The SAGE Handbook of
Marxism

The SAGE Handbook of Marxism intends to set the agenda for Marxist understandings of the present and for the future. It will provide an in-depth cartography of – and original contribution to – contemporary Marxist theory and research, showcasing the vitality and range of today’s Marxisms.

The *Handbook* sets out from the premise that it is possible to bring together diverse work across the disciplines to demonstrate what is living and lively in Marxist thought, providing a transdisciplinary ‘state of the art’ of Marxism, while inspiring contributions to areas of research that still remain, in some cases, embryonic. The aim is to demonstrate how attention to shifting social and cultural realities has compelled contemporary researchers to revisit and renovate classic Marxian concepts as well as to elaborate – in dialogue with other intellectual traditions – new frameworks for the analysis and critique of contemporary capitalism.

The past decade has witnessed a resurgent interest in Marxism within and without the academy. This renaissance of sorts cannot be framed, however, as a simple return of Marxism. The multiple crises of Marxism since the 1980s – in both political and academic life – have had lasting and in some cases irreversible effects for certain understandings of Marxist theory. Yet it is also true that theoretical approaches that largely defined themselves by contrast with Marxism – from postcolonial theory to deconstruction, from post-Marxism to certain varieties of feminism – have encountered serious limits when it comes to thinking the patterns of change and domination that define capitalism.

The SAGE Handbook of Marxism intends to advance the debate with essays that rigorously map and renew the concepts that have provided the groundwork and main currents for Marxist theory, and to showcase interventions that set the agenda for Marxist research in the twenty-first century.

<i>List of Figures</i>	xii
<i>Notes on the Editors and Contributors</i>	xiii
<i>Editors' Introduction</i>	xxxiv

VOLUME 1

PART I	REWORKING THE CRITIQUE OF POLITICAL ECONOMY	1
1	Merchant Capitalism <i>Jairus Banaji</i>	3
2	Mode of Production <i>John Haldon</i>	24
3	Social Reproduction Feminisms <i>Tithi Bhattacharya, Sara R. Farris and Sue Ferguson</i>	45
4	Rent <i>Stefano Dughera and Carlo Vercellone</i>	68
5	Value <i>Tommaso Redolfi Riva</i>	85
6	Money and Finance <i>Jim Kincaid</i>	102
7	Labour <i>Guido Starosta</i>	118
8	Automation <i>Jason E. Smith</i>	135
9	Methods <i>Patrick Murray</i>	153
10	The Transformation Problem <i>Riccardo Bellofiore and Andrea Coveri</i>	171

PART II FORMS OF DOMINATION, SUBJECTS OF STRUGGLE		189
11	Class <i>Beverley Skeggs</i>	191
12	Punishment <i>Alessandro De Giorgi</i>	212
13	Race <i>Brenna Bhandar</i>	232
14	Slavery and Capitalism <i>Leonardo Marques</i>	248
15	Gender <i>Sara R. Farris</i>	268
16	Servants <i>Laura Schwartz</i>	296
PART III POLITICAL PERSPECTIVES		309
17	Politics <i>Panagiotis Sotiris</i>	311
18	Revolution <i>Neil Davidson</i>	328
19	State <i>Heide Gerstenberger</i>	348
20	Nationalism and the National Question <i>Gavin Walker</i>	366
21	Crisis <i>Ken C. Kawashima</i>	387
22	Communism <i>Alberto Toscano</i>	409
23	Imperialism <i>Salar Mohandesi</i>	430

PART IV	PHILOSOPHICAL DIMENSIONS	449
24	Totality <i>Chris O’Kane</i>	451
25	Dialectics <i>Harrison Fluss</i>	474
26	Time <i>Massimiliano Tomba</i>	491
27	Space <i>Kanishka Goonewardena</i>	507
28	Alienation <i>Amy E. Wendling</i>	527
29	Praxis <i>Miguel Candiotti</i>	543
30	Fetishism <i>Anselm Jappe</i>	559
31	Ideology-Critique and Ideology-Theory <i>Jan Rehmann</i>	576
32	Real Abstraction <i>Elena Louisa Lange</i>	593
33	Subsumption <i>Andrés Saenz de Sicilia</i>	609

VOLUME 2

PART V	LAND AND EXISTENCE	631
34	Primitive Accumulation, Globalization and Social Reproduction <i>Silvia Federici</i>	633
35	Commons <i>Massimo De Angelis</i>	643
36	Extractivism <i>Verónica Gago</i>	662

37	Agriculture <i>Kohei Saito</i>	683
38	Energy and Value <i>George Caffentzis</i>	700
39	Climate Change <i>Matt Huber</i>	711
PART VI DOMAINS		727
40	Anthropology <i>Erica Lagalisse</i>	729
41	Art <i>Gail Day, Steve Edwards and Marina Vishmidt</i>	747
42	Architecture <i>Luisa Lorenza Corna</i>	766
43	Culture <i>Jeremy Gilbert</i>	785
44	Literary Criticism <i>Brent Ryan Bellamy</i>	807
45	Poetics <i>Daniel Hartley</i>	823
46	Communication <i>Nicholas Thoburn</i>	839
47	International Relations <i>Maïa Pal</i>	858
48	Law <i>Robert Knox</i>	876
49	Management <i>Gerard Hanlon</i>	899
50	The End of Philosophy <i>Roberto Mozzachiodi</i>	920
51	Technoscience <i>Les Levidow and Luigi Pellizzoni</i>	940

52	Postcolonial Studies <i>Jamila M. H. Mascot</i>	959
53	Psychoanalysis <i>Samo Tomšič</i>	980
54	Queer Studies <i>Peter Drucker</i>	998
55	Sociology and Marxism in the USA <i>David Fasenfest and Graham Cassano</i>	1013
56	The University <i>Roderick A. Ferguson</i>	1029

VOLUME 3

PART VII INQUIRIES AND DEBATES		1045
57	Intersectionality <i>Ashley J. Bohrer</i>	1047
58	Black Marxism <i>Asad Haider</i>	1067
59	Digitality and Racial Capitalism <i>Jonathan Beller</i>	1084
60	Race, Imperialism and International Development <i>Kalpana Wilson</i>	1104
61	Advertising and Race <i>Anandi Ramamurthy</i>	1128
62	Dependency Theory and Indigenous Politics <i>Andrew Curley</i>	1150
63	The Primitive <i>Miri Davidson</i>	1167
64	Social Movements <i>Jeffery R. Webber</i>	1184
65	Riot <i>Joshua Clover</i>	1201

66	Postsecularism and the Critique of Religion <i>Gregor McLennan</i>	1216
67	Utopia <i>Chiara Giorgi</i>	1234
68	Affect <i>Emma Dowling</i>	1251
69	The Body <i>Søren Mau</i>	1268
70	Animals <i>Oxana Timofeeva</i>	1287
71	Desire <i>Hannah Proctor</i>	1300
72	Filming <i>Capital</i> <i>Pietro Bianchi</i>	1320
73	Horror Film <i>Johanna Isaacson and Annie McClanahan</i>	1337
74	Three Debates in Marxist Feminism <i>Cinzia Arruzza</i>	1354
75	Triple Exploitation, Social Reproduction, and the Agrarian Question in Japan <i>Wendy Matsumura</i>	1373

61.3	The smiling worker	1143

Notes on the Editors and Contributors

THE EDITORS

Sara R. Farris is a Reader in the Department of Sociology at Goldsmiths University of London. She has published widely on issues of gender, migration, social reproduction and racism/nationalism as well as social and political theory. She is the author of *Max Weber's theory of personality. Individuation, politics and orientalism in the sociology of religion* (Brill Academic Publishers 2013) and *In the name of women's rights. The rise of Femonationalism* (Duke University Press 2017).

Beverley Skeggs is Professor of Sociology at Lancaster University. She has published *The Media; Issues in Sociology; Feminist Cultural Theory; Formations of Class and Gender; Class, Self, Culture Sexuality and the Politics of Violence and Safety* (with Les Moran) and *Feminism after Bourdieu* (with Lisa Adkins), and with Helen Wood, *Reacting to Reality TV: Audience, Performance, Value and Reality TV and Class*. As an ESRC Professorial Fellow she developed a “sociology of values and value” and whilst Director of the Atlantic Fellows Programme, established the ‘Global Economies of Care’ theme at the LSE. She is also the Chief Executive of The Sociological Review Foundation.

Alberto Toscano is Professor of Critical Theory in the Department of Sociology and Co-Director of the Centre for Philosophy and Critical Theory at Goldsmiths, University of London, and Visiting Professor at the School of Communications at Simon Fraser University. Since 2004 he has been a member of the editorial board for the journal *Historical Materialism: Research in Critical Marxist Theory* and is series editor of The Italian List for Seagull Books. He is the author of *The Theatre of Production* (2006), *Fanaticism: On the Uses of an Idea* (2010; 2017, 2nd edn) and *Cartographies of the Absolute* (2015, with Jeff Kinkle). A translator of Antonio Negri, Alain Badiou, Franco Fortini, Furio Jesi and others, Toscano has published widely on critical theory, philosophy, politics and aesthetics.

Svenja Bromberg is a Lecturer in the Department of Sociology at Goldsmiths, University of London. Her research and teaching are in continental philosophy and social theory with a focus on issues of emancipation, radical democracy, and materialist philosophies. She completed her PhD “Thinking ‘Emancipation’ after Marx - A Conceptual Analysis of Emancipation between Citizenship and Revolution in Marx and Balibar” in 2016. Svenja is a co-editor of *Eurotrash* (published 2016 at Merve Verlag, Berlin together with Birthe Mühlhoff and Danilo Scholz) and a member on the editorial board of the journal *Historical Materialism*. She recently published ‘Marx, an ‘Antiphilosopher’? Or Badiou’s Philosophical Politics of Demarcation’ in: Völker, J. (ed) (2019), *Badiou and the German Tradition of Philosophy*, London: Bloomsbury Academic.

THE CONTRIBUTORS

Jeremy Anderson is Head of Strategic Research at the International Transport Workers' Federation (ITF) and previously worked for the Service and Food Workers' Union of Aotearoa New Zealand. His PhD (Geography, Queen Mary, University of London) analyses transnational union organising campaigns.

Cinzia Arruzza is Associate Professor of Philosophy at the New School for Social Research. She works on ancient Greek philosophy and Marxist and feminist theory. She is the author of *Dangerous Liaisons: The Marriages and Divorces of Marxism and Feminism* (2013), *Plotinus. Ennead II 5. On What Is Potentially and What Actually* (2015), *A Wolf in the City: Tyranny and the Tyrant in Plato's Republic* (2018) and co-author of *Feminism for the 99%. A Manifesto* (2019).

Jairus Banaji studied Classics, Ancient History and Modern Philosophy at Oxford in the late 1960s and eventually returned to India to do Modern History at Jawaharlal Nehru University (JNU), New Delhi soon after that institution was founded. After working with the unions in Bombay for about 10 years, he returned to Oxford to do a DPhil in Roman history. This was later published as *Agrarian Change in Late Antiquity: Gold, Labour, and Aristocratic Dominance* (2007, 2nd edn). He has been a Research Associate with the Department of Development Studies, SOAS, University of London for a number of years, and is associated with the journals *Journal of Agrarian Change* and *Historical Materialism*. His latest books include *Exploring the Economy of Late Antiquity: Selected Essays* (2016) and *A Brief History of Commercial Capitalism* (2020).

Brent Ryan Bellamy is an instructor in the English and Cultural Studies departments at Trent University. He is the author of *Remainders of the American Century: Post-Apocalyptic Novels in the Age of US Decline* (2021) and co-editor of *An Ecotopian Lexicon* (2019) and *Materialism and the Critique of Energy* (2018). He teaches courses in science fiction, graphic fiction, American literature and culture, and critical world building. He currently studies narrative, US literature and culture, science fiction, and the cultures of energy.

Jonathan Beller is Professor of Humanities and Media Studies and co-founder of the Graduate Program in Media Studies at Pratt Institute. His books include *The Cinematic Mode of Production: Attention Economy and the Society of the Spectacle* (2006), *Acquiring Eyes: Philippine Visuality, Nationalist Struggle, and the World-Media System* (2006), *The Message is Murder: Substrates of Computational Capital* (2017) and *The World Computer: Derivative Conditions of Racial Capitalism* (2021). He is a member of the *Social Text* editorial collective.

Riccardo Bellofiore was Professor of Political Economy at the University of Bergamo, now retired. There he taught macroeconomics, monetary economics, international monetary economics and history of economic thought. His research interests include Marxian theories of value and crisis, the dynamics of the capitalist contemporary economy, macro-monetary and financial approaches and the philosophy of economics.

Brenna Bhandar is Reader in Law and Critical Theory at SOAS, University of London. She is the author of *Colonial Lives of Property: Law, Land and Racial Regimes of Ownership* (2018) and co-editor with Rafeef Ziadah of *Revolutionary Feminisms: Conversations on Collective Action and Radical Thought* (2020) and with Jon Goldberg-Hiller of *Plastic Materialities: Politics, Legality and Metamorphosis in the Work of Catherine Malabou* (2015). She is a member of the *Radical Philosophy* editorial collective.

Tithi Bhattacharya is a Professor of South Asian History at Purdue University. She is the author of *The Sentinels of Culture: Class, Education, and the Colonial Intellectual in Bengal* (Oxford University Press, 2005) and the editor of the now classic study, *Social Reproduction Theory: Remapping Class, Recentering Oppression* (Pluto Press, 2017). Her recent coauthored book includes the popular *Feminism for the 99%: A Manifesto* (Verso, 2019) which has been translated in over 25 languages. She writes extensively on Marxist theory, gender, and the politics of Islamophobia. Her work has been published in the *Journal of Asian Studies*, *South Asia Research*, *Electronic Intifada*, *Jacobin*, *Salon.com*, *The Nation*, and the *New Left Review*. She is on the editorial board of *Studies on Asia and Spectre*.

Pietro Bianchi is Assistant Professor of Critical Theory at the English Department of the University of Florida. He has written *Jacques Lacan and Cinema. Imaginary, Gaze, Formalisation* (2017) and several articles and essays on Lacanian psychoanalysis, film studies and Marxism in journals such as *Crisis&Critique*, *Angelaki*, *Filozofski Vestnik*, *Fata Morgana* and *S: Journal of the Circle for Lacanian Ideology Critique*. He also regularly collaborates as a film critic with Italian media outlets *Cineforum*, *Doppiozero*, *FilmTv* and *DinamoPress*.

Ashley J. Bohrer is a scholar-activist based in Chicago. She holds a PhD in Philosophy and is currently Assistant Professor of Gender and Peace Studies at the University of Notre Dame. Her academic work focuses on the relationship between exploitation and oppression under capitalism. She is the author of *Marxism and Intersectionality: Race, Gender, Class and Sexuality under Contemporary Capitalism* (2019).

George Caffentzis is a philosophy scholar and activist. He received his PhD in Philosophy from Princeton University in 1977, with a dissertation entitled 'Does Quantum Mechanics Necessitate a Theoretical Revolution in Logic?'. He

has taught logic and philosophy of science in universities in the USA and at the University of Calabar, in Nigeria, and he has lectured in several universities in Europe and Latin America. His scholarly focus since the 1980s has been the philosophy of money and Marxist theory. Caffentzis is now a retired Professor Emeritus of Philosophy at the University of Southern Maine. His published work includes a three-volume study of the 'British empiricist' philosophers' contribution to the development of monetary theory and empire: *Clipped Coins, Abused Words and Civil Government: John Locke's Philosophy of Money* (1989), *Exciting the Industry of Mankind: George Berkeley's Philosophy of Money* (2000) and *Civilizing Money: David Hume's Philosophy of Money*, which is now under contract with Pluto Press. Other works include *In Letters of Blood and Fire* (2013), recently published in Spanish, *No Blood for Oil* (2017) and *A Thousand Flowers: Social Struggle against Structure Adjustment in African Universities* (2000, co-edited with Silvia Federici and Ousseina Alidou).

Miguel Candiotti has a degree in Philosophy (National University of Rosario), a Master's degree in Interculturality (University of Bologna) and a doctorate in Humanities (Pompeu Fabra University). He has studied deeply the development of the concept of praxis in Marx and early Italian theoretical Marxism (from Antonio Labriola to Antonio Gramsci). Among his published articles are 'The Enigma of the *Theses on Feuerbach* and the Secret Thereof' (2014), 'Fetishism of Use Value? Towards a Marxist Theory of Value and Power in General' (2015), 'Karl Marx and the Practical Materialist Theory of Alienation of the (Collective) Human Subject' (2016) and 'The Revolutionary Moral Idealism Inherent in the Practical Materialism of Karl Marx' (2017). Since 2015 he has been working as a Professor and Researcher at the National University of Jujuy, where he leads the chairs of Political Philosophy and Metaphysics.

Graham Cassano is an Associate Professor of Sociology at Oakland University. His most recent books include *A New Kind of Public: Community, Solidarity, and Political Economy in New Deal Cinema, 1935–48*, *Eleanor Smith's Hull House Songs: The Music of Protest and Hope in Jane Addams's Chicago* and the forthcoming *Urban Emergency: (Mis)Management and the Crisis of Neoliberalism*.

Charmaine Chua is Assistant Professor of Global Studies at the University of California, Santa Barbara. Her work explores the co-constitution of logistical technologies, global supply chains and racialised dispossession in the context of US empire. Charmaine holds a PhD in Political Science from the University of Minnesota, Twin Cities. She is the reviews and magazine editor for *Environment and Planning D: Society and Space* and a member of the *Abolition Journal* and Amazonians United collectives. Her work has been published in *Theory and Event*, *Historical Materialism* and *Environment and Planning D*, among other venues.

Joshua Clover is the author of seven books, including *Roadrunner* (2021) as well as *Riot.Strike.Riot: The New Era of Uprisings*, a political economy of social movements, with recent editions in French, German, Turkish and Swedish. He is currently Professor of English and Comparative Literature at the University of California Davis as well as Affiliated Professor of Literature and Modern Culture at the University of Copenhagen.

Luisa Lorenza Corna teaches at Middlesex University and at the University of Portsmouth. She is also a Visiting Lecturer at the University of Milan/Bicocca's Master's in Critical Theory. Her main concern is the relationship between politics, art and architectural theory. Since completing her PhD her research has developed along three main lines: Marxism and theories of the city, with a focus on the postwar Italian context; art and architectural historiographies; and the influence of feminist epistemologies on histories and theories of art. She has written for various journals, including *Parallax*, *Historical Materialism*, *Radical Philosophy*, *Art Monthly*, *Texte Zur Kunst* and *Jacobin*. At the moment she is completing, with Jamila Mascat and Matthew Hyland, an anthology of Carla Lonzi's art historical and feminist writings for Seagull Books. She is also working on her first monograph, tentatively titled *Fugitive Lives*, which examines the theme of leaving the art/architectural world from the point of view of the critic.

Andrea Coveri holds a PhD in Economics from Marche Polytechnic University. He is currently Postdoctoral Research Fellow in Applied Economics at the University of Urbino, where he taught global political economics and micro-economics. His research interests include Marxian theory of value, global value chains, innovation dynamics and industrial policy.

Katie Cruz is a Senior Lecturer in Law at the University of Bristol. She researches sex work, trafficking for sexual exploitation and sex tourism through the lens of Marxist feminist legal theory. Katie is currently working on a monograph about sex-worker-rights activists' social and legal use of rights discourse in the UK. This empirically grounded research investigates the possibilities and limits of rights for sex workers using legal doctrinal methods and Marxist feminist theory. Katie regularly collaborates with sex-worker-rights activists in the UK and has a long-standing history of sex-work and feminist activism. She is Co-Director of the Bristol Centre for Law at Work and an editor of the journal *Feminist Legal Studies*.

Andrew Curley (Diné) is an Assistant Professor in the School of Geography, Development and Environment at the University of Arizona. His research focuses on the incorporation of Indigenous nations into colonial economies. His recent publications speak to the role of Diné coal workers and environmentalists in Navajo politics of energy transition. He has also published on Indigenous water law and water rights.

Miri Davidson is a PhD student at Queen Mary, University of London. She writes about the history of anthropology and the French left.

Neil Davidson. Born in Aberdeen, Neil Davidson (1957–2020) was an activist and a historical sociologist who wrote on revolution and nationalism. For much of his working life, Davidson was a civil servant in Scotland. In 2008 he began teaching at the University of Strathclyde and in 2013 joined the Sociology Department at Glasgow. Davidson was the author of three monographs: *The Origins of Scottish Nationhood* (2000), *Discovering the Scottish Revolution 1692–1746* (2003), which was awarded both the Isaac and Tamara Deutscher Memorial Prize and the Saltire Society's Andrew Fletcher of Saltoun Award, and the monumental *How Revolutionary Were the Bourgeois Revolutions?* (2012). He published three collections of essays with Haymarket Press and co-edited *Alasdair MacIntyre's Engagement with Marxism* (2008), *Neoliberal Scotland* (2010), *The Longue Durée of the Far-Right* (2014) and *No Problem Here: Understanding Racism in Scotland* (2018). At the time of his premature death, Davidson was working on numerous projects, including a book on uneven and combined development; a response to the critics of his work on bourgeois revolutions; a study of neoliberalism; and a book on the 'actuality' of revolution. It is hoped that these and other works will be published in the near future.

Gail Day's *Dialectical Passions: Negation in Postwar Art Theory* (2011) was short-listed for the Isaac and Tamara Deutscher Memorial Prize. She is Professor of Art History and Critical Theory, and Director of Research in the School of Fine Art, History of Art and Cultural Studies at the University of Leeds, where she is Co-Founder of the Centre for Critical Materialist Studies. Gail is also part of the research collective Marxism in Culture (at the Institute of Historical Research, London). With Steve Edwards and colleagues from Universidade de São Paulo she initiated the project Aesthetic Form & Uneven Modernities, and she belongs to DESFORMAS (Centro de estudos Desmanche e Formação de Sistemas Simbólicos at USP).

Massimo De Angelis is an author, teacher and activist who has engaged with the question of post-capitalist transformation for over four decades. He is Emeritus Professor at the University of East London. He is the founding editor of *The Commoner*, a web journal that began to problematise the role of the commons for radical transformation as early as 2001. He is the author of several publications on crises, governance, value, social revolution and the commons. His last two books, *Omnia Sunt Communia* (2017) and *The Beginning of History* (2007), develop a framework and a theory of hope that both recognise the systemic patterns and horrors of capitalist development and the ruptures and emergence of post-capitalist systems based on struggles and the commons.

Nicholas De Genova is Professor and Chair of the Department of Comparative Cultural Studies at the University of Houston. He previously held teaching appointments in urban and political geography at King's College London, and in anthropology

at Stanford, Columbia and Goldsmiths, University of London, as well as visiting professorships or research positions at the Universities of Warwick, Bern and Amsterdam. He is the author of *Working the Boundaries: Race, Space, and 'Illegality' in Mexican Chicago* (2005), co-author of *Latino Crossings: Mexicans, Puerto Ricans, and the Politics of Race and Citizenship* (2003), editor of *Racial Transformations: Latinos and Asians Remaking the United States* (2006), co-editor of *The Deportation Regime: Sovereignty, Space, and the Freedom of Movement* (2010), editor of *The Borders of 'Europe': Autonomy of Migration, Tactics of Bordering* (2017) and co-editor of *Roma Migrants in the European Union: Un/Free Mobility* (2019).

Alessandro De Giorgi is Professor of Justice Studies at San Jose State University. He received his PhD in Criminology from Keele University in 2005. Before joining SJSU, he was a Research Fellow in Criminology at the University of Bologna and a Visiting Scholar at the Center for the Study of Law and Society, University of California Berkeley. His research interests include critical theories of punishment and social control, urban ethnography and radical political economy. He is the author of the book *Rethinking the Political Economy of Punishment: Perspectives on Post-Fordism and Penal Politics* (2006) as well as of several articles in journals such as *Punishment & Society*, *Theoretical Criminology*, *Critical Criminology* and *Social Justice*. His most recent work is ethnographic research on the socioeconomic dimensions of mass incarceration and prisoner re-entry in Oakland, California.

Emma Dowling is a sociologist and political scientist at the University of Vienna, where she is Assistant Professor of Sociology. Previously, she held academic positions in Germany and the UK. Her research interests include social change, social movements, emotional and affective labour, gender, care and social reproduction, financialisation and feminist political economy. She has published in journals such as *Sociology*, *New Political Economy* and *Cultural Studies* ↔ *Critical Methodologies*, and she is the author of the monograph *The Care Crisis* (2021).

Peter Drucker has been a socialist feminist, anti-imperialist and LGBTIQ activist for over 40 years in New York, San Francisco, Amsterdam and Rotterdam. Trained as a historian (BA, Yale, 1979) and political scientist (PhD, Columbia, 1993), he writes on Marxist and queer theory. From 1993 to 2006 he was Co-Director of the Amsterdam-based International Institute for Research and Education, and he is still an IIRE Fellow and Lecturer. He is the author of *Max Shachtman: A Socialist Odyssey through the 'American Century'* (1993) and *Warped: Gay Normality and Queer Anti-Capitalism* (2015), and the editor of the anthology *Different Rainbows* (2000). He has written for publications including *Gay Community News*, *Against the Current*, *International Viewpoint*, *Grenzeloos*, *New Left Review*, the *Journal of European Studies*, *Development in Practice*, *Historical Materialism*, the *Journal of Middle East Women's Studies*, *Salvage*, *Rampant* and *Mediations*. He helped initiate the Sexuality and Political Economy Network.

Stefano Dughera, economist, is Research Fellow (Postdoc) at the University of Turin, Department of Economics and Statistics. His research lies at the intersections of labour and institutional economics. He is co-author with Carlo Vercellone of ‘Metamorphosis of the Theory of Value and Becoming-Rent of Profit’, in *Cognitive Capitalism, Welfare and Labour: The Commonfare Hypothesis* (2019).

Steve Edwards is Professor of History and Theory of Photography at Birkbeck, University of London. His publications include *The Making of English Photography, Allegories* (2006), *Photography: A Very Short Introduction* (2006) and *Martha Rosler: The Bowery in Two Inadequate Descriptive Systems* (2012). He is a member of the editorial boards for the *Oxford Art Journal* and the *Historical Materialism* book series as well as a convenor for the long-running University of London research seminar Marxism in Culture. He is currently working on a book on artist Allan Sekula with Gail Day and completing a major study of early English photography.

David Fasenfest is an Associate Professor of Sociology and Urban Affairs, College of Liberal Arts and Sciences, Wayne State University, and the editor of *Critical Sociology* and two book series, *Studies in Critical Social Science* and *New Scholarship in Political Economy*, both with Brill. His research focuses on inequality, urban development and Marxism. He is the author of ‘Monsieur Le Capital and Madame La Terre on the Brink’ (2017, with Penelope Ciancanelli, in *Towards Just and Sustainable Economies: Comparing Social and Solidarity Economy in the North and South*), ‘Marx, Marxism and Human Rights’ (2016, *Critical Sociology*), ‘Marxist Sociology and Human Rights’ (2013, in the *Handbook of Sociology and Human Rights*) and *Marx Matters* (forthcoming, Brill).

Silvia Federici is a feminist activist, teacher and writer. She was one of the founders of the International Feminist Collective, the organisation that launched the Campaign for Wages for Housework. She is the author of books and essays on political philosophy, feminist theory, cultural studies and education. Her published works include *Caliban and the Witch: Women, the Body and Primitive Accumulation* (2004), *Revolution at Point Zero: Housework, Reproduction and Feminist Struggle* (2012) and *Re-Enchanting the World: Feminism and the Politics of the Commons* (2018). She is Emerita Professor at Hofstra University.

Roderick A. Ferguson is the William Robertson Coe Professor of Women’s, Gender and Sexuality Studies and American Studies at Yale University. He received his BA from Howard University and his PhD from the University of California, San Diego. An interdisciplinary scholar, his work traverses such fields as American studies, gender studies, queer studies, cultural studies, African American Studies, sociology, literature and education. He is the author of *One-Dimensional Queer* (2019), *We Demand: The University and Student Protests* (2017), *The Reorder of Things: The University and Its Pedagogies of Minority Difference* (2012) and *Aberrations in Black: Toward a Queer of Color Critique* (2004). He is co-editor with Grace Hong of the anthology *Strange Affinities: The*

Gender and Sexual Politics of Comparative Racialization (2011). He is also co-editor with Erica Edwards and Jeffrey Ogbar of *Keywords of African American Studies* (2018).

Sue Ferguson is a Marxist-Feminist scholar and activist and Associate Professor Emerita at Wilfrid Laurier University and Adjunct Professor with the Graduate School at Rutgers University. Her published work includes articles on feminist theory, childhood and capitalism, and Canadian political discourse. Her book, *Women and Work: Social Reproduction, Feminism and Labour* was published in 2020 by Pluto Press and has been translated to Spanish by Sylone/Viento Sur. Ferguson is also a member of Faculty4Palestine and on the editorial board of *Midnight Sun*.

Harrison Fluss is a philosophy Professor at Manhattan College in New York City, and a corresponding editor at *Historical Materialism*. He earned his PhD in philosophy at Stony Brook University in New York, specialising in German Idealism. He is the author of the book *Prometheus and Gaia: Technology, Ecology, and Anti-Humanism* (2021), and his writings have appeared in *Left Voice*, *Jacobin*, *Salvage* and *The New Republic*.

Andrea Fumagalli is an activist and Professor of Economics and History of Economic Thought in the Department of Economics and Management at University of Pavia and at Iuss-Pavia. He also teaches eco-social economics at the Free University of Bolzano. He is a member of the Effimera Network and a founder member of Bin-Italy (Basic Income Network, Italy). His publications include *The Crisis of the Global Economy: Financial Markets, Social Struggles and New Political Scenarios* (2010, with S. Mezzadra), 'Life Put to Work: Towards a Theory of Life-Value' (2011, with C. Morini, *Ephemera*), 'Finance, Austerity and Commonfare' (2015, with S. Lucarelli, *Theory, Culture and Society*), *Economia politica del comune* (2017) and *Cognitive Capitalism, Welfare and Labour: The Commonfare Hypothesis* (2019, with A. Giuliani, S. Lucarelli and C. Vercellone).

Verónica Gago teaches political science at the Universidad de Buenos Aires and is Professor of Sociology at the Instituto de Altos Estudios, Universidad Nacional de San Martín. She is also Researcher at the National Council of Research (CONICET). She is the author of *Neoliberalism from Below: Popular Pragmatics and Baroque Economies* (2014, 2017) and *International Feminist* (2020), and she is co-author of *A Feminist Reading of Debt* (2020, 2021). She coordinates the working group Popular Economies: Theoretical and Practical Mapping at Consejo Latinoamericano Ciencias Sociales (CLACSO). She was part of the militant research experience Colectivo Situaciones, and she is now a member of the feminist collective Ni Una Menos.

Heide Gerstenberger was Professor for the Theory of State and Society at the University of Bremen. She is now retired. Her research, though covering a wide range of topics, has centred on the development of capitalist states. She was also engaged in the analysis of maritime labour. Her main publications are *Die subjektlose Gewalt*.

Theorie der Entstehung bürgerlicher Staatsgewalt (2007, translated as *Impersonal Power: History and Theory of the Bourgeois State*). In 2017 she published *Markt und Gewalt. Die Funktionsweise des historischen Kapitalismus*, which is being translated as *Market and Violence: The Historical Functioning of Capitalism*.

Jeremy Gilbert is Professor of Cultural and Political Theory at the University of East London, where he has been based for many years. His most recent publications include *Twenty-First-Century Socialism* (2020), a translation of Maurizio Lazzarato's *Experimental Politics* and the book *Common Ground: Democracy and Collectivity in an Age of Individualism* (2013). *Hegemony Now: How Big Tech and Wall Street Won the World* will be published by Verso in 2022. He is the current editor of the journal *New Formations* and has written and spoken widely on politics, music and cultural theory, having given keynotes at numerous international conferences on these topics and on the politics and practice of cultural studies. He writes regularly for the British press (including the *Guardian*, the *New Statesman*, *open Democracy* and *Red Pepper*) and for think tanks such as IPPR and Compass. He also hosts several popular podcasts.

Chiara Giorgi is Assistant Professor at Sapienza University of Rome, Department of Philosophy, where she teaches contemporary history. Her main research topics are the welfare state, the healthcare system, history of fascism, Italian colonialism, Italian socialism and Marxism. Her books include *A Heterodox Marxist and His Century: Lelio Basso* (2020, editor), *Storia dello Stato sociale in Italia* (forthcoming, with I. Pavan), *Rileggere Il Capitale* (2018, editor), *Costituzione italiana: articolo 3* (2017, with M. Dogliani), *Un socialista del Novecento. Uguaglianza, libertà e diritti nel percorso di Lelio Basso* (2015), *L'Africa come carriera. Funzioni e funzionari del colonialismo italiano* (2012), *La previdenza del regime. Storia dell'INPS durante il fascismo* (2004) and *La sinistra alla Costituente. Per una storia del dibattito istituzionale* (2001).

Kanishka Goonewardena was trained as an architect in Sri Lanka and is now Professor, Department of Geography and Planning, University of Toronto. His work has focused mostly on space and ideology, drawing from Marxist and allied critical theories, with publications in journals such as *Historical Materialism*, *Antipode*, *Society and Space*, *Planning Theory* and the *International Journal of Urban and Regional Research*. He co-edited *Space, Difference, Everyday Life: Reading Henri Lefebvre* (2008) and is currently researching the historical geography of the concept of imperialism.

Asad Haider is the author of *Mistaken Identity: Race and Class in the Age of Trump* (2018) and an editor of *Viewpoint Magazine*.

John Haldon is Shelby Cullom Davis '30 Professor of European History Emeritus at Princeton University. He is currently also Director of the Princeton Climate Change

and History Research Initiative and Director of the Program in Medieval Studies Environmental History Lab. His research focuses on the history of the medieval eastern Roman (Byzantine) empire, in particular the period from the seventh to the twelfth centuries; on state systems and structures across the European and Islamic worlds from late ancient to early modern times; on the impact of environmental stress on societal resilience in pre-modern social systems; and on the production, distribution and consumption of resources in the late ancient and medieval world.

