn, securing the extraction of rents (Zeller, 2008: 87).

Second, Marxist scholarship has emphasised the role of IP in constituting divisions of labour (Braverman, 1974). Where the general intellect is objectified into systems of machines, the worker is transformed into their mere appendage and thus reduced to the role of supervisor of their automated motions. This is executed through the dissemination throughout industrial production in the early twentieth century of what are known as ‘Taylorist’ principles, or the so-called ‘scientific management’ of labour processes. Especially in the form of patents, IP contributed to this tendency to capital’s ‘real subsumption’ of labour by supporting the dissociation of the labour process from workers’ skills through the codification of labour practices and the attendant division of the labour process into units dissociated from skilled labour. This amounted to control over the labour process executed through the separation of its conception from its execution, a separation materialised in industrial machinery itself (Braverman, 1974; Pagano, 2014). It bears pointing out that in recent decades this alienating separation of conception from execution, of mental from manual labour, has been partly displaced where creative sectors of production have granted labour higher levels of independence, and where the brutality of labour-process fragmentation seems less visible. In this regard, some Marxists have, though not without reservations, welcomed the rise of a knowledge-based capitalist economy. This stems from the belief that an emerging figure of immaterial labour would transcend the industrial division of mental and manual labour or might at least grant greater autonomy to labour (Hardt and Negri, 1994; Lazzarato, 1996). Nonetheless, it is by now apparent that a parallel process of deskilling, fragmentation, and control grounded upon the imposition of IP rights is coming to rule the knowledge-based economy. This is especially the case as algorithms have begun to shape and regulate human cognition and communication, and become increasingly central to profitable zones of capitalist production (Pasquale, 2015; Pasquinelli, 2015).

Third, a Marxist analysis permits a view of IP as a juridical form that regulates or mediates the realisation of the value of knowledge commodities (Starosta, 2012). Here, it is important to understand that, like land, labour, or money, knowledge can be treated in terms of what Karl Polanyi (2001) called a ‘fictitious commodity’, that is, it can be disembedded from the broader social relations from which it emerges and thus become naturalised as a thing (Jessop, 2007). For knowledge to appear as a commodity it has to be codified and detached from the collective processes of creative labour whence it arises. This is a process increasingly prevalent in the current epoch. For while in earlier periods knowledge could escape market mechanisms, insofar as it was not usually directly produced for sale, as the knowledge-based economy becomes a more important sector of contemporary capitalism, knowledge products are increasingly priced and sold. In the process, knowledge is increasingly assessed and valued in terms of economic rather than epistemic criteria (Jessop, 2007). In this context, we can draw on Rodrigo Alves Teixeira and Tomas Nielson Rotta’s (2012) account of an ongoing ‘autonomisation’ of capital, whereby the latter seeks to free itself from its dependence upon labour for the production of value. Where the value of information commodities has no relation to their use-value, and as the value of information tends towards zero, the price of knowledge or information can be considered to take the form of rent (Rigi, 2014).

This brings us finally to analyses that understand IP through Marxist theories of rent. From this perspective, IP enforces the extraction of value from knowledge production for a title holder located outside the sphere of production. While Marx never produced a general theory of rent, relegating the issue instead to occasional reflections, a number of authors have drawn on Marx’s work to understand the role of IP in the context of knowledge or information rent (Zeller, 2008; Teixeira and Rotta, 2012). We follow Jakob Rigi (2014) in dividing Marxist theories of information rent between those that conceive it, on the one hand, in accordance with Marxian value theory (Perelman, 2002; Zeller, 2008; Rigi, 2014) and, on the other, mainly post-workerist Marxists who understand IP rent as the core form of value extraction for what they view as the present mode of ‘cognitive capitalism’ (Hardt and Negri, 2009; Vercellone, 2010).

For theorists of cognitive capitalism, contemporary value production has entered a new stage in which value is increasingly produced not only through labour congealed in material objects but through life itself – in the form of immaterial goods such as knowledge, emotions, affects, and social relations. As this socially diffused, so-called ‘biopolitical’ labour is increasingly self-organising and autonomous from capital, the latter relies more and more upon IP in order to capture value through rent, rather than through the organisation of labour’s direct exploitation.

While theorists of cognitive capitalism depart quite acutely from Marx in claiming that the law of value ceases to be operative where value production is no longer restricted to the time and place of work, Marxist analyses of IP as

a form of rent generally draw on Marx's own understanding of landed property. Just as Marx wrote that 'landed property presupposes that certain persons enjoy the monopoly of disposing of particular portions of the globe as exclusive spheres of their private will to the exclusion of all others' (1992b: 740), so IP gives its owner a monopoly over fragments of human knowledge, ideas, or inventions. Remaining with the analogy of landed property, we can derive four types of rent from Marx's discussions in *Capital, Volume III*: absolute rent, monopoly rent, differential rent I, and differential rent II. Absolute and monopoly rents are based on mechanisms that inhibit any other capital from flowing into a given sector enclosed by property title (Zeller, 2008). Accordingly, not only do they allow title holders to set prices for services or commodities above their value, by excluding others from access to intellectual productions or innovations, they can prevent profits from equalising in a given sector. Differential rents I and II refer to different levels of productivity of land due to either differences in material conditions, in the first case, or different levels of capital investment, in the second. Accordingly, they are rarely used by Marxist theorists as lenses through which to look at the issues raised by IP. While Zeller (2008) understands IP or information rents through the frame of Marx's notion of absolute rent, Rigi holds that while IP can generate differential rent, 'absolute information rent is unlikely to exist' (2014: 923). This is because, in Marx's terms, absolute rent is a comparative category that refers to the level of productivity of a given piece of land (or in this case, knowledge). In contrast with monopoly rent which is generated by the singular properties of commodities produced through the use of land (or knowledge), absolute rent is paid out for sole use of land (or again, knowledge). As a consequence, Rigi (2014) suggests that insofar as the most widespread forms of IP – trademarks, copyrights, and patents – generate monopoly rent, the latter can be viewed as the most common form of information rent in the current structure of the knowledge-based economy.

For all of their variations, these theories of rent – together with the preceding conceptions of accumulation by dispossession, the division of labour, and fictitious commodities – all share a view of IP as a social relation. That is to say, they reject the dominant view of IP as a natural object or outcome of production, viewing it instead as a historical mode of expropriating commonly or publicly held knowledge and practices to transform them to individuated and exclusive commodities. This reflects a process whose history is as old as that of capitalism itself.

HISTORICAL DEVELOPMENTS OF INTELLECTUAL PROPERTY

While a comprehensive Marxist history of IP has yet to be written, we can nonetheless offer a brief overview of the development and expansion of IP rights. This should help to indicate how IP rights have been situated within broader

developments in capital accumulation, and especially within the capitalist tendency to separate the 'conception and execution' of (and the direct incorporation of) science and technology into the labour process (Braverman, 1974). This further implies a process of the commodification of knowledge through patents, trademarks, or copyrights; processes by which knowledge is codified, separated from manual labour, and disentangled from material products in order to acquire independent form in machines, expert systems, immaterial products, and services, or to be made to circulate through markets (Jessop, n.d.).

While the production of knowledge historically occurred outside the market, the subsumption of knowledge production by capital begins in the mercantile period, in fifteenth-century Venice (May and Sell, 2006; Drahos, n.d.). In particular, a 1474 Venetian decree made patents subject to a generalised law rather than processes of individual petition and grant. This can be considered the first IP law since grants were no longer based on the relation of the petitioners to authority but upon the applicant's conformity with formal criteria. The Venetian decree is significant in particular insofar as it reflects a shift in the control of knowledge from guilds to individual rights holders and thus, reflected the early emergence of an abstract conception of knowledge as transferable property (MacLeod, 2002).

When Britain passed the Statute of Monopolies in 1624 and the Statute of Anne on copyright in 1710, these were the first systematic legal methods to offer patent and copyright protection, respectively (Sherman and Bently, 1999). They provided clear benchmarks for the assessment of applications, established the first fixed terms for the concession of patents, and shifted the authority for the granting of patents away from the Royal Court to the judiciary. However, throughout the seventeenth and eighteenth centuries, IP was mainly defined by the use of patents as a means of increasing state power. And yet, as they were in practice often generated as a privilege rather than as an individual right, IP laws did not extend in this period beyond the territory of the sovereign granting them (Sherman and Bently, 1999). Where states adopted IP legislation, this was viewed as a legitimate means of encouraging the migration of useful inventions to their territory (May and Sell, 2006).

Up to the nineteenth century, the IP landscape comprised a widening assortment of national laws and approaches to regulation, but it nevertheless implied the increasingly widespread view of property in knowledge as self-evident (MacLeod, 2002; Sell, 2003). Yet as economies industrialised, throughout the 1800s policies of IP isolationism gradually gave way to liberal policies promoting greater bilateral relations (Drahos, n.d.). This was primarily as a response to the problem of free-riding; unsurprisingly, it was industrially advanced Britain which, having most to lose from free-riding, inaugurated a strategy of IP reciprocity. Bilateralism, grounded upon the principle of reciprocal adjustment between states and discrimination between citizens and non-residents, came to prevail (Drahos, n.d.). A gradual shift from bilateralism to the international organisation of IP was marked by the landmark conventions in Paris 1883 and

Berne 1886. These not only entailed the formation of unions for the protection of industrial property, and literary and artistic works, but also the creation of permanent bureaus that would eventually morph into the World Intellectual Property Organization (WIPO) in 1967. This burgeoning late nineteenth-century international IP regime would be grounded in principles of non-discrimination and the right of priority to the first applicant (Sherman and Bently, 1999; May and Sell, 2006). By this period, the idea of property in knowledge became increasingly accepted among governments, policymakers, and capital more broadly, even if national standards differed significantly as states maintained sovereign discretion over standards (Drahos, n.d.).

In the early twentieth-century epoch of monopoly capital, patents were increasingly used to control markets for purely commercial reasons as liberal world order increasingly gave way to economic nationalism. A truly global period of multilateral legislation only began to emerge after 1945, especially with the founding of the Bretton Woods institutions. In this epoch IP rights were increasingly viewed as reflective of ideals of freedom, democracy, and competition, while cartels and corporate mergers that had dominated the era of monopoly capital were mainly displaced by a model of corporate governance reflective of the highly centralised and oligopolistic US auto industry (May and Sell, 2006). The post-war international IP regime was challenged by post-colonial states, as evidenced by wider access to copyrighted materials established in the 1967 Stockholm Protocol and 1971 Universal Copyright Convention; in the same period, Brazil and India passed laws to exclude pharmaceuticals from patenting (Duttfeld and Suthersanen, 2008).

A profitability crisis in the 1970s, increasingly viewed in the USA as resulting in part from a widening knowledge deficit (especially in light of rising competition from Japan and Germany), set off a period of increasing valorisation of knowledge-intensive and design-intensive commodities (Zeller, 2008; Jessop and Sum, 2013). Through a series of legal and policy decisions in the USA, beginning in the late 1970s, the rights of patent, trademark, and copyright holders were both expanded and prioritised. In this context, IP increasingly came to mean more than the privatisation of scientific and technological knowledge, representing an attempt to accrue surplus profits through the extraction of monopoly rents (Smith, 2010). Crucially, a 1980 US Supreme Court ruling made monopoly claims on life-forms possible while new US legislation (the so-called 'Bay-Dole' Act) created a context where publicly funded research could be easily captured by private enterprise (Helmreich, 2009; Mirowski, 2011). In short, US capital came increasingly to champion opportunities for extracting monopoly rents as a response to declining revenues and accordingly spearheaded a push for an expanding definition of patentable matter.