Gerard Hanlon is a Professor of Organizational Sociology at the Centre for Labour and Global Production, Queen Mary University of London. Historically, his interests focused on professional labour and expertise, but more recently his work has concentrated on management theory and neoliberalism, the changing nature of work and subjectivity, the shift from a real to a total subsumption of labour to capital, innovation and entrepreneurship. Much of this more recent work is captured in his most recent book, *The Dark Side of Management – A Secret History of Management Theory* (2016). He is currently researching the historical relationship between the emergence of the modern military and the rise of capitalist management of the division of labour and organisation in the era of early industrial capitalism.

Kate Hardy is an Associate Professor in Work and Employment Relations at the University of Leeds, Associate Editor of *New Technology, Work and Employment* and a feminist activist. Her research interests include paid and unpaid work, gender, agency, Marxist feminism, collective organising, political economy, the body, disability, sex work and social struggles. Her work has been widely published academically and in news media. Kate is committed to developing methodologies which work alongside research participants in order to undertake socially and politically transformative research. To do so, she has worked closely with AMMAR, the sex workers' union of Argentina, other sex workers' movements and with Focus E15, a homeless movement in East London led by single mothers. Kate is a founding member of Partisan Collective and Greater Manchester Housing Action, both based in Manchester.

Daniel Hartley is Assistant Professor in World Literatures in English at Durham University. He is the author of *The Politics of Style: Towards a Marxist Poetics* (2017) and has published widely on Marxist theory and contemporary literature.

David Harvie is the author (with The Free Association) of *Moments of Excess: Movements, Protest and Everyday Life* (2011) and the co-editor of *Commoning* (2019, with George Caffentzis and Silvia Federici). He was an editor of *Turbulence: Ideas for Movement*. He has also published on the political economy of education, value theory and struggles, and social finance. He is a member of the Leicester-based Centre for Philosophy and Political Economy and also of Plan C. He sings with Commoners Choir and is part of the Aftermathematics project (Twitter: @ftermathematics).

Tine Haubner is a Research Assistant at the Chair of Political Sociology at the Sociological Institute of the Friedrich Schiller University in Jena. She researches and teaches on issues such as social reproduction, informal and voluntary work, social inequality and the welfare state. In her work she combines theoretical with qualitative-empirical research. She received her doctorate in 2016 with a thesis on exploitation in the field of informal elder care. In her dissertation, she subjects the German elder-care system to a fundamental critique and develops a feminist-theoretical concept of exploitation for sociology, which is able to think of exploitation beyond industrial profit maximisation. In doing so, she combines social exclusion, social vulnerability and the appropriation of labour in a way that considers both economic and cultural-symbolic factors of exploitation. Her current research interests focus on strategies of social reproduction beyond state, market and family. In this context, she researches voluntary work in the structural change of the welfare state and informal economies in rural poverty areas in Germany.

Rohini Hensman is a writer and independent scholar who comes from Sri Lanka and is resident in India. She has written extensively on workers' rights, feminism, minority rights, globalisation and a Marxist approach to struggles for democracy. Her book *Workers, Unions, and Global Capitalism: Lessons from India* (2011) was based on her PhD thesis for the University of Amsterdam, and her most recent book is *Indefensible: Democracy, Counter-Revolution, and the Rhetoric of Anti-Imperialism* (2018). She has also written two novels: *To Do Something Beautiful*, inspired by her work with working-class women and trade unions in Bombay, and *Playing Lions and Tigers*, which tells the interlocking stories of 14 women, men and children from different parts of Sri Lanka and different ethno-religious and social backgrounds as they confront political authoritarianism and war.

Ståle Holgersen is Researcher at the Institute for Housing and Urban Research, and Department of Social and Economic Geography, Uppsala University. His research interests include urban policy, housing and class, climate change and economic and ecological crises. He is the author of *Staden och Kapitalet* (2017) and has published numerous articles in journals such as *Antipode*, *Planning Theory*, the *International Journal of Urban and Regional Research*, *Human Geography* and *Tijdschrift voor Economische en Sociale Geografie*. He is currently Principal Investigator for two major research projects: one on the far right and climate denialism (White Skin, Black Fuel) and one on Swedish housing (The Housing Question in Times of Crisis).

Matt Huber is an Associate Professor of Geography at Syracuse University. He is the author of *Lifeblood: Oil, Freedom and the Forces of Capital* (2013). He is currently working on a book on class and climate politics for Verso Books.

Johanna Isaacson is an Instructor of English at Modesto Junior College and a founding editor of *Blind Field* journal. She is the author of *The Ballerina and the Bull: Anarchist Utopias in the Age of Finance* (2016) and the forthcoming book *Stepford Daughters: Tools for Feminists in Contemporary Horror*.

Anselm Jappe is the author of *Guy Debord* (1993, 2016), *Les Aventures de la marchandise. Pour une critique de la valeur* (2003, 2017), *L'Avant-garde inacceptable. Réflexions sur Guy Debord* (2004), *Crédit à mort* (2011, translated as *The Writing on the Wall*, 2016), *La Société autophage* (2017) and *Béton – Arme de construction massive du capitalisme* (2020). He has contributed to the German reviews *Krisis* and *Exit !*, founded by Robert Kurz, which developed the ‘critique of value’. He currently teaches at the Fine Art Schools of Sassari, Italy, and has been Visiting Professor in various European and Latin American universities. He also lectured at the Ecole des hautes études en sciences sociales and at the Collège international de philosophie, Paris.

Ken C. Kawashima is Associate Professor at the University of Toronto, Department of East Asian Studies, and the author of *The Proletarian Gamble: Korean Workers in Interwar Japan* (2009), ‘Capital’s Dice-Box Shaking’ (2005, *Rethinking Marxism*) and ‘The Hidden Area between Marx and Foucault’ (2019, *positions: asia culture critique*); co-editor with Robert Stolz and Fabian Schaeffer of *Tosaka Jun: A Critical Reader* (2014); and the English translator of Uno Kōzō’s *Theory of Crisis* (forthcoming). He researches and teaches Marxist political economic theory; the histories of capitalism in Japan and colonial Korea; the critique of ideology, everyday life and racism; and theories of the subject. He also composes, sings and records blues music as Sugar Brown.

Jim Kincaid taught sociology and social policy at the Universities of Aberdeen, Leeds and Bradford before early retirement to spend more time with Marx. He was a member of the editorial board of *Historical Materialism*, from 2002 to 2006, and has been Corresponding Editor since then. He has published in *Historical Materialism* and elsewhere on topics which include East Asia, the Hegel–Marx connection, the logic of Marx’s *Capital*, financialisation and the 2008 crisis. He edited, and contributed to, symposia in *Historical Materialism* on the work of Chris Arthur and of Costas Lapavistas. A selection of his publications is available on his Researchgate website.

Robert Knox is a Senior Lecturer in Law at the School of Law and Social Justice, University of Liverpool. He is a member of the editorial boards of *Historical Materialism* and *The London Review of International Law*.

Erica Lagalisse is an anthropologist and writer, a Postdoctoral Fellow at the London School of Economics (LSE), editor and editorial board member at *The Sociological Review* and Visiting Researcher at the Anarchism Research Group at the University of Loughborough. She is the author of *Occult Features of Anarchism – with Attention to the Conspiracy of Kings and the Conspiracy of the Peoples* (2019). Her contribution in this volume, ‘Anthropology’, is inspired in part by her PhD dissertation, titled ‘“Good Politics”: Property, Intersectionality, and the Making of the Radical Self’. This ethnography explores anarchist networks crossing Québec, the USA and Mexico to examine settler ‘anarchoindigenism’, and

draws on anthropological, feminist and critical race theory to show how Anglo-American leftists have pre-empted the black feminist challenge of ‘intersectionality’ by recuperating its praxis within the logic of neoliberal property relations.

Elena Louisa Lange is a philosopher and Japanologist. She is currently Senior Research Fellow and Lecturer at the University of Zurich. Her publications have appeared in *Historical Materialism*, *Science & Society*, *Crisis and Critique*, *Consecutium Rerum*, *The Bloomsbury Companion to Marx*, *the Sage Handbook of Frankfurt School Critical Theory* and others. She is co-editor of two books on Asian philosophy. Her second monograph is *Value without Fetish: Uno Kôzô's Theory of Pure Capitalism in Light of Marx's Critique of Political Economy* (2021). She is co-editor of the forthcoming collection *The Conformist Rebellion: Marxist Responses to the Contemporary Left*.

Les Levidow is a Senior Research Fellow at the Open University, where he has studied agri-environmental-technology issues, especially techno-market fixes, consequent controversy and alternative agendas. A long-running case study was the agri-biotech controversy, focusing on the EU, USA and their trade conflicts. This research resulted in two books: *Governing the Transatlantic Conflict over Agricultural Biotechnology: Contending Coalitions, Trade Liberalisation and Standard Setting* (2006) and *GM Food on Trial: Testing European Democracy* (2010). Over the past decade his research themes have broadened to agricultural innovation priorities, the bioeconomy, corporate environmental stewardship, natural capital assessment, alternative agri-food networks and the agroecology-based solidarity economy in South America. As an early entry point into such issues, he participated in the *Radical Science Journal* Collective in the 1970s and 80s. The *RSJ* was replaced by a new journal, *Science as Culture*, on which he has served as co-editor.

Leonardo Marques is Professor of History of the Colonial Americas at Universidade Federal Fluminense, Niterói. He has worked with themes related to capitalism, slavery and the slave trade in an Atlantic context for the last two decades, having published a large number of essays and two books on these topics. His first book, *Por aí e por muito longe: dívidas, migrações e os libertos de 1888* (2009), explores the trajectories of former slaves in the last years of slavery and in the post-emancipation period in the state of Paraná, Brazil. His second book, *The United States and the Transatlantic Slave Trade to the Americas, 1776–1867* (2016), explores the different forms of US participation in the transatlantic slave trade and how they changed over time. He is currently working on a global environmental history of mining in Brazil from the colonial period to the present.

Jamila M. H. Mascot is Assistant Professor in Gender and Postcolonial Studies at the Department of Media and Cultural Studies, Utrecht University. Her research interests focus on Hegel's philosophy and contemporary Hegelianism, Marxism, feminist theories and postcolonial critique. She is the author of *Hegel a Jena. La critica dell'astrazione* (2011). She has co-edited *Femministe a parole* (2012);

G. W. F. Hegel, *Il bisogno di filosofia 1801–1804* (2014); M. Tronti, *Il demone della politica. Antologia di scritti: 1958–2015* (2017); Hegel & Sons. *Filosofie del riconoscimento* (2019); *The Object of Comedy: Philosophies and Performances* (2019); and A. Kojève, *La France et l'avenir de l'Europe* (2021).

Wendy Matsumura teaches modern Japanese history at UC San Diego. She is currently working on a project titled Japanese Grammar: Crisis and Oikonomics after World War I, which examines the relationship between oikonomics, imperialism and anti-capitalist struggle in the Japanese empire through a Marxist feminist perspective. Her first book, *The Limits of Okinawa: Japanese Capitalism, Living Labor, and Theorizations of Community* (2015), traced the contested emergence of Okinawa as Japan's exotic 'South' as part and parcel of the process of the former Ryukyu Kingdom's annexation and transformation into one of the empire's premier sites of sugar production.

Søren Mau is a postdoctoral researcher interested in value-form theory, Marxist feminism, Marxist ecology and radical philosophy. He is the author of *Mute Compulsion: A Marxist Theory of the Economic Power of Capital* (2022), which is an attempt to build a theory of how the logic of capital reproduces its grip on social life by means of an abstract, impersonal and anonymous form of power. He is currently working on a research project on Marxism and the body, which will hopefully result in a book. He is a member of the editorial board of the journal *Historical Materialism* and a member of the board of the Danish Society of Marxist Studies.

Annie McClanahan is an Associate Professor of English at the University of California, Irvine. She is the author of *Dead Pledges: Debt, Crisis, and 21st Century Culture* (2016). Her work has appeared in *Representations*, *boundary2*, *South Atlantic Quarterly*, *theory & event*, the *Journal of Cultural Economy* and elsewhere, and she is co-editor of the online, open-access journal *Post45*. She is currently completing a book titled *Tipwork, Microwork, Automation: Culture after the Formal Wage*.

Gregor McLennan is Emeritus Professor and Senior Research Fellow in the School of Sociology, Politics and International Studies at the University of Bristol. He is the author of *Marxism and the Methodologies of History* (1981), *Marxism, Pluralism and Beyond* (1989), *Pluralism* (1995), *Sociological Cultural Studies* (2006) and *Story of Sociology* (2011); and he is the editor, with extensive commentary, of Stuart Hall, *Selected Writings on Marxism* (2021). He has also published a range of papers evaluating the contemporary entanglement of post-secularism, the postcolonial and critical sociology.

Sandro Mezzadra is Professor of Political Theory at the University of Bologna, Department of Arts, and is Adjunct Research Fellow at the Institute for Culture and Society of Western Sydney University. In the last decade his work has centred on the relations between globalisation, migration and political processes, on contemporary capitalism and on postcolonial theory and criticism. He is an

active participant in the ‘post-workerist’ debates and one of the founders of the website Euronomade. His books include *In the Marxian Workshops: Producing Subjects* (2018). With Brett Neilson he is the author of *Border as Method, or, the Multiplication of Labor* (2013) and of *The Politics of Operations: Excavating Contemporary Capitalism* (2019).

Salar Mohandesi is an Assistant Professor of History at Bowdoin College. His research focuses on the transnational history of theory, social movements and political cultures in the wider context of war, revolution and imperialism. His current book project traces the history of anti-Vietnam War activism in France and the USA from the early 1960s to the late 1970s to explain how and why human rights displaced anti-imperialism as the dominant way of imagining internationalism in North America and Western Europe.

Roberto Mozzachiodi is a doctoral student at Goldsmiths, University of London, a workplace organiser and a translator. He is a Visiting Lecturer at Regent’s University. He writes on Francophone Marxist histories and philosophy.

Patrick Murray is Professor of Philosophy at Creighton University in Omaha, Nebraska. He is the author of *The Mismeasure of Wealth: Essays on Marx and Social Form* (2016, 2017) and *Marx’s Theory of Scientific Knowledge* (1988), and the editor of *Reflections on Commercial Life: An Anthology of Classic Texts from Plato to the Present* (1997). For Brill, he is working on *Capital’s Reach: How Capital Shapes and Subsumes* and a reissue of *Marx’s Theory of Scientific Knowledge*. With Jeanne Schuler he has co-authored a book manuscript under review, *False Moves: Basic Problems with Factoring Philosophy*. His research interests centre on the relationship between capitalism and modern philosophy and include the British empiricists, Kant, Hegel, Marx and the Frankfurt School.

Brett Neilson is Professor at the Institute for Culture and Society at Western Sydney University. With Sandro Mezzadra he is co-author of *Border as Method, or, the Multiplication of Labor* (2013) and *The Politics of Operations: Excavating Contemporary Capitalism* (2019). With Ned Rossiter he has coordinated four large transnational research projects: *Transit Labour: Circuits, Regions, Borders* (2009–11), *Logistical Worlds: Infrastructure, Software, Labour* (2013–15), *Data Farms: Circuits, Labour, Territory* (2016–19) and *Packet Politics: Automation, Labour, Data* (2020–3). His work empirically studies changing formations of space and time as a means of generating concepts to understand shifting relations among economy and politics.

Chris O’Kane is Assistant Professor of Political Science at the University of Texas Rio Grande Valley. O’Kane works on social and political thought and political economy, especially Marx and Frankfurt School Critical Theory. O’Kane has published articles on real abstraction, negative totality, Marx, Henri Lefebvre, Theodor W. Adorno, Frankfurt School Critical Theory, critical political economy

and heterodox economics. He is a corresponding editor of *Historical Materialism*. With Beverly Best and Werner Bonefeld he is co-editor of *The Sage Handbook of Frankfurt School Critical Theory* (2018). With Werner Bonefeld he co-edits *Critical Theory and the Critique of Society* for Bloomsbury Academic Press.

Maia Pal is a Senior Lecturer in International Relations at Oxford Brookes University. Her main research explores early modern European and colonial history in terms of legal and imperial expansion and extraterritoriality. Her research develops Marxist historical sociology in international relations and international law. She has also worked on critical pedagogy and contemporary student protests through the concept of counter-conduct. She has published in *Radical Philosophy*, *Global Society*, *Salvage*, *Historical Materialism* and *International Studies Perspectives*. She is a co-editor of *The Extraterritoriality of Law: History, Theory, Politics* (2019) and the author of *Jurisdictional Accumulation: An Early Modern History of Law, Empires, and Capital* (2020). Maia has been an editorial board member for *Historical Materialism* since 2015 and is a member of the Political Marxism research group at the University of Sussex.

Luigi Pellizzoni is Professor in Sociology of the Environment and Territory at the Department of Political Sciences, University of Pisa, and coordinator of the research group and discussion community Politics–Ontologies–Ecologies. His theoretical and empirical interests intersect three fields: risk, uncertainty, environmental change and sustainability; social and ecological impacts of techno-science innovation; and contentious politics, new mobilisations and the transformation of governance. He has authored approximately 140 scientific works. His articles have been published in journals such as *Theory Culture & Society*, the *British Journal of Sociology*, the *European Journal of Social Theory*, the *Journal of Classical Sociology*, *Public Understanding of Science*, *Science as Culture*, *Environmental Politics* and *Environmental Values*. His most recent book is *Ontological Politics in a Disposable World: The New Mastery of Nature* (2016).

Hannah Proctor is a Wellcome Trust Research Fellow at the University of Strathclyde. She was previously a fellow at the ICI Berlin and received her PhD from Birkbeck, University of London. Her first monograph, *Psychologies in Revolution: Alexander Luria's 'Romantic Science' and Soviet Social History*, was published as part of the Palgrave Macmillan series Mental Health in Historical Perspective in 2020. She is currently working on a book for Verso provisionally titled *Burnout: On the Psychic Aftermath of Political Struggle*. She is a member of the editorial collective of *Radical Philosophy*, is web and social media editor of *History of the Human Sciences* and writes a regular column for the 'Culture' section of *Tribune* magazine.

Anandi Ramamurthy is Professor of Media and Culture at Sheffield Hallam University. Her books include *Imperial Persuaders: Images of Africa and Asia in Britain* (2003), *Visual Culture and Decolonisation in Britain* (2006, edited with Simon

Faulkner), *Black Star: Britain's Asian Youth Movements* (2013), *Colonial Advertising and Commodity Racism* (2013, edited with Wulf Hund and Michael Pickering) and *Struggling to Be Seen: The Travails of Palestinian Cinema* (2019, with Paul Kelemen).

Jan Rehmann is Visiting Professor for Critical Theory and Social Analysis at Union Theological Seminary in New York and Director of the PhD programme; Privatdozent at the Free University in Berlin; and co-editor of the *Historical-Critical Dictionary of Marxism (HKWM)*. His books include *Deconstructing Postmodern Nietzscheanism: Deleuze and Foucault* (forthcoming), *Max Weber. Modernisation as Passive Revolution: A Gramscian Analysis* (2015), *Theories of Ideology: The Powers of Alienation and Subjection* (2013), *Pedagogy of the Poor* (2011, with Willie Baptist) and *The Churches in Nazi Germany* (1986).

Paul Rekret teaches political theory at Richmond American International University in London. He is the author of two books: *Down with Childhood* (2017) and *Derrida and Foucault: Philosophy, Politics and Polemics* (2018), along with numerous articles on contemporary political and cultural theory in journals including *Theory, Culture & Society*, *South Atlantic Quarterly* and *Constellations*. He is currently working on a new edition of George Caffentzis's book *Clipped Coins* and a monograph on popular music and the refusal of work. He also writes as part of Le Mardi Gras Listening Collective.

Tommaso Redolfi Riva teaches philosophy and history at Liceo Statale Enrico Fermi in Cecina. He is an independent researcher. He graduated in Philosophy at the University of Pisa and has a PhD in History of Economic Thought from the University of Florence. He has published several articles on Marx, Marxisms and the *Neue Marx-Lektüre*. He is co-editor with Riccardo Bellofiore of *Ricerche sulla critica marxiana dell'economia* (2016), an Italian collection of the most important articles by Hans-Georg Backhaus.

Andrés Saenz de Sicilia is a Postdoctoral Research Fellow in Philosophy at the UNAM, Mexico City and Associate Lecturer at Central Saint Martins, University of the Arts London. He received his PhD from the Centre for Research in Modern European Philosophy at Kingston University and has previously held appointments at University College London, Newcastle University and the University of Amsterdam. His research interests include post-Kantian philosophy, Marxism and critical theories of capitalism and violence.

Kohei Saito is Associate Professor of Political Economy at Osaka City University. His book *Karl Marx's Ecosocialism* (2017) won the 2018 Isaac and Tamara Deutscher Memorial Prize.

Laura Schwartz is Reader in Modern British History at the University of Warwick. Her most recent monograph is *Feminism and the Servant Problem: Class and Domestic Labour in the Women's Suffrage Movement* (2019).

Jason E. Smith writes about contemporary philosophy, art and politics. His book on automation is called *Smart Machines and Service Work: Automation in an Age of Stagnation* (2019). He teaches in the Graduate Art Department at Art Center College of Design in Pasadena, California.

Panagiotis Sotiris is a journalist and independent researcher working in Athens. He has taught social and political philosophy at the University of Crete, Panteion University, the University of the Aegean, the University of Athens and the Hellenic Open University. A member of the editorial board of *Historical Materialism*, he has edited the collective volume *Crisis, Movement, Strategy: The Greek Experience* (2018) and is the author of *A Philosophy for Communism: Rethinking Althusser* (2020).

Guido Starosta is Professor in the History of Economic Thought at the National University of Quilmes and a member of the National Council of Scientific and Technical Research (CONICET). He has previously held teaching and research positions at the universities of Manchester and Warwick. His research interests are in issues of method, value-form theory and subjectivity in the Marxian critique of political economy. He is the author of *Marx's Capital, Method and Revolutionary Subjectivity* (2015) and co-editor of *In Marx's Laboratory* (2013). His other publications on these themes have appeared in *Capital and Class*, *Historical Materialism* and *Science & Society*. He also works on the political economy of development (with a regional focus on Latin America), and his work has appeared in *Antipode*, *New Political Economy* and *Third World Quarterly*. He is co-editor of *The New International Division of Labour: Global Transformation and Uneven Development* (2016).

Krystian Szadkowski is Assistant Professor at the Faculty of Philosophy, Adam Mickiewicz University Poznań. He is the editor of the Polish Marxist journal *Praktyka Teoretyczna*, and his interests cover Marxist political economy and transformations of higher education systems in Central Eastern Europe, as well as the issues of the public and the common in higher education. He has worked as a researcher for Education International (Brussels) and as a consultant in policy projects funded by the Polish Ministry of Science and Higher Education. He is currently working on the book *Capital in Higher Education: A Critique of the Political Economy of the Sector*.

Nicholas Thoburn is Reader in Sociology at the University of Manchester. He writes on political publishing, critical theory, social movements and architecture. He is the author of *Anti-Book: On the Art and Politics of Radical Publishing* (2016) and *Deleuze, Marx and Politics* (2003). He is a member of the editorial board of the culture and politics journal *New Formations*.

Oxana Timofeeva is a Professor of the Centre for Practical Philosophy 'Stasis' at the European University at St Petersburg, a leading researcher at Tyumen State University, a member of the artistic collective Chto Delat? (What is to be done?), the deputy editor of the journal *Stasis* and the author of the books *History of Animals* (2012, 2018), *Introduction to the Erotic Philosophy of Georges Bataille* (2009) and *How to Love a Homeland* (2020).

Massimiliano Tomba obtained his PhD in Political Philosophy at the University of Pisa. He is Professor in the History of Consciousness Department at the University of California, Santa Cruz. Previously, he taught political philosophy at the University of Padova. He has published several books on the political philosophy of Kant, Hegel, the post-Hegelians, Marx and Walter Benjamin, among them *Krise und Kritik bei Bruno Bauer. Kategorien des Politischen im nachhegelschen Denken* (2005), *La vera politica. Kant e Benjamin: la possibilità della giustizia* (2006), *Marx's Temporalities* (2013), *Attraverso la piccola porta. Quattro studi su Walter Benjamin* (2017) and *Insurgent Universality: An Alternative Legacy of Modernity* (2019).

Samo Tomšič obtained his PhD in philosophy at the University of Ljubljana. He is currently a Research Associate at the Humboldt University Berlin and a Visiting Professor at the University of Fine Arts Hamburg. His research areas comprise contemporary European philosophy, psychoanalysis, structuralism and epistemology. He is the author of two monographs in English, *The Capitalist Unconscious: Marx and Lacan* (2015) and *The Labour of Enjoyment: Toward a Critique of Libidinal Economy* (2019).

Ben Trott is based at the Institute for Philosophy and Art Theory within the Faculty of Humanities and Social Sciences at Leuphana University of Lüneburg. His work has been published in the *Cambridge Journal of Economics*, *South Atlantic Quarterly*, *Emotion, Space & Society*, *Global Discourse*, *ephemera: theory & politics in organisation* and the *Journal of Labor and Society*. He is co-editor with Mike Laufenberg of *Queer Studies: Schlüsseltexte*, which is forthcoming with Suhrkamp.

Carlo Vercellone, economist, is Full Professor at University of Paris 8, Department of Culture and Communication. He is also a member of the Centre d'Études sur les Médias et l'Internationalisation (CEMTI) and Associate Researcher at CNRS-Centre d'Économie de la Sorbonne (CES) and Sophiapol (University of Paris 10). His research focuses on the knowledge economy, cognitive capitalism, the welfare state and basic income, political economy of the commons, platform capitalism and digital labour. His latest publications are 'From New Institutional Economics of the Commons to the Common as a Mode of Production' (2019, with A. Giuliani, *South Atlantic Quarterly*), *Cognitive Capitalism, Welfare and Labour* (2019, with A. Giuliani, S. Dughera, A. Fumagalli and S. Lucarelli), and 'Les plateformes de la gratuité marchande et la controverse autour du Free Digital Labor : une nouvelle forme d'exploitation ?' (2020, *Revue Ouverte de l'Ingénierie des Systèmes d'Information*).

Marina Vishmidt is a writer and editor. She teaches at Goldsmiths, University of London. Her work has appeared in *South Atlantic Quarterly*, *Ephemera*, *Afterall*, the *Journal of Cultural Economy*, *Australian Feminist Studies* and *Radical Philosophy*, among others, as well as a number of edited volumes. She is co-author of *Reproducing Autonomy* (2016, with Kerstin Stakemeier) and *Speculation as a Mode of Production: Forms of Value Subjectivity in Art and Capital* (2018, 2019).

She is one of the organisers of the Centre for Philosophy and Critical Thought at Goldsmiths, a member of the Marxism in Culture collective and on the board of the New Perspectives on the Critical Theory of Society series (Bloomsbury Academic).

Gavin Walker is Associate Professor of History at McGill University in Montreal, Quebec. He is the author of *The Sublime Perversion of Capital* (2016) and the forthcoming *Marx et la politique du dehors*. He is the editor of *The End of Area: Biopolitics, Geopolitics, History* (2019, with Naoki Sakai) and *The Red Years: Theory, Politics, and Aesthetics in the Japanese '68* (2020) as well as the editor and translator of Kojin Karatani's *Marx: Towards the Centre of Possibility* (2020). He is the author of dozens of articles and chapters in critical theory, modern intellectual history and the history of Marxist theory. Among other projects, he is now writing a short book on the national question.

Jeffery R. Webber is an Associate Professor in the Department of Politics at York University, Toronto. His latest book is *The Last Day of Oppression, and the First Day of the Same: The Politics and Economics of the New Latin American Left* (2017).

Amy E. Wendling is Professor of Philosophy and Associate Dean of Humanities and Fine Arts at Creighton University, a Jesuit University in Omaha, Nebraska. She is the author of two books: *Karl Marx on Technology and Alienation* (2009) and *The Ruling Ideas: Bourgeois Political Concepts* (2012). She has written many articles about the philosophy of technology, political economy, ethics and the intersections of race and gender with the capitalist social form, among other topics. She is a member of Phi Beta Kappa, the American Philosophical Association, and the Society for Phenomenology and Existentialist Philosophy.

Kalpana Wilson is a Lecturer in the Geography Department at Birkbeck, University of London. Her research explores questions of race/gender, labour, neoliberalism, imperialism and reproductive rights and justice, with a particular focus on South Asia and its diasporas. She is the author of *Race, Racism and Development: Interrogating History, Discourse and Practice* (2012) and co-editor of *Gender, Agency and Coercion* (2013). She has published widely on themes of race, gender, international development, women's agency and rural labour movements in journals including *Development and Change*, *New Formations*, *Feminist Review* and *Antipode*. She is a founder member of the South Asia Solidarity Group.

Jamie Woodcock is a Senior Lecturer at the Open University and a researcher based in London. He is the author of *The Fight against Platform Capitalism* (2021), *The Gig Economy* (2019), *Marx at the Arcade* (2019) and *Working the Phones* (2017). His research is inspired by workers' inquiry and focuses on labour, work, the gig economy, platforms, resistance, organising and videogames. He is on the editorial board of *Notes from Below* and *Historical Materialism*.

Introduction: Mapping the Marxist Multiverse

Svenja Bromberg, Sara Farris,
Beverley Skeggs and Alberto Toscano

WHICH HANDBOOK FOR WHAT MARXISM?

The handbook is not a neutral form in which to try and gather, as we have here, some of the most innovative, expansive and inquisitive critical research in contemporary Marxist theory. Ever since a 25-year-old Karl Marx, penning his critique of Hegel's *Philosophy of Right* in the *Deutsch-Französische Jahrbücher*, asserted that 'theory also becomes a material force as soon as it has gripped the masses', the intellectual traditions that he and Friedrich Engels initiated have been incessantly preoccupied with how to compile, clarify and circulate the arguments, methods and findings of a critical project that has never enjoyed the comforts of self-sufficiency – even when it ascended into the rarefied air of mathematical formalisation or sought shelter in the institutions of higher learning and social reproduction. And so, when in 1878 the Italian anarchist Carlo Cafiero threw himself into the arduous task of compressing the first volume of *Das Kapital* into a 100-page *Compendium*, a veritable pocket abridgement, Marx greeted his efforts 'to make an impression on the public' with gratitude, while hoping that in the future he would place 'greater emphasis on [the] materialist basis of *Capital*'.¹

In the wake of Marx's death, Marxism came to be consolidated or crystallised into doctrinal forms that were always hotly contested – within and between tendencies, parties or indeed states that in different ways referred back to the authors of *The Communist Manifesto* and *The German Ideology* for guidance and legitimation. While each strand and school may have tried to claim

correctness and continuity with the ‘classics’ or, in that burdensome formula, the ‘founding fathers’, Marxisms have always been partial, polemical totalisations, ever since Karl Kautsky tussled with Eduard Bernstein over the theoretical direction of German social democracy in the 1890s, the very intellectual conjuncture in which the first ‘crisis of Marxism’ was declared. As Marxism came to be framed and over-determined by party and state forms, the tasks of organisation, pedagogy, proselytism and propaganda that accrued to it and the workers’ movement throughout the twentieth century often found a momentary vehicle in the handbook and similar formats.

Sometimes, as in the Third International’s manual *Armed Insurrection*, anonymously co-authored among others by Ho Chi Minh and Mikhail Tukhachevsky,² the weapons of criticism could be wholly subordinated to criticism by weapons. Or, as in Emil Burns’s 1935 *A Handbook of Marxism*,³ the handbook could serve as a kind of authoritative breviary, reducing Marxism – this fractious, mutable, ephemeral science – to the abridged and quotable works of Marx, Engels, Lenin and Stalin, capped by the programme of the Third International. Handbooks or manuals could also be the object of instructive and consequential criticisms internal to the Marxist camp. In his prison notebooks, Antonio Gramsci took Nikolai Bukharin (who had earlier co-authored another important manual, namely the *ABC of Communism*) to task for distorting, in his *Historical Materialism: A Popular Manual of Marxist Sociology*, the philosophy of praxis into a sociology. He criticised the Bolshevik theorist and leader for grafting a schematic Marxist sociology onto a metaphysical materialism, while not really addressing the key material for such a handbook, namely popular ‘common sense’, with all its sedimentations and contradictions.⁴ The handbook could also serve as a way of synthesising and popularising particular theoretical approaches within Marxism, as in Marta Harnecker’s best-selling *Los conceptos elementales del materialismo histórico* (The Elementary Concepts of Historical Materialism), the second edition of which in 1970 was prefaced by her former teacher Louis Althusser.⁵

We write this introduction two decades into a twenty-first century that very much appears as a Gramscian interregnum, now plagued all too literally by ‘morbid symptoms’, which in the guise of the Covid-19 pandemic have revealed the myriad ways in which the ‘old’ – the mode of production that has governed our life-worlds for centuries – is not so much dying as killing both human beings and the very possibility of novel and just ways of organising collective life on this finite planet. The handbooks of the 1900s have become largely archaeological artefacts of the short twentieth century, while the nexus between socialism and print has been profoundly transformed.⁶ But while many of the forms of struggle and organisation that marked Marxism’s determining presence on the historical stage of the ‘age of extremes’ have passed, we are convinced that the idea of a Marxist handbook is more urgent than ever. Often dated to the aftermath of the 2007–8 financial crisis, but seeded by the upsurge in anti-capitalist theorising in the context of the 1999 ‘Battle of Seattle’ and the ‘anti-globalisation’ movement,

a renascent interest in, and circulation of, Marxian and Marxist ideas has certainly been in evidence over the past few years. This has occurred not just in grudging recognitions by penitent liberal commentators, but in the context of a mainstreaming of progressive ideological challenges to the neoliberal despotism of TINA (there is no alternative) – from debates around the capitalist origins of the climate crisis and projects for ‘Green New Deals’ to the combative prominence of anti-racist and abolitionist discourses in the wake of the George Floyd Rebellion, from the International Women’s Strike to global opposition to a predatory and plundering regime of financialisation.

From Southern Europe to Latin America, and in the political context and conjuncture where this collection was conceived, the UK, leftist advances have largely been repelled, but the intellectual ferment is real. Much of this has been rendered possible by the independent work of journals which, struggling against the frequent hostility of academic institutions or the doctrinal shibboleths of political organisations, have created spaces for the production and reproduction of Marxist thought. Three of the editors have been closely involved with the journal *Historical Materialism* – whose pages and annual conferences, both in London and internationally, have served as an immensely fecund meeting point with a wide range of scholars, activists and theorists committed to a critical renewal of the Marxist tradition, many of whom we are fortunate to host in this *Handbook*. But to restrict ourselves to the Anglosphere, without the *Monthly Review* and *Rethinking Marxism*, *Race & Class* and *New Left Review*, *Feminist Review* and *Midnight Notes*, the creation if not of a counter-public sphere or a counter-hegemony but at least an alternative to the myriad ways of *not* really talking about capitalism or its others, would not have been possible. More recently, publications like *Viewpoint*, *Endnotes*, *Spectre* and *Jacobin* have reinvented the nexus of politics, text and theory in ways both attuned to a very different media ecology and to the most urgent challenges of the present.

In a poem entitled ‘Thought in the Works of the Classics’, from his wonderful compendium of dialectical parables, *Me-Ti: Book of Interventions into the Flow of Things*, the German playwright and theorist Bertolt Brecht suggests that though Marxist thought ‘appears so commanding / It still shows that it means nothing without an audience / Would neither have come nor know / Where to go or where to stay / If not accepted. Indeed, if not taught / By those ignorant yesterday / It would quickly lose its force and rapidly collapse’.⁷ While we brook no illusions that a handbook such as ours will have the reach of Marxist manuals from past revolutionary conjunctures, we know that the chapters in these volumes bear the imprint not just of bygone but of ongoing experiences of activism, militant research and political organisation. The authors of this *Handbook*’s entries have all found ways of teaching themselves Marxism in and by teaching others, and of realising that the ‘classics’ only mean something with an audience – especially that of a generation of students born well after socialism or Marxism appeared as epochal, geopolitical forces, and encountering capitalism in the

strikingly unmediated if potentially disabling form of their own educational debt. This *Handbook*, born out of the editors' own pedagogical experiences, as well as their research and political commitments, is centrally oriented by the problem of how to make Marxism a living concern, a vital method, in a conjuncture where many political and ideological continuities have been shattered, while capitalism still stands, as Marx suggested in the third volume of *Capital*, as 'the religion of everyday life'.

WITHOUT GUARANTEES, WITHOUT APOLOGIES: REMAKING MARXISM FOR THE TWENTY-FIRST CENTURY

While Marxist thought might not be subject to the same embargos and anathemas that marginalised it in earlier moments, the current articulation of theory and praxis is extremely lopsided. While critiques of capitalism, even ones that foreground Marxist categories, have gained in circulation and acceptability – prodded not least by the eye-watering acceleration of inequality over the past decades – the 'indissoluble nexus between scientific theory and revolutionary political praxis'⁸ that had long defined the singularity of Marxism appears to have collapsed; indeed, as Lefebvre declared in the midst of the last 'crisis of Marxism', the abyss between theory and praxis should become the starting point for a contemporary reflection on Marx and Marxism.⁹ While perversely flattering to radical egos, the conspiracy theories coursing through a planetary alt-right (and the Tory party) regarding the Caligari-like powers of 'Cultural Marxism' (and its kin Critical Race Theory) wildly project the secret victories of Max Horkheimer or Antonio Gramsci where what we have are but relative progressive gains in certain spheres of education and longer-term mutations in social mores. And while one cannot but salute the presence of laudatory articles on Marx in the likes of *Teen Vogue* – including aperçus sorely missing from many more 'classical' Marxists, such as the recognition that '[m]any political writers and artists like Angela Davis, Frida Kahlo, Malcolm X, Claudia Jones, Helen Keller, and Walter Rodney integrated Marxist theory into their work decades after his death'¹⁰ – the mere popularisation and diffusion of ideas linked to his work and that of other revolutionary thinkers in his tradition was not quite what the 'Old Moor' meant by theory gripping the masses.

That said, this *Handbook* was not born from a spirit of defeat but one of enthusiasm at finding ourselves part of a motley and international crew of scholars committed not to the beleaguered guardianship of the holy texts against the corruptions of Mammon and Moloch, but to the searching, disputatious, (self-)critical and inescapably collective labour of forging tools with which to carve capitalism at its joints. This is not just a matter, to borrow the felicitous and influential metaphor of Frantz Fanon, of 'stretching' Marxism – which might suggest a more unified or settled Marxist canon than we'd be prone to accept – but of

reworking it under changed and changing conditions, with and for subjects and contexts of struggle that are not the ones under which its concepts and categories were originally forged.¹¹ The inescapably *material, historical and political* nature of concepts, so central to the very notion of a historical materialism, must be applied to Marxism itself – as so many of the authors in this handbook generatively demonstrate.

In a recent interview, Angela Y. Davis – addressing in particular the way in which the notion of racial capitalism has sometimes been seen as of late to require placing a wedge between Marxism and the Black radical tradition – has tackled the issue of reworking Marxism in the present with a spirit of critical generosity that we have tried to make our own in bringing this *Handbook* together. As she writes:

I think that we are not so much ‘stretching Marxism’ as we are continuing to build upon and critically engage with its insights. Dedicated adherents to a particular way of thinking often assume that to challenge any of the associated ideas is a disavowal. In both his works of philosophy and political economy, Marx always emphasised critique – and, of course, this became the primary approach of the Frankfurt school: critical theory. What I find especially inspiring about the Marxist tradition is its emphasis on interdisciplinarity. Even as *Capital* is categorised as a work within the discipline of political economy – despite the fact that Marx considered it a *critique* of political economy – if one reads it, one discovers philosophy, literature, sociology (which was not yet an institutionalised discipline), cultural critique, and so on. What I have always appreciated is the openness of Marx’s work, its implicit invitation to push it in new directions.¹²

Davis’s qualification also deserves quoting: ‘Unfortunately, reductionist tendencies of some contemporary Marxist literatures create an inhospitable climate for the continuation of the tradition of critique through serious engagement with new theoretical approaches associated with Black and women of colour feminisms’.¹³ Our gamble in this *Handbook* has been to foreground those perspectives within contemporary critical Marxist theory which eschew, or indeed dismantle, such reductionism while remaining committed to the analytical and political potentials of an open Marxist framework. We are thus building upon but also problematising concepts and insights inherited from a polymorphous and contested tradition (so contested and divisive that it might on occasion be more just to speak of traditions, recognising what Lefebvre termed ‘an exploded Marxism’¹⁴). We have also tried to heed David Roediger’s timely meditations on ‘the difficulty of maintaining a comradely tone during periods of social quiescence’, phases when the accumulation of defeats for race, class and gender justice ‘structures both our confusion and our bitter certainties’.¹⁵ How to foster agonism without antagonism, contradiction without calumny, has been a preoccupation throughout the envisioning, commissioning and composition of this *Handbook*.

Almost four decades after Stuart Hall declared the need to move towards a Marxism without guarantees, it seems it is the only Marxism we can or should seek to inhabit. Leaving aside the amused reference to a flourishing Marxist sectarianism, now largely vanished, Hall’s comments at an Australian centenary symposium on Marx in 1983 still resonate:

There is no need to insist that there is a single, unified marxism; you have only to come into any public meeting and you can see the 57 varieties. There is no need to insist that his was a dogmatically finished and completed theoretical labour – anybody who dares to end the critical volumen of his major work with a question: ‘What is class, then?’ and dies – is clearly not in the business of wrapping the whole thing up. Indeed the notion that somewhere back there is the Book of Revelations or Old Moore’s Almanac – a sort of litany that you look up when you are not feeling good, or to find out whether you should travel on Friday the 13th – a general book by which you guide and shape your life – is contrary to virtually every line that Marx wrote. He was irreligious, deeply secular, highly rationalist, critical theoretical and historical. In my view the crisis of Marxism liberates us for some future kind of marxism work though it disables us from some other kinds.¹⁶

This *Handbook* is certainly no almanac of predictions or Book of Revelations, but it very much seeks to map that ‘future kind of Marxism’, our own contemporary Marxism, which responds to (and may in a sense have been ‘liberated’ by) the crisis of Marxism that accompanied the upsurge of neoliberalism – which we take to have been above all a *political* crisis intimately linked to the *unmaking* of a particular figure of class (paradigmatically white, industrial, male, Western) – and the revolutions in capitalism’s forms of exploitation and regimes of accumulation. The generativity and generosity of much contemporary Marxist research – or research which may not identify itself as Marxist but is happy to integrate and rework Marxist concepts and methods without apology or compunction – is also a product of this absence of guarantees, this lived sense that there is no (implicitly fragile, precarious) doctrinal kernel that must be defended against enemy incursions. Expatriated, ‘orphaned’ from any socialist homeland imagined or real, and without nostalgias, such a Marxism can certainly breed disputes, differences, polemics but its relation to other intellectual and political traditions of anti-capitalism, liberation and critique is not modelled on that fortress paradigm which was for so long the (at times forgivable) weakness of Marxisms trying to survive in the deeply inhospitable ecosystems of late capitalism.

We could also suggest, by way of mild provocation, that such a non-defensive practice of Marxism largely undermines the very *raison d’être* of that rather nebulous entity which is post-Marxism (unless we restrict the latter to the theoretical propositions of Ernesto Laclau, Chantal Mouffe and their followers). Post-Marxism requires the preliminary closure of Marxism, the transformation of a method and a research programme into dogma, of what Hall called Marx’s ‘critical and subversive thoughts’ into settled and conservative ones, the turning of the plural, conjunctural and disputatious multiverse of Marxism (to borrow a notion from the great Marxist thinker of utopia, Ernst Bloch¹⁷) into a closed and repetitious universe, wherefrom to plan one’s deconstructive escape.

Instead of positing a monolithic, metaphysical, foundational Marxism, from whose clutches a contemporary thinking of emancipation must extricate itself, it is more fruitful to attend to the multiple ways in which Marxism emerges as a *decentred* kind of theory, a science that is revolutionary to the very extent that its motor and standpoint – exploited and classed historical subjects in struggle, in their variety and contingency – lives outside of it, and cannot be merely

deduced from capital as that theory's object. In a text from 1975 that was only recently published, the French Marxist philosopher Louis Althusser perspicuously observed that Marx's writing shared a singular trait with those of two other unclassifiable theoretical pioneers, Niccolò Machiavelli and Sigmund Freud: 'The impression of finding ourselves confronted with texts (theoretical and abstract though they may be) whose status does not come under the usual categories: texts that are always to one side of the place they occupy, texts lacking an inner centre, texts which are rigorous, yet seem to be dismembered, texts that designate a space different from their own'.¹⁸ Once again, as in the abovementioned poem by Brecht, the problem is that of the audience, or of what Althusser will call 'the virtual position of the interlocutor in the topography' of Marxist theory. This interlocutor, a reader who will come to Marxism with their struggles and their positions, individual and collective, and who will in turn be interpellated by it, dislocates the theoretical apparatus. As Althusser further observes:

The theory's internal dispositive, insofar as it is *unbalanced*, induces a disposition to practice that continues the theory by other means. This is what lends Marxist theory its strangeness and what is responsible for the fact that it is necessarily unfinished (not like an ordinary science, which is unfinished only in its theoretical order, but in a different way). In other words, Marxist theory is haunted, in its theoretical dispositive itself, by a certain relationship to practice, which is at once an existing practice and a practice to be transformed: politics.¹⁹

We hope that this *Handbook* too, in its very diverse components, is 'unbalanced' in the sense of giving the reader a detailed and complex sense of how the most exciting contemporary Marxist scholarship across a welter of domains embraces its being haunted, unfinished by practice and politics.

AIMS, STRUCTURE, CONTENTS

The *Handbook* is a labour of love that has been in gestation for a long time: We began the project in 2012 at Goldsmiths when we were all teaching together. Since then we have faced many challenges (as have the contributors) including three deaths of close family members, serious illnesses, three children born, employment problems, institutional challenges, plus the regular difficulties of combining writing with everything else. Social reproduction was made apparent in every way. The *Handbook* became a much larger task than we had imagined, but also a much more exciting one, as we discovered the huge amount of recent scholarship on and with Marxism, scholarship that took many different and unanticipated directions. We hope that the contributions we have assembled will serve as a foundation and direction for contemporary Marxist research and provide new angles and approaches for the analysis and critique of contemporary capitalism in the twenty-first century.

The aims for the *Handbook* were from the beginning manifold in that we wanted to bring together contributions that revisit and rework classical Marxist concepts; those that bring Marxist ideas and frameworks to bear on concepts and problems that were never or barely the focus of Marx, Engels and other ‘classical Marxist’ figures, thereby reinvigorating the uses to which Marxism can be put; inquiries and interventions into contemporary debates that draw on Marxist ideas and frameworks of analysis; and accounts of the role Marxism and Marxist methods play in different disciplinary, interdisciplinary and transdisciplinary domains and fields. We also strongly wanted to break with the widespread tendency in previous handbooks of Marxism, as well as in some areas of Marxist scholarship, to neglect or marginalise research and authors concerned with race, gender and sexuality in particular. Such a marginalisation and neglect often took the form not so much of excluding these topics, but of relegating women, people of colour or queer authors to topics directly pertaining to racism or sexism, while the bulk of Marxist concepts remained the exclusive domain of white, Western male writers. Our attempt to fight these tendencies has not always been entirely successful. We had to confront the problem that the field of Marxist political economy remains predominantly male and white; moreover, a number of women, people of colour and queer authors we tried to commission were unavailable or had to pull out of the collection due to work and life demands. Within the limitations of our knowledge and networks, the goal has always been that of identifying and approaching for each topic those contributors whom we believed could provide an expert and fresh approach that would expand Marxist horizons in transformative dialogue with feminist, racialised and non-Western perspectives.

At the outset of the project, we asked all contributors to give an overview of how they would approach their topic of inquiry, setting out the stakes of past and present scholarly debates, and putting forward their own interpretations and positions on the key issues. As one of our external reviewers noted: ‘A good synthesizing handbook chapter is so hard to write. It needs to be both accessible to new scholars looking for inspiration and appealing to established experts who are ready to be surprised by a fresh take on old topics’. We hope we have achieved this. We are exceedingly grateful to our external reviewers who regularly provided superb constructive criticism. Even though personal reasons and burdensome workloads meant that we lost some contributions along the way, the whole process resulted in three volumes and 87 chapters in total.

The challenge then became how to organise such diverse and numerous contributions in a way that is true to the spirit with which we conceived the *Handbook* as showcasing an open and anti-dogmatic understanding of Marxism, which does not end up recreating well-trodden hierarchies between foundational work and subordinate or optional applications, between Western and global Marxism, or in which political economy trumps other disciplinary engagements with Marxism. After much debate and experimentation, we structured the *Handbook* into seven sections:

Part I: Reworking the Critique of Political Economy

Part II: Forms of Domination, Subjects of Struggle

Part III: Political Perspectives

Part IV: Philosophical Dimensions

Part V: Land and Existence

Part VI: Domains

Part VII: Inquiries and Debates

This structure is our map of sorts for navigating the three volumes – needless to say, there are countless other possible paths our readers can take. Not only do our headings – for instance, ‘forms of domination’ – easily apply to entries in some of the other sections, but the entries themselves contain many implicit and explicit cross-references, suggesting articulations, trajectories and interferences which we have done our best to foster. Whatever the worth of the base and super-structure model, we envisaged the *Handbook* as a living web of concepts, debates and interventions, rather than as a settled edifice of doctrine.

Part I, ‘Reworking the Critique of Political Economy’, gathers entries that focus primarily on Marx’s and Marxist analyses of the logic and history of the capitalist mode of production. The first chapter, on ‘Merchant Capitalism’, by Jairus Banaji, challenges a widespread reading of the history of capitalism as one in which merchants did not play as big a role as large-scale industry, and puts in historical perspective the key role of merchant capitalism for the evolution of the new mode of production. The second chapter, by John Haldon, reconstructs the history and stages of elaboration of the concept of ‘Mode of Production’ in Marx. In Haldon’s reading, the concept of mode of production is to be understood as an ‘epoch of production’ and not a ‘set of techniques’. Under this analytic lens, the mode of production becomes the conceptual tool to determine the differences between different ways of organising wealth and labour in human history. In ‘Social Reproduction Feminisms’, Sue Ferguson, Tithi Bhattacharya and Sara R. Farris outline some of the main contributions to the debate on the nature and role of social reproduction within capitalism and in relation to women’s oppression, particularly as they unfolded in Europe and North America. From the early feminist communists’ articulation of unpaid labour to the Wages for Housework Campaign and Social Reproduction Theory, the authors foreground the centrality of life-making activities for capitalism, but also how such activities have been theoretically and practically undervalued by Marxist and non-Marxist economists alike. Stefano Dughera and Carlo Vercellone’s chapter on ‘Rent’ articulates insights from the *Grundrisse* and the third volume of *Capital* to outline a neo-workerist theory of what they call the ‘becoming-rent of profit’ in cognitive capitalism. They argue that new modes of regulation and development

under contemporary capitalism are based on rent rather than on profit, and this has major implications for the epistemic foundations of capitalism. In the fifth chapter of this section, Tommaso Redolfi Riva focuses on Marx's theory of value as the specific form that labour assumes in a society in which its socialisation is achieved by means of a system of private monetary exchange of commodities and as the impersonal form of social domination in capitalist society. Redolfi Riva reads Marx's theory of value not as the arrival point of the classical labour theory of value, but as a distinct theory that is discontinuous with previous theoretical traditions. In the entry on 'Money and Finance', Jim Kincaid reconstructs Marx's monetary theory along three main axes: 1) money as a measure of the socially necessary labour time required to produce commodities; (2) credit money as the major form of money in capitalist society; and 3) money capital as both the starting point and the end point of the circuit of production and circulation which is central in a capitalist system. This chapter is followed by one on 'Labour', by Guido Starosta, who provides a comprehensive discussion of the notion of labour in Marxian social theory. Starosta offers a systematic reconstruction of the concept of labour as the 'unity of its many determinations', which appear scattered in Marx's own writings. Taking the simplest determination of human labour as conscious life-activity, the chapter probes further into the different concrete determinations that comprise the material character of production and its changing historical modes of existence. In the entry on 'Automation', Jason E. Smith details how Marx saw the automatic factory as a technical and material 'mode' of producing posited by the inner tendencies of capital itself. Yet, for Smith, Marx envisioned obstacles to the automation of certain labour processes, due either to the nature of the labour process itself or to the nature of the 'laws' governing the development of the capitalist mode of production. In the chapter on 'Methods', Patrick Murray argues that Marx adopted Hegel's method of immanent critique directed at philosophy and political economy. Ultimately, Murray looks at Horkheimer's interpretation of Marx's method as one that allows us to better understand Marx's conceptual toolbox. The last chapter of this part, 'The Transformation Problem', by Riccardo Bellofiore and Andrea Coveri, argues that if Marx's value theory of labour is reconstructed as a macro-monetary theory of capitalist production, the transformation from values to prices can be proved irrelevant to the validity of the key concept of exploitation. The latter, they contend, has to do with the social form of production, being grounded in the consumption of workers as living bearers of labour-power.

Part II, 'Forms of Domination, Subjects of Struggle', begins with Bev Skeggs's chapter on 'Class', which takes its starting point from a critique of the marginalisation of class analysis within Marxism. For Skeggs, centring class means understanding it not just as an analytical category but as a symbolic space in which struggles to extract, defend and protect value are dynamically shaped and lived in the context of the cultural logic of capitalism. Alessandro De Giorgi's entry offers a reconstruction of different neo-Marxist perspectives on 'Punishment'. From the

revisionist histories of punishment of the 1970s, to the critique of penalty, to the economic reductionism of some neo-Marxists who have not paid sufficient attention to racialisation and the symbolic and political dimensions of punishment, De Giorgi surveys the field and offers new research directions. In the chapter on 'Race', Brenna Bhandar offers a view of three major figures in the Black radical tradition: Stuart Hall, Cedric Robinson and Angela Y. Davis, exploring how they engaged with Marxist thought and its limitations as they relate to the articulation of race and capitalism. Here Bhandar shows the ways in which Marxist thought interacted with other critical theories of capitalism to develop theoretical frameworks able to capture the role of race within our social formations. Leonardo Marques's chapter on 'Slavery and Capitalism' reconstructs key positions as well as lesser-known contributions concerning the connections between slavery and capitalism within and beyond Marxism. In particular, he focuses on the scholarship that revolves around the New History of Capitalism, which has renewed interest in Marx's and Marxist approaches to slavery. In the chapter on 'Gender', Sara R. Farris outlines some of the main tenets of the theorisation of 'gender' within Marxism. From Marx's early writings to Engels's *The Origin of the Family, Private Property and the State*, and on to the main contemporary debates among Marxist and socialist feminists on the relationship between gender relations and relations of production, as well as on ideology, race and transness, the chapter foregrounds the category of gender as a central theoretical and practical battlefield for the definition of Marxist and left political strategies. Laura Schwartz's chapter on 'Servants' provides a theoretical and historical reconstruction of the figure of the servant within Marx's economic theory as well as within subsequent Marxist perspectives and movements. While Marx considered servants as an unproductive category of workers from a capitalist viewpoint, feminists have challenged some of the main tenets of Marx's views and offered new insights into the role of the servant class for capital accumulation.

Part III, on 'Political Perspectives', is introduced by Panagiotis Sotiris's chapter on 'Politics'. Here Sotiris retraces Marx's thinking on politics and political practice and how such questions were answered by various traditions of Marxism. From Lenin, Gramsci and postwar Marxism to the discussions that followed 1968, and on to those that occurred in the context of the new radicalism emerging at the end of the millennium around the 'Battle of Seattle', the chapter offers an overview of different debates on politics in Marxism that centre on the state and left-wing political strategy. In the chapter on 'Revolution', the late Neil Davidson focuses on the concept of 'social revolution' vis-à-vis that of 'bourgeois revolution' as developed by Marx and Engels in particular. The fate of the state, for Davidson, is the key to determining the form taken by any revolution as well as its potential success. Heide Gerstenberger's chapter on the 'State' begins with a critique of supra-historical conceptions of state power. For Gerstenberger, capitalist state power is defined by the separation of state and society, not of politics and economics. Such a distinction defines Marxist state theory and its approach to the analysis of state

functions and political strategies. Gavin Walker's entry on 'Nationalism and the National Question' considers the political history of debates on the nation within socialist practice. He presents a comprehensive theoretical assessment of the limits and possibilities of the analysis of nationalism within contemporary Marxism. Ken Kawashima's chapter on 'Crisis' focuses on the concept of capitalist crisis in Marx in four movements: (1) crisis as excess capital and surplus populations, (2) as a phenomenon of capitalist accumulation that is possible and inevitable, (3) as interregnum and political crisis and (4) as transition towards revolution. Alberto Toscano's essay on 'Communism' reviews the semantic and political history of communism before Marx, and its ensuing appropriation by Marx (and Engels), particularly after the Paris Commune, whose success and defeat inspired generations of Marxists, from those focused on a critique of social democracy to those attempting to define a non-state state. The chapter also gives an overview of theoretical debates on communism that emerged in the wake of the '68 movement and addresses contemporary discussions on abolitionism as a vital dimension of the problem of communism. In the subsequent chapter on 'Imperialism', Salar Mohandesi surveys the history of Marxist theories of imperialism, analyses the shared limitations of those theories and concludes by discussing a way forward that incorporates insights from state theory. In particular, Mohandesi interrogates the crisis of the concept of imperialism within contemporary Marxism and argues that instead of abandoning the term, we need to address one of its enduring weaknesses: the under-theorisation of the role of the state.

Part IV gathers texts that focus on the 'Philosophical Dimensions' of Marx and Marxist traditions. The first chapter, by Chris O'Kane, reconstructs the concept of 'Totality' in Marx and in subsequent theorisations of a number of Marxists. O'Kane identifies a double-faceted conception of totality within most Marxist approaches: on the one hand, a tendency to critique non-Marxist ideologies as unable to grasp society as a whole; on the other, the theorisation of totality as that which can grasp history as a whole from an emancipatory perspective. In the chapter on 'Dialectics', Harrison Fluss traces the development of dialectics, from its pre-history in Kant's critical philosophy towards its contemporary expressions in today's theoretical conjuncture. Fluss discusses the strengths and limits in Hegel's philosophy as well as debates on the dialectics of nature, the relationship between dialectics and ontology, and the ambiguous status of dialectics in Marx and Engels. In the chapter on 'Time', Massimiliano Tomba explores the concept of time in Marx in relation to value in order to show how under capitalism time comes to be dominated by socially necessary labour time. The latter not only determines the value of commodities, but also works as the normative temporality that compresses and synchronises many temporalities. Tomba furthermore provides an analysis of time that outlines the parallel temporalisation of space, which produces a field of possibilities in which conflicting temporalities open up room for liberation. In the chapter on 'Space', Kanishka Goonewardena offers a survey of various invocations of space and geography in Marxism and allied radical political traditions in order to make sense of its

significance for left revolutionary politics today. From Marx and Engels's important reflections, to Lefebvre's path-breaking work on space, to the writings of Gramsci, Williams, Massey, Harvey, Neil Smith and others, Goonewardena advocates a holistic conception of space that goes beyond the typical conventions of academic disciplines. The concept of 'Alienation' is the focus of Amy Wendling's chapter, which she interprets in light of its Hegelian roots. While alienation is an explicit theme of Marx's early work, the entry also demonstrates that alienation is an enduring theme in his later work. Wendling's essay also reviews the twentieth-century debates that developed around the concept of alienation, arguing that the concept maintains all its salience not as an existential or moral condition, but as a specific condition of capitalist society. In the chapter on 'Praxis', Miguel Candiotti questions the usual understanding of the Marxian concept of praxis as one confined mainly to the *Theses on Feuerbach*. He argues that this delimitation led to the conception of praxis as an activity of the senses, rather than one evident to them. For Candiotti, such an interpretation is at the root of the idealist interpretation of praxis that has traversed different Marxist traditions. The chapter on 'Fetishism', by Anselm Jappe, examines the Western Marxist debate on the concept as developed particularly by Lukács, Rubin, Korsch and Colletti, among others. It then provides an overview of the revived interest in the concept of fetishism after Postone's 'critique of value'. Fetishism is understood as the very heart of Marx's conception of capitalism as a society which is not only 'unjust', but also destructive and self-destructive – an irrational system that is pushing the world towards an epoch-defining economic and ecological crisis. Jan Rehmann's chapter on 'Ideology-Critique and Ideology-Theory' challenges the tendency to place Marx and Engels's concept of ideology in opposition to that developed by Gramsci. On the contrary, Rehmann shows that their particular combination of Ideology-Critique and Ideology-Theory brings them together to allow for the development of a materialist theory of the ideological, one that gets rid of the idea of ideology as 'false' consciousness'. 'Real Abstraction' is the concept examined in the subsequent chapter, by Elena Louisa Lange, who follows, evaluates and critically comments on the place of real abstraction in the work of the German Marxist economist Alfred Sohn-Rethel (1899–1990). The chapter details the trajectory of the concept of real abstraction from Sohn-Rethel's works of the early 1930s through to those of the late 1970s, and attempts to revise and rehabilitate it in the latest, influential readings of real abstraction in Marxian value theory. In the last chapter of this part, Andrés Saenz de Sicilia provides a critical overview of the main theoretical issues and debates surrounding the Marxist concept of 'Subsumption'. The chapter explores the significance of the concept in the philosophical tradition that Marx inherits and then the Marx's engagement with it, first in the context of his philosophical writings and then in his critique of political economy. The chapter then moves to explore the use of subsumption in the work of Adorno and Negri, as well as within labour process theory, Marxological debates and Latin American Marxism.

Part V, 'Land and Existence', begins with Silvia Federici's chapter, 'Primitive Accumulation, Globalisation and Social Reproduction', where she develops an

understanding of globalisation as continuously re-enacted, ‘normalising’ primitive accumulation, and thus producing a systematic devaluation of social reproduction. Federici demands that, instead of invoking some kind of abstract universal subject, we pay attention to the histories of differentially expropriated and oppressed social subjects in order to unmask the immiseration and violence that the capitalist system exerts. Where Federici emphasises capitalism’s urge to expropriate and enclose, Massimo de Angelis in his chapter, ‘Commons’, turns his attention to an alternative, post-capitalist mode of production and organisation of resources: *commoning* as a way for commoners to govern their commonwealth or organise their relations to each other and to nature. Such a new system of production, reproduction and social relationality requires not merely a political rupture or event, but a sustained social revolution that starts with providing alternative solutions to problems that the capitalist system cannot solve. In the following chapter, Verónica Gago positions the concept of ‘Extractivism’ as central to our ability to grasp past and present capital accumulation processes – ranging, in its expanded sense, from the extraction of raw materials and people, to women’s ‘body-territories’, data and financial extraction exercised through debt. For Gago, the extractive logic has become a privileged mode of value production in the current phase of accumulation, and is therefore critical to an updated understanding of exploitation. One salient frontier for contemporary extractivist practices is agribusiness, which is the focus of Kohei Saito’s chapter, ‘Agriculture’. He returns to Marx’s critique of modern agriculture, specifically soil exhaustion and the problem of the natural limit, which he argues needs to be understood in the general context of Marx’s *critique* of political economy. Marx can thereby be seen to offer us an approach to ecological crisis that focuses on the distortive effect that capital has on the metabolic relation between man and nature, highlighting the thoroughly social character of this crisis. In the next chapter, George Caffentzis turns to ‘Energy and Value’ and the revival of Marxist Energy Studies, whose beginnings he traces back to Marx and Engels’s engagements with thermodynamics and the energetic framework that Caffentzis identifies in the value transformations at the heart of Marx’s critique of political economy. Caffentzis’s interest in the recent revival of Marxist and eco-socialist engagements with energy commodities and energy regimes centres on them as sites of class struggle. This emphasis on a working-class politics of climate is also an important vector in the final contribution to this part, namely Matt Huber’s chapter on ‘Climate Change’. While we need to understand the historical and structural role of fossil fuels as constitutive of the shift from the formal to the real subsumption of labour under capital as well as the contemporary manifestations of climate capitalism, it is vital for Huber that we do not fetishise capital and its power at the expense of developing a collective emancipatory politics that strives to socialise and collectivise control over energy systems.

Part VI, ‘Domains’, looks at the role of contemporary Marxist approaches and frameworks in multiple disciplines and fields of study. In her chapter on ‘Anthropology’, Erica Lagalisse opts for a two fold approach, asking how Marx

treated and utilised anthropology for his own project of historicising capitalism and, in turn, how Marxist theory influenced and continues to influence anthropology and ethnographic methods, especially via its concepts of struggle, conflict and class consciousness. In their chapter on 'Art', Gail Day, Steve Edwards and Marina Vishmidt diagnose and map a revival of Marxist, materialist and system-critical approaches to art and art writing since the new millennium against the background of a longer history of the multifaceted relationship between art and Marxism. They identify key debates in the field around the concepts of commodities and value, labour and the labour process and social reproduction. Luisa Lorenza Corna contributes a chapter on 'Architecture' in which she retraces the first, scattered, references to architecture in Marxian and Marxist literature before turning to key moments in the development of a Marxist theory and history of architecture in the second half of the twentieth century, centred around Manfredo Tafuri and Fredric Jameson. For Corna, it is through the foregrounding of concepts such as labour, production, technological advancements and automation that Marxist theory has entered into recent architectural projects and theory. Jeremy Gilbert follows with a chapter on 'Culture' – alongside feminism and anti-racism one of the major dimensions missing from traditional Marxism, both in the anthropological sense of 'making/living' culture and as an understanding of the significance of the symbolic economy and representations. Gilbert rectifies this by tracing the centrality of a Marxist cultural theory from the works of Marx and Engels to the tradition of Cultural Studies that began in Britain in the early 1960s with the key figures of Raymond Williams and Stuart Hall and has continued to develop into the twenty-first century. Brent Ryan Bellamy's chapter on 'Literary Criticism' explores the different discussions of Marxist criticism of literature from the 1970s around concepts such as objective form, absent cause and metacommentary, and then the twenty-first century problematics of financialisation, the subject(s) of capital, world literature and ecology. Siding with Carolyn Lesjak and her imperative of 'reading dialectically', Bellamy defends a Marxist focus on history and form as existing within complex social relations against the anti-political new formalism that arguably dominates the field today. In the next chapter, on 'Poetics', Daniel Hartley develops a theory of a Marxist poetics grounded in Marx's contestation of the strict Ancient Greek separation between *praxis* and *poiēsis*. This Marxist poetics has three strands: communist poetry, a literary theory that understands literature as an 'imitation of action' [*mimēsis praxeōs*] and, finally, literature as a modality of political organisation. In the chapter on 'Communication', Nick Thoburn analyses how capitalist accumulation shapes communication and communicative forms such as the book, the manifesto, the journal and social media. He asks what a Marxist counter-politics of textual communication might look like. For Thoburn, this will require answering the Adornian question of which textual and media forms might better articulate the fractured non-identity of class. Maïa Pal, in her chapter on 'International Relations', portrays the relationship between mainstream 'international relations'

(IR) and Marxism as a mutually challenging one, in the sense that a Marxist critical perspective is interested in problematising the emergence of nation-states in the wake of the West's imperialism and its mission to universalise capitalism, rather than neutrally forecasting states' behaviours on the international terrain. At the same time, Marxist theory itself suffers significant shortcomings when it comes to theorising the state, the international and imperialism, which Marxist IR scholars have had to grapple with. 'Law', as Rob Knox shows in his contribution, suffered a similar lack of systematic theorisation in Marx and Engels's oeuvre, which serves as one explanation why it remained peripheral to the Marxist tradition, even though legal thought and concepts such as property are absolutely central to capitalism and thus to any critique of political economy. Knox concludes by surveying a contemporary commodity-form-theory revival following Pashukanis, while pointing to yet underdeveloped areas of Marxist legal scholarship concerning race, gender, sexuality and other antagonisms not reducible to class. In the next chapter, Gerard Hanlon addresses 'Management', a topic rarely foregrounded in Marxist critiques of capitalism, even though it is, as Hanlon argues, indispensable to closing the gap between the potential labour that could be achieved by workers and that is actually provided. Through processes of standardisation and differentiation of the workforce along gender, race, class, age and other axes, management instils discipline and thereby plays a central role in making capitalist social relations hegemonic in the workplace. Addressing the relationship between Marxism and philosophy, Roberto Mozzachiodi develops his argument around the problem of 'The End of Philosophy' and its continued pertinence in contemporary debates. He identifies the problematic as having been introduced in Marx and Engels's writings and later taken up with renewed fervour, first in the interwar period as a challenge to the so-called Marxist orthodoxy and then again in French Marxist debates during the Cold War, specifically by Henri Lefebvre and Louis Althusser. Les Levidow and Luigi Pellizzoni turn to another contentious topic for Marxism, namely 'Technoscience', or science and technology. While Marx at times presented 'science' as a desirable exit from philosophy, designating it as a critical method for analysing how reification and fetishism naturalise capitalist social relations, prevalent Marxist approaches ended up adopting or imitating positivist science and making claims for scientific objectivity. Levidow and Pellizzoni examine contemporary debates with an interest in a contradictory potential in technology, understood both as an enclosing resource and a knowledge commons, while also considering how it might facilitate communities that can create new commons beyond capitalism. In her chapter on 'Postcolonial Studies', Jamila M. H. Mascat retraces what she calls 'the unhappy marriage' between Marxism and postcolonial studies, from the inception of the latter as an academic field in the 1980s to more recent reiterations of this tension fuelled by Chibber's polemical *Postcolonial Theory and the Specter of Capital*. Mascat sees a possibility of superseding the long-standing conceptual and theoretical conflicts by stressing how postcolonial theory 'with its emphasis

on differences, its attention to microhistories and singularities, its dedication to discourse, textuality and the symbolic' can be seen critically to supplement or 'stretch' Marxism, which, in turn, pushes Marxism to be attentive to the 'colonial wounds' and 'site-specific experience' that are essential for building radical political alliances in the postcolonial present. Samo Tomšič's contribution on 'Psychoanalysis' examines once again the tension-ridden encounter of Marxism and psychoanalysis from the viewpoint of the nexus between power and enjoyment. Following Lacan, Tomšič develops a structuralist account of the autonomy and causality of the symbolic order that allows him to think through the centrality of unconscious labour in Freud's work and the concept of the drive in Marx. In the chapter on 'Queer Studies', Peter Drucker shows that Marxist queer studies have their roots as much in the first interactions between socialist movements and homosexual emancipation as articulated by Kollontai or Marcuse as in North American universities in the twenty-first-century, a fact that he sees as a symptom of this field's disproportionate concentration in imperialist countries. The scholars in the field, so Drucker argues, share an aversion to economic reductionism and an interest in – besides the sexual dimensions of several concepts drawn from Marxist political economy – performativity, intersectionality and homonationalism, and transgender, intersex and gender queer lives and struggles. In their contribution, 'Sociology and Marxism in the USA', David Fasenfest and Graham Cassano map the reception and influence of Marx's theory of social class and historical materialism before and after the 1960s – the historical moment in which they identify a critical turn in US sociology and a reinvigoration of a Marxist sociology, in concert with the rise of the new social movements. In the final chapter of this section of the *Handbook*, Roderick A. Ferguson takes on 'The University'. He shows how Marxist frameworks have addressed the university as an institution that is intimately connected to the dynamics of political economy and to social struggles within and outside its walls. Ferguson pays particular attention to the differing approaches to the criticism of the university and the tensions between them – which go back, on the one hand, to differing understandings of whether or not capitalism is primarily constituted along economic lines or shaped by extra- or non-economic social forces, such as race and colonialism, and, on the other, to differing positions within social struggles themselves.