In the 1980s the USA also began exporting its IP regime globally. Initially, this was done through a bilateral IP enforcement strategy by including IP issues in trade processes and supporting IP enforcement with sanctions. The 1986

Uruguay Round of GATT Treaty negotiations was an important turning point in the globalisation of the US neoliberal IP regime. A lobby formed of 12 major US corporations, known as the Intellectual Property Committee, effectively drafted what would later become the WTO's TRIP agreement at the close of the Uruguay Round in 1994 (Sell, 2003).

It is widely accepted that the terms of the TRIP agreement were pushed through using bilateral pressure and the threat of sanctions by the USA, European states, and Japan, especially upon states in the global South whose economies would suffer under TRIP (Sell, 2003). Subscription to TRIP was not only made a condition of WTO membership, it extended monopoly privileges of rights-holders and expanded state obligations to defend IP rights. TRIP is also unique as an agreement insofar as it demands states take up positive legislative action to establish IP protections; insofar as it is linked to WTO dispute mechanisms, TRIP also links IP to broader issues of international trade. It is no exaggeration to say that TRIP reflects a contemporary global IP regime that entrenches a global division of mental and manual labour and of knowledge and information. This is most clearly shown by the fact OECD countries hold 97% of the world's patents and 80% of research and development and scientific publications (Jessop, 2007; Zeller, 2008).

INTELLECTUAL PROPERTY AS A SITE OF STRUGGLE

It has been suggested that the global IP regime embodied in TRIP amounts to a contemporary movement of enclosure (Perelman, 2002; Boyle, 2008). Not unlike the historic appropriation of lands that were traditionally held in common, contemporary IP rights parcel the knowledge commons into separable and transferable objects that subsequently fall under exclusive control. One crucial terrain for this process involves the enclosure of information and knowledge of biological and natural processes, insofar as these are deemed the non-obvious and useful inventions of intellectual labour.

For instance, the 1992 Convention on Biological Diversity (CBD) pledges signatories to share the 'benefits of biodiversity'. Insofar as this commitment to the natural commons is grounded in the logic of a Lockean labour theory of property, in practice it has meant that raw genetic and other biological resources are left free for appropriation through patents won by a commercialised life science industry. Where the biological is conceived as common, this merely leaves it free for appropriation through intellectual labour which ostensibly 'invents' it through patenting (Parry, 2004; Brand and Görg, 2008; Helmreich, 2009). The same logics of appropriation of knowledge and information from the bio-commons are evident in the Human Genome Project (HGP). This was a state-sponsored commercial enterprise created to protect US and UK pharmaceutical companies from licensing costs in the event that the human genome would be

patented. Not unlike the CBD, the HGP ostensibly protects the bio-commons but in fact entails a model where publicly generated knowledge underpinned by state expenditure and posited as common, becomes the object of IP appropriations for pharmaceutical industry extraction of monopoly rent on therapies and treatments derived from the HGP (Halbert, 2005).

Pointing to the appropriation of indigenous or peasant knowledges and practices, some scholars have suggested understanding the contemporary IP regime as a new iteration of colonialism where traditional knowledge of living processes is mainly extracted from the global South to the North through the application of patents (Shiva, 1997). Global struggles over knowledge and information can also be understood in terms of new forms of the global division of labour. For instance, growing numbers of people in rapidly de-industrialising cities, excluded from access to healthcare or labour markets, act as subjects in clinical pharmaceutical research in exchange for wages or healthcare (Rajan, 2006; Cooper and Waldby, 2014). Analogous global divisions of mental and material labour are also present in knowledge production in information and computing sectors where the intellectual labour of engineers and programmers is inseparable from manufacturing, extraction, and recycling industries primarily located in the global South (Dyer-Witherford, 2015).

Among the numerous sites of contestation over IP, higher education systems are particularly significant strategic sites for capital's appropriation of public knowledge. This can be understood in terms of two processes. First, as they are transformed into the engines of national knowledge economies, universities are expected to conform to the needs of the national economy. Moreover, expected to adopt an entrepreneurial ethos themselves, universities increasingly engage in market activities including the production of patents, the regulation of copyright policies to secure revenue flows from the products of intellectual labour, and the marketing and trademarking of themselves as brands (Slaughter and Rhoades, 2004, 2009). Second, internal systems of academic prestige distribution are instrumentalised by the academic publishing industry to stimulate the appropriation of public knowledge on a mass scale (Perelman, 2002; De Angelis and Harvie, 2009; Peekhaus, 2012; Szadkowski, 2016). Despite this two-fold expansion of the university as an engine of IP production, the results are highly contested. While the number of university-declared patents has sky-rocketed since the early 1980s, only an extremely small number of universities have accrued 'blockbuster' patents that deliver substantial profits (Owen-Smith, 2003). Moreover, not only do most higher education institutions lack the infrastructure to protect patents, those located in the global periphery endure local industrial conditions less favourable to IP protection (Ramos-Vielba and Fernandez-Esquinas, 2012; Rooksby and Pusser, 2014). In effect, the overall trend is for the transformation of the higher education sector into a publicly subsidised research stream for capital while being exposed to ongoing cycles of enclosures or disciplined into entrepreneurial behaviour.

The parasitic relationship cultivated by capital in relation to the knowledge commons and mediated by IP is particularly evident in the academic publishing industry. Estimated to be worth \$10 billion annually, research shows that publishers add relatively little value to the publishing process (Beverungen et al., 2012: 931; Fuchs and Sandoval, 2013). Moreover, an ongoing series of mergers and acquisitions means that the academic publishing market amounts to an oligopoly where the five largest firms control over half of all published articles in some areas of scholarship (Larivière et al., 2015). Accordingly, publishers are not only engaged in processes of dispossession and enclosure of knowledge, they extract monopoly rents by selling knowledge not easily reproduced as knowledge commodities, primarily in the form of journal articles (Peekhaus, 2012). Knowledge grows progressively more exclusive and highly regulated through an increasingly powerful IP regime that regulates access.

There has been significant resistance to the enclosure and commodification of academic labour, especially in the form of campaigns for open science and the promotion of ‘creative commons’ for academic work. However, the publishing industry has responded by gradually moving towards a capitalist model of ‘open access’ in science where new lines of profit not premised on knowledge enclosure become increasingly prevalent – such as ‘pay-to-publish’ or ‘article processing charges’ for publication. It has been argued that such cases reveal capital abandoning private property but not its command over knowledge (Szadkowski, 2016: 80–5).

Looking beyond the university, IP is broadly instrumentalised to fuel growth for capital devoid of its own sources of invention. However, the extension of IP rights can also produce irrationalities for capital. Evidence suggests that the use of patents can hinder economic growth, while few patents produce value (Mazzoleni and Nelson, 1998; Belloc and Pagano, 2012; Demirel and Mazzucato, 2012; Mazzucato, 2013; Pagano, 2014). This is not surprising given that patents are often used strategically to reinforce monopolies, i.e. to restrict the distribution and development of technical and scientific knowledge, rather than as sources of value in themselves (Zeller, 2008).

Effectively from the beginnings of its extensive and intensive expansion, capitalist activity has been accompanied by IP. It bears emphasising, however, that this process has not always been smooth or devoid of friction. Dispossession is resisted by indigenous populations defending common resources or by scientists preserving resources for knowledge production. Numerous initiatives seeking to maintain open access to knowledge, from cooperative universities and open repositories to the promotion of ‘creative commons’ licences and open-code knowledge infrastructure, continue to emerge, though it bears noting these are often underpinned by liberal premises and are prone to co-optation by capital. Ultimately, where capitalist notions of private property are applied to easily reproducible and transferable intangible objects, these are doomed to fail. Perhaps nothing ultimately undermines the arbitrary brutality of modern conceptions of property more than the enclosure of human knowledge, ideas, and practices.

Deportation

Nicholas De Genova

Deportation, as a mechanism for the expulsion of migrants, is not a topic addressed directly in Marx's writings. This is due principally to the relative novelty during the late nineteenth century, in the years immediately prior to Marx's death, of deportation as a legal 'remedy' or punishment for specific categories of migrants designated as 'unwanted', 'unwelcome', or 'undesirable'. This is not to suggest, of course, that there was not already a history of mass expulsions and coercive population transfers of various kinds. Indeed, deportation must be meaningfully situated in relation to the 'transportation' of convicts and the full genealogy of diverse forms of expulsion (Walters, 2002/2010). Nevertheless, as a specific juridically inscribed and ordinarily individualized mode of immigration enforcement, deportation was largely unknown during Marx's lifetime.

Consequently, there is very little indeed within Marx's corpus that lends itself directly to a Marxian theory of deportation. Rather than deportation, migrant mobility during Marx's lifetime was overwhelmingly subject to active processes of *importation*. In the mass exodus of the Irish fleeing the potato famine of 1846, for instance, Marx notably recognized what he characterized as 'a systematic process' that not only entailed 'a new way of spiriting a poor people thousands of miles away from the scene of its misery', but also served, in effect, as 'one of the most lucrative branches of [Ireland's] export trade' – exporting the labor-power of its surplus population while also mobilizing the migrants themselves as a source of remittances that not only subsidized those left behind but further fueled migration by financing the travel costs of subsequent generations of

migrants (1867/1976: 862). From the opposite vantage point of the USA, Marx discerned with respect to Irish labor migration a concomitant ‘importation of paupers’ (1867/1976: 939). Migration, in short, was inseparable from various forms of labor recruitment, and thus profoundly entangled with the global mobility of labor (De Genova, 2018). Immigration law – as a means for the orchestration, regimentation, and subordination of migrant labor – only emerged later, as a statist reaction formation responding to the primacy and relative autonomy of human mobility and as a mechanism for the legal mediation of the global capital–labor relation (cf. De Genova, 2016a).

Indeed, until the latter decades of the nineteenth century, migration had been largely unregulated and state borders were relatively open for the transnational mobility of labor. In the USA, for instance, provisions for the deportation of ‘undesirable’ migrants were only enacted as a means of enforcing the explicitly racist Page Act of 1875, specifically targeting Chinese migrants, whereupon the denial of admission at a US port of entry would trigger a deportation. Then, with the subsequent Chinese Exclusion Act of 1882, the purview of deportation was broadened to serve as a penalty for the lack of a certificate of legal residence (Ancheta, 1998; Chang, 1999; Hing, 1993; Kim, 1994; McKeown, 2008; Salyer, 1995; Saxton, 1971; cf. Calavita, 1984). Immigration law itself was virtually non-existent until precisely this era, which introduced a panoply of racial, religious, moral, criminological, public health, and political exclusions, prominently distinguished by the sorts of overtly racist laws, enacted across the Americas and beyond, which specifically sought to bar the migration of Chinese labor (McKeown, 2008).

In time, with a multiplication of the categories of migrant non-citizens who were rendered subject to deportation, and hence classed as deportable, there eventually emerged and was consolidated the figure of the migrant that could be more generically branded as ‘illegal’ (Calavita, 1984; De Genova, 2004, 2005: 213–50; Nevins, 2002; Ngai, 2004), or even ‘criminal’ (Dowling and Inda, 2013; Griffiths, 2015; Hasselberg, 2016; Kanstroom, 2012; Peutz, 2006/2010; Stumpf, 2006). Susceptibility to deportation becomes a defining if not definitive material and practical mechanism for enforcing the profound and ever deepening consequentiality of migrant ‘illegality’; an indefinite and usually prolonged socio-political condition of deportability becomes the pragmatic, actionable form of migrant illegalization (De Genova, 2002, 2010a, 2014). It is precisely in such ways that the social and legal fiction of migrant ‘illegality’ achieves its density as a real abstraction, ‘purely social in character, arising in the spatio-temporal sphere of human interrelations’ (Sohn-Rethel, 1978: 20), an abstraction that is ‘not ... a mere mask, fantasy, or diversion, but ... a force operative in the world’ (Toscano, 2008: 274). Thus, whereas migrant ‘illegality’ is a prominent example of the state’s deployment of the law as a tactic that serves to mediate the capital–labor relation and, more generally, to regiment social life, by producing juridical categories that are lived as unequal sociopolitical conditions of tremendous

consequence (De Genova, 2016a), deportation marks the conjuncture of that particular branded 'foreign'-ness (De Genova, 2018) with its lived susceptibility to the material and practical recriminations of the law. Likewise, inasmuch as all non-citizens ('legal' and 'illegal' alike) eventually become more or less subject to deportation, given one or another conditionality or triggering contingency (Goldring and Landolt, 2013), the possibility or prospect of deportation comes to be a premier and rather enduring material and practical expression of the very distinction (and profound inequality) between citizen and non-citizen (Anderson et al., 2013).

If sovereignty has come, to a significant extent, to be predicated upon a state's right to police its borders and control who may cross them, then the expulsion of those found to be in violation of such restrictions would appear to have arisen as an almost inexorable consequence (Kanstroom, 2007). Deportation, consequently, emerges as a technology of state power that refines and amplifies the capacity of borders to operate as means for the production of spatialized difference (De Genova, 2016a). Conversely, we should also therefore recognize that the institutionalization of deportation itself (and ensuing expansion of its purview) may be taken as one rather palpable sign of a critical historical threshold – the consolidation of what Nandita Sharma (2018) designates to be the veritable nationalization of state power (see also Mongia, 1999).

It is instructive, however, that deportation was first enacted not against all non-citizens, and therefore not primarily as a way to enact a partition between citizenship and non-citizenship, but rather as a technique for the exclusion of a particular, expressly racialized, and racially denigrated category of transnational human mobility. In a sense, the primacy of the racial obsession (Chinese exclusion) preceded and importantly prefigured what were still relatively inchoate notions of national identity and even citizenship. The service that deportation thereby did for hardening and clarifying the boundaries of nation-state space and citizenship is evident, but perhaps becomes much starker only in retrospect. What today appears to us as a kind of 'deportation creep' (Walters, 2018), whereby the purview of the deportation power continuously broadens to encompass ever more categories of migrants and other non-citizens and eventually comes to contaminate the presumptive security of citizenship itself, can thus be seen to have started much earlier – indeed, from the very outset. Beginning with a rather specific and circumscribed target among the full spectrum of non-citizen 'foreigners', deportation has advanced inexorably to encompass them all – to the point that now, on an effectively global scale, there is virtually no non-citizen (including the ostensibly 'legal' 'permanent resident') who is not potentially deportable, given the right combination of circumstances and triggering contingencies. Little surprise, then, that deportation increasingly sweeps up in its purview those putatively 'suspect' categories of citizens, again predictably prioritizing those who are racially affiliated with 'foreignness' (Stevens, 2011; cf. Kanstroom, 2012). As Sharma (2018) persuasively contends, the unprecedented introduction of border

and immigration controls, prominently including deportation, evident across the globe beginning in the latter part of the nineteenth century, was the premier form for enacting a nationalization of state sovereignty. Indeed, sovereignty itself has come to be ubiquitously associated with a state's power to control its borders and determine who, or what categories of people, may cross them, under what conditions, and with which stipulations. Borders may therefore be understood to be means of production, crucial for the sociopolitical (statist) production of spatial difference as well as the spatialization of the difference between distinct categories of people produced as the state's presumptive 'insiders' and 'outsiders' (De Genova, 2016a; cf. 2010a). Nonetheless, Daniel Kanstroom emphasizes that the mounting use of deportation law as a form of 'extended border control' also came to serve the ends of 'post-entry social control' (2007: 92).

If today we have come to customarily understand the susceptibility to deportation as a principal and defining distinction that separates citizenship and non-citizenship, we need nonetheless to remain vigilant against ever imagining that citizenship can be assumed to be somehow equated with any presumable 'safety' from various forms of coercive expulsion. After all, the other conventional association with the term 'deportation' – especially in many European contexts – is Nazism's herding of Jews and other 'enemies' into prison labor camps, which of course were eventually converted into death camps. So it seems to be perilous to become complacent about the idea that deportation could ever be exclusively reserved only for non-citizens. If nothing else, the meticulously legalistic proclivities of the Nazis demonstrate precisely that citizens can always be stripped of their legal personhood and subjected to any and every atrocity otherwise more routinely reserved for non-citizens. That is to say, rather than naively taking complacent recourse to the liberal proposition that 'no human being is "illegal"', a more sober assessment of the historical record would suggest that, subordinated by state power, ultimately, we are *all* (at least potentially) 'illegal'.

Indeed, over recent years and still today, we have witnessed reactionary statist campaigns against the spectral threat of 'migration' even in contexts where those who are made to stand in as the 'foreign' object of nativist contempt and suspicion are not in fact migrants or refugees at all. In particular, there has been an escalation of nativist convulsions against 'illegal immigrants' targeting native-born (racialized 'minority') fellow citizens. In the eastern borderlands of the Democratic Republic of the Congo, native-born Congolese citizens who are the descendants of Hutu and Tutsi people resident for generations on the Congolese side of the border have been derisively labeled 'Rwandans' and targeted for expulsion. Similarly, in the Dominican Republic, the native-born descendants of migrant workers who were recruited generations earlier from neighboring Haiti have been recast as 'Haitians', legally stripped of their birthright citizenship, and rendered stateless, denigrated as 'illegal immigrants' in the only land where they have ever lived. Meanwhile, in Myanmar (Burma), Rohingya Muslim native-born citizens have similarly been legally stripped of their citizenship, castigated

as ‘illegal immigrants’ from Bangladesh, and subjected to vicious pogroms, confined in virtual concentration camps, massacred, and driven across the border in the hundreds of thousands. In this instance, the susceptibility to deportation of alleged ‘illegal immigrants’ serves merely as an alibi for the genocidal alternating current of extermination and mass expulsion. Indeed, these examples are but a few of the more extraordinary among a proliferation on a global scale of new formations of nativism directed not merely at migrant ‘foreigners’ but rather toward minoritized fellow citizens who may be re-purposed as virtual or de facto ‘foreigners’ – indeed, often as outright ‘enemies’ – within the space of the nation-state (De Genova and Roy, 2020).

What emerges then in a still more stark way is the pivotal role of deportation in producing the conditions of possibility for sustaining the casual and callous disposability not only of migrant labor per se, but also the outright and abject disposability of human life. Whole categories of people are simply treated as superfluous and, although their illegalized (hence, ‘cheap’ and tractable) labor is plainly in great demand and truly desirable among many employers, their (racialized) bodies, their persons, their lives, and the wider communities in which they participate are branded as ‘undesirable’ and rendered virtual ‘waste’, human ‘garbage’ to be simply disposed of (De Genova, 2017a, 2017b). It is in this sense, perhaps, that deportation has assumed a paradigmatic quality in our era of neoliberal global capitalism (De Genova, 2010a; Peutz and De Genova, 2010).

Despite the extraordinary examples of outright mass murder and mass expulsion, however, these ubiquitous processes of subjecting migrants to the threat of deportation are far more commonly (and far more productively) implicated in their precaritization, and thus the subordination of their labor. There is a deep consonance between ‘national’ and racialized identities as manifestations of the naturalization of social and political inequalities that correspond to the (bordered) spatial differentiation and division of the planet according to a proliferation of distinct fields of force, working out the variously localized and historically specific compromises of the politics of the otherwise global capital–labor relation. This indeed is where a universalistic and ostensibly homogenizing ‘economic’ regime premised upon labor-in-the-abstract sustains and requires the ‘political’ production (and naturalization) of difference – racial, ‘cultural’, ‘national’, and so forth – as a basis for ever proliferating and exquisitely refined hierarchies of distinction and division in the material, practical, lived, and indeed embodied experience of living labor, as labor-for-capital (De Genova, 2018; cf. 2012, 2016b).

Hence, we must begin from an appreciation of immigration law and border enforcement as means of labor subordination (De Genova, 2002, 2013, 2016a). Relations of domination and subordination in the labor process itself are a precondition for capital accumulation. As Marx explains, because human beings realize our purposes in the materials of nature consciously, our work requires that we ‘subordinate [our] will’ to such tasks: ‘a purposeful will is required for the

entire duration of the work. This means close attention' (1867/1976: 284). Thus, labor subordination – and also the ensuing (political) problem of social domination, more broadly – is inextricable from the subordination routinely enacted through the everyday organization of work within the capitalist labor process, in which superintendence and management assume what Marx characterized as an inherently 'despotic' form (1867/1976: 44–50; cf. De Genova, 2006, 2010b). Yet, if domination and subordination are pervasive, indeed routine, these relations are precisely political in the most elementary sense: they are relations of unequal power, constituted in and of struggle. 'The establishment of a normal working day', Marx memorably notes, 'is ... the product of a protracted and more or less concealed civil war' (1867/1976: 412). In Marx's account, centuries of outright and extravagant violence devoted to the subordination of labor to capital – for which the state-form is instrumental, and through which it ultimately becomes rigidified and institutionalized – eventually secure what comes to appear as merely 'the silent compulsion of economic relations', and thus produce 'a working class which by education, tradition, and habit' has been conditioned to perceive 'the requirements of [the capitalist] mode of production as self-evident natural laws'. Only thereafter may the sorts of 'direct extra-economic force', which distinguish the repressive apparatuses of state coercion, come to be reserved for 'exceptional cases' (1867/1976: 899; cf. 915–16).

The dialectics of labor and capital are conventionally conceived in narrowly 'national' terms, but they correspond in fact to a larger dialectics between global capital (crudely identified with the 'economic') and the diverse spatial – and indeed, corporeal – particularizations of the social relations of struggle (which may thus be properly called the 'political') (Holloway, 1994). The effectively global regime of capital accumulation produces a systemic separation between the 'economic' and the 'political', whereby 'economic' relations (above all, wage-labor) appear in general to be strictly voluntary, contractual, impersonal, and free of direct coercion, and the means of organized violence and repression (the 'political') are supposed to be the exclusive purview of the state, reserved as a resource for the similarly impersonal Rule of Law. This separation entails a constitutive contradiction between a veritable world economy, predicated upon the universal abstraction of labor, and a global order of territorially defined (putatively 'national') states through which the expressly political relations of labor subordination and social order are orchestrated, regimented, and enforced, and in a manner that is rigorously differentiated by the borders of sovereignty and citizenship and the nationalized boundaries of identity.