Part VII, 'Inquiries and Debates', is the longest and most diverse part of the *Handbook*. It starts off with Ashley Bohrer's chapter on 'Intersectionality', in which she explores the different stages of the complex and recently intensified relationship between Marxism and intersectionality: their shared history, Marxists' criticisms of intersectionality on issues such as identity politics, class, etc. and finally rapprochements that have started to value the differences between the two frameworks as productive 'differences in emphasis'. It is followed by a chapter on 'Black Marxism' by Asad Haider. Here, Haider problematises any understanding of 'Black Marxism' as Marxism generated by Black people, or a strand of Marxism that enquires specifically into the meaning of race or

the relation of 'race and class'. Instead, by working through Cedric Robinson's concept of 'racial capitalism' and the 'Black Belt Thesis', with its argument for Black self-determination in the aftermath of racial slavery, Haider positions Black Marxism as a central component of the international Marxist tradition. In the process, he rejects the validity of efforts within Marxism to abstract the essence of capitalism from racial divisions, which would require conceiving of capitalism apart from its actual history of constitution and development. In 'Digitality and Racial Capitalism', Jonathan Beller puts forward the proposition that capital – which he grasps, following Robinson and others, in terms of racial capitalism – was always a computer, thereby recasting Marx's theory of commodification as an account of incipient digitisation. Beller argues for a co-evolution of racial abstraction and information, the medium through which racial capitalism imposes its value-generating strategies of social differentiation. In her chapter, 'Race, Imperialism and 'International Development'', Kalpana Wilson also interrogates the relationship between race and capital – now in the context of the concept of 'development' as it is linked to imperialism and concerns the unequal material relationships and processes which structure engagement between the global South and the North. Anandi Ramamurthy turns our attention to 'Advertising and Race'. Traversing various racialised representations in advertising campaigns throughout the nineteenth and twentieth centuries, Ramamurthy articulates the different ways in which advertising not only acts to structure commodities as the centre of our social worlds, but also reproduces legitimating ideologies of race, gender and class to service the accumulation of capital. In his chapter on 'Dependency Theory and Indigenous Politics', Andrew Curley situates dependency theory as a way forward in telling the history of Indigenous peoples in the context of the development of global capitalism – an argument which emerges out of his fieldwork in the Navajo Nation and the identification of a need to blend theoretical critique with empirical Marxist scholarship, in and with native communities. Miri Davidson turns to 'The Primitive' as a contradictory figure in the Marxist tradition and its intersections with anthropology and ethnology. Her investigation of different moments of the Marxist debate on 'primitive societies' raises important questions about the scope and aims of the Marxist project, namely: are Marxist categories commensurable with the radically non- or anti-modern logics represented by the figure of the primitive? And is Marxism to be understood as a critical theory of capitalism or does it have a wider, anti-civilisational remit? Jeff Webber contributes a chapter on Marxist theory within 'Social Movements' and social-movement studies. Looking at the difficulties that social-movement studies have with the issue of capitalist totality, Webber argues that an expansive, processual, historical and temporal conception of class struggle needs to be at the centre of any adequate Marxist approach to social movements – a challenge in which we can be guided by recent Marxist-feminist interventions. Joshua Clover investigates one specific form of social contest, namely the 'Riot', which, he argues, has generally been subordinated to

the strike as the primary form of class struggle and, therefore, misrecognised in its nature and the historical specificity of its relation to capitalist accumulation and its limits. With his contribution, Clover locates strike and riot within the larger categories of production and circulation struggles and positions the riot as a form of struggle conditioned both by recompositions of class and reimpositions of racial hierarchies that order exclusion from the wage. In his chapter, 'Postsecularism and the Critique of Religion', Gregor McLennan revisits Marx's and Marxism's difficult relationship with religion, which has wavered between its outright rejection as ideology and more rarely, an embrace of certain popular religious traditions as holding the potential to transform oppressive social relations. McLennan's postsecularism thesis takes its inspirations from Marx and proposes an exit from such dualistic views, instead conceiving the secular and the religious as historically and conceptually intertwined. Such a position allows Marxists fully to appreciate the social importance and subjective appeal of religion, while allowing them to remain unapologetic in upholding the integrative pluralism of the secular scientific outlook. Chiara Giorgi contributes a chapter on the highly contested and not unproblematic concept of 'Utopia'. Having surveyed the history of the use of the concept in Marxist literature, including a recent revival, Giorgi concludes that as a tool of conflictual anticipation and investment in concrete struggles, utopian thought remains an important dimension of transformative politics striving to lead beyond capitalism. In her chapter on 'Affect', Emma Dowling brings Marxism into conversation with affect theory, focusing on three core aspects: affect and ideology, affective labour, and affect and organising. She argues that while there is no distinct Marxist theory of affect, the affective register is pertinent for the contemporary Marxist critique of political economy and the analysis of ideology, subjectivation and alienation, along with the ways in which the capitalist valorisation of labour takes place in the present and the forms of resistance that emerge to contrast it. Søren Mau focuses on 'The Body', which he argues plays a central role in Marx's writings, from his general conception of nature, society and history, to his critique of the capitalist mode of production and the capital – labour relation. He shows how the logic of capital inserts itself in the processes through which the body reproduces its necessary metabolism, thereby fortifying capital's power over the most fundamental level of social reproduction. In recent decades, Mau argues, the body has again become a central concern for Marxist scholars, in several forms: as a rereading and rediscovery of Marx's analysis, as a continuation and expansion of topics and themes which were underdeveloped in Marx's writings and as the conscious effort to fill out gaps in traditional Marxist theory. Oxana Timofeeva develops a Marxist account of 'Animals' and animality, which she centres around the dialectical character of the general relation between human and nonhuman animals and the specific one in Marx's discussion of human essence and species-being, between the human worker and the worker animal. Hannah Proctor starts her chapter on 'Desire' by diagnosing a marked absence of this concept from the lexicon of

Capital. Moving on to Marxist conceptualisations of desire, Proctor asks whether desire is formed or deformed by history. Can desire transform the world or will it only change when the world does? In 'Filming Capital', Pietro Bianchi confronts the problem of the appearance and manifestation of capital as a contradictory object. He argues that cinema, as a science of appearances, should not be a way to grasp the secret of value and bring it to visibility, but instead it can be seen to be a mean to reflect on capital's self-effacing form of appearance, where the antagonism of class struggle is erased and transubstantiated in the one-dimensionality of the image. In their chapter, on 'Horror Film', Johanna Isaacson and Annie McClanahan make the argument for a shift in recent horror films away from the concern with the violence of productive labour towards what they call a Marxist-feminist criticality attuned to concerns of gender, race and everyday life, and problems of reproductive labour and the reproduction (now in crisis) of the capital – labour relation itself. Cinzia Arruzza outlines 'Three Debates in Marxist Feminism': 1) how feminists have attempted to rethink Marx's critique of political economy to account for gender oppression; 2) the intersection of gender, class and race; and 3) the relation between capitalist accumulation, commodity consumption and the formation and reification of sexual identities. She highlights feminist contributions and limitations, which she attributes to the lack of an articulated discussion of women's and LGBTQ+ people's political and social subjectivation and the lack of a full integration of race and racism in the structural analysis of social reproduction. Wendy Matsumura's discussion of the Japanese Marxist Uno Kōzō's shortcomings in analysing the agrarian question link in with Arruzza's and other authors' foregrounding of social reproduction. In her chapter, 'Triple Exploitation, Social Reproduction and the Agrarian Question in Japan', Matsumura argues that Uno's treatment of the 'small farm household' as a stable category of analysis and potential subject of revolutionary action in interwar Japan leaves its patriarchal origins unquestioned (not unlike the function the white, male factory worker fulfils for revolutionary dreams in the Euro-American context) and thereby sidelines the struggles of *Buraku* women. Matsumura draws two important lessons from her analysis: that the household is always a space of contradiction and that even thinkers like Uno Kōzō, who made such major contributions to the understanding of Japanese capitalism, to countering economistic and Eurocentric historical models and designations of unevenness as backwardness, are not immune to reproducing similar gendered logics in aspects of their work. Katie Cruz and Kate Hardy survey Marxist feminist thought on 'Prostitution and Sex Work' primarily from the twentieth and twenty-first centuries, identifying a number of shared beliefs: 1) the historicisation of prostitution and sex work as a product of the social relations of capitalism; 2) an emphasis on sex workers' agency as workers and as political actors; and 3) an understanding of the state and the law as sites of class struggle. In his chapter, on 'Work', Jamie Woodcock seeks to move beyond an abstract opposition between strands of Marxist theories that either argue that 'nothing has really changed' concerning

work under capitalism or that ‘everything has changed’. Woodcock connects the theory of work to ongoing empirical changes and struggles over work – with a special focus on digital labour and new forms of work – always with an eye to search for ways of going beyond work and capitalism in the future, which has been expressed in anti-work theories. In her chapter, ‘Domestic Labour and the Production of Labour-Power’, Rohini Hensman focuses on the fact that for workers, labour-power is inseparable from themselves as living human beings, making the relations and conditions under which labour-power is produced – in other words, domestic labour – a much more central element of class struggle than many Marxists, including Marx and Engels, have accounted for. Revisiting key and yet unresolved issues in the domestic-labour debate of the 1970s, Hensman concludes that a vital struggle, which deserves more attention and analysis, is to bring about the conditions that allow for the production of physically and psychologically healthy, anti-authoritarian, egalitarian, loving, caring human beings. Charmaine Chua and Jeremy Anderson both focus on logistics. Chua’s chapter, ‘Logistics’, examines how logistics functions as a material and social force structuring contemporary capital accumulation through the control and coordination of global systems of circulation, regarding the ‘logistics revolution’ in the 1960s and 70s as a significant turning point. If Chua sees in logistics capital’s ‘fantasy of frictionless flow’, Anderson’s chapter ‘Labour Struggles in Logistics’ focuses on the question of what kind of power lies with those who can reintroduce significant friction into the process, namely logistics workers. Analysing the organising strategy of the International Transport Workers’ Federation over the past two decades, Anderson notes that gains for logistics workers have been incremental rather than transformational for different reasons linked to organising around the corporate form. Anderson concludes that mobilisations have been more successful when they also draw on associational and institutional power, rather than just structural power. Tine Haubner’s chapter on ‘Welfare’ starts off by outlining classical Marxist understandings of welfare, specifically the welfare state, as a set of institutions and policies that emerge from the contradictions of capitalist accumulation. Thinking about the changing role of the welfare state and policies after the end of its ‘golden age’ in the mid-1970s, Haubner details how the German welfare state has developed a ‘care reserve army’ to cope with the state crisis in care, one that heavily relies on gender and migration. She calls this ‘community capitalism’, as it exposes capital’s reliance on this crisis of social reproduction in order to limit the costs of labour by first excluding and then exploiting vulnerable groups. Ståle Holgersen writes on ‘The Urban’, arguing that urban theory and Marxism need and benefit from each other – as long as relations and tensions between social relations and spatial forms are carefully negotiated. The city should neither be annihilated by the wider political economy and abstract Marxist frameworks, nor blind us with its bright lights from seeing capitalism and the class conflicts and resistances that ensue in urban spaces. The two chapters that follow focus on cognitive capitalism. In their chapter, on ‘Cognitive Capitalism’,

David Harvie and Ben Trott confront the cognitive-capitalism thesis, as proposed by Yann Moulier Boutang and others, and explore the relationship between the emergence of cognitive capitalism and other recent shifts in the global political economy, including globalisation, financialisation, increasing precarity, the blurring of life and work time, the increasing hegemony of ‘immaterial’ forms of labour, biopolitical logics and the ‘feminisation’ of labour. Andrea Fumagalli’s essay on ‘Bio-Cognitive Capitalism’ focuses on what he defines as essentially the contraction of cognitive capitalism and bio-economy, which means that bio-cognitive capitalism is the term that defines contemporary capitalism, at least as far as Western countries are concerned, if not the planet as a whole. The next chapter, by Paul Rekret and Krystian Szadkowski, focuses on ‘Intellectual Property’, understood, within a Marxist framework, as a commodity whose value is constituted not by the quality of the thing itself but as a product of social relations. Their contribution elaborates the role of intellectual property in capitalist production and the division of labour. It also conceives of intellectual property as a site of struggle against the enclosure of information and knowledge of biological and natural processes, as well as in higher education and the academic publishing industry. Part VII comes to a close with two contributions that bring Marxist concepts and frameworks to bear on the field of migration studies and struggles. Nicholas De Genova charts a history of the development of ‘Deportation’, which was initially conceived as a technique for the exclusion of particular racially denigrated categories of transnational human mobility. He urges us to understand deportation not just as a negative and necropolitical power of expulsion and disposability, but as a form of ‘productive power’ which capitalism employs to discipline and compel migrant labour. Deportation is a site of unresolved struggle of labour subordination that has become paradigmatic in our era of neoliberal global capitalism. In their chapter, on ‘Borders’, Sandro Mezzadra and Brett Neilson take debates surrounding the multiplication of borders in an age of globalisation as their point of departure. From a Marxist point of view, they emphasise the notion of world market and turn to ‘so-called primitive accumulation’ from the angle of the heterogeneous bordering devices that enable and prompt the emergence of capitalism. Mezzadra and Neilson position the fight for freedom of movement at the heart of a new communist internationalism, which they argue needs to be linked to political practices that contest not only territorial borders but also the multiple frontiers, social boundaries and forces of capital that migrants encounter both in their paths of movement and points of origin and arrival, however provisional these may be.

ACKNOWLEDGEMENTS

We would like to express our profound gratitude to Neil Davidson’s partner, Cathy Watkins, for allowing us to draw from an unpublished manuscript of

Neil's to compose the entry that he had generously accepted to write for the *Handbook* but which his illness and death prevented him from completing. We also want to thank Neil's longtime friend Steve Edwards and Duncan Thomas, from Haymarket Books, for making the publication of this essay possible.

Merchant Capitalism

Jairus Banaji

‘Merchant’s or trading capital’, as Marx (1981: 379ff.) refers to it as the start of the sequence of chapters where this is discussed in *Capital* Volume 3,¹ was largely marginal to Marx’s understanding of the capitalist mode of production, which, of course, was embodied in the dynamics (the laws of motion) of industrial capital and personified by the industrial capitalist. In fact, in its leading form, viz. as commercial capital, it was simply a transmuted form of industrial capital itself, a circulation of the commodity capital of the industrialist, ‘for ever penned into [industrial] capital’s circulation sphere’. Merchant capitalists do figure in Volume 3 but they do so strictly as agents of industrial capital.

I shall argue that it was perfectly consistent for Marx to argue in this way, since he saw the accumulation of industrial capital as the driving force behind the capitalist mode of production and his interest lay in analysing the accumulation process of a total capital dominated by large-scale industry. However, this conception *will not work historically* when Marxists have to deal with periods of history where industrial capitalism (the capitalist mode of production in Marx’s sense) was largely embryonic or even completely absent. The reason why most Marxists tend not to be troubled by this is that the centuries of early capitalism have on the whole been framed either in terms of a historically nebulous ‘age of primitive accumulation’ (Dobb) or, from the 1950s on, as a prolonged transition from feudalism to (industrial) capitalism with its implied ‘coexistence’ of modes of production. But a major upshot of this conceptual indifference has been the abdication of this whole field of history to historians working largely

outside a strictly Marxist tradition, even if at least some of those historians, notably Fernand Braudel, were influenced by Marx.

This chapter will begin with the way Marx understands merchant's capital, underscoring both the methodological nature of his discussion and the conflation it generates when abstracted from its methodological context. It will then turn to the radical divergence within the later Marxist tradition on the issue of merchant capitalism. The remainder of the chapter mobilizes the rich historiography that allows us to reinstate a notion of merchant capitalism as a perfectly valid category consistent with Marx's own ideas about capital. This integration of history into theory is absolutely crucial to any future progress in the way Marxists debate and understand capitalism.

MARX ON MERCHANT'S CAPITAL

The two strongest features of Marx's discussion of merchant's capital in Volume 3 relate, first, to the distinction he draws at the very start of Part Four when *defining* this type of capital (that is, his opening sentence in Chapter 16), and, second, to his repeated reference to the merchant as a capitalist and his frequent references therefore to both 'merchant capitalists' and 'commercial capitalists' (Marx, 1981: 391, 403, 406, 407, 411, etc.). The second of these features should make it plain that 'merchant' in this chapter of the *Handbook* stands for the more powerful groups of merchants connected with the import/export trades and the money-markets, and not for the mass of traders, which, in most countries even today, consists of the smaller retail businesses and petty traders straddling the middle class and the mass of wage-labourers.

'Merchant's or trading capital is divided into two forms or sub-species, commercial capital and money-dealing capital', writes Marx at the start of Chapter 16. Under 'money-dealing capital' Marx includes money-changing and the bullion trade, and notes that money-dealing in either form 'first develops out of international trade' (Marx, 1981: 435, 433). In its most developed form, money-dealing, Marx says, includes the 'functions of lending and borrowing, and trade on credit', though these are discussed in the chapters on interest-bearing capital (Marx, 1981: 436). Thus, the distinction drawn as Chapter 16 opens is basic and opens the way to a more expansive discussion of the origins of capitalism since finance and the money-markets become integral to our topic. Second, the same chapter describes the merchant as 'a particular species of capitalist', making it clear that we are dealing here with capitalists (Marx, 1981: 382).

The 'specific nature' of commercial capital, Marx claims, relates to its function in facilitating the circulation of industrial capital through the transformation of commodity capital into money. The money capital advanced by the merchant does this 'through perpetually buying and selling commodities'. 'This is its exclusive operation', the 'exclusive function of the money capital with which

the merchant operates'. Thus, commercial capital or the money capital advanced by merchants 'remains for ever penned into capital's circulation sphere' (Marx, 1981: 386). The buying and selling of the commodities that make up the commodity capital produced by the industrialist are 'functions peculiar to commercial capital' (Marx, 1981: 379), although in reality, Marx acknowledges, commercial capital can also be found involved in businesses such as the transport, storage and dispersal of goods. A crucial step in the analysis claims that a 'theoretical definition' of commercial capital and thus of merchant's capital as a whole has to abstract from those 'real functions'. 'For our purpose, where what matters is to define the specific difference of this special form of capital, *we can therefore ignore these functions* ... We only have [the] pure form once those functions are discarded and removed' (Marx, 1981: 380, emphasis added). Buying in order to sell is commercial capital's 'true function' because the merchant's role is to act as a circulation agent of industrial capital.

To repeat, the 'theoretical definition' of commercial capital commits Marx to the view that buying and selling is the sole function of the merchant or of commercial capital. The meaning of 'sole' here is strictly contingent on the methodological context in which it occurs. Of course, in reality – that is, viewed *historically* – things were quite different. The bigger merchants did a great deal besides buying and selling. They transported goods, 'organized and financed voyages' (Brenner, 1993: 79), owned or controlled shipping, organized household producers into putting-out networks (co-ordinated production *as a whole*), financed and managed plantation industries as well as owned plantations, invested in the production of new designs (Poni, 1997; Sewell, 2010), invested in metal and mining enterprises (Morgan, 1993: 102) and so on. And all this in addition to their involvement in the money-market, in royal/government/plantation finance, marine insurance, the financing of trade through bills of exchange (hence *merchant* banks), investments in tax farming, etc. Thus, Marx's conception of buying and selling as the *sole* function of commercial capital is a simplifying assumption, as Henryk Grossman (2021) called these methodological abstractions in *Capital*, an assumption peculiar to the circulation of industrial capital as Marx analyses this in Volume 2. When Marx writes 'we can therefore ignore these (real) functions', he makes it clear that he is simplifying the description of the role of merchant's capital in its actual or historical existence, reducing it to the sole aspect that matters for him. The abstraction involved here is from 'the *real* history of the relations of production' (Marx, 1973: 460; emphasis added), a history that obviously cannot be written if we simply retain the simplifying assumptions used in *Capital* as this would generate the sort of circularity that Marx elsewhere calls a 'forced abstraction' (Marx, 1968: 437). Not only did Marx see 'the understanding of the past' as 'a work in its own right' (one which he hoped to undertake but, of course, never did) (Marx, 1973: 461), but because of his awareness of the past he even allowed for the *direct control of production by commercial capital* (in a passing reference to the Dutch East India Company)² and, of course, allowed

for the merchant's domination of craft labour in the putting-out system. All the same, the formal definition of merchant's capital as a pure function or agency of industrial capital, which runs through the *Grundrisse* as well, affected his historical judgements, severely at times,³ and probably accounts for a major conflation in his work which it is worth describing straightaway.

Marx tends to conflate 'industrial capital' and 'the subordination of production to capital', not allowing for the possibility that the latter is a much wider process where, for example, *merchant*-controlled enterprises could remain substantially distinct from industrial capital in the strict sense in which he analyses this in *Capital*. Ironically (given his own ambivalent stand on merchant capitalism), among later Marxists it was Maurice Dobb who stated the distinction most lucidly. About the 'fairly extensive capitalist-controlled 'putting-out' system[s]' of the fourteenth to seventeenth centuries, Dobb wrote: 'The subordination of production to capital ... is to be regarded as the crucial watershed between the old mode of production and the new, even if the technical changes that we associate with the industrial revolution were needed ... for the full maturing of the capitalist mode of production' (Dobb, 1946: 143). Here Dobb disentangles the evolution of the capitalist mode of production from its later development of industrial capitalism, seeing the 'merchant-manufacturing element' less as an expression of industrial capital than of the merchant's dominance over domestic industry and manufacturing workshops. For Marx, in contrast, it was true by definition that commercial capital implied the 'non-subjection of production to capital'. At least he enunciates something close to this tautology in a passage in *Capital* which tells us: 'The independent and preponderant development of capital in the form of commercial capital *is synonymous with the non-subjection of production to capital*' (Marx, 1981: 445, emphasis added).

Despite statements of this sort, Marx was well aware that trading firms like the Dutch East India Company could 'dominate production directly' and also that merchants had established widespread control over putting-out networks – for example, in the cottage industries spread through the Russian countryside, which, he tells us in Volume 2, 'are already being pressed more and more into the service of capitalist production' (Marx, 1978: 318–19). Here the capitalist 'first intrudes in his capacity as merchant'. Two passages are especially interesting in this context. In the first, a passage from the *Grundrisse*, Marx writes:

The way in which money transforms itself into capital often shows itself quite tangibly in history; e.g. when the merchant induces a number of weavers and spinners ... to work for him, making their secondary into their chief occupation; but then has them in his power and has brought them under his command as wage labourers. (Marx, 1973: 510).

About this system he says later in the same text: 'Here, then, the mode of production is not yet determined by capital, but rather found on hand by it' (Marx, 1973: 586), meaning by 'mode of production' the *labour process* of the households drawn into these networks by the merchant. The second passage occurs in the famous historical chapter of Volume 3, when Marx turns to a discussion of the

possible transitions into capitalism and begins initially with a twofold transition. The producer may become a merchant and capitalist, Marx says, or ‘Alternatively ... the merchant may take direct control of production himself’ (Marx, 1981: 452). The second of these possible trajectories was, Marx thought, a less progressive form of the transition to capitalism because, again, it left the ‘mode of production’ – that is, the labour process – unaltered. It is worth citing this passage in full not just because he cites the example of the French silk industry, something I shall come back to later, but because his description of merchant capitalism is less terse than it is in the *Grundrisse* passage cited above and even more illuminating theoretically:

Alternatively, however, the merchant may take direct control of production himself ... Right up to the middle of this century, for example, the manufacturer in the French silk industry, and the English hosiery and lace industries too, *was a manufacturer only in name*. In reality, he was simply a merchant, who kept the weavers working in their old fragmented manner and exercised *only control as a merchant; it was a merchant they were really working for*. This method always stands in the way of the *genuine* capitalist mode of production and disappears with its development. Without revolutionizing the mode of production [labour process, JB], it simply worsens the conditions of the direct producers, transforms them into mere wage-labourers ... Somewhat modified, the same relationships are to be found in the manufacture of furniture in London, which is partly carried out on a handicraft basis. This is particularly the case in Tower Hamlets ... The merchant is the real capitalist and pockets the greater part of the surplus-value. (Marx, 1981: 452–3, emphases added)

We shall see later that Marx in fact considerably underestimated the degree to which merchants controlled work organization in the silk industry of Lyons. The theoretical issue for historical materialists is how we should characterize the type of capital involved in, for example, putting-out systems of the kind described above. Were these forms of *industrial* capital, had the merchant *become* an industrialist, or should we posit a distinct regime of capital accumulation where, as Marx seems to suggest, manufacture was a function of mercantile accumulation? The latter would constitute merchant *capitalism*, at least one important variety of it. Engels, in the famous ‘Supplement’ that he added to Volume 3 in 1895, shortly before he died, saw the textile putters-out of the later middle ages and early modern period as incarnations of industrial capital and therefore the putting-out system as an early, merchant-dominated form of industrial capitalism (Engels, in Marx, 1981: 1042–3). This characterization seems to be supported, for example, by Mousnier’s view that ‘the basis of French mercantilism was industry’ (Lublinskaya, 1968: 35, summarizing Mousnier’s argument in *Les XVI^e et XVII^e siècles*), but in fact for Mousnier the various types of manufactories that flourished in France from the seventeenth century were aspects of a powerful and wide-ranging commercial capitalism (Mousnier, 1967: esp. 94–8). In fact, there is a passage in the *Grundrisse* where Marx proposes a more complex image precisely when discussing mercantilism:

Then came the Mercantile System, an epoch where industrial capital and hence wage labour arose in manufactures ... [The Mercantilists] already have faint notions of money as capital, but actually gain only in the form of money, of the circulation of *mercantile* capital ...

Industrial capital has value for them, even the highest value – as a means, not as wealth itself in its productive process – because it creates mercantile capital and the latter, via circulation, becomes money. (Marx, 1973: 327–8)

So here industrial capital is said to be (for the later Mercantilists) a means of ‘creating mercantile capital’, which, again, is tantamount to saying that industry was a function of the accumulation of mercantile capital or a function of merchant capitalism.

LATER MARXISTS: THE RETREAT INTO RETICENCE

Among writers working in a Marxist tradition the inchoate nature of Marx’s own thinking about the place of merchant capital in the history of capitalism has generated a division between those like Franz Mehring, Mikhail Pokrovsky and I.I. Rubin who read Marx as saying that capitalism went through an entire *period* of history characterized by the dominance of merchant capitalism⁴ and, on the other side, later Marxists working in an exegetical tradition shaped by the attack on Pokrovsky himself. Dobb was the crucial link between these periods of Marxist thinking, and it was essentially his influence that would shape the reticence or hostility of writers like Perry Anderson and Robert Brenner towards the idea of merchant capitalism. Mehring had espoused the radical view that merchant capital was the ‘revolutionary force of the fourteenth, fifteenth and sixteenth centuries’: ‘Revolutionary merchant capital not only created modern absolutism but also transformed the medieval classes of society’ (Mehring, 1975: 1, 3). Broadly speaking, it was this view that passed into the stream of Russian Marxism. Barber writes that ‘No single concept was so identical with Pokrovsky as that of commercial capitalism, and *none had such influence during the 1920s on the study of Russian society*. The notion of commercial capitalism was certainly grounded in Marxist theory’ (Barber, 1981: 57; emphasis added). Lenin himself referred to Pokrovsky’s ‘Marxist assessment’ in *Brief History of Russia* (Pokrovsky, 1933) and told him he was ‘extremely pleased with your new book’ (Lenin, 1966: 530, letter dated 5 December 1920).

Here, as in so much else, Stalinism proved a major turning-point. The idea that Marxists could fruitfully reason with categories like ‘merchant capitalism’ and ‘commercial capitalism’ was forever banished within the (altogether spurious) tradition of orthodoxy that began to be constructed from the 1930s. Dobb’s own ambivalence is brilliantly shown by his stating (in 1946) that ‘we cannot speak of a special period of “Merchant Capitalism”, *as many have done*’ and then immediately qualifying this with an odd footnote that says:

Some seem, however, to have used the term ‘Merchant Capitalism’ to apply, not to the mere existence of large capitals and specialized merchants in the sphere of trade, but to the early period of Capitalism when production was subordinated to the ‘merchant manufacturer’

under the putting-out system. *The strictures in the text do not, of course, refer to this usage of the term.* (Dobb, 1946: 17; emphasis added)

Pokrovsky would doubtless have found the distinction suggested here quite meaningless since it was precisely the particular structures of capital accumulation embodied in the putting-out system and large-scale international trade and their widespread prevalence from the later middle ages that buttressed periodizations of the sort that Dobb claimed to find problematic. At any rate, Stalinist orthodoxy had a major influence on post-war Marxism. The earlier sense of a tradition among Marxists that could plausibly read the history and politics of capitalism through a mercantile lens rapidly disintegrated till the gradual revival of this perspective in fresh work from the 1980s. By then, however, it was largely non-Marxist traditions of historical scholarship that had appropriated these ideas and turned them into histories of capitalism that the post-war Marxist tradition continued to lack.

Before turning to those histories, it may be helpful to look quickly at Anderson and Brenner. Diffidence on the Marxist side of the theoretical divide within scholarship would contrast sharply with the way non-Marxists felt free to capture abdicated territory and exploit the historical potential of a perspective that might have yielded a stronger historiography from Marxists themselves. The disproportion was strikingly obvious in France, where a whole generation or more of historians made ‘merchant capitalism’ central to their perspectives on the sixteenth century and, more widely, to the whole period from the later middle ages to the eighteenth century.⁵ But this was replicated in Britain both in R. H. Tawney’s ability to foreground commercial capitalism when writing about the Reformation and later, of course, in debates about the nature of British capitalism that go back to Anderson’s own seminal interventions in the 1960s. Yet both in *Lineages of the Absolutist State* (1974), where mercantile *capitalism* appears only once (despite frequent references to ‘mercantile capital’) (Anderson, 1974: 138, in the chapter on England), and in ‘Figures of Descent’ (1987) there is a striking refusal to characterize the wider economic system in terms of the particular *nature* of the capitalism driving it. Anderson would say that ‘the bourgeoisie of London was commercial and financial in character ... as opposed to the manufacturing and mining that dominated the North’ (Anderson, 1987: 34), but, unlike other historians of British capitalism (notably Geoffrey Ingham), reason not in terms of merchant or commercial capitalism, but of ‘the peculiar British form of financial and mercantile capital’ (Anderson, 1987: 75), of ‘finance’,⁶ of ‘English commercial imperialism’ (Anderson, 1987: 72), of ‘the City as a complex of British capital’ (Anderson, 1987: 69) and so on. A similar and in some ways even more striking ambivalence runs through Robert Brenner’s *Merchants and Revolution*, his best single work. He is willing to characterize the ‘new merchants’ (those connected with the colonial trades) as ‘capitalist entrepreneurs in colonial production’ (Brenner, 1993: 685) and even call a section of the book ‘West Indian

sugar capitalism' (Brenner, 1993: 159ff.), but he rigorously abstains from any reference to merchant or commercial *capitalism* as such, though the whole book is centrally about its evolution and internal conflicts. Brenner refers throughout to an agrarian 'capitalist aristocracy',⁷ a 'capitalist landlord class' (Brenner, 1993: 715) and so on, and, of course, repeatedly to 'agrarian capitalism', but he systematically avoids characterizing the merchant class in overtly capitalist terms. The merchant class was 'dynamic' and 'entrepreneurial'⁸ but only once is it described as *capitalist* (as far as I can see), and the expression 'commercial capitalism' is entirely missing.