Deportation, much like the border itself, is a productive power: it does not only punish illegalized migrants by evicting them from the space of one or another state, but also generates the very condition of possibility for the disposability and precarity of all those who are compelled to live under the horizon of possible arrest, detention, and deportation while yet remaining at large, un-deported, as labor branded as 'illegal' (De Genova, 2002; cf. 2018). In place of the palpable

sociopolitical relation of migrant labor to the state (a relation that is precisely mediated by state borders and the law), border policing and immigration law enforcement deliver the appearance of a categorical non-relation of the 'national' state and illegalized 'foreign' labor (De Genova, 2010a). Migrant border-crossers' ostensible 'illegality' thus requires the public, fetishized, and spectacular verification that appears to be revealed through deportations, raids, and other enforcement tactics. Indeed, if there were suddenly no more border patrols or inspections, no border policing or passport controls whatsoever, there would still be migrant 'illegality' as long as the law, its real point of production, were to remain unchanged. We can only be made to believe in that 'illegality', however, to take it seriously, once it appears as a thing-in-itself – reified as the supposed effect of the deliberate acts of a spectacular mass of sundry violators of the law transgressing a border. Therefore, we can begin to recognize that migrant 'illegality' emerges as the effect of one or another particular state's mediation of what is truly a global social relation of labor and capital, an antagonistic relation of conflict in the process of being fixed as a relation of subordination. The primary means for such mediation are the law and its enforcement. And among the various forms of immigration enforcement, deportation is exemplary. Nonetheless, while a spectacle of exclusion (whether through border patrols or deportation) is essential to this political process, subordination is always inherently a matter of inclusion and incorporation (De Genova, 2013).

The 'illegal' migrant is conscripted for the raw productive power and creative capacity of her human life, as living labor. This sheer productive and generative capacity of human life (the power to transform itself, as well as its always-already social configuration, by transforming its objective/external circumstances), this raw life-force, is immediately apprehensible as a constituent and constitutive power – (living) labor – which must be assiduously subordinated to the everyday mandates of capital accumulation, commodifiable, in Marx's telling formulation, as *labor-power*. Thus, it is precisely in the 'illegal' migrant's deportability that we may encounter anew the centrality and constitutive role of labor, actively recruited yet rendered eminently disposable (De Genova, 2010a). The exquisitely refined legal vulnerability of illegalized migrant labor – above all, materialized in its deportability – plainly serves to radically enhance the preconditions for its routinized subordination within the inherently despotic regime of the workplace. Here, then, we may recognize that it is precisely the Marxist theoretical arsenal that has been indispensable in advancing contemporary understandings of deportation. Likewise, it is deportation that provides a vital conceptual key for elaborating new Marxian insights, more generally, into migration and borders as legal and political questions of ever increasingly urgent global concern.

While the putative 'illegality' of migrants has become the single most prominent 'problem' for immigration and asylum law and policy on a global scale during recent decades, this does not mean that it is the sort of problem that is meant to be remedied. Instead, what I have called the legal production of

migrant ‘illegality’ (De Genova, 2002, 2004, 2005) is constantly provided the ostensible justification to continue apace, ever revising and refining the terms and conditions of further migrant illegalization. Hence, we witness the entrenchment and fortification of what is effectively a global deportation regime (De Genova and Peutz, 2010) as well as an accompanying expansion of migrant detention (Flynn and Flynn, 2017; cf. De Genova, 2017c). Deportation and other immigration enforcement practices confirm that migrant illegalization is never finished, once and for all time; rather than *faits accomplis*, the diverse and historically specific productions of migrant ‘illegality’ must continue to be re-produced through everyday struggles between migrant labor and capital as well as the ongoing state practices of (re-)bordering. Notably, these border-making and border-enforcing activities have been increasingly and pervasively relocated to sites within the ‘interior’ of migrant-receiving states, such that illegalized migrants are made, in effect, to carry borders on their very bodies (Khosravi, 2010: 97–120) as border enforcement comes to permeate the full spectrum of everyday life activities and spaces. Thus, as ‘problems’ for the government of transnational human mobility and migration ‘management’, these processes of illegalization remain the open-ended sites for migrant struggles and unforeseen disputes over immigration and refugee politics.

Nevertheless, ‘the silent compulsion of economic relations [that] sets the seal on the domination of the capitalist over the worker’, and allows for ‘direct extra-economic force’ to become ‘exceptional’ (Marx, 1867/1976: 899), ordinarily remains true even for those illegalized migrant workers subject to immigration raids and deportations. Although the spectacle of immigration enforcement is a persistent and pernicious reminder of the extraordinary vulnerabilities that suffuse the migrant predicament, raids and deportations are relatively exceptional instances of direct coercive intervention by state power into the everyday relations between capital and migrant labor. Even amidst heightened immigration policing or aggravated deportation campaigns, such exceptional extra-economic punitive and repressive measures on the part of the state merely intensify, to greater or lesser extents, what is otherwise a protracted and mundane condition of ‘unauthorized’ residence and illegalized labor. In other words, even within the relatively exceptional predicament of migrant workers’ ‘illegal’ status – which after all becomes a formative part of the ‘education, tradition, and habit’ inculcated into such workers – these more coercive (and plainly political) dimensions of their particular condition as migrant labor generally achieve a commonsensical banality as merely ‘economic’ ‘facts of life’, with the machinations of state power and the compulsions of the law rendered effectively routine by the normalization of each migrant’s ‘illegality’ as a kind of ‘private’ transgression and her deportability as something akin to an individualized disability.

While there should be no doubt that deportation is a profoundly punitive iniquity, and furthermore that deportation’s bureaucratic euphemization as an ostensibly ‘administrative’ or merely ‘procedural’ consequence of some presumptive

act of migrant transgression in fact represents an increasingly ubiquitous contemporary manifestation of what Hannah Arendt famously called ‘the banality of evil’ (1963/2006; cf. De Genova, 2014), the power of deportation is not purely ‘necropolitical’ but rather must be understood to be productive and disciplinary (De Genova, 2015, 2017a, 2017b). While deportation has this punitive and at times even potentially deadly character, it is precisely deportability – the susceptibility to deportation – that plays a distinctly disciplinary role in the production of the conditions of possibility for migrant labor-power to serve as a highly desirable commodity of choice for employers.

We must recognize the remarkable systematicity with which deportation ever increasingly supplies capital with the ever renewable resource of routinely disposable labor in the exquisite form of illegalized (hence, deportable) migrant labor. Even in the face of escalating deportations (in the USA and across the world), it is usually still the case that only a minority are actually deported while the great majority of those who are susceptible to deportation remain in a protracted condition of vulnerability to this profoundly punitive repercussion of the law. Importantly, this means that deportation, perhaps more than anything else, does a crucial work of subordination on the ‘inside’ of the space of the state. And then, on the ‘other’ side of the border, ‘outside’ the space of the deporting state – as the growing ethnographic literature on the aftermaths of deportation have shown (Khosravi, 2017) – there is life after deportation even if the deporting state imagines deportation to be a kind of closure, a seemingly conclusive act of dumping ‘undesirable’ migrants onto the ordinarily poor countries to which they are juridically affiliated by their (sometimes only apparent) citizenship (De Genova, 2017b). Furthermore, life after deportation often involves the re-mobilization of the deported migrants, the re-initiation of their migratory projects, often against all odds and under circumstances that may look more than ever like the flight of refugees from conditions in which life is truly inviable (Coutin, 2010; cf. Khosravi, 2017; Slack, 2019). But this reminds us that even under the worst of circumstances and within the very asphyxiating constraints of various regimes for governing human mobility, there are persistent manifestations of autonomy, which I have called the autonomy of deportation (De Genova, 2017a, 2017b; cf. De Genova et al., 2018).

If, as I have argued, the illegalization of migrant labor must be apprehensible as a form of labor subordination, whereby the policing of state borders and the enforcement of immigration law serve to politically and legally mediate a global relation between capital and labor, then deportation is plainly one of the premier tactics for the pursuit of capital’s (and the state’s) interests in that global relation of struggle. The direct deployment of deportation itself, however, is neither the most commonplace nor the most productive manifestation of that enforcement of the interests of capital in the subordination of labor. After all, capital is permanently and irreversibly dependent upon labor, particularly upon the vital powers and creative capacities of living labor as the source of value. Consequently, capital’s

principal stake in the subordination of labor is not in labor's exclusion or expulsion but rather in its effective subjection and subjugation within the labor process.

The agonistic and artificial division between 'native' (or citizen) labor and 'migrant' (or more precisely, non-citizen) labor is a perfect fabrication sustainable only with recourse to the tactics and technologies of borders for producing and upholding partitions between (nation-)state territories and their corresponding populations. These sociopolitical and juridical productions of the difference between 'national' (or 'native') labor and 'foreign' labor, of course, are politically useful and can be manipulated and exploited to foster antagonisms among working people, as well as to target and persecute specific categories of non-citizens. In this respect, deportation can likewise be mobilized as a weapon against particular groups for one or another political purpose. Yet deportation is ordinarily an individualized punishment directed at non-citizen individuals for specific reasons concerning their immigration status or some other violation of the law. Of course, while deportation has indeed been increasingly deployed against alleged migrant 'criminals' (including those who may have been previously 'legal' migrants but have been rendered subject to deportation by some other violation of the law), the susceptibility to deportation is pervasive for virtually all those migrants branded as 'unauthorized' and 'illegal'. Thus, far more than outright deportations, it is deportability that is ubiquitous. If the deportation power is one of the premier forms of the enforcement of capital's interests in the global subordination of labor, the productivity of that power resides above all in the capacity of that power to discipline migrant labor by relegating it indefinitely to a sociopolitical condition distinguished by deportation as its defining horizon.

Yet labor subordination is an ever unfinished business, because the capital-labor relation is intrinsically a relation of struggle, and therefore an irreconcilably antagonistic one.

The subordination of illegalized and deportable migrant labor, in particular, is inseparable from the primacy and sheer 'disobedience' of autonomous border-crossing itself, as well as the outright insubordination of migrant struggles. Recall the mass migrant protest mobilizations in the USA in 2006, when migrants, their children, and their allies marched in the millions in cities and towns all across the country to defeat what would have been the most punitive immigration law in US history. '¡Aquí estamos, y no nos vamos! Y si nos sacan, nos regresamos!' [Here we are, and we're not leaving! And if you throw us out, we'll come right back!]. So rang out the resounding affirmation of (Latino) migrant presence in the USA. What was plainly at stake in this chant was precisely the question of migrant 'illegality' and undocumented migrants' susceptibility to deportation. By implication, the millions of migrant protesters proclaimed, in effect: 'We're here, we're "illegal", catch us if you can!' In this spirit, migrants matched their affirmations of presence with the assurance that even if they were to be deported, they could never in fact be truly expelled and their presence could never be truly eradicated: they would come right back. I have written previously about the ubiquity and

emotive power of the ¡Aquí Estamos! chant in the context of the 2006 migrant protest mobilizations, in terms of what I consider to be a defiant politics of incorrigibility (De Genova, 2010c). The migrant protesters proclaimed, in effect: not only are we here, but also: we have no proper place within your normative or legal order, and there is nothing you can do about it – you can never get rid of us. This sensibility conveys both an implicit recognition of the legal production of migrant ‘illegality’ (the fact that the US immigration regime itself generates the conditions of possibility for ever more migrant ‘illegality’), as well as the more elementary dependency of a large cross-section of capitalist employers on the labor of illegalized migrants as a workforce of choice. Anticipating another slogan of the ensuing struggles over US immigration politics, associated mainly with the struggles of the undocumented but US-raised sons and daughters of migrants who brought them to the USA as small children (so-called DREAMers),¹ Latino migrants during the 2006 marches (in their millions) were boldly announcing that they were Undocumented, Unafraid, and Unapologetic – deportable, but insurgent nonetheless.

Thus, while the deportation power is a pernicious tool in the arsenal of contemporary statecraft, it is crucial to not allow for it to become yet another inducement for elegiac lamentations of the presumed ‘powerlessness’ and victimization of migrant labor or operatic denunciations of the ruthlessness of the state that become unwitting paeans to its sovereign power. Migrant labor – and especially illegalized migrant labor, so commonly inured to its multifarious sociopolitical disabilities – retains the intrinsically incorrigible subjectivity of all labor, and remains an always potentially disobedient, intractable, and insurgent force.