REINSTATING MERCHANT CAPITALISM

This retreat of historical materialism from the analysis of merchant capitalism left the field wide open to the more general stream of historiography, the upshot of which was that no coherent Marxist tendency survived or re-emerged. While studies that either deal directly with merchant's capital or describe the structures of merchant capitalism are arguably less common than the numerous works that simply refer to one or other of them in passing,⁹ work done by *Marxist* historians that belongs to the former category is even harder to find. Given the weight of orthodoxy on this issue, they could only have written in quiet defiance of the tradition. Carlo Poni, Peter Kriedte, Bob Shenton and Leo Noordegraaf are among a handful of examples of this,¹⁰ but just listing their names demonstrates the point about the lack of any conscious tendency. The breakthrough represented by Braudel's *The Mediterranean and the Mediterranean World in the Age of Philip II* would usher in several decades of solid historical work reflective of a deeper modernism in historiography (Mousnier, Dermigny, Carrière), one unconstrained by spurious orthodoxies, the results of which can be seen in the strong body of work done by historians in France and Italy down (more recently) to superlative studies of the Mediterranean sugar industry (Ouerfelli, 2008) and of Florentine silk firms (Tognetti, 2002). In *Mediterranean*, Braudel clearly saw himself writing a history of *capitalism*:

Our systems of classification use the term 'commercial capitalism' to describe the agile, already modern and indisputably effective form taken by economic life in the sixteenth century. All activity did not necessarily contribute to its advance but much depended on its dynamism and magnetism. *The imperatives of large-scale, long-distance commerce, its accumulation of capital, acted as driving forces.* It was in the space defined by a commercial economy that industrial activity was kindled at Genoa, Florence, Venice, and Milan, particularly in the new and revolutionary textile industries, cotton and silk. (Braudel, 1973: 319, emphasis added)

About the latter he wrote, 'there grew up a textile industry *on capitalist lines* and connected to distant markets' (Braudel, 1973: 213, emphasis added). 'Almost everywhere this industry was of a capitalist nature, conforming to the familiar

pattern of the *Verlagssystem* [putting-out system]' (Braudel, 1973: 431). But if the sixteenth century gave a powerful boost to large-scale capitalist trade, it was finance, not industry, that formed the true pendant of its commercial pole, with the more powerful layers of merchant capital fluctuating between 'banking' and trade. 'The importance of purely financial transactions, with all their sophisticated ramifications, increases the further one goes up the scale of merchants ... It was becoming widely known that commercial operations could be settled at the fairs almost *miraculously*' (Braudel, 1973: 439). *Mediterranean* would devote some of its most fascinating pages to the 'financial' capitalism of the Genoese (Braudel, 1973: 500–10).

Thus 'commercial capitalism' encapsulated capitalist enterprise in both commerce and finance (as it had done for Tawney and, before him, for Marx), and if in England 'The age of Elizabeth saw a steady growth of capitalism in textiles and mining', along with a great increase of foreign trade and the growth of a money-market, as Tawney (1938: 180) suggested, 'in industry the rising interest was that of the commercial capitalist' (Tawney, 1938: 141). Trade, finance and industry were simply moments of the accumulation of *mercantile* capital, of its ability to flow seamlessly across the most diverse markets and forms of activity.

Terminology

The historical corpus resonates with a rich terminology describing various groups of capitalist merchants and their firms – commercial businesses, banking houses, merchant-bankers, merchant-entrepreneurs, merchant-manufacturers, mercantile bourgeoisie, 'bourgeoisie of bankers, shipowners and merchants' (Tawney, 1938: 21) and so on. Of course, at the lower levels of abstraction at which much of this historiography works one would come across silk entrepreneurs (Molà, 2000: 219), Greek trading houses (Harlaftis, 2010: 246), City rubber barons (White, 2004: 131, 137), large milling and exporting firms that controlled Burma's rice trade (Cheng, 1968: 64ff.), etc. But if we sort out this empirically rich and even confusing mass of terms, then beyond purely generic descriptions like 'merchant capitalists', they fall broadly into four categories: (1) terms like 'merchant-entrepreneurs', 'merchant-manufacturers' and their counterparts in the European languages, *mercanti-imprenditori*, *mercanti-setaioli*, etc.; (2) terms like 'merchant-bankers', 'financiers', 'financial aristocracy' (Braudel, 1973: 343) and so on (*mercanti-banchieri*, *négociants banquiers*, etc.); (3) terms like 'merchant-planters' (Brenner, 1993: 163, 166) and 'maritime bourgeoisie' (James, 1938: 22, 35); and (4) 'merchant firms' or 'trading firms' or 'commercial houses' (*firμες commerciales*, *case di commercio*, etc.). Examining these more closely, it becomes apparent that each category corresponds to a major *structure* or organizational pattern in the history of merchant capitalism and can thus form the basis for a taxonomy that might help to impose a more rational shape on the literature.

A Broad Taxonomy of Merchant Capitalism

These forms or structures are as follows:

- 1 the *Verlagssystem*, where the merchant capitalist is essentially a putting-out merchant;
- 2 international money-markets;
- 3 plantation businesses ('colonial trades'); and
- 4 the produce trades.

In the industrial towns of Europe 'modern industry grew up ... with the capitalist forms of the *Verlagssystem*', Braudel (1973: 323) wrote. *Verlag* was widespread not just in textiles and metalworking but throughout the leather, wood, jewellery, ceramics and craft-based luxury trades (Holbach, 1991), and could always expand thanks to the 'mobility of both artisan and merchant classes' (Braudel, 1973: 433). In France, by the eighteenth century 'millions of peasants worked for city merchants' (Lefebvre, 2005: 42). Silk was typically one of those 'luxury industries' about which Marx said 'the merchants import both raw materials and workers from abroad', but although Marx himself seemed to think that in these sectors 'the merchant *becomes an industrialist directly*' (Marx, 1981: 453–4, emphasis added), this cannot be construed to mean that merchant's capital finally became industrial capital. The Italian silk industry in fact embodied a form of merchant capitalism, as Tognetti shows in his fine case-study of the bigger merchant houses of Renaissance Florence. There, the rapid expansion of the industry in the fifteenth century was fuelled by what he calls 'a new desire on the part of the big merchant-bankers of Florence to invest in the manufacture of silk' (Tognetti, 2002: 26 ('[la] nuova propensione dei grandi mercanti-banchieri fiorentini agli investimenti nella manifattura serica')). In the late fifteenth century, with the industry growing by leaps and bounds, 'the most efficient and modern companies' in the *arte della seta* reflected the drive of these *mercanti-banchieri* to make 'massive investments' in the silk business (Tognetti, 2002: 30). An interesting feature of Tognetti's account is the way he highlights the modernity of merchant's capital during the Renaissance. The bigger merchants could dominate the industry thanks to their managerial skills, their scale of resources, operational flexibility and profound knowledge of European markets (Tognetti, 2002: 33–4). A similar perspective runs through Carlo Poni's work on the Lyons silk industry, where differentiation and flexibility were 'used consciously as an annual market strategy' (Poni, 1997: 68). 'The Lyons silk merchants were the first, as far back as the closing years of the seventeenth century, to use annual product differentiation as a strategic weapon to create barriers to entry, to capture important shares of the international market and to outmaneuver firms in competition with them' (Poni, 1997: 41). Lyons merchant capitalists perfected business strategies that were thoroughly modern in conception, with rapid innovations geared to fashion markets that radiated out of Paris, the training of hundreds of designers who commuted between Paris and Lyons, and speed

and perfection in the assembling of looms. But here was a productive system ‘based essentially on putting-out’ (Poni, 1997: 45): ‘the Lyons merchants (and the designers) were the very first to exploit fully and systematically the flexibility offered by the artisan or putting-out organization of production’ (Poni, 1997: 67).

In Lyons’ *Grande Fabrique*, the network of putting-out firms in silk manufacture, ‘the majority of the weavers ... worked on piece rates for the *marchands fabricants* ... from whom they received the designs and the raw material’ (Poni, 1997: 47). Here was an élite of fewer than 100 putters-out pitted against a mass of some 8,000 weavers who were known simply as *ouvriers* (Poni, 1997: 48). It is worth noting that Poni sees the *fabricants* essentially as merchants and never calls them industrialists. In any case, through the *Verlagssystem* merchant capitalists created Europe’s first industrial working class, dispersed and therefore not ‘directly subsumed’ by capital, but wage-labourers, in Marx’s own description. ‘All contemporary records, both in Flanders and England, point to a large class of *wage-earning craftsmen* ... subservient to the capitalist draper’ (Carus-Wilson, 1952: 382; emphasis added).

Money-Markets

Antwerp emerged as Europe’s leading money-market in the second and third quarters of the sixteenth century. An English memorandum written in 1564 claimed that in Antwerp ‘there are thirty or forty great merchants who could lend 300,000 £ without hurt to their other business’ (Ehrenberg, 1928: 263). Vast sums were loaned to the Spanish, French and English monarchies by the ‘great financiers’ of the sixteenth century, who were described in 1530, by the Paris law faculty no less, as ‘those “rich and powerful” *merchants who no longer deal in commodities, but in money and exchange*’ (Ehrenberg, 1928: 323; emphasis added). In England, too, ‘the great merchants involved themselves in Government finance ... Governments relied substantially upon London merchants for loans’ (Beier and Finlay, 1986: 15–16). The term ‘exchange’ in the quote from the Paris lawyers referred, of course, to the circulation of bills of exchange (short-term commercial credits) and to arbitraging between the exchanges (da Silva, 1956), between bills and bullion and so on. Genoese bankers were the dominant force of the sixteenth-century bill markets. The system of *asientos*¹¹ underpinning the finances of the Spanish monarchy implicated ‘enormous financial operations’ (by the Genoese especially), but those operations were only possible thanks to the commercial and banking networks that straddled money-markets across western Europe in a fluid integration of trade and finance. Braudel’s description of how this worked remains unsurpassed even today (Braudel, 1973: 500–17). A disciple, the Dutch Hispanicist Nicolás Broens, who died at a tragically young age, showed how pivotal mercantile networks were to the Spanish Habsburgs and their financial dealings (Broens, 1989). As the Portuguese *marranos* who had replaced the Genoese by the second quarter of the seventeenth century told the Inquisition, ‘There was no distinction to be made between the capital used for

commercial purposes and that invested in the *asientos*' (Broens, 1989: 52). Again, the *modernity* of this 'economic structure' shows how the most advanced sectors of capitalism cared little for the opinion of rivals 'still half-immersed in the past' (Braudel, 1973: 509–10, referring to the Venetians). The bill of exchange was the perfect instrument of commercial capitalism (Carrière et al., 1976: 71), widely used in the seventeenth through nineteenth centuries. In Marseilles towards the end of the eighteenth century the volume of maritime trade may well have been upwards of 200 million pounds, whereas the reserves of cash at the disposal of Marseilles' merchants was estimated at a mere 1.8 million! (Carrière et al., 1976: 180). Antwerp–Amsterdam–London: by the nineteenth century London's accepting and discount houses were the bedrock of the City's dominance as the premier international money-market, with the greater share of global transactions denominated in sterling. British merchant banks were emblematic of a whole structure of commercial capitalism that revolved around 'acceptances' and the flotation of foreign loans, and was buttressed by the stupendous expansion of international trade in the middle decades of the nineteenth century. London was, as the City's historian described it, 'a short-term money market of unrivalled liquidity and security' (Kynaston, 1994: 331) and, of course, a major source of the invisible earnings that sustained British capitalism more than any real or imagined industrial lead.

Plantations

'The commercial capitalism of the eighteenth century developed the wealth of Europe by means of slavery and monopoly', Eric Williams wrote in *Capitalism and Slavery* (Williams, [1944]: 210). If sugar became the main driver of colonial slavery, the sugar colonies themselves were very largely externally financed, as both Adam Smith (Smith, 2006: 139ff.) and Marx knew. The big planters dealt directly with commission agents in England (Dunn, 1973: 208). By 1750 virtually all London sugar merchants traded on commission (Morgan, 1993: 193–5). But, as K. G. Davies noted, 'One effect of the commission system was the widespread indebtedness of planter to agent' (Davies, 1974: 154). For example, 'in 1790 George Hibbert, a leading London sugar merchant, gave evidence that £20 million of debts were due from the West Indies to British creditors' (Smith, 2006: 173). By then, of course, much of the finance was secured by mortgages, and West-India merchants like the Lascelles (the Earls of Harewood) could foreclose on their loans to emerge as major owners of sugar estates (Smith, 2006: chapter 7).¹² 'Jamaica', Braudel writes in *The Wheels of Commerce*, 'was ... a capitalist machine', but he qualifies this by saying 'The planters made a profit of 8 to 10% at the very most':

In fact the balance of *trade* for Jamaica, even calculated in colonial pounds, works out at a slight advantage for the island ... *but at least half of the total for imports and exports made its way invisibly back to England* (in freight charges, insurance, commissions, interest on debts, and transfers of money to absentee landlords). All in all, the net benefit for England

in the year 1773 was getting on for £1,500,000. In London, as in Bordeaux, the proceeds of colonial trade were transformed into trading-houses, banks and state bonds. (Braudel, 2002: 279; emphasis added)

Laird Bergad's study of the Matanzas sugar economy lays out an even more lucid case of merchant economic control over planters. But in Cuba not only did the Havana merchant houses finance the growth of sugar in the early part of the nineteenth century, 'Many merchants also *invested* heavily in sugar production' (Bergad, 1990: 66; emphasis added). By the late 1850s 'large-scale merchant establishments ... began to establish direct ownership over the largest and most productive sugar mills in the Matanzas region' (Bergad, 1990: 133–4). And as a more advanced, capital-intensive industry emerged from mid-century, it was big Havana merchants 'with international connections' who 'financed the most important aspects of the Matanzas sugar economy' (Bergad, 1990: 173). In general, Bergad concludes, 'It is certain that Cuban sugar production generated *substantially more profits for brokers [merchants] than for growers*' (Bergad, 1990: 178; emphasis added).

Produce Trades

Just as capitalism emerged in a purer form in the Dutch and English East India Companies than it ever did in Portugal's 'monarchical capitalism' (Dias, 1963)¹³ or in Spanish imperialism, with the joint-stock companies incarnating a more advanced type of capitalist enterprise despite being what Dermigny rightly called 'semi-public corporations' (Dermigny, 1970: 449), the mercantile capitalism that eventually characterized British economic expansion in the main part of the nineteenth century was no longer encumbered by the legacies of mercantilism once private capital had broken the Company's monopoly. The produce trades were the backbone of this new regime of capital accumulation. Ironically, perhaps, it is Alexander Chayanov's work on the Russian peasantry that best defines the model of this form of capitalist domination. He called it 'vertical capitalist concentration' (Chayanov, 1966: 262):

bringing agriculture into the general capitalist system need by no means involve the creation of very large, capitalistically organized production units based on hired labor ... agriculture ... becomes subject to trading capitalism that sometimes in the form of very large-scale trading undertakings *draws masses of scattered peasant farms into its sphere of influence* and, having bound these small-scale commodity producers to the market, *economically subordinates them to its influence* ... Through these connections, every small peasant undertaking becomes *an organic part of the world economy*. (Chayanov, 1966: 257–8; emphasis added)

The 'trading machine' (the organizational set-up of mercantile businesses) or 'trading capitalism' (Chayanov, 1966: 257, 258) 'penetrates, with its hundreds or thousands of branches, to the full depths of the peasant farms and, *leaving them free as regards production, entirely dominates them economically*' (Chayanov,

1966: 261–2; emphasis added). Of course, where quality was an issue capitalist firms ('lead firms' in much of the modern literature on supply chains) could 'actively interfere in the organization of production, too' (Chayanov, 1966: 262).

The essential point in all this is that capital deals with *household* producers whose aggregate (family) labour-power is exploited through price domination. The model was discussed in the 1970s by Michael Cowen, Henry Bernstein and myself (Cowen, 1981; Bernstein, 1977; Banaji, 1977), and has been restated more recently in my paper for the Bernstein *Festschrift* (Banaji, 2016). Its essential elements are (1) households with *some* degree of control of their own means of production; (2) a system of advances (usually in cash, otherwise trade goods); and (3) lead-company reliance on middlemen. Marx allowed for the possibility that the advances given by the 'English government' to opium growers in parts of North India in the nineteenth century embodied a *circulation of capital* (Marx, 1980: 201). This is correct and forms the key to the whole system of accumulation at work in all of the produce trades (opium, indigo, jute, sugar, cotton, palm oil, groundnuts, cocoa, rice, etc.). The firms dominating these various circuits of capital were the agency houses and *maisons de commerce* typical of the nineteenth century, the big merchant firms that came to dominate the West African trade in the early twentieth century and so on. As for the brokers through whom advances were circulated into household commodity production, they became an integral feature of the system because international merchant capitalists were operating in environments where local dealers controlled the trade at lower levels. A major problem posed precisely for the biggest European merchant firms, massive conglomerates like UAC, was that the contractors they relied on were often large and wealthy dealers who 'were liable to use ... commissions to finance their own operations or purchases for other trading firms' (Fieldhouse, 1994: 443–4, on the Kano contractors). This was an 'abuse' of the advance system that UAC simply had to live with (Fieldhouse, 1994: 119–21). It was essential for the foreign trading companies to maintain a big turnover (that is, *maximize* their buying of export produce) in order to retain their share of purchases against competitors, and the advances given to African middlemen were pivotal to that strategy since they enabled merchants who lacked capital 'to buy produce on a large scale for the overseas company' (Fieldhouse, 1994: 113ff., on UAC strategy). International merchants were never fully able to bypass the produce buyers, who, of course, as Shenton says, 'also appropriated a share of surplus value and profit' (Shenton, 1986: 15).

WIDER PERSPECTIVES

By the early twentieth century the dominant French commercial firms were 'vertically integrated trading and shipping combines' operating extensively throughout French West Africa (Boone, 2006: 44). The pattern was different in French Indochina, where there was a stronger representation of purely financial groups ('finance capital' in a sense closer to Rudolf Hilferding's) and a conglomeration

of interests linked to mining, cement, electricity, chemicals and the rubber industry (Morlat, 2008). In Britain UAC itself emerged in 1929 from a fusion of 93 separate companies (!) when A & E merged with the Niger Company, but it was never anything other than a powerful *merchant* firm (an incarnation of merchant's capital) even when integrated into one of the world's biggest industrial enterprises (Fieldhouse, 1994: 10–11). Bob Shenton's account of Nigeria repeatedly underscores the concentration and centralization of capital that came out of the conflicts between merchants (the Niger Company) and shipowners (Elder Dempster) and between competing commercial capitals.¹⁴ These are all features of an advanced and even sophisticated capitalism and a warning to us not to succumb too readily to the seductive power of clichés such as the persistent characterization of merchant capital as 'antediluvian', with its distinct implication of an *essential* backwardness. On the contrary, what the last few pages bring out quite forcefully is the remarkable *modernity* displayed by the evolution of these forms of capital. The concentration and centralization of capital,¹⁵ combinations (price agreements) and pools (Cheng, 1968: 64ff.), monopolistic market behaviour, vertical integration¹⁶ and the drive for new markets are all features typical of capitalism which are *also* found, *to one degree or another*, in the history of large-scale commercial enterprise since the twelfth century. And so, of course, is competition, which raged within most industries controlled by mercantile capital (silk, sugar, ceramics, rice exports, cotton piecegoods, raw cotton, tobacco and so on), between commercial firms or trading companies, between foreign and local merchants and middlemen, between ports in the same maritime region (e.g., Antwerp vs Rotterdam), and, finally, between the major commercial powers themselves – both city-states, like Venice, Genoa and Florence, and the newer maritime nations of Portugal, Spain, Holland and Britain.

David Ormrod has said that Tawney 'explained British economic development in the sixteenth and seventeenth centuries through the maturing of a *specifically commercial form of capitalism*' (Ormrod, 2003: 3, emphasis added). This perspective is at best only implicit in Marx, who, of course, agreed that the sixteenth and seventeenth centuries 'rapidly advanced the development of commercial capital' (Marx, 1981: 454), saw manufacture as the 'predominant form taken by capitalist production' c. 1550–1770 (Marx, *Capital*, 1976: 489),¹⁷ and knew, from Adam Smith, that merchants had played the key role in establishing import-substituting luxury manufactures in Europe (Marx, 1973: 858), but never explicitly posited merchant capital's control of production as a form of the capitalist mode of production (of what Marxists call 'capitalism'). The mercantilist seventeenth century was for him a period when '*industrial capital* and hence wage labour arose in manufactures' (Marx, 1973: 327; emphasis added).

These hesitations have allowed a quasi-orthodoxy to emerge that confines our concepts of the capitalist mode of production to large-scale industry and industrial capitalism and works in terms of a sharp division between circulation and production, reiterating the notion that commercial capital 'remains forever penned into capital's circulation sphere'. I've suggested above that this view *will*

not work historically, which is why properly Marxist accounts of early capitalism are so few and far between. In reviewing Dobb's book Tawney had already presciently attacked his 'preoccupation with the industrial engine' and asked if the 'restricted sense' of capitalism favoured by Dobb had not 'ceased to be the usage most convenient for the purposes of history' (Tawney, 1950: 310–11). Indeed, *historically* merchants straddled industry, money-markets and foreign trade as largely integrated sectors of accumulation. '[I]t was a perfectly normal and anticipated practice for commercial entrepreneurs to invest in and manage manufacturing enterprises' (Supple, 1977: 424). One widespread form of this was the putting-out system.¹⁸ In the transition debate Georges Lefebvre argued that the putting-out system ('Way No. 2') 'could lead to capitalism just as easily as Way No. 1', adding 'I do not believe that Marx was aware of this'. By means of this form of industrial organization, 'the merchant is transformed into a capitalist, as Marx defines one; it is this development which explains the emergence of urban class struggles in Italy and Flanders in the fourteenth and fifteenth centuries' (Lefebvre, 1976: 124). And Lefebvre went on to make the wider and deeply significant point that it was precisely 'the collusion between commerce and the State' that 'promoted the development of capitalism' (Lefebvre, 1976: 125).

Given the kinds of restructuring we've seen under contemporary forms of capitalism (Lichtenstein, 2012), merchant's capital seems much less archaic today than it obviously did to Marx. Production processes were structured to allow for a *combination* of in-house manufacturing operations and outsourcing, as in Amsterdam's wool industry. Moreover, 'the putting-out system was, for many purposes, economically superior to a workshop form of organization ... It could adapt to fluctuations in demand quickly, and with minimum cost to the businessman' (Supple, 1977: 426). In northern France, where textile production was widely dispersed through the countryside, the merchants who dominated the industry and produced for international markets had a marked preference for rural workers, knowing that the supply of labour was elastic and wages endemically low (Goubert, 1960: 127–37; Kriedte, 1983: 12ff.). But in large parts of Europe putting-out systems also 'paved the way for the emergence of factory production' (Beckert, 2014: 144). The sharp separation between merchant capital and modern industry is untenable at this level as well. In cotton textiles, 'eventually ... merchants nearly everywhere would concentrate production in factories' (Beckert, 2014: 145). In the Italian silk industry, the diffusion of the Bologna-style hydraulic silk mills in the main part of the seventeenth century was again driven by the 'great sums of money' *merchants* invested in the silk trade. These mills employed hundreds of workers and were the first properly mechanized factories in western Europe (Poni, 1976; Molà, 2000: 241, 'vast sums'). In Bologna itself they were 'capable (collectively) of processing a million pounds of raw silk a year' (Sella, 1997: 46), implying the sort of mass production that Marx already associated with manufacture proper (Marx, 1973: 510–11). And, finally, the sheer 'diversity and flexibility of forms of production' that developed under 'commercially organized capitalism' (Sewell, 2010: 116) extended to the economic role of the state

as well. In Venice, the core of the shipbuilding industry was managed by the state *on behalf of private capital* through the system of the *galere da mercato*. The famous Arsenale was a ‘large-scale manufacturing operation’ with up to 2,000 workers and a substantial output of a small repertoire of types of galleys built in labour processes that reflected a ‘factory organization’. Moreover, like the silk entrepreneurs or *setaioli* and their hydraulic mills, the Venetian state wanted workers who showed ‘docility and willingness to work’ (Davis, 1991).

Marx was wrong to suggest that the ‘preponderant development of capital in the form of commercial capital is synonymous with the *non-subjection* of production to capital’ (Marx, 1981: 445, emphasis added). I have argued that Marxists have largely abdicated this terrain to others and left much of Marxist economic history in a rut. Britain’s industrial expansion has, of course, always been seen as the epitome of industrial capital as this emerged in Marx’s day, but it is precisely debates about the nature of British capitalism that underscore the need to abandon those legacies of formalism. In *Capitalism Divided?* Ingham argued that ‘the City’s commercial capitalism gradually became a prop for the [British] economy as a whole’ (Ingham, 1984: 97), citing Rubinstein’s finding that ‘the wealthy in Britain have disproportionately earned their fortunes in commerce and finance rather than in manufacturing or industry’ (Rubinstein, 1981, cited by Ingham, 1984: 135–6). Britain’s commercial capitalism *conglomerated* the interests of bill brokers and discount houses, merchant banks, commission merchants, direct importers, brokers and shipbrokers, cargo agents, shipping companies, London plantation companies and, of course, the northern manufacturers who depended on all of the above. Britain had emerged as a major power in the late seventeenth and early eighteenth centuries, her ‘aggrandizement’ ‘impelled by the powerful forces of commercial capitalism’ (Brewer, 1994: xiii–iv). But, as Brewer goes on to say, ‘no amount of commercial skill, merchant shipping or national prosperity could secure the domination of trade routes or the protection of bases and colonies. These required troops and a navy which in turn, required money and proper organization’ (Brewer, 1994: xv). The triumph of European commercial capitalism depended decisively on the powerful backing of the state, a sort of Crown–company partnership (Brenner, 1993: 65) that, in England’s case, extends back to the Elizabethan commercial expansion that was bound up, as Brenner showed, with the newer trades to the south and east (that is, the Mediterranean and Asia). *The European empires were a legacy of this alliance between state and commercial capital*. By the sixteenth and seventeenth centuries naval power and the use of force were systematically integrated into competitive struggles between major blocs of capital.¹⁹

Notes

- 1 Chapters 16 to 20.
- 2 Marx (1981: 446–7): ‘As for the manner and form in which commercial capital operates when it dominates production directly, a striking example is given not only by colonial trade in general (the so-called colonial system), but quite particularly by the operations of the former Dutch East India Company’. The expression ‘colonial trade’ referred chiefly to the plantation-based Atlantic trades.

- 3 Some of Marx's historical judgements in Chapter 20 will have to be discussed elsewhere. The view that 'where commercial capital predominates, obsolete conditions obtain' (Marx, 1981: 444) is hard to reconcile with the very substantial development (cultural, intellectual and economic) of leading commercial centres like Venice, Florence and Amsterdam.
- 4 Cf. Rubin (1979: 25–6): 'the age of *merchant capital* was also the age of *absolute monarchy* ... It was during the age of merchant capitalism that *a close alliance was formed between the state and the commercial bourgeoisie*, an alliance which found expression in mercantilist policy'.
- 5 See Braudel (1973), first published in 1949, with a second, revised, edition in 1964, and Mousnier (1967), Mauro (1966) and Carrière (1973).
- 6 Anderson (1987: 57); see also 59 ('dominance of finance over industry') and 76 ('a world capital of finance without true finance capital').
- 7 Brenner (1993: 713, 715): 'England's unique capitalist aristocracy'.
- 8 Brenner (1993: 713): 'a dynamic maturing entrepreneurial merchant class', but nowhere called a class of merchant capitalists.
- 9 Among the former (apart from the works cited in note 5), see Ho (1954); Dias (1963); Poni (1976); Kriedte (1983); Ingham (1984); Ormrod (1985); Shenton (1986); Chapman (1992); Fieldhouse (1994); Mueller (1997); Noordegraaf (1997); Tognetti (2002); and, most recently, Marler (2013). There are good contemporary accounts of the way commercial firms operate in Harriss-White (2008) and Mezzadri (2017). The much larger group of those (historians or others) who use 'merchant capitalism' or related terms more or less in passing includes E. P. Thompson, J.-P. Sartre, A. G. Frank, J. Polišensky, John Brewer, and John Darwin, among many others.
- 10 Carlo Poni's most Marxist work belongs to the seventies: Poni (1972, 1976).
- 11 These were contracts with the king of Spain involving short-term loans collateralized by government bonds.
- 12 Smith (2006: 183) notes: 'Then suddenly, between 1773 and 1787, more than 27,000 acres were added to the family's West Indian land portfolio'.
- 13 In *O Capitalismo monárquico* Nunes Dias refers repeatedly to commercial capitalism.
- 14 Shenton (1986: 97): 'Concentration and centralization were the only means of commercial survival'.
- 15 Concentration of capital: Zahedieh (2010: 8, 58, plantation imports into London); Morgan (1993: 189, Bristol sugar merchants); Devine (1975: 4, 74, Glasgow tobacco merchants); Braund (1975: 41, Burma rice trade); Angeli (1982: 97ff., Milan silk industry).
- 16 A crucial strategy of the German non-ferrous metal traders, see the cases discussed in Becker (2002).
- 17 For the chronological span suggested by Marx, see Marx (1976: 445).
- 18 'The putting-out system was developed precisely in the export sector and where the specialization of labour was highly advanced, as in Leiden, a high technical level was achieved': Noordegraaf (1997: 175). Wynn (2008) is a fascinating account of how a modern firm like OCM could organize its carpet business almost entirely on a domestic industry basis.
- 19 Those struggles, the competition between commercial capitals and other topics in this chapter are discussed at greater length in Banaji (2020).

Mode of Production

John Haldon

INTRODUCTION

The concept of ‘mode of production’ has become so entrenched within historical materialist discussion as well as historical and sociological practice that there has often been a tendency to forget why Marx evolved the notion in the first place, with the result that the concepts have more often than not been forced upon the evidence, to the detriment of historical explanation. We should recall that Marx was chiefly interested in understanding the workings and potential of capitalism. Not only were his often vague and very generalised remarks on other ways of organising production relations in other (earlier) societies aimed chiefly at elucidating and highlighting the specific characteristics of capitalist production relations and contrasting them with qualitatively very different earlier systems; but his ideas, and those of Engels, developed over the course of their lives, so that the other ‘modes’ evolved somewhat haphazardly through Marx’s writing across many years. As Eric Hobsbawm noted, it was in the end Engels who wrote more, and was more interested in, these other earlier modes of production (Hobsbawm, in Marx, 1964: 41–59). This has unfortunately often meant that historians have lost sight of the complexity of social-cultural systems in attempting to pinpoint a specific ‘prime mover’ for social change or to over-rigidly categorise historical societies into particular types. The vain search for a single version of what Marx is supposed to have said on the subject has also been misleading; in fact his discussions are often vague and allusive, or sometimes just contradictory, as he himself tried to work out the processes concerned.

As already noted, Marx's primary political purpose was to analyse and clarify the nature of capitalist relations of production. His historical materialism evolved through his own writings as a means of understanding the nature of exploitation, class relations, the relationship between different elements of capitalist production, and the relationship between productive forces and social relations – in order, in his view, to change things for the better. It is not, therefore, a neutral, value-free analytical instrument or toolkit. To the contrary, it is a method aimed at revealing the fundamental economic relationships of a given social structure, in order to understand how, and under what conditions, differential and contradictory or conflicting relationships to the means of production of distinct socio-economic groups can generate social change (and, for some, to see how human actions might influence such processes). This brings with it an inevitable focus on 'the economic' as the arena of social practice which is in some way or other determinant of other socio-cultural forms and relationships. The danger, of course, is that social being can be reduced all too easily to economics in the crudest sense, and this has been, indeed, the major criticism directed – often with justification – at Marxist thinkers, whether academics, scholars and intellectuals, or political activists (not that these categories are in any way mutually exclusive). Finding a way of avoiding such reductionism has been a central concern of historical materialist intellectuals and scholars since the end of the nineteenth century.

PROBLEMS, CONCEPTUAL AND PRACTICAL

Critics of a social historical materialist approach have argued that complexity is such that it is impossible to locate any single determinant for social change; rather, the contingency and the interdependency of a range of factors of variable status should be the basis for explanation. Most recently, and influenced by discussions in the fields of complexity theory and chaos theory, along with criticisms of linear approaches to explanation in the social sciences more widely, some have argued that any explanation that seeks to locate a first cause for any historical event is at the very least completely subjective, if not fundamentally flawed (David, 1985; Rigby, 1995; Byrne, 1998; Lewin, 1999). There have been a number of responses to this sort of critique, but one of the most effective has been the argument that, providing the terms of the discussion are set appropriately, it is entirely possible to pursue a broad (epistemologically) materialist agenda in which 'the economic', for example, forms the fundamental skeleton around which other factors are articulated, so that a dialectical relationship between all elements can be assumed, while at the same time permitting individual aspects to be studied without losing sight of their position as part of an evolving or emergent whole. This entails appreciating the three-dimensional relationship between agency and structure, contingency and context, and

perception/belief and practice (Godelier, 1984; Miller, 1984; Larrain, 1986; Rigby, 1987; Sayer, 1987; McLennan, 1989; Callinicos, 2004; Banaji, 2010a; Da Graca and Zingarelli, 2014).¹ From this perspective, therefore, the value of a concept such as ‘mode of production’ is that it offers general interpretative rules that can serve as a heuristic framework to suggest what questions should be asked of the evidence about a particular set of social and economic relationships, how they evolve and change, and how one can set about understanding the disparate and disjointed historical data as representative of a dynamic social totality.