* * * * *

Critical research into deportation has begun to constitute a distinctive area of inquiry within the wider field of migration studies. What ought to be apparent already is that the actual event of deportation, as a punitive act of administrative state power that ordinarily subjects people to grievous trauma and injustice, is commonly shielded from much judicial scrutiny or procedural oversight, and consequently is rather difficult (and often virtually impossible) to witness and observe. While there may be exceptions, this is an area of the exercise of state power that tends to be remarkably insulated from public view and largely enshrouded in secrecy. William Walters incisively identifies ‘the spatial, legal, bureaucratic, and material work of secretisation, the work of making deportation secret’ as a central but largely unexamined theme to which critical research must be addressed in order to interrogate the relations of bodies, space, and power at work in this elusive sociopolitical process (2020: 27). ‘We should take seriously the way secrecy is made and unmade’, Walters continues, ‘the fact it can take multiple forms, that it is not self-explanatory, and that there is a

complexity to the politics of secrecy' (2020: 30). The deliberate seclusion and segmentation of deportation from the purview of the public (including not only academic researchers but also investigative journalists and, perhaps most importantly, anti-deportation activists) nonetheless renders such enactments of state power, in and of themselves, to be inherently evasive of critical study.

Deportation is not reducible to the ostensible event of deportation alone, however. As may be inferred from the foregoing argument about deportability, and as ought to be already evident, deportation is better understood to encompass a variegated continuum of circumstances and contingencies that may or may not necessarily culminate in an actual deportation, but which impose deportation as the defining horizon for a more diffuse sociopolitical condition of susceptibility to deportation. This makes an interrogation of deportation indispensable for the critical study of migration, more generally. Even putatively 'legal' migrants are not immune to the menace of deportability inasmuch as deportation has increasingly become the ultimate supplemental punishment reserved expressly for non-citizens who are convicted for other 'criminal' offenses (Griffiths, 2015; Hasselberg, 2016; Peutz, 2006/2010). Likewise, sometimes long prior to the actual event of deportation, for those who have been issued an order of deportation, the legal battles of appealing and contesting a prospective deportation similarly provide a considerably more expansive context for investigating what precisely is entailed in deportation as a juridical procedure for the expulsion of those migrants who somehow manage to have occasion to plead their cases (Hasselberg, 2016). Furthermore, as a growing body of research has amply demonstrated, neither is the actual event of deportation a conclusive end to any given migratory project, and the study of migrants' post-deportation experiences and perspectives – above all, their not-uncommon renewed efforts to migrate again – has afforded scholarship with an abundance of new opportunities for researching deportation (Álvarez Velasco, 2019, n.d.; Bhartia, 2010; Brotherton and Barrios, 2011; Coutin, 2010; Kanstroom, 2012; Khosravi, 2017; Lecadet, 2013, 2017; Peutz, 2006/2010; Slack, 2019; Zilberg, 2004, 2007, 2011). Of course, neither is it the case that deportation ever ceases to produce enduring ramifications in the families, communities, and places from which deportees have been expelled, where their abrupt dislocation and absences continue to be palpable (Dreby, 2012, 2013; Drotbohm, 2015; Golash-Boza, 2013, 2015; Golash-Boza and Hondagneu-Sotelo, 2013; Hasselberg, 2016). Anti-deportation campaigns, moreover, have emerged as a crucial site of struggle redefining the politics of immigration as well as citizenship (Nyers, 2003/2010; 2019). Indeed, deportation regimes create a complex web of spatial and temporal interconnections across the planet through which migration and deportation increasingly entail a succession of serial multi-directional mobilities and repercussions (Álvarez Velasco, 2019, 2020, n.d.; Drotbohm, 2011; Khosravi, 2016; Lecadet, 2013, 2017). We therefore must transpose the critical perspective associated with the concept of the autonomy of migration into an appreciation of what I have designated to be the

autonomy of deportation (De Genova, 2017a, 2017b): the incorrigible subjective force that animates migration is not abruptly extinguished when confronted by the state's deportation power, but rather persists and sometimes defies deportation as the most coercive form of forced mobility, and subverts even the most oppressive constraints on human mobility.

At the very outset of his intellectual itinerary, Marx famously discerned in the incipient proletariat 'a class with *radical chains*' – a class bereft of property, with no standing in civil society, no historical entitlements, and no particular claims, which embodied not a one-sided and self-interested antithesis to modern conditions but rather a complete antithesis to the very premises of capitalism and the modern state. Thus, here was a class that was not an estate with a positive station within the social order, but rather one that was constituted only negatively, as an abject and 'foreign' but inextricable presence, inherently corrosive and always potentially subversive. This class alone revealed 'a universal character' and thus could invoke 'only a *human* title' (1844/1975: 186; emphases in original). Its very existence as a class was both a symptom and a harbinger of '*the dissolution of the existing world order*', and therefore its own abolition would be its existential vocation (1844/1975: 187; emphasis in original). Many years later, Marx identified 'the basis of the whole process' of the formation of the capitalist class to be those 'epoch-making' historical moments 'when great masses of men [and women] are suddenly and forcibly torn from their means of subsistence, and hurled onto the labor-market as free, unprotected, and rightless proletarians' (1867/1976: 876). Free. Unprotected. Rightless.

Radical chains were forged, therefore, of a treacherous sort of freedom. The freedom of movement is inseparable in practice from the movement of 'free' people, the mobility of free labor, which is, within the global regime of capital accumulation, a freedom that is distinctly circumscribed. This is the freedom to dispose of one's own labor-power as a commodity, as if one were the owner of a commodity like any other. At the same time, this is also the peculiar freedom of being unencumbered by any other means of production with which that elemental capacity for productive labor might be set in motion (1867/1976: 272–4). *Vogelfrei* – literally, free as a bird, expelled from any proper human community, entirely exposed and legally unprotected (1867/1976: 896n.). Deportation reminds us that the radical chains forged of a freedom without rights or protections may serve not simply to confine and fetter us in place, but also to drag us mercilessly to the ends of the earth, and back again. It is in this respect that migration and migrant labor may be taken to be paradigmatic of the more global condition of labor as such, and deportation is one of the premier forms for its subordination and disciplining. And yet the freedom of movement remains the freedom of life itself, not merely the mundane necessity to make a living but the freedom to truly live. Deportation, as a more or less juridical, more or less arbitrary, exercise of state power, is therefore an exquisitely concentrated abnegation of that freedom, one more usurpation by the state of the power of human life

itself. The freedom of movement, as an inherently unpredictable and definitively open-ended precondition for human self-determination, can only ever be a perpetual and troublesome affront to the self-anointed sovereignty of state power. Deportation, then, must be apprehensible as a site of unresolved struggle.

Note

- 1 The 'DREAMer' moniker is derived from the abortive legislative bill, the Development, Relief and Education for Alien Minors Act, first introduced in the US Senate in 2001 (intentionally so named in order to be popularized as the DREAM Act). The original version of the bill was first introduced in the US House of Representatives earlier in 2001 with another title: the Immigrant Children's Educational Advancement and Dropout Prevention Act.

Borders

Sandro Mezzadra and Brett Neilson

BORDERS, BOUNDARIES, AND GLOBALIZATION

Since the inception of the discussion of globalization in the early 1990s, critical studies have exhibited a growing interest in borders. It is no exaggeration to say that the question of borders has shadowed claims for greater global integration and interconnection. Primarily borders have been understood as a negative enabler of these processes – the limit to be overcome, to recall a memorable phrase from Marx’s *Grundrisse* (1973: 408). In this conception, borders were primarily national territorial borders, and thus predictions or hopes for a ‘borderless world’, elaborated in popular business manuals such as those authored by Kenichi Ohmae (1990, 1995), were accompanied by debates about a decline of the nation-state (see, for instance, Miyoshi, 1993). While this perspective, which takes the nation-state as the privileged object of global processes, has never fully disappeared, it has been relativized by approaches that emphasize the role of the city (Sassen, 1991), the transnational corporation (Barnet and Cavanagh, 1994), or the environment (Foster, 2002). The question of the nation-state’s persistence has been eclipsed by the need to trace its transformations, adaptations, and diversification of forms. At the same time, there is wide recognition that globalization has occasioned open borders for capital and goods but the multiplication of barriers for the movement of human bodies. This realization has prompted since the early 1990s a rigorous theoretical engagement with the topic of the border in the

work of Étienne Balibar, who has played a pioneering role in placing it at the center of critical studies (see, for instance, Balibar, 1992). It has led a number of commentators (see, for instance, Dalby, 1998) to apply the term ‘global apartheid’ to the geographies of globalization. The use of the term apartheid implies not simply a normative condemnation of the inequalities created and enforced by the differing mobilities of populations. It also registers the operation of borders beyond state demarcations and highlights the need to rethink politics and obligations across boundaries in ways that take seriously ‘the social and economic consequences of the current global division of labour’ (140). It is particularly with regard to this latter endeavor that a reflection on the role of borders in Marxist thought remains a vital and urgent task.

Although migration control has only recently (since the late nineteenth century) become a prominent function of geopolitical borders, myriad boundaries and lines of demarcation (e.g. the one between the countryside and the city or the one between colonies and metropolis) have been deployed to manage the mobility of labor since the inception of modern capitalism. As Nicholas De Genova (2016) argues, this link between borders and the global mobility of labor accounts for the prominence of borders in any ‘radical working class politics’ and related theory and practice of ‘socialist internationalism’. Even more fundamentally, mobility and movement are key features of Marx’s definition of labor (see De Genova, 2010). ‘Real’, ‘living’ labor, Marx writes in his unpublished ‘Results of the Immediate Process of Production’, stresses the fact that the worker’s ‘expenditure of his life’s energy, the realization of productive faculties’ is ‘his movement and not the capitalist’s’ (Marx, 1976: 982). The very concept of labor power is predicated upon a kind of ontological primacy of ‘motion’ and ‘unrest’ (1976: 296), which finds its expression in Marx’s emphasis on the *potential* character of labor power (see Virno, 1999: 121; Macherey, 2014: 164–5). The latter is indeed famously defined as ‘the aggregate of those mental and physical *capabilities* existing in the physical form, the living personality, of a human being, capabilities which he *sets in motion* whenever he produces a use-value of any kind’ (Marx, 1976: 270, emphasis added). It is not surprising therefore that, as Marx himself demonstrated in his analysis of ‘so-called primitive accumulation’ in *Capital*, volume 1, mobility as well as its government and ‘taming’ become essential fields of struggle where the very production of labor power as a commodity is at stake. In his underground but continuous conversation with Marx, Michel Foucault grasped this point in *Discipline and Punish* (1995) and above all in *The Punitive Society. Lectures at the Collège de France, 1972–1973* (2015). Yann Moulier Boutang (1998) also provided a challenging reconsideration of some aspects of Marx’s thought precisely from this angle. Considering the relevance of borders and boundaries in the management of labor mobility, they are destined to remain a crucial topic for any Marxist investigation of borders.

Borders and boundaries, we have just written. Independently of the differences of meaning between these two terms, whose definition floats according

to disciplines and scholars (see Houtum, 2005), we have used this phrase to signal the need to pay attention to what we have described in an earlier book as a process of ‘heterogenization’ of borders that runs parallel to their ‘multiplication’ (see Mezzadra and Neilson, 2013). Speaking of heterogenization implies a reference to profound transformations of the very institution of the border that are currently underway. These transformations, which correspond to what Saskia Sassen in her sociological account of globalization has termed ‘the actual and heuristic disaggregation of “the border”’ (2007: 214), point to a kind of unpacking of the multiple (legal, cultural, linguistic, social, and economic) components of the concept and institution of the border. While the geopolitical line of separation between nation-states has held together for some time these components in modernity, acting as a kind of magnetic line, they are now more often than in the past traced far away from the literal border. They also play multifarious roles in the shaping of forms of domination and exploitation. This is the reason why a careful investigation of and a conceptual reflection upon other bordering devices must supplement the prevalent attention to geopolitical borders in critical border studies.

BORDERING DEVICES IN MARX’S ANALYSIS OF SO-CALLED PRIMITIVE ACCUMULATION

An investigation of what we may call the semantic field of the border in Marx’s work makes it possible to grasp both the heterogeneity of bordering devices and the crucial roles they played at the origin of modern capitalism. We can point in this respect to three broad areas that figure prominently in Marx’s analysis of ‘so-called primitive accumulation’, with the proviso that this analysis is not merely relevant from a historical point of view but rather singles out a set of problems that are doomed to recursively haunt the development of capitalism writ large (see Mezzadra, 2018, appendix). A first bordering device is ‘enclosure’. Marx mentions this device in the section of *Capital*, volume 1 on ‘so-called primitive accumulation’, where he discusses how the ‘enclosure’ of ‘common property’ is a key moment in the ‘expropriation of the agricultural population’. Marx focuses specifically on the role of law within this process, a topic he had already investigated in the early 1840s in his articles dedicated to the ‘Debates on Theft of Wood’ in the *Rheinische Zeitung* (see Linebaugh, 1976). The ‘forcible usurpation’ of the commons, vital for the reproduction of life of huge multitudes of rural poor, already begins at the end of the fifteenth century, he writes in *Capital*. But while it was long ‘carried on by means of individual violence’, he ironically notes that ‘the advance made by the eighteenth century shows itself in this, that the law itself becomes the instrument by which the people’s land is stolen’ (Marx, 1976: 885). Enclosures (literal and metaphorical) have never ceased since then to be performed in order to circumscribe (to

border) the space of private property. It is important to keep in mind this link between the semantic field of the border, law, and private property, which reformulates under the completely different conditions of modern capitalism a problematic well known to ancient Roman jurists. Such a link sheds light on the intrinsic violence of private property and on its structural implication in the production of poverty (which is one of the basic concerns in Marx's analysis of 'so-called primitive accumulation').

At the same time, Marx's attention to the role of law in the violent establishment of private property paves the way for an analysis of the structural homology between the legal institution of private property and the state-form, which was for instance at the center of Evgeni Pashukanis' critique of law (2001, see also Amendola, 2017). The relevance of heterogeneous although connected borders for the origin of both private property and the modern territorial state reinforces this homology. This is a *second* area of investigation on borders that one can carve out of Marx's analysis of 'so-called primitive accumulation'. While Marx does not explicitly mention territorial borders in his analysis, it is well known that in these pages he emphasizes the role of the modern state in prompting the emergence of capitalism. This is already clear from his concern with law in the analysis of enclosures. Even beyond that, he writes in these sections of *Capital* some of his most famous and discussed lines on the state. Summing up his analysis of primitive accumulation, he maintains that all its 'different moments' as well as their systematical combination – from colonization to the modern tax system, from enclosures to national debt – depend upon 'the power of the state, the concentrated and organized violence of society, to hasten, as in a hothouse, the process of transformation of the feudal mode of production into the capitalist mode, and to shorten the transition' (Marx, 1976: 915–16). That the process of concentration and organization of the 'violence of society' onto the power of the state is predicated upon processes of bordering that make society itself a bounded space was definitely something Marx was aware of. This can be deduced from other passages of his work, for instance where he writes regarding the 'state's compulsion' that gives paper money its 'objective validity' that it 'can only be of any effect within the internal sphere of circulation which is circumscribed by the boundaries of a given community' (1976: 226).

The articulation between the bordering devices that give rise to private property of the land and the tracing of boundaries upon which the existence of the modern territorial state is predicated emerges therefore as an important topic from Marx's analysis of primitive accumulation. And while it is important to stress that the 'boundaries of a given community' would play a key role in the bordering (and steady nationalization) of markets, and first of all of the labor market, it is also crucial to point to the activity of the state in the regulation, 'taming', and repression of the mobility of labor. This is the main question Marx (1976: 896) deals with in his analysis of the 'bloody legislation against vagabondage' that was enforced throughout Western Europe since the end of the fifteenth century.

The criminalization of the poor (of the ‘fathers of the present working class’, Marx writes, and we should definitely add ‘and the mothers’ considering the crucial relevance of the ‘degradation of women’ in the whole process; Federici, 2004) was a crucial step in the enforcement of ‘the bloody discipline that turned them into wage laborers’ (1976: 905). This analysis continues to resonate in the present and to inspire critical scholars as well as activists engaged with migration. However, it is important to emphasize that such ‘bloody’ policies against the poor depended on the consolidation of territorial boundaries, on the establishment of bounded spaces (the ‘workhouse’), and on new colonial and imperial geographies of indentured and forced labor as well as of convict transport.

These geographies point to the *third* question we want to extrapolate from Marx’s analysis of ‘so-called primitive accumulation’ regarding the semantic field of the border. His emphasis on the role of slave trade, conquest, and colonialism at the origin of modern capitalism is well known and has been often praised by anti-colonial and anti-racist thinkers (see for instance Du Bois, 1992: 56–7). This emphasis is consistent with one of Marx’s main theoretical points, which means with his awareness of the *global* coordinates of modern capitalism since its inception. Moreover, in his critique of political economy the ‘world market’ is something more than a mere geographic description of the scope of capitalist valorization and accumulation. It is a full-fledged concept, which again facilitates and at the same time invites an analysis in terms of borders. As Gavin Walker notes, Marx’s mention of Africa as a ‘warren’ (‘a bounded, fenced, captured territory’) in his analysis of primitive accumulation foreshadows ‘the formation of “area” or “civilization” as a political technology of control’ (2011: 390). This means that a process of bordering merges geographic and cognitive borders that coincidentally produce Europe (and later the ‘West’) and its multiple others. The notions of ‘area’ or ‘civilization’ were doomed to play important roles in the organization of the ‘world market’, a process within which the economic and territorial division of the world would enter shifting combinations while remaining at the center of Marxist theories of imperialism. A way to reframe those debates is to focus on the relations, frictions, and tensions between what we call the expanding frontiers of capital and political borders – which means primarily, in the modern age, the borders of states. Although, it is important to add that in the colonial world borders were traced in ways that were significantly different from the linear geometrical model that became prevalent in Europe (see Mezzadra and Neilson, 2013, Chapter 3; Benton, 2010).

THE WORLD MARKET AND THE ‘INTERNATIONAL’ DIVISION OF LABOR

Writing with Friedrich Engels in *The Communist Manifesto*, Marx famously declares that ‘the bourgeoisie has through the exploitation of the world market

given a cosmopolitan character to production and consumption in every country' (2002: 223). Yet, even as we recognize the force of the concept of the world market, which is to say both its concrete nature and abstract character, there is a need to account for how its workings cross another Marxist concept that is particularly important for understanding the role of borders and processes of bordering: the international division of labor. In *The Poverty of Philosophy*, Marx had already argued that the deployment 'of machinery and of steam' had allowed industry to become 'detached from the national soil' and dependent 'only on the markets of the world, on international exchanges, and on an international division of labor' (Marx, 2008: 152). It is certainly important to account for the ongoing effects of primitive accumulation and the many histories of labor that encompass slavery and indenture. However, the concept of the international division of labor finds its genealogy in classical works of political economy such as William Petty's *Political Arithmetick* (1690), Adam Smith's *Wealth of Nations* (1776), and David Ricardo's *On the Principles of Political Economy and Taxation* (1821). These works did not employ the adjective 'international' to describe the way in which labor was divided, largely because they were written in a period that preceded the internationalization of the world, but they displayed an awareness of the relation between what Marx called the world market and the emergence of capitalist social formations within bounded territories. The division of the world into discrete labor markets delineated primarily by national borders, but also by the rural/urban and colony/metropolis divides mentioned above, was a complex and incomplete process. Nevertheless, its coincidence with the forging of the figure of the 'free' laborer (free to sell his/her labor power as a commodity) was important to the political and legal constitution of what we can call the industrial and national moment of capital. In the hands of Marx, the concept of the international division of labor (and its attendant separation of the working class into nationally bounded sections) provided not only a perspective on the world scale of capitalist production but also a means of envisioning and encouraging its political subversion through proletarian internationalism.

We agree with Nicholas de Genova (2016) when he writes that the Stalinist proposal to 'build socialism in one country' was 'a radical betrayal of Marxism' and that an 'internationalist perspective' is fundamental to 'any Marxian reflection on questions of migration and borders'. Yet in considering the processes of constitution of the labor market, it is important to account both for the assumptions that underlie the scientific and normative aspects of Marx's analysis of the accumulation of capital, as compared to 'so-called primitive accumulation', and for the real shifts in the arrangement of labor markets and their borders that have accompanied the most recent wave of globalization. These are connected matters, but, for analytical purposes, we can separate them.

In the chapter of *Capital*, volume 1 entitled 'The Transformation of Surplus Value into Capital', Marx explains his expanded model for the reproduction of capital. Here, he elaborates a set of conditions by which the capitalist is materially

compelled to accumulate surplus product on a progressively extending scale, working in a kind of spiral as opposed to a linear sequence. Although Marx systematically recognizes the historical precedence of the world market over the national in his writings, he is forced at this moment to assume a closed-model economy to explain why the surplus product must be used productively rather than exchanged for another product that is consumed unproductively. He writes in a note: 'In order to examine the object of our investigation in its integrity, free from disturbing subsidiary circumstances, we must treat the whole world of trade as one nation, and assume that capitalist production is established everywhere and has taken possession of every branch of industry' (Marx, 1976: 727). This is clearly an exercise in idealization and abstraction done to provide algebraic or arithmetic proofs of his main arguments. To this extent it is equivalent to other assumptions made by Marx, such as the temporary simplification he makes in *Capital*, volume 1 about prices being directly proportional to labor values. In the *Grundrisse*, he writes of the necessity of making 'fixed suppositions' that 'become fluid in the further course of development' in order to offer an analysis that does not end up 'confounding everything' (1973: 817). In the case of the assumption about the world market 'as one nation', he seeks to develop an argument about capital's reproduction in the abstract before attaching it to a system of nation-states. Nonetheless, it betrays a moment in which the closure or bordering of an economy rests paradoxically upon the assertion of a borderless world.

Not accidentally does Rosa Luxemburg quote this note from *Capital*, volume 1 in the chapter of *The Accumulation of Capital* (2003) entitled 'Expanded Reproduction: Contradictions'. Luxemburg aims to exhibit the limits of a model that assumes the presence of only capitalists and workers. She also seeks to show how capital needs to prey on its 'outsides', by which she means on non-capitalist environments, in order to pursue its logic of endless accumulation. A more flexible approach extends beyond Luxemburg's understanding of capital's 'outsides' in territorial terms – a vision that led her to see imperialism as the final stage of capitalism. Thinking in this way gives us an understanding not only of the necessary intertwining of primitive accumulation with the normal accumulation of capital, even in its industrial and national moment, but also an interpretive grid through which to analyze the extractive workings of contemporary capitalism (Sassen, 2014; Mezzadra and Neilson, 2015, 2019). With respect to issues of migration and borders, this approach means highlighting the mobility of labor as constitutive for the formation of national labor markets. It is always important to emphasize that an analysis that works from that other peculiar commodity – money – must accompany and counterpoint any approach to labor as a privileged category for understanding the role of borders in the world market. However, the peculiar position of labor as both antagonist of capital and its object of exploitation allows an approach that grapples at once with capital's necessarily expansive logic and its relation with its 'outsides'. In this regard, the inseparability of the commodity of labor power from the human body of its 'bearer' is a crucial factor.