The problem lies in the fact that ‘mode of production’ has often been understood or employed in different, often mutually exclusive, and certainly confusing ways, on all of which there is a substantial literature (e.g. Hindess and Hirst, 1975; Keyder, 1976; Bailey and Llobera, 1981; Berkta, 1987; Rigby, 1987: 208–250; Callinicos, 2004: 40–54; Banaji, 2010b). Thus we find it applied to historically verifiable instances of the structure of the labour process, examples that are then generalised and universalised to provide a series of ‘types’ of productive organisation: the domestic mode, the peasant mode, the nomadic mode, and so on. In one respect this is legitimate as a descriptive exercise, and is used in this way by Marx himself to describe a system of production, or labour process (as, for example, in his discussion of merchant capital, where both usages occur together (Marx, 1974: III, 323–37)). But this parcellisation of types of labour organisation provides in the end only a description, given that the techniques of production and the nature of the labour process are only one element in the set of relations that make up a mode of production in Marx’s broader sense (e.g. Godelier, 1977: 24; Perlin, 1985: 96ff.). Indeed, it is essential to differentiate between the various historical forms of the exploitation of labour, and the relations of production. Neither slavery nor serfdom, as ways of exploiting labour and extracting surplus, for example, along with the systems of property rights with which they may be associated, must necessarily indicate a mode of production, since by themselves they do not describe the totality of the relations of production, appropriation, and distribution of social wealth, nor how the production, accumulation, distribution, and redistribution of surplus wealth is integrated into a process of social reproduction of the society in question as a totality. Neither, of course, can it help to explain political power relations except as a product of random circumstances (Banaji, 2010a).

More problematic, perhaps, is the tendency to confuse the *concept* ‘mode of production’ (and the specific sets of economic relationships each mode describes) with *actual* historical social formations. Thus we find accounts of the transformation of mode of production, when in fact what is meant is a shift in the relations of production of a social formation or society from those characteristic of one mode of production to those of another. A frequent corollary of this is the identification of a mode of production on the basis of institutional forms, familiar from a given historical example and generally accepted as belonging to the mode in question. Probably the best example of this fallacy is to be found in the discussion of

feudalism, where, according to this view, societies can only be 'feudal' if their institutional arrangements approximate to those of western Europe at the appropriate time. Thus modes of production proliferate as descriptive terms applied to specific types of social formation which, according to the organisation of the dominant labour process, do not appear to fit into any of the 'classical' modes, so that we read of the 'African mode', for example, or of the 'Asiatic mode', which, while never intended by Marx to be employed in this way, tended to be negatively applied to all those social formations that could not be fitted into one of the other established modes (e.g. Mukhia, 1981, 1985).²

A third approach is closer to the intentions of Marx, in theorising the mode of production, on the basis of known historical examples, as a model of a set of characteristic *economic* relationships, consisting of a specific combination of forces and relations of production which, in their interaction, generate certain contradictions specific to that particular combination, contradictions that can lead to the breakdown of the social system through which they are given expression. 'Forces of production' refers both to means of production and the technical levels or methods of production (including the labour process); 'relations of production' refers to the way in which the means of production (land, tools, livestock, etc.) are effectively controlled, and by whom, and the ways in which the direct producers are associated with those means of production and with their own labour-power (Marx, 1974: III, 791; Callinicos, 2004: 40–54). In reality, these two sets of criteria overlap, but it is the specific manner in which direct producers and means of production are combined which, in Marx's words, 'distinguishes the different economic epochs of the structure of society from one another' – that is, to say, which differentiates one mode of production from another (Marx, 1974: II, 36–7).

Thus, while the fundamental elements necessary to differentiate one mode from another are reasonably clear from Marx's analysis of capitalism, his discussion of non-capitalist modes is sketchy and incomplete, chiefly because he was concerned to determine and describe the structural preconditions for the appearance of capitalism rather than the origins of those preconditions. Since he moves from a somewhat technologically determinist position in his earlier writing, where the growth (or not) of the productive forces was the key to change, to a position (for example, in the *Grundrisse*, in the section discussing 'pre-capitalist economic formations') where the changes within the social relations of production are the crucial element, this has led to further confusion and ambiguity in the interpretation of his writing on the subject of the transition from feudalism to capitalism (for a summary of the history of this text, see Hobsbawm, in Marx, 1964: 9–11).

MARX AND HIS MODES

Allowing for the constraints imposed on him by the nineteenth-century conceptual language at his disposal, and by contemporary knowledge of the historical

societies that he used as the basis for his discussion, Marx characterised particular epochs (primitive communal, ancient, feudal) or particular sets of economic relationships ('Germanic', 'Asiatic') as 'modes of production', but his writings are neither clear nor consequential, with the result that there have been many different attempts to define what he may have 'really meant'. Additionally, he did not necessarily imply that these different types of economic organisation were successive; rather, they represented alternative forms, analytically distinct stages, of societal evolution. Most would agree that, at the very least, Marx did not intend a mode of production to represent any specific society but, rather, one set of possible social relations of production from a limited number of historically verifiable sets: on this basis, and in view of the almost infinite variety of *forms* of socio-economic organisation (i.e. culturally determined institutional arrangements), it is possible to generate a relatively small number of models of sets of economic relationships.

Marx wrote in terms of four or five such historical modes of producing, appropriating, and distributing wealth and of combining labour-power with the means of production, each of which has as its corollary certain ecological and organisational conditions necessary to its reproduction.³ But the notion of understanding human social history through a series of 'modes of production' really only becomes dominant during the period of the Second International in the years after 1889, and represents a somewhat economistic, or economically reductionist, appreciation of social evolution, whereby successive modes of production define the epochs of history and are overthrown in revolutionary transformations resulting from the contradictions between forces and relations of production: once forces of production outstrip production relations and fetter them, revolution becomes inevitable. Clearly, there are enormous problems with such an approach, and it has for some time now been abandoned, to be succeeded by an ongoing debate about the nature and heuristic value of the notion of 'mode of production' as such. Even the value of thinking about social and economic transformation in terms of 'modes of production' (as opposed to the value of employing Marx's materialist method in analysing historical societies) continues to be debated within Marxist historiography, if only because the definition of a mode of production itself remains problematic and contested, most especially in respect of non-capitalist economic relations.⁴

In this connection Marx also had to confront the question of transition from one mode to another. While never a major subject for analysis, it was addressed on an occasional basis in connection with both the transition from a capitalist to a socialist mode of social organisation and with that between pre-capitalist modes or between feudalism and capitalism. No general theory of transition evolved as a result of these considerations, however, although Marx's approach shifted across time – from that outlined in his earlier writings, where a technological determinist view predominates, to one in which the internal dynamics and contradictions particular to each mode of production play the key explanatory role.

Thus in respect of the transition from feudalism to capitalism, for example, it is initially the corrosive impact on feudal relationships of merchant activity and commerce, of the expansion of urban centres, and of the growth of a Eurasian and then transatlantic/global market that play the key role. In his later reflections, in contrast, he focuses on property relations and the processes whereby the vast majority of producers become separated from the means of production. Commerce and the growth of markets can stimulate the process of commodification of goods and services, but it is shifts in production relations and property relations, indicated in the processes of class struggle, that are the real cause of transition from feudalism to capitalist social relations of production. The so-called ‘transition debate’ became especially prominent in the decades after World War II, with different arguments picking up on these strands in Marx’s various writings on the subject, and it remains today a subject for discussion and controversy (for surveys and summaries of the debates, see Hilton, 1976; Brenner, 1978; Aston and Philpin, 1985; Hilton, 1990; and Epstein, 2000).

So we come to the question: how did Marx want to use the concept ‘mode of production’, and what is its heuristic value for empirical historical analysis? As a starting point, Marx’s statement about the relationship between owners of the conditions of production and producers themselves is usually taken as fundamental:

The specific economic form, in which unpaid surplus labour is pumped out of direct producers, determines the relationship of rulers and ruled, as it grows directly out of production itself and, in turn, reacts upon it as a determining element. Upon this, however, is founded the entire formation of the economic community which grows up out of the production relations themselves, thereby simultaneously its specific political form. It is always the direct relationship of the owners of the conditions of production to the direct producers – a relation always naturally corresponding to a definite stage in the methods of labour and thereby its social productivity – which reveals the innermost secret, the hidden basis, of the entire social structure...

Marx goes on to note – important for our discussion – that this relationship also elucidates

the political form of the relation of sovereignty and dependence, in short, the corresponding specific form of the state. This does not prevent the same economic base – the same from the standpoint of its main conditions – due to innumerable different empirical circumstances, natural environment, racial relations, external historical influences, etc., from showing infinite variations and gradations in appearance, which can be ascertained only by analysis of the empirically given circumstances. (Marx, 1974: III, 791–2).

This is the approach deployed by Marx in his analysis of capitalist relations of production as a general type, abstracted from his research on nineteenth-century British and European economies, and his elucidation of a series of ‘laws’ which govern the enormous complexity of capitalist production and exchange relations. ‘Capitalism’ was thus, for Marx, a heuristic model of social-economic relations – a mode of production – governed by a set of historically specific laws of motion, while at the same time ‘capitalist’ was a descriptive term that could be applied to

a wide range of actually existing social formations, in which the set of production relations and forces of production described by that term were dominant. But in thinking about the development and inner workings of capitalism, Marx also had to consider social-economic relationships which were non-capitalist, and it was in this way that his partial and often relatively uninformed conceptualisations of the ‘primitive communist’, ‘ancient’, ‘slave’, and ‘feudal’ modes came into being (some occasionally described under different terms, such as ‘Germanic’ or ‘Asiatic’). He never devoted as much attention to theorising these in detail as he did to capitalism (Engels devoted a great deal more), so that much discussion and some confusion has reigned in this respect. But he grounded his ideas on feudal relations in his studies of the late ancient and medieval history of western and central Europe, taking the word ‘feudal’ as his descriptive term for the fundamental features of the set of economic relationships that he found because it was the dominant term among historians at the time to describe the medieval societies they dealt with. And feudal relations were the more important to him because it was out of these that capitalism, the main focus of his study, evolved.

OTHER MODES OF PRODUCTION: FROM LINEAGE TO SLAVERY

Kin- and lineage-based modes of surplus appropriation are described by Marx and Engels under the rubric of ‘primitive communal’ or ‘tribal’ social relations – they exhibit only a limited degree of internal economic, but still kin-based, differentiation (Marx, 1964: 71ff.; Hindess and Hirst, 1975: 18f., 79–108; see the useful discussions in Terray, 1972; Bonte, 1977; Godelier, 1977; and Rey, 1979). Their evolution or transformation into social forms based clearly on class exploitation invariably involves the loosening of kinship ties and dissolution of the associated forms of social praxis, although the extent of this ‘loosening’ process depends upon historically local factors, such as the degree to which kinship and lineage structures also serve as production relations. This does not have to mean that localised or regional bonds of kinship and lineage do not continue to play a key role in the *regulation* of the relations of production and distribution, nor that they do not continue, from the economic perspective, to *function as* social relations of production. But such ties no longer dominate the mode of surplus appropriation and distribution. The increasing complexity of the division of labour and the domination of the producing population by a social and economic elite promote the rapid evolution of institutional means of maintaining and reproducing this evolving class domination, whatever the culturally determined *form* these relationships actually assume. The concomitant extension of networks of coercive political and economic power across a much wider social and geographical space than kinship ties can adequately handle then leads in the longer term to the development of state-like structures. This is how Marx envisaged the ‘ancient’ mode of production.

The concept of an 'ancient mode of production' is thus a developed variant of the idea of primitive communal exploitation. But whereas in the latter clan- and kinship-relations framed by concepts of lineage and lineage-identities determine access to social wealth and to the exploitation of resources, in the ancient mode the focus of social-political and cultural power becomes the urban centre. Marx had in mind the early city-states of the Mediterranean world, understood as the developed and urban-centric form of this still basically agrarian community, whose state represented the incorporation of the citizen body as a group of landowners with collective rights in public lands.⁵ The exploitation of citizens by other citizens and by the state takes place in the first instance through the collective appropriation of surpluses for common ends – warfare, for example. But as slavery comes increasingly into the picture along with other forms of social and economic subordination and stratification among the community's members, so the division of labour becomes more complex, and the appearance of class antagonisms marks a new stage – indeed, a transformative one – in the development of the relations of production. As objective antagonisms between social groups with regard to their different relationships to the means of production evolve, so the state becomes the legislative and executive arm of the ruling class of citizens, which can exploit it thereafter to maintain and promote their own class interests and the extraction of surplus (Marx, 1964: 71–82). The process of state formation, where it is an endogenous development and not imposed by conquest/assimilation, has often been very gradual, and under certain conditions – for example, where democratic political organisations were founded upon a relatively widespread use of slave labour in agricultural production – this can lead to a degree of social and economic equilibrium within the citizen body (de Ste Croix, 1981: 283–300, esp. 286–8).

As soon as a society has attained this stage, it can be said to have transformed its relations of production and, more especially, its mode of appropriation of surplus. No longer does the community, whatever kinship and lineage structures it still exhibits, control the means of production as a community (of clans or families, for example, within which other forms of non-economic subordination existed) with equal, or at least equivalent, rights in their exploitation and distribution. Instead, one group – a class in the economic sense – can now exert control over both the rate of exploitation (that is, the amount of surplus actually demanded) and the mode of surplus appropriation, and by invoking the various instruments of non-economic coercion (the law, customary practice, military force, and so on) can exploit the labour of other groups.

State forms are not, however, necessary to exploitation – to the contrary, it is clear that relations of exploitation can be maintained through lineage structures, too, as a number of anthropologists have tried to show. But the state eventually becomes the legislative and executive organ of a ruling class of citizens, who can henceforth use it to maintain their own position. In the second place, the use of slave labour in an estate-based economy tends to increase dramatically the

economic power of the elite, who are best able to profit from this type of labour investment. In the ancient and Hellenistic worlds, this produced the dominance of vast wealth generated through plantation- and factory-based production based on slavery and focused on an extensive commercial market. It was just this sort of exploitation which gave the political-military elite of the Roman Republic and early Principate (i.e. from Augustus into the second century CE) its pre-eminent position, even though slavery by no means dominated agricultural production in the Roman world as a whole in purely numerical terms.

The state was an important element also in what Marx and Engels referred to as the 'Asiatic mode of production'. This was a catch-all concept that, for them, described the major 'oriental' empires of China, India, ancient Mesopotamia, Iran, and so forth (hence, in the broadest sense, 'Asiatic'), and represented a distinct form of social organisation placed between primitive communal societies and those characterised by the ancient mode. A hallmark of social formations in which the Asiatic mode was dominant was the primacy of the state. This played a dominant role, a result of its monopoly of land ownership, its political and military power, as well as – depending on the geographical context – its control over irrigation systems and public works, secular and religious, in the widest sense. Societies in which the Asiatic mode dominated were seen as the earliest class societies, where a small group – the ruling class – generally a semi-theocratic elite, extracts social surplus through their monopoly of coercion, legitimated through attributions of divinely granted spiritual authority. Marx and Engels, partly inspired by some of Hegel's ideas about oriental society, considered the great Asian nations to have been the first civilisations in the true sense. But they never theorised this mode explicitly – indeed, the occasional references to it were generally vague as to its key features, compared with their comments on feudalism, for example. The term appears for the last time in the Preface to *The Critique of Political Economy* (1970: 21), first published in 1859, after which Marx and Engels retained just four basic forms of societal evolution: tribal, ancient, feudal, and capitalist. It has proved an especially intractable concept and has generated widespread disagreement. Although some theorists have attempted to formulate a coherent concept with analytically useful characteristics, the notion of an Asiatic mode has been largely abandoned, although it does occasionally raise its head (Thorner, 1966; Krader, 1975; Keyder, 1976; Bailey and Llobera, 1981; Dunn 1982; Currie, 1984; Lubarz, 1984; Marshall, 1998; McFarlane et al., 2005; Zingarelli, 2014).

The much debated 'slave mode of production' has likewise generated a good deal of discussion – indeed, Marx himself preferred to speak of slave systems or slave economy within ancient society, which he differentiated from earlier (communal) and later (feudal) social forms. Although undoubtedly very widespread at times, slavery is now generally recognised to have had a relatively limited chronological and geographical dominance in the ancient world in those periods when it did develop, and can be seen on the whole as a comparatively volatile

and contingency-bound mode of surplus appropriation. It represented a mode of the exploitation of labour, rather than a set of relations of production, and is hence to be viewed as one aspect of a broader set of production relations that would be characteristic of a mode of production as such. Institutionalised slavery certainly appears to have dominated relations of production at times in the Roman world from the first century BCE into the early second century CE – but chiefly in Italy – and in Greece in the fifth and fourth centuries BCE (in certain city-states) (see especially Finley, 1973, 1980; Hopkins, 1978; and Carandini, 1979: 128ff., 140ff., 166–79; see also Patterson, 1979; de Ste Croix, 1981: 133ff., 505–9; Wood, 1981: 3–22; Rathbone, 1983; and Wickham, 1988), in the sense that it was through the labour of slaves, whether organised on an intensive plantation basis or not, that the ruling elites of these social formations received the wealth that supported their power and social-cultural dominance (de Ste Croix, 1981: 52–5; Wickham, 1985: 187–9). But contradictions within this type of slave exploitation are such that it seems always to have given way to less unstable forms of exploitation.

Slavery *as a mode of production* (as opposed to a legally defined status) in the period from the second century BCE to the second century CE is thus a somewhat problematic concept, since slavery was both regionalised (representing the source of wealth and power of the Italian ruling class which dominated the Roman state at that time) and closely tied in with market production. That is to say, the evolution of intensive plantation slavery was stimulated by the existence of a market and of the possibility of considerable profits in return for the necessary investment in slaves. While intensive and efficient, like all forms of capital investment it also depended on the market for its raw materials, which, of course, included slaves. Problems of capital outlay and of supply and demand affected this system, therefore, more drastically than they affected the traditional tenant holding or small freeholder; its brittleness meant that it could be a much riskier enterprise. Not all social formations in which slavery played a major role depended on markets, of course. But then warfare and conquest, which both fuel markets and provide direct sources for slave recruits, tend to have only a restricted development before the supplies are exhausted or begin to fluctuate too violently to permit forward economic planning. Since slaves do not, on the whole, reproduce themselves as a workforce, turning them into tenants and providing them with their own means of subsistence and reproduction is one solution to this problem, and this typifies the development of the Roman state from the third century CE at least. But this is no longer plantation slavery and the slave mode of production, although slavery as a condition continued well into the medieval period in the west; until at least the eleventh century a good proportion of the agricultural population seems to have been of servile status, especially on the larger estates of the Church or of private landlords, although mostly as tenants with allotments, providing for their own subsistence, and only rarely entirely alienated from the product of all their labours, subsistence even in servitude being provided by the

slaves themselves. And while biological and social reproduction were clearly hedged about with a range of juridical and physical hindrances, alienated plantation labour is not what the forms of medieval slavery seem to represent. In the final analysis, it seems more profitable to see slavery for what it is: a specific, historically determinate form of the exploitation of labour that has existed, in different degrees and with varying quantitative impacts, since antiquity until comparatively recently, in social formations characterised by very different relations of production (Patterson, 1980; Rathbone, 1983).

Current debates have focused on the degree to which it can be argued that slavery in relatively commercialised productive sectors of the pre-modern world, most particularly in the Roman and Islamic worlds, should be understood as a key element in what are in effect proto-capitalist production relations (see esp. Banaji, 2016; Tedesco, 2016; Banaji and Tedesco, 2017). The question of whether or not there was an ancient capitalism has been an issue debated by Marxist and non-Marxist historians since Mommsen and Meyer (Mommsen, 1864; Meyer, 1910). In current debates a distinction between different capitalisms has been drawn, in which for the pre-industrial economy of the highly monetised and commercialised Roman world (from the first century BCE onward) the term 'precocious' or 'proto' capitalism, to indicate the activity of individual capitalists, is preferred to a 'capitalist mode of production'. This would thus include the huge, industrial-scale monocultures of wine, olive oil, and other consumables as well as a series of commercialised enterprises including shipping, warehousing, quarries, and so forth, invested in and managed by (or on behalf of) members of the Roman elite. There is no suggestion here that ancient society in general was capitalist, nor that the economy of the Roman world more broadly, certainly partly shaped by these enterprises, was in any respect based on industrial capital – a position at times implied in the writings of the great ancient historian Michael I. Rostovtzeff, in some respects implicit also in more recent work by economic historians such as Peter Temin, and argued more explicitly and polemically by a historical sociologist such as Walter Runciman (Rostovtzeff, 1957; Runciman, 1995; Temin, 2012; discussion in Tedesco, 2016). Rather, while capital and wage labour existed in the ancient world, their combination, accompanied by the general expropriation of the producing population, was both highly sectoral and regional. The main exponent of this approach, Jairus Banaji, thus speaks of a predatory and 'unproductive' capitalism in the ancient Roman world, a capitalism that characterised the economic activities of individuals or groups of capitalists rather than the wider economy of Roman society, but one in which, where slavery played a significant role, it did so because it formed only one element of a more complex set of production relationships.

Such an approach cannot be separated from discussion focused around slavery in the American south before the 1860s, where unfree labour was the key to the wealth and power of the southern elite. Their plantations and commercial enterprises were fully integrated into an international commercial exchange network

dependent on capitalist production relations, and it was primarily on this basis that slavery as a form of exploitation of labour, enmeshed in a wider set of capitalist relations of production, could survive. Marx himself certainly treated these phenomena as examples of a particular form of labour relations within broader sets of social relations of production, as has been pointed out (Marx, 1964: 118–19; Banaji, 2010a: 351–3).⁶ Slavery in the southern states of the USA (or in the Caribbean and Brazil) (Engerman and Genovese, 1983) cannot represent a ‘slave mode of production’ as such, but rather an anomalous form of capitalist enterprise based entirely on the generation of absolute surplus value through a monopoly in land and its produce and the maximisation of the exploitation of the workforce through intensive labour practices and the extension of the number of hours that could be worked (Genovese, 1966; Banaji, 2010a: 67–71, 143–4; García Mac Gaw, 2015).

FEUDALISM AND THE TRIBUTARY MODE OF PRODUCTION

Neither Marx nor Engels set out to generate a theory of feudal social relations, but since they were interested in the origins of capitalism, Marx’s initial quest was to identify the system of surplus appropriation and distribution which preceded capitalism in England in particular, and out of which capitalist relations grew. Of course, the established tradition of political economy was quite familiar with the idea of a feudal economy, but for Marx, since whatever could be detected as immediately pre-capitalist must also represent a fundamentally different way of organising the production of wealth and the appropriation of surplus, it must also represent a different mode of production, one that might be universalised, just as capitalist relationships can be universalised, regardless of the particular institutional characteristics differentiating forms of the basic model. From this he generated his ‘feudal mode’, and it was on this basis that he also commented on other fundamental modes of production embodied in the societies and cultures of the past, in an attempt to pinpoint key elements which distinguished one epoch from another. Marx’s concept of the feudal mode of production was based in his study of western European medieval society. On the one hand, ‘feudalism’ described a historically dynamic and evolving set of juridical and institutional relationships that had gradually come into existence over the period spanning from some time after the end of Roman society in the west to the eleventh century – a perspective present in the existing historiography available to Marx. On the other hand, feudalism was based upon a particular organisation of labour-power and surplus appropriation (dependent peasant tenants of varying degrees of social subordination paying rent in kind, services, or cash to their landlords on the basis, however disguised or mediated by custom, law etc., of physical coercion) within the structure of a particular system of political power relations (the feudal ‘pyramid’ of sub-infeudation and vassalage

rooted in mutual military obligation). Marx's concern with feudal relations tended, therefore, to a degree of selectivity according to the issues with which he happened to be dealing in his different writings – in particular, forms of labour and the ways through which the ruling class appropriated the products of labour, and the forms of feudal rent as contrasted with forms of appropriation of surplus value under capitalism. The coercive nature of lord–vassal relationships, of landlord–tenant/peasant relations and the juridical institutions that evolved to protect these, the interface between a 'natural' economy of subsistence and the payment of rent in kind or money, and the relationship between these and the impact of urban markets and commerce, along with a range of other factors, all surface in the context of different discussions within Marx's writing. There are broad characterisations of the feudal mode, but there is no obvious 'theory' of either feudalism or the precise nature of a feudal mode of production in western Europe (his main focus) except insofar as it is undoubtedly seen as a dynamic and changing process of societal evolution arising out of specific and definable historical circumstances (Wickham, 2008 and esp. 2021).

There has been a good deal of debate about the value of a concept of a 'feudal mode of production', the extent to which it can be usefully generalised, and the degree to which it is analytically helpful in understanding pre-capitalist societies. Two opposing approaches dominate: some have preferred a restricted use, adhering to what they believed Marx intended – a definition in which serfdom, characterised by labour services on the demesne, and the lords' direct intervention in the labour process and management of the estate, are the fundamental economic features, and in which production for use was the key feature of economic life. Others have preferred a wider application, whereby 'feudalism' (in its non-institutional, *economic* sense) can be understood as the basic and universal pre-capitalist mode of production in class societies. On this latter argument, the chief characteristics of 'feudal' production relations consist in the following key, differentiating propositions: (1) that the extraction of rent, in the political-economy sense of feudal rent, under whatever institutional or organisational guise it appears (whether tax, rent, or tribute), is fundamental; (2) that the extraction of feudal rent as the general form of exploitation depends on non-economic coercion as the basis for appropriation of surplus by a ruling class or its agents; and (3) that the relationship between rulers and ruled is exploitative and contradictory in respect of control over the means of production (in other words, class conflict is inscribed within its basic structure). This model would thus describe all those class-based social formations where these three sets of conditions and production relations dominate. Yet because Marx himself never evolved a single, coherent theory of feudalism, he varied between a descriptive and empirical Eurocentric approach, in which the specific characteristics of European feudal social formations dominate, and a much broader theoretical exposition of the feudal economy, depending on what he was discussing.

One way around this issue is to employ the idea of a 'tribute paying' mode, originally conceived to replace the confusing, unpopular, and largely abandoned

‘Asiatic’ mode to which Marx occasionally made reference (Amin, 1976). Here, the feudal mode appears as a ‘borderline’ or ‘peripheral’ example or articulation of the tributary mode, marked out by the specific nature of the degradation of the community in respect of its control over the land, and consequently its means of subsistence and reproduction. In both modes, tributary and feudal, the essential process of surplus appropriation is the same, as is the economic relationship (however defined juridically) between producers and means of production. What varies between the tributary and the feudal mode is simply the degree of control exercised by the ruling class, or the state or state class, over the community. This impacts on the rate of exploitation but does not affect the actual nature of the mode of surplus appropriation. It can be argued that the distinction between ‘feudal’ and ‘tributary’ modes needs to be retained, since while the two modes may be indistinguishable from the point of view of the producers (i.e. surplus labour in the form of tax or rent extracted from a smallholding peasantry), the nature of those who have effective control over the means of production (resting ultimately on coercion, and regardless of legal arrangements and so on) varies (i.e. the state, as opposed to a ruling class of landlords).

Alternatively, we could see feudalism as a historically specific instantiation of the tributary mode. The main objection to this approach is that, traditionally, tax and rent have been taken as two distinct forms of surplus extraction denoting fundamentally different relations of production. But if we argue that this is not in fact the case but, rather, understand them as two different institutional forms of the same mode of surplus extraction, we arrive at what is perhaps a more useful way of conceptualising what was the most widespread form of pre-capitalist class society. The fundamental difference is, therefore, to understand tax and rent as two *forms* of the same mode of surplus extraction reflecting two different sets of *political* relations of surplus appropriation and distribution. Adopting the terms ‘tributary mode’ and ‘tributary production relations’ *to replace* the terminology of a feudal mode would permit limitation of this latter term to a specific *social formation* (or social formations), based upon tributary relations of production but distinguished by particular historical circumstances and juridical relationships, rather than seeing feudalism as a mode of production in its own right (discussion in Haldon, 1993: 63–109; for a different approach see Wickham, 2021). The debate around the validity of this terminology will no doubt continue for some time.

THE VALUE AND USES OF THE CONCEPT OF ‘MODE OF PRODUCTION’

If we extract from Marx’s various writings his comments on ‘mode of production’ and the way he himself set about his analysis of capitalist production relations, we can conclude that a mode of production is a construct grounded in empirical observation, intended to help in locating the causal relationships

underlying the political and cultural evolution of a given society or group of societies. It does not predict the historically attested form structures take, but it does provide an analytical and functional framework within which their limiting, constraining, enabling, or dynamic results can be understood – it establishes, at a relatively general level, the range of the possible within such social-economic systems. These are the historically determinate ‘laws’, specific to each epoch or mode, established through the process of generating concepts by abstraction from empirical data, to which Marx refers. Only through detailed empirical analysis can the specific causal relationships operating across a specific period in a specific cultural system be understood, and only through such work can the multiplicity of social, economic, and political agencies be causally related within a properly holistic analysis.

In the light of these considerations, it must be apparent that modes of production do not – indeed, cannot – develop. On the contrary, it is social formations – actually existing or attested sets of social relations of production – that change, so that we must look at the shape, and the local and international context, of each social formation (or group of social formations) to see how transformative shifts in the dominance of particular sets of social relations of production are actually brought about (Banaji, 2010a: 22–3). Within the multiplicity of historical configurations of tributary or capitalist social relations of production, or, indeed, any other mode of production, it is the *specific contexts* generated by *specific conjunctures* or configurations in time and place – in other words, particular moments at which structural disparities between forces and relations of production are realised in terms of social praxis – which lead to transformations. These are predictable only in the most general sense, delimited by the conditions of existence of given sets of relations of production and by the historically specific forms of their internal contradictions.

Transformation is not, therefore, an *inevitable* consequence of process in time; but it is *always a possibility*, under specific sets of conditions. The reasons why capitalism developed out of European feudalism must be sought not in some general theoretical process of inevitability but, rather, in the empirical circumstances of social-economic evolution. ‘Mode of production’ provides an agenda, delineating the essential nature of contradictions within a given set of production relations and the basic economic possibilities or ‘laws of motion’, as noted above. But it is in actual historical societies that change in fact occurs, and where these contradictions work themselves out. It is, therefore, at this level that the *explanation* for change must be sought. The latter is a possibility determined by the historical institutional forms of expression of the underlying economic relationships, which are subject to change or disruption at the level of class struggle and the political relations of power distribution. It is essential to bear in mind that these institutional forms are, after all, the combination of sets of social practices, which local conditions have evolved to express fundamental relations of production and surplus appropriation.

At what level of analysis is the concept 'mode of production' useful? This is another point for disagreement and discussion, since it depends, obviously, on how one defines the term, as the discussion so far has shown. It should be remembered that in theorising a mode of production and highlighting the fundamental contradictions within the social relations of production, no more than a basic framework is established within which it is then possible to examine empirically an actual historical society. Marx noted that only by identifying those elements that were not common to all forms of production is it possible to explain different historical outcomes, and that there was no inevitability about the ways in which any given social-economic formation would evolve, even if it is possible to limit the range of evolutionary possibilities (because of the structural properties and limitations of a mode of production through the lens of which the social formation in question is being examined).

'Mode of production' thus has value only at a fairly high level of abstraction; it works as a means of distinguishing, at the level of political economy, some very basic differences in the ways in which surplus wealth is generated and appropriated. Trying to formulate laws of motion beyond this level is, as becomes clear from reading Marx's own historical work, pointless. The concept of a given mode of production offers some very basic clues as to the potentials and evolutionary possibilities open to societies in which a particular mode of production is represented, but I do not think that it can be detailed in respect of organisational capacities and arrangements. 'Mode of production' in itself does not help, for example, to differentiate between early-nineteenth-century England and twentieth-century Japan, both capitalist social formations yet utterly different in institutional detail and evolutionary trajectory. On the contrary, only by careful empirical analysis of the actual historical cases can the causal relationships leading to change and transformation be identified (Marx, 1973: 85; 1974: III, 791–2).

All social formations include elements of different ways of organising labour, different methods of appropriating surplus, and different ways of organising the distribution of that surplus among those who control the means of production. And by the same token, control of the means of production is usually compromised or inflected by a range of factors, physical (such as distance) as well as institutional or social (the forms in which surplus is taken, the availability of money to facilitate the transfer of values, and so forth). In the same way that many examples of commercial investment can be found across the ancient and medieval worlds in Europe and Asia – the dense network of businesses in thirteenth- and fourteenth-century Italian towns, for example, or the highly profitable ceramics manufacturing activities, as well as the heavily market-orientated olive-oil and wine-producing industries in different parts of the Roman world from the first century BCE into the later Roman period – so slave production can be found in societies dominated by tributary/feudal relations of production, and estates managed through forms of serf labour can be found in parts of a world in which capitalism is clearly dominant. Each social formation represents

a particular historical exemplification of the ways in which different modes of production – different ways of combining forces and relations of production – are expressed. While modes of production as models of sets of social-economic relationships are derived by comparing historical examples of societies that share similar fundamental characteristics, the consequent advantage of defining a mode of production in respect of its basic tendencies or ‘laws of development’ is that it helps in setting up a framework within which the various types of exploitation of labour and appropriation of surplus can be located in their historical context, in which historical evidence can be situated and interrogated, in which cause and effect can be determined, and through which both short-term as well as longer-term changes and transformations can be understood.

CONCLUSION

The issues outlined in the foregoing discussion are not the only critically important questions relevant to Marx’s construct of mode of production. The question of how to define ‘the economic’, for example, its role in determining the fundamental shape of a mode of production, and the problems raised by the use or misuse of terms such as ‘base’ (or ‘economic base’) and ‘superstructure’ in Marx’s and Marxist writing are also integral aspects of any discussion around the historical materialist approach to the concept of mode of production and to understanding society, whether historical or not. But for the present discussion, we may conclude that Marx’s aim in conceptualising ‘mode of production’ – a general model of a set of relations of production derived from his study of specific historical societies – was to create a heuristic framework, intended to serve as a means of asking questions about the basic structures informing the ways in which a given social-economic system worked, and in particular to help elucidate the mechanisms of capitalist production relations and their fundamentally exploitative nature. A mode of production is an abstraction from known historical examples, representing no specific society but, rather, one set of possible social relations of production from a number of such sets (Perlin, 1985: 90–2, 97–101 categorises this approach as ‘macrological’). How many such sets we identify has been the source of much discussion, but across the vast terrain of human social-economic evolution, it is possible to reduce the almost infinite variety of *forms* of social-economic organisation (i.e. culturally determined institutional arrangements) to a relatively small number of basic social-economic types, modes of producing and extracting surplus. Recent discussions have for the most part focused on four historical modes of producing, appropriating, and distributing wealth and of combining labour-power with the means of production: the primitive/lineage/‘peasant’ mode, the ancient mode (which remains to some degree problematic, along with the associated slave mode, which, as we have seen, is not a viable concept), the tributary/feudal mode, and the capitalist

mode.⁷ In this writer's view, the tributary mode in fact covers most ancient societies that can no longer be described under the primitive or lineage mode. But, as noted, this remains a point for further discussion.

If a mode of production – a model of a set of social-economic relations – has been adequately theorised (that is to say, if the relations between its constituent elements are coherent), it should serve as a heuristic device that can inform the questions that should be asked of the evidence about a particular set of social and economic relationships, and how one can go about understanding the disparate and disjointed historical data as representative of a dynamic social totality. This was realised in Marx's presentation of exactly this type of analysis for capitalist relations of production as a general type, based on his painstaking researches on nineteenth-century British and European economies, and his elucidation of a series of what he called 'laws' (a term which belies the ways in which Marx actually envisaged these processes and which led to a good deal of criticism and especially to accusations of determinism). What Marx termed 'laws' might better be described as 'structurally determined tendencies' (although this is a rather long-winded formulation) that govern the enormous complexity of capitalist production and exchange relations. Fundamental to the efficacy of his analysis and its social-scientific value was the simple fact that he was able to demonstrate that, however different the various *forms* of capitalist economy actually were, they all operated on the same fundamental principles. This was, for Marx, the essence of a mode of production: a heuristic model, derived from the study of actually existing social formations in which similar sets of relations of production and similar or comparable forces of production were dominant, and which was intended to elucidate the working of such production relations in many different contexts.

The value of the concept of mode of production, along with all the issues that accompany it, has also been the subject of often detailed and always challenging critiques from a non-Marxist perspective – in particular challenging the reductionism and economism of some Marxist writers, or forcing a reassessment of the relationship between social relations and culture, belief systems, the agency–structure relationship, to name but a few. Members of the Frankfurt School were especially important in respect of a sympathetic but highly critical challenge to the ways in which Marxists integrated individual agency and the power of cultural systems into theories of 'mode of production' – for example, Adorno and Horkheimer (1986) and especially Habermas (1971). Marxist thinkers have responded by defending, rearticulating, and elaborating their positions (for example, G. A. Cohen's work on Marx's theory of history) – as well as by reconfiguring or revising their arguments to take these critiques on board (such as Alex Callinicos's work on agency and structure, or most recently Jairus Banaji's work on mode of production) (Cohen, 1978; Callinicos, 2004; Banaji, 2010a). Historical materialist thought and approaches have influenced, directly and indirectly, a great deal of social science and humanities thinking over the last century and more. And while Marxist historiography may often be seen as marginal to

mainstream academic culture, if not to public political life (depending on where we look in the world), it is also clear that it continues to play an active, lively, and increasingly (again) influential role in thinking about how human societies have evolved and in particular in articulating how relationships of exploitation and oppression can be revealed, understood, and challenged.

Notes

- 1 All with different perspectives and conclusions.
- 2 On Indian 'feudalism'. One result is evident in the (critical) statement made by the Marxist anthropologist Maurice Bloch that 'we should all retain the right to construct as many or as few modes of production as we like for the purposes at hand': Bloch (1980: 129).
- 3 Marx elaborated these basic types in *Pre-Capitalist Economic Formations* (Marx, 1964: 67–120), although he discussed them elsewhere as well, often adding or changing details as his views evolved. See in particular Eric Hobsbawm's extremely useful 'Introduction' (Marx, 1964: 9–65).
- 4 The evolution of 'dialectical materialist' historical interpretation is usefully surveyed and discussed in McLennan (1981).
- 5 For the main characteristics of the ancient mode, and other alternative post- 'primitive communal' inflections on this evolution, see Marx (1964: 71ff., 92ff.), and the comments of Wood (1981).
- 6 Banaji has produced by far the most cogent and effective recent analysis of the ways in which slavery and capitalism can be associated.
- 7 The 'peasant mode' is theorised as a separate mode from the primitive/lineage mode by Wickham (2005: 536–40).

Social Reproduction Feminisms

Tithi Bhattacharya, Sara R. Farris and
Sue Ferguson

INTRODUCTION

As the COVID-19 pandemic raged through the planet, devastating lives and livelihoods, capitalist governments worldwide had to make an important shift in their governing strategies.

Overnight, nurses and janitors, agricultural workers and supermarket stockers temporarily assumed greater importance than the stockbroker and the banker. The work of producing commodities for profit suddenly took a backseat while reproductive labour, the work that reproduces our capacity to labour, and ultimately life itself, was put centre stage.

Social Reproduction (SR) feminism is the name given to that set of conceptualizations from different strands of Marxist and socialist feminism trying to explain these processes of life-making, how such processes are part of capitalist accumulation and what this means for how we as individuals and as a society produce and maintain our lives and human capacities. SR feminism is thus a loose but nonetheless broadly coherent school of thought – one that identifies and develops the insight that the social labours involved in producing this and the next generation of workers plays an important role in the capitalist drive to produce and accumulate surplus value. The tradition picks up on, and aims to correct, the naturalization of the gendered division of labour seen in Marx's critique of capitalism and in the socialist tradition more broadly. It does so by developing

an insight at the heart of *Capital* Volume 1, where Marx identifies ‘labour power’, or our capacity to labour, as the ‘special commodity’ that the capitalist needs to set the system in motion and keep it running. Our labour power, Marx tells us, has the ‘peculiar property of being a source of value’ (Marx, 1977: 270) because with that labour power, we create commodities and value for capitalism. The appropriation of our surplus labour by capitalists is the source of their dominance. Without our labour power, then, the system would collapse. But Marx is frustratingly silent on the rest of the story. If labour power produces value, how is labour power itself produced?

In the following sections we outline the trajectory of SR feminism, particularly as it unfolded in Europe and North America, by focusing upon the main theoretical contributions.¹ By critically engaging with Marx’s critique of political economy, SR feminism extends his analysis to grapple with the ways in which the social reproduction of labour power ground processes of accumulation in relations of social oppression. This unfinished project has, as we show below, a pointed political message: the fight against capitalist exploitation must be, at one and the same time, a fight against social oppression.

MARX AND SOCIAL REPRODUCTION

Marx discusses the idea of social reproduction in Volume I of *Capital*. In chapter 23 on ‘Simple Reproduction’, he urges us to consider that ‘viewed ... as a connected whole, and as flowing on with incessant renewal, every social process of production is, at the same time, a process of reproduction’ (Marx, 1977: 711). More specifically, he tells us, capitalist production reproduces the wage-labourer, the essential condition of further capitalist production. A century later, both Louis Althusser and Pierre Bourdieu begin from this Marxian insight to theorize the ways in which ‘ideological state apparatuses’ (Althusser) and ‘cultural capital’ (Bourdieu) feature in the broader reproduction of capitalism (see Cammack, 2020).

Marxist and socialist feminists, however, introduced an important distinction between the reproduction of capitalist social relations as a whole, or ‘societal’ reproduction, and ‘social reproduction’ which refers more narrowly to the processes, institutions and work necessary to renew labour power and life itself (Arruzza, 2016; Laslett and Brenner, 1989: 383; Luxton, 2006: 28–30). Labour power, and the labour that produces it, thus became the key categories on which SR feminism focused. Marx defines labour, ‘in the physiological sense’, as the ‘expenditure of human labour-power’ (Marx, 1977: 137). Labour is the practical and conscious interaction of a subject with the world around them. While its social form varies historically, labour is the precondition of all (pre-capitalist and capitalist) societies. And in the chapter devoted to labour power, Marx presents it not so much as an abstract concept but as a material and even sensuous reality: ‘We mean by labour-power, or labour-capacity, the aggregate of those mental

and physical capabilities existing in the physical form (*Leiblichkeit*), the living personality, of a human being, capabilities which he sets in motion whenever he produces a use-value of any kind' (Marx, 1977: 270). Shortly after, Marx argues that labour power exists only in the 'living body (*lebendige Leiblichkeit*)' of the worker (Marx, 1977: 272); it 'exists only as a capacity of the living individual' (Marx, 1977: 274).

Labour power is also, in capitalist societies, a commodity. In order to survive, its bearers (workers) must sell their labour power to a capitalist in return for a wage.² But, according to Marx, labour power is a 'peculiar commodity'. It is peculiar because it is one 'whose use-value possesses the peculiar property of being a source of value, whose actual consumption, therefore, is itself an embodiment of labour, and, consequently, a creation of value' (Marx, 1977: 270). It is this aspect of labour power – its exploitation by capital through relations of waged labour and its role in determining and producing capitalist value – that Marx explores in depth in *Capital*.³ And it is this aspect of labour power that has tended to dominate discussions in Marxist theory and revolutionary socialist politics ever since.

For social reproduction theorists, analyses of capitalism that focus solely on value-productive (waged) labour are flat, one-sided and overly abstract. They are capital-centric in that they understand labour and labour power in the same way capital understands them – exclusively as 'resources' for making profits rather than also as elements of making life. But, as Tithi Bhattacharya writes in a seminal explanatory essay, 'what we designated ... as two separate spaces – (a) spaces of production of value (point of production) (b) spaces for reproduction of labor power – may be separate in a strictly spatial sense but they are actually united in both the theoretical and operational senses' (Bhattacharya, 2015).⁴ Following this thread of analysis, SR feminists, particularly from the late 1960s onwards, proposed to look at labour more expansively, without losing sight of its concrete features. Labour, in their view, is first and foremost the practical human activity required to produce life in general and to produce workers for capital in particular. While the creation of capitalist value and profit requires labour power be abstracted from those concrete realities, critiques of capitalism can and should begin from the fact that labour power is an *embodied* capacity that is socially (and hierarchically) organized. The adoption of such an approach reveals just how complicated any process of regeneration of such embodied capacities must necessarily be.

From a social reproduction lens, then, Marx's famous story in *Capital* Volume 1 about the owner of money and the owner of labour power (Marx, 1977: 280)⁵ as the two *dramatis personae* encapsulating the secret of capitalist accumulation, is not in fact the full story. It requires an addendum. As Nancy Hartsock (1983) put it, if after descending with the capitalist and worker into the realm of waged work we were then to follow the worker home into yet another hidden abode of production, we might observe another change in the *dramatis personae*:

He who before followed behind as the worker, timid and holding back, with nothing to expect but a hiding, now strides in front, while a third person, not specifically present in Marx's account of the transactions between capitalist and worker (both of whom are male) follows timidly behind, carrying groceries, baby, and diapers. (Hartsock, 1983: 234)

That is, in completing the entire cycle of production (the production of value at the factory followed by the production of labour power at home), we see how economic class relations are grounded in gender hierarchies:

By descending into the even more hidden, even more fiercely privatized space of the household, we see men and women who may be formally equal under the law transformed through the gender division of labor into relatively privileged and penalized subjects. (Weeks, 2011: 25)

SR feminism thus begins from the assumption that the renewal of our labour power – which involves life-making activities from eating, resting and gestating to learning, creating art and playing sports – is socially organized in ways that both *correspond* to and *contradict* the priorities of capitalist accumulation. In other words, the biological and cultural processes and institutions of social reproduction are neither natural nor neutral. Referring to a specific strand of SR feminism known as Social Reproduction Theory (SRT), Aaron Jaffe argues that this approach does not simply trace ‘our needs, how we try to satisfy them’. Rather, more significantly, it theorizes ‘how we are limited and constrained when other, better, freer possibilities are available’ (Jaffe, 2020: 4).⁶ SR feminism is above all a theory that attempts to explain the link between labour power reproduction and capitalist accumulation, on the one hand, and social oppressions, on the other.

Early social reproduction feminists attended almost exclusively to the gender hierarchy that mediates the relation between life-making and value-making, or the reproduction of labour power in the home. They argued that the activities that renew the labour power and life of workers under capitalism occur prevalently within the family and are performed predominantly by women. One of their most important insights is that capitalism depends upon the regulation of women to perform unwaged and/or low-paying social reproductive labour. That is, capitalism presumes and also helps to shape and perpetuate the subordination and domination of working-class women.

The early focus on theorizing gender relations to the exclusion of other forms of oppression has – in light of criticism – led some social reproduction feminists to develop and complexify their understanding of capitalist social reproduction in ways that account for its imbrication in racist, heterosexist, ableist, colonialist and other social hierarchies. Much of that work has been pursued within the SRT framework that Jaffe discusses – a framework that evolved out of engaging with Lise Vogel's approach in her book, *Marxism and Women's Oppression: Toward a Unitary Theory* (2013 [1983]). We explain below how Vogel's specific theorization of the relation between social reproductive labour and capitalist processes of accumulation points

beyond the limits of more binary (gender/class) conceptualizations of capitalism. And how, seen in this light, SR feminism is as much a theoretical framework as a political project for full-scale social transformation.

MARY INMAN'S *IN WOMAN'S DEFENSE*

The relation between production and reproduction has been at the centre of Marxist and socialist feminist theorizing and activism from the early twentieth century onwards. Even though they did not refer to it as social reproduction, several feminists influenced by the work of Marx analysed the household and women's labour as a site which entertained a close relationship with the point of capitalist production.

One of the first sophisticated attempts at theorizing the relationship between reproductive labour, women's oppression and capitalist work can be found in Mary Inman's 1940 book, *In Woman's Defense*. A member of the CPUSA, Inman conceived of her book as a contribution to her party's reflection on 'the woman question' (as it was called by socialists and communists at the time). Women's work in the home, she contends, contributes to the production of overall social wealth. Housewives are 'the pivot of the system' who provide 'indispensable social labour'. While its connection to the capitalist system is obscured by its private nature, housework is 'knit into the productive process' (Inman, 1940: 34, 133, 136). Inman positions women's unpaid labour as productive work in both the conventional sense of that term, as well as in the more technical, Marxist, sense denoting labour that produces capitalist value. Her argument directly contradicted the dominant view within the Party and broader Left, which designated housework as a form of consumption, not production. Although a great number of women's traditional domestic chores had been commodified (weaving, canning and schooling, for instance), Inman pointed out, a woman still maintains her home and raises children. Housewives produce, she wrote, 'the most valuable of all commodities ... Labor Power' (Inman, 1940: 149).

Inman specifies that this is the lot of working-class women alone – women who are 'without property and have been denied the use of the earth except on the terms of those who claim title to it'. The wealthy but dependent woman, she writes, 'is a sort of glorified servant ... [who] does no work'. Similarly, only 'subject women' whose labour produces the 'subject children' become the workers and soldiers of tomorrow (Inman, 1940: 59, 102, 138).⁷ Inman goes on to bemoan the wastefulness of individualized household production. Under the current system, for example, 100 women are employed to feed 100 men, whereas under a collective or cooperative system, she proposes, community kitchens would require far less labour time. She further argues that resources and day nurseries should be made available to diminish the drudgery of housework and allow women to more easily work for a wage.

Inman concludes that the struggle against capital need not be limited to the shop floor. It can and should also take place in communities. Whereas previous socialist feminists, such as Alexandra Kollontai in Russia and Clara Zetkin in Germany, had also supported community struggles, they did not offer any analysis of how such actions might challenge capitalist forms of wealth production. Rather, they argued that working-class support for feminist causes brings workers together into a larger, stronger political force against capital. Inman's originality lies in grasping that while capital has unified the working class across gender lines by involving all forms of labour (men's and women's, waged and unwaged) in the process of accumulation, in depending on the unpaid labour of reproducing workers, capital has also already divided the class along gender lines.

As provocative as Inman was about gender politics, she had little to say about race. She makes passing mention of it in both *In Woman's Defense* and in her 1964 pamphlet, *The Two Forms of Production under Capitalism*. The absence of any analysis of racism in *Two Forms* is all the more surprising considering that this text came out 15 years after the seminal article by Claudia Jones. In 'An End to the Neglect of the Problems of the Negro Woman!' (1949), Jones outlined the complex interplay of race, gender and class in the lives of African American women. Its publication coincided with an ascendant Black and Latinx feminist movement drawing attention to the racial, gendered and class-based experiences of the US welfare system. Inman, however, merely notes that 'Negro women are particularly victimized by the present system', while going on to reinforce racial stereotypes of black women as poor mothers (Inman, 1964: 35n5).

The interplay between gender and racial oppression under capitalism, or the ways in which race and racism necessarily change the terms in which we understand the link between production and social reproduction, were mostly overlooked by early social reproduction feminists. It is only from the 1970s onwards that Black theorists push feminists to integrate race into their reflections. But before we develop this point, we need to briefly discuss the work of Margaret Benston. As we shall see, her 1969 article helped to establish the main terms upon which Marxist feminists will debate (and ultimately develop distinct positions within) SRT.

MARGARET BENSTON ON PAID AND UNPAID WORK

Inman's work was not well received by the CPUSA leaders and did not reach a wide audience. Yet, five years later another Marxist-feminist analysis of the social wealth produced by housewives would help spark a vibrant international debate about the role of domestic labour in capitalism. Margaret Benston's article, 'The Political Economy of Women's Liberation', published in a 1969 issue of *Monthly Review*, advanced the idea that women's unpaid work in the home constitutes production (not consumption) essential to the capitalist process of

value creation. Unlike Inman, however, Benston stresses that housewives do not engage in capitalistically 'productive' labour because, she reasons, they do not produce goods or services for sale on the market: housewives create use values, not exchange values. That is, their 'products' are consumed immediately in the privacy of their homes by people with whom they share family ties. Such work, she then suggests, is not capitalist, but *pre-capitalist*:

The household ... constitutes an individual production unit, a pre-industrial entity, in the same way that peasant farmers or cottage weavers constitute pre-industrial production units. The main features are clear with the reduplicative, kin-based, private nature of the work being the most important. (Benston, 1969: 17)⁸

Although not, strictly speaking, capitalist labour, housework, claims Benston, 'is very profitable to those who own the means of production' (Benston, 1969: 18). It and women's oppression more generally keep production costs down. To begin, she notes, a single wage covers the cost of two people's 'socially necessary' labour and, moreover, the availability of housewives to serve as a reserve army of labour fuels competition among workers, allowing capitalists to pay lower wages. Capitalists also benefit from the fact that a wife and children are dependent upon a man's wages, making wage-earners less likely to strike, change jobs or forego work all together.

Benston's argument is about the structural relationship of women's unpaid work to paid work. This necessary relationship, she insists, is the critical, socio-material lever of oppression. And it is also the critical lever of liberation. Equality in paid work, she agrees, is an important goal. But it will not liberate women: 'As long as housework and childcare remain a matter of private production and the responsibility of women, wage-earning women will simply carry a double work-load' (Benston, 1969: 21). She argues for the socialization of such work but cautions that only a socialist system will put human welfare above profit; in capitalist societies, the public provision of care work is likely to dehumanize women, not liberate them. For Benston, then, the promise of women's liberation lies in women asserting control over the conditions in which they perform unpaid work. Like Inman, Benston calls on women to resist their 'exploitation' as housewives. Such resistance cuts against capital's reliance on the family for higher profits and social stability. Housewives, she insists, have a role to play in the transition to socialism because of (not despite) their unique position relative to capital.

WAGES FOR HOUSEWORK AND THE DOMESTIC LABOUR DEBATE

Benston's article anticipates that current within SR feminism that Susan Ferguson has called the 'Marxian school of social reproduction' (Ferguson, 2020). This refers to those feminists who accept Marx's 'value theory as authoritative' and conceive of unpaid and much paid (public sector) social reproductive labour as

necessary to the production of surplus value but not, in itself, productive of surplus value. As we will see, the answer to the question on whether reproductive labour produces exchange or use values will divide social reproduction feminists for decades to come. Meanwhile, Benston's work helped set the grounds upon which the so-called Domestic Labour Debate⁹ would subsequently build its main arguments (Hensman, Chapter 78, this *Handbook*). The contributors to the Domestic Labour Debate aimed to solve above all the riddle of exactly how women's unpaid labour in the home is part of the process of creating surplus value.

This question was also the focus of the international Wages for Housework campaign. In 1972, Mariarosa Dalla Costa, Silvia Federici, Brigitte Galtier and Selma James – representing feminist organizations in Italy, the USA, France and England, respectively – founded the International Feminist Collective, which then launched Wages for Housework (WfH) campaigns in Padua and London. Over the next five years, feminists in multiple North American and European cities, as well as in Trinidad & Tobago, followed suit. They paid particular attention to the significance of patriarchal oppression as an axis of power. As Federici explains in her 1975 pamphlet, *Wages Against Housework*, capital and men both benefit from women's oppression:

In the same way as God created Eve to give pleasure to Adam, so did capital create the housewife to service the male worker physically, emotionally and sexually, to raise his children, mend his socks, patch up his ego when it is crushed by the work and the social relations ... that capital has reserved for him. (Federici, 2012: 17)

In insisting that men too have an interest in sustaining women's oppression, WfH feminists stressed that capitalism is not simply an economic system of 'free' waged labour. More accurately, they argued, it is a political system of unfreedom: it relies on extra-economic (gender) oppression to produce the labour power upon which it thrives. The political upshot is that women must organize separately from men, while also making their demand on capital (through the state) for wages. WfH feminists did not, however, advance the wage demand as an end in itself. Rather, wages for housework was 'only a basis, a perspective, from which to start', explained Dalla Costa and James. Its 'merit is to link immediately female oppression, subordination and isolation to their material foundation: female exploitation' (Dalla Costa and James, 1972; see also Weeks, 2011) As such, the demand that housewives be given a wage reveals the power women have to withdraw from housework, to refuse it, in the same way that striking waged workers stand up to capital.

LISE VOGEL AND THE UNITARY THEORY

Together with Benston's 1969 article, Lise Vogel's book, *Marxism and the Oppression of Women: Toward a Unitary Theory* (2013 [1983]) is now

considered a critical point of reference for the contemporary renaissance of SR feminism, particularly for the ‘Marxian school of social reproduction feminism’ or SRT. Vogel broke with the tendency to search for an explanation of women’s oppression within the (unpaid and invisible) nature of housework and the gender relations within the patriarchal household. Instead she examined and elaborated the analysis of what she stressed was a necessary but contradictory relation between social reproductive labour and the processes of capital accumulation. Others before her had noted that this relational dynamic existed. But, preoccupied with trying to explain the ‘cause’ or ‘origin’ of women’s oppression, their analyses ultimately pivoted on the oppressive nature of housework itself. Vogel was not interested in identifying causes and origins, readily conceding that patriarchal power relations predated capitalism. Rather, she asked how we can understand the *systemic logic* that sets the conditions whereby people reproduce themselves, on the one hand, and capital produces value, on the other. She proposed that women’s oppression was sustained and shaped in the working through of the dynamics of that relationship.

Therein Vogel identified and unpacked a deep and abiding contradiction. Capitalists do not directly control the (re)production of labour power (the processes of which involve, she insists, capitalistically ‘unproductive’ labour).¹⁰ They do, however, pay the wages and some of the taxes through which workers gain the means of subsistence to reproduce themselves. Because competition compels capitalists to keep wages and taxes as low as possible, the social reproduction of labour presents them with a dilemma: they require human labour power but must constrain the conditions of life that generate it. As Vogel observed, ‘From the point of view of capital, the social reproduction of the workforce is simultaneously indispensable and an obstacle to accumulation’ (Vogel, 2013 [1983]: 156). Capitalism thus exists only by consistently thwarting the flourishing of human life on which it nonetheless depends.

For the bulk of history, ruling classes have resolved this dilemma primarily by off-loading as much responsibility for the reproduction of labour power on private households as possible. Because women are biologically able to give birth and breastfeed, it is necessary for the ruling class to find ways to regulate women’s bodies and the caretaking labour that has conventionally fallen to them, while also keeping the costs of so doing as low as possible. To that end, it relies on its state to ensure the privatization and regulation of social reproductive work through policies and policing that tend to reinforce existing gender and sexual hierarchies. Thus, for Vogel, ‘women’s oppression in class societies is rooted in *their differential position* with respect to generational replacement processes’ (Vogel, 2013 [1983]: 129, emphasis in original). It is not sustained and reproduced simply because they take on the bulk of domestic labour, however much that labour can be an *expression* of their oppression as well as a source of gendered conflict.

Earlier theorists from Inman to Benston to Dalla Costa analysed ways in which the relationship between production and reproduction drew patriarchal

relations into the very constitution of capitalist wealth. Vogel's contribution is in highlighting and unpacking the political–economic logic of that co-constitution. In this way, she reveals the ways in which women's oppression is *integral* to the capitalist relations of production themselves – the way, that is, that capitalist production requires and makes possible the ongoing oppression of women. The specific expressions of that oppression will, she says, vary; they can only be known through historical (not theoretical) investigation.

In this way, Vogel avoids attributing undue determinative weight to unpaid domestic work. Although a common aspect of women's oppression, and the historically dominant means of reproducing labour power at little cost to capital, she contends, gendered labour and the patriarchal household do not explain why capitalism is a sexist system. Rather, that explanation lies in grasping the dynamics of the necessary but contradictory relation of the reproduction of labour power to capitalist accumulation. That is, women's oppression in capitalist society is grounded in a socio-material or structural logic of capitalist reproduction that limits the possibilities for women's freedom and equality.

Vogel's focus on the relation of social reproductive labour to capital needs to be stressed because it allows her to point beyond the household as a site for analysing labour power's reproduction. Vogel mentions, for example, that workers are also reproduced in 'labor camps, barracks, orphanages, hospitals, prisons, and other such institutions' (Vogel, 2013 [1983]: 152). And, as others have pointed out, there are many more such sites, not least among them the community-based organizations that Claudia Jones and other anti-racist feminists highlight as the core of much of African American women's activism. Moreover, schools, hospitals and the homes of middle-class White employers of Black and immigrant housekeepers and child-minders, are sites of *paid* social reproductive work. The labour in these spaces and times is – just like unpaid housework – organized in and through manifold social hierarchies, including gender, race, coloniality and heterosexuality. As some recent studies of social reproduction show, the full scope of labour power's reproduction is governed through local, national and global regimes that draw on various forms of oppression in ways that tend to reinforce them (see, for example, Farris, 2017). In ensuring the social reproduction of certain communities is more precarious and under-resourced than others, they facilitate the reproduction of an unequal, internally divided, global workforce.

From Vogel then, we can grasp that *all* processes and institutions of social reproduction (including but well beyond individual households) come up against capital's hostility to life-making. Capital sets the terms of life-making precisely because capitalists and the capitalist state own and control the vast majority of the resources essential to reproducing life (the means of subsistence). This has tremendous consequences for anti-capitalist politics because it means that any (anti-racist, feminist, etc.) struggle for expanding and controlling the conditions under which the working class socially reproduces life, is potentially a struggle against capitalism.

Vogel's book, first published in 1983, was an expanded version of an earlier article she wrote in response to Heidi Hartmann's controversial intervention 'The Unhappy Marriage of Marxism and Feminism: Towards a More Progressive Union' (Hartmann, 1979). While Hartmann had notoriously advocated for a 'divorce' between Marxism and feminism and initiated what would be later called a 'dual system' analysis (Farris, Chapter 15, this *Handbook*), Vogel pointed in a different direction. Rather than abandoning Marxism, she proposed that socialist feminists try to explain women's oppression under capitalism in terms of a unitary, materialist framework, or theory, which takes the daily and generational production and reproduction of labour power as its point of departure. The 'unitary theory' that Vogel's project aimed to build thus invited socialist feminists to search for a single, integrated theoretical account of both women's oppression and capitalist accumulation. She proposed this could be accomplished by expanding the conceptual reach of the historical materialist methodology Marx deploys in *Capital* so as to rigorously explain the roots of women's subordination to men under capitalism. But while her 'unitary theory' was above all an attempt at understanding economic (or class) exploitation and gender domination as a unified process, thereby rejecting the dual analyses that conceived of each as springing from different systems, a growing number of scholars today use her work as a basis from which to develop a unitary theory that takes into account the ways in which gender and class interlink with racial and other social oppressions.

THE QUESTION OF VALUE

As we briefly mentioned earlier, one of the main divisions between different currents of SR feminism related to the question: does the work that goes into producing labour power create the actual value that capitalists then appropriate when they sell the products of waged labour? Mary Inman, various contributors to the Domestic Labour Debate, and those involved in the international WfH campaign all proposed that it does. Capitalist value is generated, they claimed, not simply through the waged labour that produces commodities for sale (as Marx insists) but also through unpaid domestic labour. That's because, women's unpaid work of cooking, cleaning and caring produces the commodity, human labour power, which they and/or their husbands (and in time their children) sell to capitalists who, in turn, exploit it to generate value and surplus value. The wage and the family obscure the value-making function of domestic labour: wages appear to be paid only for work done during the hours that a worker is 'at work'; and the family appears to be a private, interpersonal institution outside of the labour/capital relation. Accordingly, capitalists don't only depend upon those whose labour reproduces this and the next generation of workers; they directly *exploit* them (in the Marxian sense of appropriating the value of their labour).

This perspective informed the WfH campaign strategy, which called on housewives to refuse work.¹¹ Because ‘every moment of our lives functions for the accumulation of capital’, striking against housework and social reproductive labour more broadly conceived has the potential, Federici argued, to obstruct the creation of value (Federici, 2012: 35). Crucially, the campaign linked this strategy to the demand that women be paid a wage for housework. This was not intended as a typical campaign demand insofar as the WfH theorists did not believe it could be won. Indeed, that was their point: the demand for a wage was intended to draw attention to the fact of domestic labour’s economic value and the *impossibility* of its full recompense under a capitalist system. The refusal of housework was also intended as a refusal of its commodification (through the hiring of nannies, for instance) and a demand for it to be organized by the state (through social services). While the campaign’s revolutionary goals were regularly misinterpreted by both its critics and adherents, the WfH campaign has remained a highly influential strand within SR feminism, with Federici’s work in the twenty-first century reigniting and broadening the current’s political conclusions.¹²

Other Marxist feminists – those who have expanded upon Vogel’s work and developed a position that has come to be called SRT – have a different take on the question of whether social reproductive labour produces value. Following from Marx, they argue that value is determined in a capitalist economy in the process of producing goods and services *for exchange* (that is, in *commodity* production). In other words, value is created only in those circumstances in which the product of labour is sold on the market and where it produces a profit.¹³ In the case of (unpaid and much paid, public sector) social reproductive labour, observe SRT feminists, the good or service produced never circulates on the market.¹⁴ The *unpaid work* of preparing breakfast at home, helping children with homework, comforting someone who is sick, along with the *paid work* of cleaning bedpans in public hospitals, or teaching students in public schools – these are all examples of social reproductive work that produces ‘products’ whose consumption is not dependent upon their sale. Such work produces material, emotional and/or intellectual goods and services necessary to life, including health, love, attention, discipline, knowledge and much more. Its producers may be waged or unwaged, ‘housewives’, paid domestic workers, community activists and public sector workers – anyone whose work is geared, in the first instance, to meeting specific life needs and desires. Such work is not undertaken *because* its product will realize value through its sale on the capitalist market. True, it contributes to creating a commodity, labour power, which will eventually be sold on the market (as those who subscribe to the WfH position argue).¹⁵ But because the products of that labour are not produced for exchange on a capitalist market, insist SRT feminists, the labour is not, and cannot be, productive of value; neither, then, does it tend to be organized strictly in accordance with the capitalist logic of value creation.

Here, value creation is understood to require both forms of labour, those that are capitalistically ‘productive’ and those that are not. Because capitalism is

premised upon dispossessing the working class of their means of subsistence – which then requires people to sell their labour power for a wage – capital still tends to dominate ‘unproductive’ work processes involved in creating life. But it can only do so indirectly. The logic and domination of capitalist value creation can and does affect the time, place, rhythm and pace of social reproductive work in public schools and hospitals, at home and in the community. But it does not subject that work to the calculations of value production in the way that it does, for instance, the labour processes at McDonald’s or Amazon.

Labour in general resists total subsumption by capital precisely because there can be no labour without life – without a living human being, whose life needs can and will assert themselves against capital time and again. For both historical and systemic reasons, however, ‘unproductive’ social reproductive labour tends to be less subordinated to capital than ‘productive’ labour. The disagreements over social reproductive labour and value creation inform the way each approach conceptualizes the possibilities for resistance. While the WfH tradition tends to promote the importance of moving beyond or outside capitalist relations, through the creation of alternative spaces to capitalism, the SRT tradition looks instead towards struggles to break the system from within.¹⁶

ANALYSING RACE AND RACISM

SR feminists in the 1970s made it possible to conceptualize and explore the logic behind capital’s interaction with – and dependence upon – social power relations such as patriarchy. But these analyses also shared a key weakness: they focused too narrowly on unpaid housework and childcare as the key to women’s oppression. In so doing, they introduced theoretical oversights and ambiguities. Among other things, they tended to attribute the reproduction of patriarchy to men’s power over women, a circular reasoning that easily defaults to an ahistorical biological reductionism. And to the extent that they situated patriarchal power as stemming from men’s position as wage-earners, they ended up generalizing what are in fact particular relations within typically White middle-class households. Such a de-historicized and universalizing conception of patriarchal power could not be sustained in the face of empirical evidence and mounting criticism.