The political and legal constitution of labor markets, whatever their borders, is today increasingly involved with the regulation and control of the movement of human bodies across borders (see Bauder, 2006). Such control is increasingly technologically sophisticated, even as it involves both atmospheric and direct violence that can never be separated from the operations of racism and sexism.

The inseparability of labor power from the human body means that the bordering processes that produce and control the mobility of labor forces work the boundaries established by gender and race in ways not subordinate to relations of social class. In other words, gender and race mark the modalities through which 'bearers' of labor power access its potency in primary and structural ways. To note how the border influences the production and reproduction of gender and race is not merely to register the prevalence of certain kinds of embodied subjects in the business of migration and border crossing. Certainly, the phenomenon dubbed 'the feminization of migration' must be part of any sustained analysis of human mobility nowadays. Likewise, the racialized nature of contemporary border and migration regimes requires constant reaffirmation in the face of analytical approaches that downplay or sidestep it. However, a mere accounting of bodies does not necessarily illustrate how political economies of gender and race interact with techniques, technologies, and geographies of bordering in the world today. To do this, it is necessary to turn to analyses of 'racial capitalism' (Robinson, 2000) and the global restructuring of reproductive work (Federici, 2012) that register how the most recent developments in global capitalism cannot be adequately tracked and analyzed if their raced and gendered dimensions are left aside. The troubling of the division between productive and reproductive labor evident in the movement trajectories and working lives of female migrant care workers, for instance, illustrates a phenomenon far more widespread than the experiences of these particular subjects. Many commentators (e.g. Hardt, 1999) take such a reconfiguration of the relationship between productive and reproductive labor as characteristic of a wider set of transformations surrounding the role of service work and affective labor in the current mode of production. Similarly, an understanding of what Angela Davis (2017) calls 'the co-constitutive relationship of racism and capitalism' sheds light on the continuities and discontinuities between colonial modes of extraction and the extractivist practices that mark contemporary capitalism, whether they take literal forms (as in mining and monocultural farming) or assume a more ethereal shape (as in finance) (Mezzadra and Neilson, 2017). These various convergences and divergences come to a head in the encounters with violence experienced by raced and gendered subjects at the border.

In *Border As Method* (Mezzadra and Neilson, 2013), we have argued that this violence is just as much associated with processes of differential inclusion as it is with the politics of exclusion. Although the workings of borders are rarely watertight or impenetrable to border-crossing subjects, their capacity to filter and select bodies in motion is no less important to the constitution of labor markets as their capacity to exclude. The fantasy of a just-in-time and to-the-point

migration- and border-control program, which would efficiently correlate cross-border migratory movements with statistically measured national labor market needs, is an irresistible one for many governments today. But the notion that the border acts merely as a valve that regulates the mobility of labor power is complicated by the fact that labor power always comes with bodies, and this opens the politics of border control to intervening factors – particularly social and cultural factors – that interfere with the vision of the border as a calibrated filtering device. Migration also, in an important sense, introduces an unbalancing aspect to the idea of a bounded labor market that tends to a state of equilibrium. This means that migratory movements and the labor power they mobilize can become a kind of turbulent excess to attempts to contain, channel, or integrate them. In analyzing this excess, it is important to emphasize how migration and borders not only constitute labor markets but also produce subjectivity. In this way, they create subjects whose mobility itself often assumes the dimensions of struggle or ‘movements’ (in the social sense) with direct consequences for the operations of capital and the world market even if it is not consciously experienced or conceived as such.

This excess and disequilibrium also rebounds upon the international division of labor, which many studies over the past decades (see, for instance, Fröbel et al., 1980; Harvey, 1989; Mies, 1998 and Silver, 2003) have understood to be becoming more complicated. In writing of a multiplication of labor (Mezzadra and Neilson, 2013: 87–93), we have sought to relate the proliferation of borders in the world today – their existence beyond national borders, in programs of externalized detention, for instance, in urban spaces, or economic zones – to tumultuous changes in the world of labor. These changes not only involve the spatial diversification of labor across, between, and within borders but also its intensification – its stretching beyond the borders of the working day as discussed by Marx into the time of life itself – and heterogenization – its expansion beyond the legal norm of the ‘free’ wage laborer into new and old forms of precarity and coercion.

BORDERING LABOR

In many parts of the world, migrants are at the forefront of these processes of intensification and heterogenization of labor. The work by Yann Moulier Boutang (1998) mentioned above demonstrates from a historical point of view that the constitution of the ‘free’ wage laborer has been counterpointed by myriad forms of ‘harnessing’ of labor mobility and by multiple special statuses assigned to (‘forced’ or ‘voluntary’) migrants. Modern slavery, indentured labor, ‘coolies’, and ‘black birds’ are part and parcel of the history of migration under capitalism and are particularly relevant from this point of view. However, it is also important to emphasize that ‘free’ migrants have been and continue to be

subject to (often legally codified) special conditions as far as authorization to live and work in the 'host country' is concerned. While this inscribes specific borders onto the labor market and frequently paves the way for processes of ethnic segmentation or urban enclaving, these borders also cut across the very composition of living labor, of the working class writ large. They often combine with other lines of division (revolving around race and gender) and provide capital and the state with powerful tools to command living labor, both at the point of production and in society.

The history of the labor movement is plagued by episodes in which unions and even parties have provided support to these strategies, pitting the defense of 'national labor' against any internationalist concern and ultimately against the interests of working-class politics. The long history of unions' discrimination against African-American migrants from the South, after Emancipation in the USA, is just one peculiar instance of this tendency. American Federation of Labor President Samuel Gompers also gave voice to similar union hostility against international migrants from Southern and Eastern Europe, who he infamously defined (picking up a phrase by Francis A. Walker) as 'beaten men from beaten races, representing the worst failures in the struggle for existence' (see Roediger, 2002: 158). At the same time, some of the most extraordinary and inspiring struggles of the revolutionary labor movement have been fought around the national, linguistic, and ethnic borders dividing the working class – as again the history of the USA demonstrates with the proletarian epic of the Industrial Workers of the World (see, for instance, Bock et al., 1976). We could provide other examples, from history and the present as well as from different locations in the world. Yet it is perhaps more important to repeat that the struggle around and against borders cutting across the composition of living labor is a crucial test for the reinvention of proletarian internationalism. While in the 1970s speaking of the 'multinational worker in Europe' (Serafini, 1974) was the result of a careful investigation of the transformation of the composition of the working class due to postcolonial and 'guest workers' recruitment schemes in the wake of World War 2, the situation has become much more complex today – in Europe as elsewhere. The problems of internationalism, which are also to be understood as problems of political translation, manifest themselves at the scale of any single large city, whose space is continuously reframed by the multiplication and increasing unpredictability of migratory routes as well as by their sedimentation in heterogeneous social and cultural practices.

PRODUCING AND REPRODUCING LABOR POWER

To conceptualize further the impact of migration on the composition of living labor, it may be useful to hark back to a classical sociological study by Michael Burawoy (1976) of the functions and reproduction of migrant labor, framed as a

comparative investigation of Southern Africa and the USA. Burawoy challenges the limits of the perspective of the individual migrant prevailing in studies of labor migration (both regarding 'push' and 'pull' factors behind mobility and the 'adaptation' of the newly arrived migrant). He shifts focus to 'clarify the functioning of a *system* of migrant labor either in its broader social, political, and economic contexts or where the flow of labor is regulated to a greater or lesser extent to suit dominant political and economic interests' (Burawoy, 1976: 1051). 'External coercive institutions and their mode of organization' become crucial topics of investigation for such an approach, which sets out to study the ways in which such institutions enable and perform the reproduction of labor forces within a given economy. Burawoy importantly distinguishes two aspects of such a reproduction, the *maintenance* and the *renewal* of the labor force. He adds that 'under capitalism the distinction between these two elements ... is normally concealed' since 'the same institutions simultaneously perform both renewal and maintenance functions' (1976: 1051–2). What distinguishes migrant labor, Burawoy writes, is precisely the fact that its organization 'not only makes the distinction apparent but is even defined by the separation of the processes of maintenance from those of renewal' (1976: 1052). They take place in geographically separate locations and are managed by different institutions.

We find Burawoy's distinction between 'maintenance' and 'renewal of the labor force' as well as his analysis on the externalization of crucial aspects of its reproduction through the recruitment of migrant labor particularly interesting from a Marxist point of view. What he signals is the relevance of migration – and at the same time of borders – within what we can term the production and reproduction of the commodity of 'labor power' (a relevance that, we want to repeat, was already foreshadowed by Marx in his analysis of 'enclosures' and the related 'bloody legislation against vagabondage'). Burawoy's insistence on the *renewal* of the labor force points moreover to a further crucial point – that is, to the fact that the working class can never be considered as an already constituted subject. The process of its constitution is always open, and this has momentous implications for a working-class politics that can never be limited to the 'point of production'. In the ages of large-scale industry, mass production, and Fordism, the attempt was made in many parts of the world to treat migrant workers as a kind of supplement to the stock of labor power present within the bounded space of the national labor market, according to the somehow predictable needs of industrial capital. Today the situation is much more complex. In the current age of flexible production and precarious employment, there has been a proliferation of point systems and sector-based, temporary, and circular migration schemes, as well as an increase in related governmental fantasies of a just-in-time and to-the-point migration. This proliferation and increase correspond to an attempt to tame for the purposes of the valorization of capital – and according to the neoliberal notion of 'human capital' – the ungovernable moments of turbulence, autonomy, and excess that continue to shape migratory movements at the global scale. This

leads to a further multiplication of internal borders, while in many parts of the world external borders become increasingly fortified against unauthorized crossing – with consequences that are lethal for tens of thousands of men and women each year.

GEOGRAPHIES OF MIGRATION AND IMPERIALISM

An often noted characteristic of contemporary global migration is the fact that its geographies have become increasingly ‘messy’ and unpredictable, exceeding by far the established ‘migration systems’ investigated for a long time by migration scholars. Terrestrial and maritime borderzones constructed as sites of ‘migration crises’ have accordingly multiplied. Besides well-known and notorious ‘hotspots’ like the ‘external frontiers’ of the EU, the borderlands between Mexico and the USA, or the elusive and shifting borders circumscribing Australia’s territory from the Pacific zone, others have gained public attention over the last years. Consider, for instance, the choppy waters of Southeast Asian oceans, the border between Bangladesh and India, or Lake Malawi and the Indian Ocean for African migrants en route toward South Africa. We understand this multiplication of migratory routes as an important symptom of the spatial disruptions and reshuffling of the geographies of development connected to capitalist globalization and as one of the driving forces behind these processes. A Marxist theory of borders should pay crucial attention to these dynamics, which place under duress not only geopolitical borders but also ‘metageographical’ lines of demarcation (Lewis and Wigen, 1997) such as the ones implied by such influential notions as ‘center’, ‘periphery’, and ‘semi-periphery’, developed by world system theorists, as well as by tricontinentalist schemes of analysis, and by the great divide between the ‘global North’ and ‘global South’. This is also the place where questions of imperialism must be investigated, and we want to do that on the basis of our interpretation of the Marxian notion of the ‘world market’ as well as of the analytical framework constructed around the relations between the expanding frontiers of capital and territorial borders.

We have already touched briefly on Rosa Luxemburg’s understanding of imperialism as driven by capital’s need to prospect and draw upon its ‘outsides’ to continue its expanding spiral of accumulation. Luxemburg’s interpretation of capital’s colonization of its ‘outsides’ requiring the literal colonization of territory needs to be questioned and extended to allow analysis of how capital operates on multiple frontiers – one thinks for instance of the plunder involved in resource or data mining, just to name two realms of extraction that are currently hotly debated (see Mezzadra and Neilson, 2017). Within its own conceptual limits, Luxemburg’s approach faces the problem of too tightly correlating the expansion of capital’s frontiers with its ‘endeavor to establish domination’ over non-capitalist ‘countries and societies’ (Luxemburg, 2003: 346). Because she understands

imperialism as ‘the political expression of the accumulation of capital in its competitive struggle for what remains still open of the non-capitalist environment’ (2003: 426), she tends to confuse or superimpose the frontiers of capital and territorial borders. Yet a Marxist theory of the border needs to maintain a tension between these two. Despite the many differences between Luxemburg and Vladimir Lenin on questions of revolutionary organization, his approach to imperialism can helpfully supplement hers in this regard. In *Imperialism: The Highest Stage of Capitalism*, Lenin contrasts the ‘actual division’ of the world, which is established ‘in proportion to capital’, with the manner in which ‘capital exporting countries have divided the world among themselves in the figurative sense of the term’ (Lenin, 1975: 79) – that is, territorially. He goes on to distinguish ‘the economic division of the world’ from ‘the territorial division of the world’, associating the former with ‘relations between capitalist combines’ and the latter with ‘the struggle for colonies’ (1975: 89). As is well known, Lenin’s analysis of capital’s expanding frontiers was linked to his emphasis on the growing prevalence of finance and monopoly capitalism, and this meant his understanding of territorial expansion encompassed not just the annexation of agrarian or non-capitalist areas but also expansion into areas where capitalist industry was already established. Ultimately, however, a Marxist theory of imperialism must also face the possibility that such areas may not be easily distinguishable from each other, which is to say, using another set of terms from Marx’s lexicon, that the operations of the ‘formal’ and ‘real subsumption’ of labor under capital may be complexly articulated.

Recent theoretical debates on imperialism and the expansion of capitalism have highlighted the distinction between formal and real subsumption. The former describes a situation where non-capitalist productive processes are appropriated by capital and synchronized with the dynamics of valorization from an external position. The latter, by contrast, is characterized by the direct intervention of capital in the organization of labor, say through mechanization or by other means of increasing workers’ productive cooperation. For Harry Harootunian, in *Marx After Marx* (2015), formal subsumption is the key to understanding the unevenness and necessary incompleteness of capitalist development under imperialism. Highlighting capital’s ‘capacity to situate practices from earlier modes alongside newer ones’, Harootunian suggests that real subsumption is ‘a proto-ideal type, which envisions the possible realization and completion of the commodity relation in an as yet unrealized future, in a last instance that never comes’ (2015: 68). Only an analysis that privileges formal subsumption, he argues, can capture ‘the temporal interruption, unevenness, fracturing, and heterogeneity’ that characterize capitalist development under imperialism. Yet, as Peter Osborne (2017) argues, Harootunian’s analysis tends to play down both the historical multiplicity of cultural practices that interrupt and interact with capital’s operations in Euro-American societies and the concrete ways in which the powers of abstraction inherent in such operations have actively transformed the history

of non-European societies. Furthermore, it obscures the way in which different forms of subsumption of labor, social cooperation, and life combine and work across a multiplicity of levels, sectors, and global spaces to synchronize how operations of capital target their 'outsides' in heterogeneous ways.

By paying attention to how the frontiers of capital work off, override, and reinforce territorial borders, it becomes possible to derive a theory of imperialism that is sensitive to how capital embodies and organizes political power as well as to the capacity of sovereign political institutions to emerge as capitalist actors. Such an approach needs to account for more than imperialism in its 'highest stage' of nineteenth-century political and territorial annexation. It must also extend to myriad earlier forms of colonialism that combined political and commercial imperatives – for instance, under the banner of the chartered company (Stern, 2011) or in complex relation to practices of buccaneering, exploration, mapping, and settlement that extended European territorial dominion in patchwork and often makeshift ways (Benton, 2010). Likewise, it must account for contemporary arrangements of empire in which states can no longer fully control the aggregate operations of capital or ensure the reproduction of labor (Mezzadra and Neilson, 2014). Such an approach means recognizing how territorial relations are increasingly disarticulated from authority and rights (Sassen, 2006), crossed by value-generating chains of logistical connection (Cowen, 2014), and governed through patterns of 'mixed constitution' (Hardt and Negri, 2000) that articulate power across different levels and institutions of military force, monetary control, and cultural and biopolitical hegemony. With regard to this latter arrangement of power, the border, once understood in a way that extends and proliferates beyond the territorial edge of the nation-state, becomes a key theme. Harsha Walia's concept of 'border imperialism', for instance, links a critique of state building within global empire to contemporary geographies of dispossession and the processes of criminalization, racialization, and precarization by which migrants are violently excluded from and differentially included in state spaces. The border, in this account, is not merely an administrative line established by imperial powers to guard and mark the extent of territory but the central institution and device through which contemporary forms of imperialism are embodied, imposed, and perpetuated. 'Undoing border imperialism', Walia contends, 'would mean a freer society for everyone since borders are the nexus of most systems of oppression' (Walia, 2013: 5).

FREEDOM OF MOVEMENT

As the above discussion makes clear, the question of the border weaves its way through many problems and predicaments that are crucial for contemporary debates in Marxism and beyond. These issues clearly extend beyond the politics of migration to cover a range of related topics, including the changing dynamics

of capitalist globalization, transformations in the structure of the ‘world market’ and the international division of labor, the shifting roles and forms of the state, the appearance of new geographies of development and production, mutations in the expression of political power, and the changing contours of citizenship, class, and political belonging. Yet drawing these issues back to the subjective experience and position of the migrant remains an important political and analytical move. This is not only because these different themes and problems crystallize around migrant experiences and border struggles that test the barriers between the inside and outside, exclusion and incorporation. It is also because such experiences and struggles, which may or may not involve announced activism and political organization, remake subjectivity in ways that provide contested grounds for building a politics of the common. It is important to remember that borders always have two sides – that they not only divide but also connect. Borders are thus a crucial object of interrogation and contestation in any politics that seeks to highlight the problem of sharing and division to construct the common and remake communism beyond – but not in ignorance of – the historically tragic record of actually existing ‘communist’ regimes.

It is important to remember that such a communist politics necessarily involves an internationalist perspective that challenges the constitution of private property. But placing emphasis on migration and border struggles also means never forgetting the barriers of life and death that many men and women on the move in the world today test on a daily basis. Staying close to the perspective of migrants and the production of subjectivity it entails means being aware of the myriad boundaries that separate critical intellectual work from the labors of migration – notwithstanding alliances and convergences that can and do occur. In the end, the border is not ‘our’ method – a device or object to be pondered or drawn into Marxist theory in order to kick it on or retrofit it for the twenty-first century. The call for freedom of movement has long been a refrain of border struggles, even if expressed implicitly, through practices of mobility rather than through overtly political acts of claim making. It is important to reaffirm this principle, even if – as Charles Heller, Lorenzo Pezzani, and Maurice Stierl (2019) have recently argued – it exhibits a series of antinomies, not least among them that it has advocates among neoliberal enthusiasts of ‘free’ market forces. Fighting for freedom of movement thus only makes sense if linked to politics that contest not only territorial borders but also the multiple frontiers and forces of capital that migrants encounter both in their paths of movement and points of origin and arrival, however provisional these may be. Following the above authors, it is also necessary to understand border struggles as pertaining to multiple social boundaries and inequalities, as well as to legal systems or rights mechanisms that might provide strategic and tactical levers with which migrants and solidarity groups can apply pressure to governments and other political entities that participate in the business of border control. If such a politics of freedom of movement can be asserted it may provide a path to translate and draw into diverse unity

many discrete border struggles unfolding in the world today. Such a prospect bears positively on the Marxist prerogative to insist on the historical necessity of struggles in which there is nothing to lose but chains.

 later Marxists, 8–10
 Marx on, 4–8
 money markets, 13–14
 plantations, 14–15
 produce trades, 15–16
 reinstating, 10–16
 terminology, 11
 wider perspectives, 16–19
- merchant capitalists, 4
- Merleau-Ponty, Maurice, 458, 474, 1274
- Merrifield, Andy, 1505, 1511, 1514, 1516, 1517n3
- Mészáros, István, 539
- Metcalf, David, 1418
- metabolic rift, 468
- methods, 153–168
 analysis without phenomenology, 165–166
 analytical Marxism, 165–166
 bourgeois horizon and, 156–157
 commodity money and transformation problem, 87, 161–162
 conceptual horizons, assessing, 155–156
 critical social epistemology, 157–159
 critique of political economy, 160–162
Grundrisse, six key points, 159–160
 immanent critique, 157–159
 inseparability of form and content, 154–155
 Marxist Orthodoxy, 162–163

- neue Marx Lektüre*, 166–168
 against *a priori*, 164–165
 reflections, Marx, 154–155
 social forms, complexity, 160
 traditional and critical theory, 166–168
 value and form of expression, 161
 #MeToo, 1187
- Mezzadra, Sandro, 68, 82n1, 213, 373, 663, 667–668, 670–672, 675, 868, 971–972, 976, 1151, 1238, 1244, 1249, 1330, 1336n1, 1456–1457
- Mezzadri, Alessandra, 20n9
- Mian, Atif, 112
- middle class, 4, 58, 205, 1020, 1021, 1024, 1036, 1037, 1507
- Miele, Chris, 781n3
- Mie prefecture, 1382–1384
- Mies, Maria, 200, 508, 634, 678, 1394
- Miéville, China, 360, 892
- migrant labor, 1362, 1577, 1580, 1582–1584, 1586, 1588, 1602, 1603
- migrant detention, 213
- migrant domestic workers, 303
- migrant workers, 303, 1060, 1140, 1144, 1145, 1494, 1499, 1579, 1583, 1603
- Milbank, John, 1223, 1228
- Miliband, Ralph, 354, 465
- Milios, John, 445n1, 469
- Mills, Charles Wright, 1019, 1020, 1101
- Mintz, Sidney, 259, 260
- Mirowski, Philip, 85
- Mitchell, Contra, 281
- Mitchell, David Robert, 1345
- Mitchell, Don, 1512
- Mitchell, Eve, 1056–1058
- Mitchell, Gregory, 1003, 1006
- Mitchell, Juliet, 270, 280–281, 981, 1057
- Mitchell, Timothy, 701, 708, 709, 1453
- mobility of labor, 1594, 1596, 1599, 1601
- mode of production, 24–42, 256, 258, 275, 454, 456, 495, 500, 652, 659
 feudalism and tributary, 35–37
 lineage to slavery, 30–35
 Marx and, 27–30
 problems, conceptual and practical, 25–27
 value and uses, 37–40
- modern capitalism, 239, 251, 253, 297, 565, 961, 1077, 1594–1597