The most developed criticisms at the time came from anti-racist feminists, such as those comprising the *Combahee River Collective* (CRC), who had long noted Black women’s ‘triple’ (class/race/gender) oppression (Bhandar, Chapter 13, this *Handbook*). By the end of the 1970s, many feminists were persuaded by the CRC’s call for a radical socialist politics that addressed the multiple ‘interlocking’ oppressions Black women experience within capitalism.¹⁷ And in her 1981 book, *Women, Race, and Class*, Communist Party USA member and Black Panther supporter Angela Davis directly reproached the tradition for its narrow focus on housework and the call from WfH feminists for a wage. The full-time

housewife, Davis points out, has only ever 'reflected a partial reality ... rooted in the social conditions of the bourgeoisie and middle classes'. Not only have poorer, racialized women been excluded from that category, certain capitalist regimes (she cites South African mining capital as an example) actively undermined it for Black families. Moreover, she argued, wages are hardly a solution for immigrant and Black women in the USA who 'have been receiving wages for housework for untold decades' as paid domestic servants in White women's homes (Davis, 1981: 229, 237).¹⁸ Picking up on a recurring theme of the 150 years of anti-racist feminism before her, Davis stresses that it is as low waged, low status workers that many Black women experience the harshest forms of oppression.

Davis's critique resonated widely. Michelle Barrett took it up in her 2014 seminal book, *Women's Oppression Today*, pointing out that the weight attached to the family as a primary site of oppression overlooks and underplays the role of the state. Black feminists have in fact argued that the violence and coercion of a racist state means 'that it is the state rather than the family that is the oppressor as far as black women are concerned' (Barrett, 2014: xxxvi). In her response to Heidi Hartmann's famous intervention in the late 1970s, Gloria Joseph makes a similar point and describes racial oppression as the 'great equalizer'. For these scholars, the family and the unpaid work of women therein do not explain the type of oppression and domination experienced by Black people in general or Black women in particular. Observing that White women have more power than Black men, Joseph writes, 'Capitalism and patriarchy simply do not offer to share with Black males the seat of power in their regal solidarity' (Joseph, 1981: 101).

Moreover, as both Claudia Jones and Angela Davis argue, in spite of its power imbalances, the family can be a site of comfort and equality for Black life. That is, for many Black women who endured slavery and who continue to endure its legacy, housework can be the space in which they exercise a measure of control (Davis, 1981: 229, 237; Jones, 1949: 3–4, 9).¹⁹ Although many White socialist and Marxist feminists supported anti-racist struggles, they often failed to grasp the challenge that anti-racist feminists posed to the domestic labour theoretical paradigm. Many continued to position unpaid housework and the family as pivotal and universal categories of their analysis and, in so doing, either wrote Black women out of their feminism or treated racism as a secondary form of oppression, external to the workings of patriarchal capitalism (see Bannerji, 1991). Others abandoned materialist frameworks all together (see Arruzza, 2013). Meanwhile, Black feminists were elaborating upon the CRC's conception of interlocking oppressions, developing what Kimberlé Crenshaw famously labelled 'intersectionality' (Crenshaw, 1989). Some of the most compelling insights and commitments of intersectionality feminism have since been critically appropriated in the more recent renewal of SR feminism. This engagement made it possible for SR feminism to grapple with racial and other forms of oppression attending an increasingly globalized neoliberal capitalism

and its authoritarian state (see Blank, 2011). For Meg Luxton, for instance, the integration of race into a unitary theory means:

[p]ut[ing] issues of imperialism, racialization and racism at the heart of gender and class analyses. Capitalist development depended on supplies of (reproduced) labour from people who originally lived outside regions where capitalist relations were dominant and on people in and from colonies; the transnational, trans-regional locus of social reproduction and capital's mobility mean that capitalism is foundationally racialized and dependent upon differences and divisions. (Luxton, 2006: 38, cited in Blank, 2011)

Isabella Bakker and Stephen Gill's *Power, Production and Social Reproduction*, an international political economy account of globalization published in 2003, made important advances in this area. Throughout the book, contributors analysed the impact global capital and neoliberal structures of governance have had on racial hierarchies in various times and places – an impact they assess mainly by examining notions of citizenship and capital's increasing reliance on exploitative regimes of migrant and marginalized labor. SR, they argued, is best conceived not so much as a set of intersecting structures, but as 'a transformative process that not only entails the constitution and reconstitution of gender, race and class and ideas about gender, race and class ... but also how a sense of identity and resistance can be actualized in this new context of intensified globalization' (Bakker and Gill, 2003: 18).²⁰

Such a conception is rooted within a historical materialist approach to understanding social relations – one that is consistent with and builds upon the challenges offered by Himani Bannerji. Bannerji is a Bengali-Canadian anti-racist feminist and Marxist sociologist and philosopher who highlighted the Althusserian influences in critical feminist political economy that had developed SR feminism in a structuralist direction.²¹ For Bannerji, such Althusserian influences had been responsible for the tradition's systematic blindness to the experiential – and to experiences of race and racism in particular (Bannerji, 1991).

Bannerji thus argued for the need for anti-racist, socialist feminism to centre the experience, subjectivity and thus political agency of racialized subjects within the capitalist totality in order to avoid de-historicizing their analyses. In the 2000s, Canadian Marxist feminist Susan Ferguson built on Bannerji's critique and used David Harvey's concept of spatialization (Harvey, 2001) to argue that SR feminism must account for racism and racialization if it wants to provide a solid account and political strategy of how the paid and unpaid socially reproductive work of women plays a key role in their oppression across cultures and racial divides. For Ferguson, bodies are racialized not because of some inherent bio-physical attribute (like the biological differentiation that is socially organized into gender differences). Rather, 'people become racialized insofar as they are associated (by skin color, cultural identity, language or accent) with other socio-geographic spaces' – spaces that are hierarchically organized between and within national boundaries in ways that tend to conform with capitalist imperatives of dispossession and accumulation. 'So while people are necessarily "territorialized"

by matter of their birth (we are all born and live somewhere)', writes Ferguson, 'they are only racialized as a function of how their location figures in the broader socio-geo-political ordering of capitalism' (Ferguson, 2008). And reproducing bodies through these socio-spatial capitalist relations is a significant means of ensuring both the ongoing devaluation of social reproduction and the availability of socially degraded bodies to perform that devalued social reproductive work. Ferguson's overarching point is that social reproductive work is not free-floating, but is anchored in specific bodies *and* places. And attending to both of these concrete aspects within a capitalist totality is what allows us to analyse social reproductive labour as always racialized as well as gendered.

In many ways, that is precisely what several SR feminists have done by analysing the global care chain – a term introduced by Arlie Hochschild to capture the transnational transfer of care work that ensues when wealthy, often White, women in the global North employ (usually darker skinned) women migrating from poorer countries as nannies and domestic workers (Hochschild, 2000). One of the most striking phenomena of neoliberal capitalism has been the feminization of migration. Since the late 1970s more and more women have been migrating in order to respond to the growing demand for care and cleaning, or social reproductive labour. Sara Farris's book *In the Name of Women's Rights: The Rise of Femonationalism* (2017), updates and refocuses the Black feminist critique of paid social reproductive work. Farris illustrates the complex ways in which Muslim women's migration to Europe and Britain is grounded in and fuels White supremacist and sexist dynamics reinforced through borders, immigration controls and settlement services. This 'commodification' of social reproduction filtered through the structures of nationhood and a naturalized, hegemonic, citizen culture takes us far beyond traditional social reproduction feminism concerns with the unpaid domestic labour of (White) women. It shows, among other things, the degree to which life-making under capitalism takes myriad forms, involving myriad social relations and forms of oppression. Other scholars inspired by these insights are exploring issues of settler colonialism, sexuality, forced labour and more.²² SRT has indeed become more and more a key site for understanding the intersection between oppression in general and class exploitation.

SOCIAL REPRODUCTION FEMINIST STRATEGIES

Recent developments within SR feminism have been especially concerned with how Marxist and socialist feminists can draw on this theoretical approach to develop feminist, anti-racist and anti-capitalist organizing and political strategies (see Arruzza and Gawell, 2020). Two related but distinct approaches can be identified. On the one hand, there are those who are renewing and elaborating a form of WfH politics. This foregrounds the call for 'a collective struggle over reproduction' through refusing to work for capital. Silvia Federici urges instead

that workers take control over ‘the material conditions of our reproduction and creat[e] new forms of cooperation around this work outside of the logic of capital and the market’ (Federici, 2012: 111). Collective spaces, she reasons, can thereby be created wherein people learn new, collective ways of living and producing. These include, for example, communal kitchens, farms and land occupations, as well as market-alternative trading systems for healthcare, childcare and other social services. Such ‘commoning’ initiatives, she stresses, can only be transformative if they are consciously revolutionary – that is, if they refuse the logic of capitalism and work towards the creation of a new, just society.

For Kathi Weeks, one step in this direction is the campaign for a Universal Basic Income (UBI). A decent, unconditional guaranteed income, she suggests, would allow people to refuse waged work and force employers to increase wages and ‘pursue opportunities for pleasure and creativity that are outside the economic realm of production’, including opportunities to ‘recreate and reinvent relations of sociality, care and intimacy’. In the process, people come to realize how capitalism organizes all work, including through a gendered division of labour that naturalizes the family. Weeks’ call for UBI is, like the WfH campaign before it, intended as a ‘perspective and provocation’ as much if not more than as a demand in its own right (Weeks, 2011: 103, 149).

Both Weeks and Federici are supporters of the ‘social reproductive strike’, or the withdrawal of socially reproductive labour as a way to single out its concealed importance under capitalism as well as a tool of political mobilization and organization. Since 2016, through feminist efforts in Poland, Spain, the UK, the Sudan, Iran, Argentina, the USA and beyond, the social reproductive strike has become indeed one of the most visible forms of Marxist and socialist feminist organizing as well as a powerful forum for and inspiration of SRT theorizing. In *Feminism for the 99%: A Manifesto*, written to explain and advance the political perspective informing the strike, Arruzza et al. (2019) offer the following rationale: ‘By withholding housework, sex, smiles, and other forms of gendered, invisible work, [striking women] are disclosing the indispensable role of social reproductive activities in capitalist society’. The authors argue for a broad conceptualization of the working class, to include unpaid social reproductive workers as well as waged workers, underlining ‘the unity of “workplace” and “social life”’. The strike is a time and place, they insist, in which everyday forces of creativity can take hold, and where ‘the impossible’ can and must be demanded (Arruzza et al., 2019: Thesis 1).

For both political perspectives, then, the social reproductive strike is a powerful weapon in the struggle against capital. The authors of the *Manifesto* depart from the WfH-informed strategy, however, in emphasizing the possibilities for striking within and against capitalist relations. That is, for Arruzza et al., the strike is not only or even primarily about withdrawing from capitalist relations. However much revolutionary commoning must be supported, in their view, it is even more urgent to support and build anti-capitalist social movements that:

(i) make direct demands on the state (without necessarily creating worker production or trading cooperatives) and (ii) build unity across workplace- and community-based protests (for better schools, healthcare, housing, transportation and environmental protections, as well as for higher wages, the end to sexual harassment at work and other workplace demands). While not work refusals in the sense discussed by Federici and Weeks, these social reproductive strikes make important claims for democratic and collective control of the conditions of (re)production. They demand that the resources for social reproduction be expanded and society prioritize meeting human need over making capitalist profit.

Following on the insights of the *Manifesto*, Tithi Bhattacharya has more recently emphasized the need to understand the role of the state and the differential impact of its withdrawal from social provisioning in the social lives of different sections of the working class. For Bhattacharya, being attentive to social reproduction and especially to the forces that inhibit the development of our capacities, trains our sight on what abolitionist feminist, Ruthie Gilmore has powerfully identified as ‘organized abandonment’ by the state of communities, which has to necessarily pair with ‘organized violence’ by that same state (Gilmore, 2008). In other words, when the state defunds social reproductive institutions such as healthcare and schools in communities of colour neighbourhoods, when they consciously refuse to investigate whether the drinking water supply of a community has been contaminated (Feely, 2018), this organized abandonment of the community must be kept in place by organized violence. Agents of the state such as the police or privately funded security then need to penetrate areas of social life like schools or hospitals, that as life-making institutions should not have anything to do with the death-making institution of law enforcement. Disciplining of poor and racialized communities thus gets woven into the fabric of social life and shapes the future of working-class lives.

It is not just racialized communities, of course, that are organized by violence. Queer people are also disproportionately targeted by the disciplinary arms of the state and suffer high unemployment and poverty levels. In grappling with these realities, some SRT scholars and activists have critically and productively engaged with gender theory to think through what it means to socially reproduce – and challenge – binary gender regimes (Arruzza, 2015; Farris, Chapter 15, this *Handbook*; Floyd, 2009).²³ Families, policing, schooling, the healthcare system and more all structure (in different ways and to different degrees) the life-making work of gay, trans, intersex, two-spirited and other queer people. At the same time, as Kate Doyle Griffiths suggests, the project of ‘queer social reproduction’ – that is, of organizing personal and collective spaces, practices and institutions that support and expand queer life-making – can and must be central to anti-capitalist resistance (Doyle Griffiths, 2018). Writing specifically of past and current queer healthcare activism, Jules Joanne Gleeson notes: ‘As the material communities supporting trans people continue to strengthen, more and more trans women will be able to assert themselves openly as women’ (Gleeson, 2017).²⁴

FROM LIFE-MAKING TO WORLD-MAKING: SRT AND THE CLIMATE CRISIS

Nancy Fraser has argued that crises of capitalism identified by Marxism are not merely the result of contradictions between forces of production, but between such forces and the social reproduction upon which they depend:

[o]n the one hand, social reproduction is a condition of possibility for sustained capital accumulation; on the other, capitalism's orientation to unlimited accumulation tends to destabilize the very processes of social reproduction on which it relies. (Fraser, 2016: 100)

In denuding social reproductive capacities, capitalism has disarticulated our collective life-making, but the harm is no longer limited to the 'social'. For it is only partially true that capitalism disarticulates the social; what is conjointly true is that it articulates social relations in very specific ways to reliably reproduce itself and its relentless productivist drive. It is this unique drive, peculiar only to capitalism, that has now triggered climate change, threatening all life as we know it. Differently put, the capitalist organizing of the 'social' has now 'unhinged, disrupted, destabilized' the climate to such an extent that any conversation about reorganizing the social must necessarily be about destabilizing capitalism. Any discussion of SR must then simultaneously be a discussion about forging a political project where the social reproduction of life is no longer subsumed under the social reproduction of the capitalist system. Where our priority is the growth and flourishing of *living beings*, human and non-human, rather than the growth and flourishing of *dead things* like the 'economy' and 'commodity production'.

Capitalism as a system is future-blind; it can and will sabotage its own conditions of possibility in its drive to 'accumulate for accumulation's sake'. Climate change, however, has put a timeline for how long this is possible. The system, and the planet with it, is experiencing time in radically transformed ways, or as Andreas Malm recently put it, 'defeated time' is now 'pouring down from the sky' (Malm, 2020).

If capitalist production is concerned only with a constant, flattened present time, SR, as theory and practice, directs attention to the future – to the ongoing reproduction of the life of the species and the social world we create in and from the natural world. Capital's reproduction of itself is now threatening that chain of generational reproduction, which is why all politics, we maintain, must become a politics of social reproduction.

Such SR politics in practice should be able to demonstrate that released from the imperatives of capitalist reproduction, we are capable of creating sustainable habitats where human lives be not just maintained but flourish, where food, art and intimacies are pursued, or *made*, if you will, with the solemnity and playfulness they all deserve.

Notes

- 1 Parts of this account are drawn from Ferguson (2020).
- 2 And it is only when labour power has been sold to a capitalist that it transforms into a quantifiable, abstract determinant of capitalist value.
- 3 His discussion, however, highlights how the commodity form of labour power also produces resistance and workers' struggle to create and preserve life against the forces of capital – an aspect of *Capital* that is often overlooked.
- 4 Bhattacharya qualifies that social reproductive work 'may' be separated from work that produces value because it is not always so; life-making may also occur in for-profit enterprises (private day-cares or hospitals, for example) and it may also be spatially integrated with productive work (as it is for people working from home or in labour camps).
- 5 The full quote reads: 'the money-owner . . . strides out in front as a capitalist; the possessor of labour-power follows as his worker. The one smirks self-importantly and is intent on business; the other is timid and holds back, like someone who has brought his own hide to market and now has nothing else to expect but – a tanning' (Marx, 1977: 280).
- 6 For example, the USA leads the chart with 3,800 kilo calories of average daily dietary intake, while people in Eritrea have available only 1,590 kilo calories for their daily meals. Colonial legacies set an upper limit on what the acceptable 'standard' for food consumption can be, thus pushing African nations to the very bottom of this global chart. A similar story of striking national difference unfolds in educational attainments and life expectancy. Consequently, processes of regeneration of labour power in Eritrea or Haiti are nested in a very different set of expectations than in the USA or the UK.
- 7 In a later publication Inman retreats from this analysis, seeking to illustrate women's common, cross-class, oppression.
- 8 There is no evidence Benston, who was Canadian, had read Inman, but the ideas about domestic labour she advances in this article had been debated and discussed among Canadian socialist feminists throughout the 1960s.
- 9 SRT or the Marxian school begins to cohere as a loose but definable 'camp' in the 2000s, when Marxist feminists revisit Lise Vogel's analysis and critique of the Domestic Labour Debate in her 2013 [1983] book, *Marxism and the Oppression of Women: Toward a Unitary Theory*.
- 10 Capital does directly control that social reproductive labour it has commodified (teachers in for-profit colleges or line chefs working in the hospitality industry, for example). But the bulk of social reproductive labour is not commodified.
- 11 WfH campaign feminists critically engaged with the Autonomist tradition within Marxism. Developed in Italy in the 1960s, Autonomists coined the term 'social factory' to capture the idea that society as a whole – not just the economic system – is directly constituted by capitalist relations of production. See Wright (2002).
- 12 Critics of the WfH campaign argued that the focus on the wage was too narrow, reformist, or potentially damaging for women, and that it would turn the state into housewives' employers, granting it the right to regulate women's lives more closely while releasing governments (and capitalists) from the responsibility to provide essential social services in the community. See Toupin (2018). For an excellent discussion of the WfH revolutionary campaign demands, see Weeks (2011).
- 13 The reason has to do with the fact that, for Marx, the determination of value is bound up with the socially average labour time it takes to produce the product, something that is only evident because production occurs in the context of a mass, capitalist (and thus competitive) market.
- 14 The exception to this rule is paid social reproductive labour whose product is sold on a competitive open market, such as workers in private day-care centres or restaurant waiters and bartenders. Here social reproductive labour does generate capitalist value.
- 15 Fortunati (1996) agrees that reproductive labour, which she stresses includes both housework and sex work, produces use value, not exchange value. But, she argues, meals, clean clothes, sexual pleasure, and so on *transform into* exchange values because the ultimate product, labour power, is

- itself a commodity. Labour power, however, is not only, or necessarily, a commodity. Rather, it is a potential that inheres in human life, which can be commodified (that is, sold to a capitalist in return for a wage), but which can also be realized in non-waged, life-making activities.

Rent

Stefano Dughera and Carlo Vercellone

INTRODUCTION

The capitalist mode of production (hereafter, CMP) has undergone major transformations over the last decades. While the appearance of new forms of rent blurred the classical distinctions between wage, profit and rent, it also stimulated a new wave of both theoretical and political debate addressing the nature and function of factor payments. In particular, a robust consensus has emerged within a certain Marxism of Ricardian inspiration, which understands rent as a *pre-capitalist inheritance* and, as such, as an impediment to the dynamic of capital accumulation. In this framework, the key function of ground rent is replaced with that of financial rent and a ‘pure’ and ‘efficient’ capitalism is depicted as rent-free. The economic stagnation which affected the advanced economies from the 1980s is therefore related to a presumed conflict between financialization and productive capitalism, whose accumulation-oriented rationale is assumed to foster both full employment and growth.

According to another kind of approach endorsed by the neo-workerist theorists of cognitive capitalism (see, e.g., Vercellone, 2005, 2007; Marazzi, 2009; Hardt and Negri, 2010; Fumagalli and Mezzadra, 2010; Lucarelli and Vercellone, 2014), this line of reasoning – based on the rigid distinction between profit and rent – is flawed, both hermeneutically and theoretically. By understanding rent along with the associated stigma for productive efficiency, as completely external

to the process of capital accumulation, it overstates the positive role of profit and thus misconceives some of the key messages in Marx's thought. In addition, it also overlooks the transformations of capitalism which followed the demise of Fordism, thus failing to capture the deeply renewed dynamics of capital accumulation and the correlated changes in the capital/labour relationship. Such transformations determined the exhaustion of the *historical system of accumulation* of industrial capitalism, whose qualitative features were largely consistent with the theoretical takes of the Marxian–Ricardian approaches. The explanatory power of this readings, however, has been seriously compromised by the transformations of the *social structure of accumulation*, which increasingly allowed the emergence of what we call the 'rentier vocation of productive capitalism' and, relatedly, of the 'becoming-rent of profit'.¹

To better understand what we mean by these definitions, we first need to discuss our understanding of rent. In our view, any form of rent is the historical outcome of a process of *dispossession*, which simultaneously constitutes the *antediluvian* element of the CMP and a structural component of its reproduction in time and space. As capitalism reproduces itself through a *regime of permanent revolution* – as already noted by Deleuze and Guattari (1983) – one may argue that:

[a]s a general rule, there is primitive accumulation whenever an apparatus of capture is mounted, with that very particular kind of violence that creates or contributes to the creation of that which it is directed against, and thus presupposes itself ... It is a violence that posits itself as preaccomplished, even though it is reactivated every day. (Deleuze and Guattari, 1987: 448–9)

In this framework, the distinction between the so-called 'ordinary' mechanisms of enlarged accumulation and the 'extraordinary' mechanisms of primitive accumulation loses much of its coherence, just like the profit/rent dichotomy. While this is consistent with many other neo-Marxist approaches, such as Harvey's (2010) conception of 'accumulation by dispossession' – two other theoretical takes clarify further the originality of our notion of the becoming-rent of profit.

It is our contention, indeed, that rent not only represents the origin but also the becoming of contemporary capitalism. Within the society of the *General Intellect*, wherein the law of value/labour time loses much of its consistency (Vercellone, 2010) and the social cooperation of labour is increasingly independent from the managerial functions of capital, the very boundaries between profit and rent blur. Ultimately, in cognitive capitalism profit – just like rent – manifests itself as a relation of distribution 'pure and simple' (Marx, 1993a: 1023), completely unlinked – in most cases – to any positive function in the organization of production.

This has major implications for the way in which labour is divided, monitored and organized at the firm-level and, more broadly, for the mode in which control is exercised over society at large. The transition from an industrial capitalism characterized by the hegemony of the logic of profit to a cognitive capitalism characterized by the hegemony of the logic of rent, in fact, is symmetrically

mirrored by the transformation of disciplinary societies into societies of control (Deleuze, 1992). Put differently, as production changes, so does the ‘mode of accumulation of men’ (Foucault, 1995: 202). Within the general paradigm in which workers behave as Foucauldian ‘self-entrepreneurs’ and produce value without managerial supervision, rent must be understood as a mere appropriation over surplus value, whose capture discontinuously requires both violent and directorial operations. The new apparatus of command for subsuming the potential of emancipation inscribed in the General Intellect society is thus based on mechanisms which largely operate outside the firm and beyond the traditional constraints of managerial and organizational control.

The remainder of the chapter is organized as follows. In the next section we lay out the theoretical framework and discuss factor payments from a Marxian viewpoint, paying particular attention to the flexible boundaries between profit and rent. Insights from the third volume of *Capital* – on the becoming-rent of profit – and from the *Grundrisse* – on the General Intellect – will serve as a fundamental reference. Thereafter we apply the theory and overview the transformations of the capital/labour and profit–rent relation in the transition from industrial to cognitive capitalism. This will allow us to remark upon the re-emergence of rent and upon the blurring between profit and rent, or, more precisely, upon what we call the ‘becoming-rent’ of profit. Finally, we conclude.

THEORETICAL FRAMEWORK

A Few Definitions

Wage, profit and rent are the main categories of income distribution stemming from the capitalist relations of production. In Marx’s theory, wages less than compensate the production of surplus value and thus constitute the origin of both profit and rent. Surplus value, in turn, does not merely result from the sum of individual surplus labour, but rather from the social cooperation of workers (Marx, 1982: 417–28). This insight will be fundamental to the analysis to follow, as it will allow us to frame the notions of organization and exploitation within our contemporary historical setting, where value-adding cooperation is not confined within the boundaries of the firm – as it used to be in industrial capitalism – but is extended to society as a whole. In this phase, the managerial function of productive capital – that is, to organize and discipline the extraction of labour from labour power² – loses much of its consistency, thus blurring the boundaries between profit and rent up to the point that both can be qualified as a pure and simple form of appropriation of surplus value, as neither of the agents who receive these payments play any role in the organization of production. To fully understand the implications of such a theoretical take, we need to analyse further the interrelations between profit and rent in order to highlight the reasons why we believe the former must not be understood as the source of the latter.

Rent: Historical and Theoretical Considerations

Theoretically, the concept of rent is a complex one. Our contention is that it is gravely misunderstood if presented as something extrinsic to capitalism. In what follows, we shall therefore list the reasons behind this take. To start with, it is worth recalling that the institutionalization of ground rent historically coincided with the formation of the first enclosures, which represent the first expropriation of the *Common* – for a definition, see Hardt and Negri (2010) – and thus constitute the *conditio sine qua non* for the commodification of both labour and ground. From this perspective, Marx defines absolute rent as a fundamental social relation and criticizes the theoretical shortcomings of Ricardo's (2004) differential rent on two intertwined accounts.

First, Ricardo naturalizes rent in capitalism by overlooking the features that distinguish the latter from other forms of interest income which were typical of the feudal mode of production. Second, the consideration of differential rent alone may suggest that land is, in its own nature, 'at everyone's free disposal', but this removes 'a principal element for the formation of capital' (Marx, 1969: 360), thus making it impossible to answer the question: 'where are the wage-labourers to come from in this case?' (Marx, 1969: 552). It is for this reason – as Marx continues – that a key condition for the very existence of the CMP is 'that land should *not* be common property, that it should confront the working class as a condition of production, *not belonging to it*' (Marx, 1969: 359).

In Marx's understanding hence, far from being a feudal legacy, rent is the opposite of the Common and, as such, it is an organic component of the CMP. Its role – within the general system of political economy – exceeds the specific functions of ground rent at the early dawn of mercantile capitalism, as it continuously creates novel and necessary conditions for labour exploitation. Rent appears in the history of capitalism each and every time the historical transformations of the CMP come to threaten the stability of its structures, since 'if capitalism is the exterior limit of all societies, this is because capitalism for its part has no exterior limit, but only an interior limit that is capital itself and that it does not encounter, but reproduces by always displacing it' (Deleuze and Guattari, 1983: 230–31). Contrary to Ricardo, then, in Marx's view it would be illogical to imagine capitalism without rent.

It is for this reason that Marx considers rent as a primary category of distribution of the CMP, rather than identifying profit as the source of its existence. Such a take would indeed deny its structural role of rent in capitalism, which, as previously recalled, has always been to privatize the social conditions of production and commodify the Common. In this view, we can understand the formation of all kinds of enclosures over time – from the early ground rent to the newest privatizations of knowledge and the welfare institutions – as diverse expressions of the same mechanism.

Despite these elements of continuity, however, it is important to remark upon a distinguishing feature of the current process of de-socialization of the economy with respect to other similar phases in the history of capitalism. Expropriation

does not rely upon conditions – as it did for land – which belong to a pre-capitalist *exterior* – in the traditional sense of Rosa Luxemburg (2003), as it is assaulting those elements of the Common built by the social struggles during the most advanced moments of capitalist development. Here, we are referring to those collective productions ‘de l’homme par l’homme’ – as Boyer (2014) calls them – assured by the welfare state, or to the commons of knowledge, or, more broadly, to all those processes which contributed to form the productive forces of what is now commonly called the knowledge-based economy (hereafter KBE). These new economic and institutional conditions may have eventually led – if fostered – towards an economy freed by the logic of the commodity. Such a trend, however, has been continuously countervailed by new waves of privatization which appropriate the General Intellect’s social cooperation by artificially creating new conditions for the extraction of rents.

According to Napoleoni (1965, our translation) in fact, rent is ‘the revenue perceived by the owner of some goods as a consequence of the fact that these goods are or are being disposed in limited quantity’ and, as such, is linked to a natural or, more often, artificial scarcity of resources. The rentier who is in the position of limiting the supply of their properties, thus, will always do so as to raise their expected income. In this framework, monopoly power is a necessary condition for the existence of rent, as it creates artificial forms of scarcity which allow the rentier to command high prices which are neither justified by the value of the goods nor by their production cost. These vampire policies must forcedly rely on some kind of institutional mechanism, of which the strengthening of intellectual property rights (hereafter IPR) is a perfect example.

In cognitive capitalism, rent is nothing but a credit instrument, a property right over a material or immaterial resource that allows the owner to appropriate a share of the surplus value without playing any role in the organization of production. As such, it can be understood as a relation of distribution pure and simple, as it plays ‘no function in the production process, at least not in the normal case’ (Marx, 1993a: 1023).

The Distinction between Profit and Rent: Theoretical Elements

According to a definition bequeathed from the classics, rent is what remains after those who contribute to production have been remunerated. The way in which the notions of who contributes to production and to what extent are defined, thus plays a crucial role in shaping the boundaries between wage, profit and rent. Classical economists, for their part, used to understand profit as the remuneration of the capital invested in production. In this view, profit has nothing to do with the retribution of the work of supervision and management – see Smith (1976: 127–141) – and capital owners in capitalism are no different from land-owners in feudalism, so that it becomes impossible to distinguish profit from rent and capitalists from rentiers.

Marx (1993a) was of a sharply different opinion. In several passages of the third volume of *Capital* he acknowledged the key role played by capitalists in the development of the factory system and remarked upon their function as organizers, coordinators and monitors, roles which concern ‘not the detailed work, but rather the workplace and its activity as a whole’ (Marx, 1993a: 507). In these passages, he introduced the distinction between functioning capital – which he also calls ‘active’ or ‘operative’ – and money-capital and, relatedly, between interest and profit of enterprise. He further based both on the specific functions or non-functions that money and operative-capitalists perform in production. In his words:³

[i]nterest is the fruit of capital in itself, of property in capital without reference to the production process, while profit of enterprise is the fruit of capital actually in process, operating in the production process, and hence of the active role that the person who uses capital plays in the reproduction process ... interest-bearing capital is capital *as property* as against capital *as function*. But if capital does not function, it does not exploit workers and does not come into opposition with labour ... the particular functions which the capitalist has to perform as such, and which fall to his part precisely as distinct from the workers and in opposition to them, are presented as simply functions of labour. He obtains surplus-value not because he works as a *capitalist* but rather because, leaving aside his capacity as a capitalist, he *also* works. This part of surplus-value is therefore no longer surplus-value at all, but rather its opposite, the equivalent for labour performed ... this process of exploitation itself appears as simply a labour process, in which the functioning capitalist simply perform different work from that of the workers. The labour of exploiting and the labour exploited are identical, both being labour. The labour of exploiting is just as much labour as the labour that is exploited. (Marx, 1993a: 497, 503, 506)

In this quotation, he seems to anticipate the separation between entrepreneurs and speculators drawn by Keynes in the *General Theory*, who invoked ‘the euthanasia of the rentier, and, consequently, the euthanasia of the cumulative oppressive power of the capitalist to exploit the scarcity-value of capital. Interest today rewards no genuine sacrifice, any more than does the rent of land’ (Keynes, 2013: 376). Despite this similarity, the Marxian analysis provides us with more up-to-date insights for the analysis of what we call the ‘becoming-rent’ of profit in cognitive capitalism, as it sketches a theoretical framework with which to analyse the current transformation of the knowledge–power relations between capital and labour, on which basis it becomes possible to understand the contemporary blurring between profit and rent.

Marx already knew that regardless of who actually performs the ‘labour of exploiting labour’ – whether it is the entrepreneur as in early capitalism or the professional manager as in the Fordist–Taylorist era of mass production (Galbraith, 1967; Chandler, 1993) – the fact that functioning capital must exploit labour from within the productive realm requires a process of knowledge polarization based on the separation between labour of conception – performed by functioning capitalists themselves or by their functionaries – and labour of execution (Braverman, 1974). In this view, the relative importance of money-capital in triggering the development of the forces of production in industrial capitalism is

complementary – if not subordinate – to the capitalists’ organizational ability. This perspective is well summarized by the radical political economist Marglin (1984: 146–147, 150) in the following quotation:

[i]n many branches of late eighteenth century industry, the barrier to entry posed by capital was quite low ... the capitalist’s ‘hold’ was in large part the organizing ability he brought to production, a consequence of a vector of personal traits and talents, ranging from extraordinary greed to extraordinary intelligence [this] provides a response to the question of why capitalists are not in general content to act as rentiers, leasing capital goods to workers ... the essence of the capitalist’s contribution is not capital, but organizing ability.

In a framework of this sort, the parasitic character of Keynes’ rentier – who unproductively consumes all of their income – is opposed to the organizing ability of the functioning capitalist, who not only supervises the labour processes but reinvests a significant share of the profits of enterprise in future production and innovation – see Marx (1993b: 349–79). In industrial capitalism thus, profit, unlike rent, plays a positive – though still oppressive – function in the struggle against scarcity. In this view, rent is a category derived from and limited by profit, and more specifically, by the profit of enterprise.

We do not mean to leave the impression, however, that Marx considered the positive role of both profit and functioning capital as a sort of ‘necessary evil’. Rather, he was well aware that the labour of coordination and supervision performed by the capitalist themselves in the early phases of capitalism ‘inevitably gets the idea into his head ... that his profit of enterprise ... is rather itself a *wage*, wages of superintendence of labour’ (Marx, 1993a: 503–504). Hence, Marx understood this historical configuration as providing capitalists with a pretext for ‘presenting profit not as surplus-value, i.e. as unpaid labour, but rather as the wage that the capitalist himself receives for the work he performs’ (Marx, 1993a: 513). However, he correctly understood that such apology was not doomed to endure. In the passages of the third volume of *Capital* that we have just quoted, he correctly foresaw the separation between ownership and management as the factor which ultimately reveals the purely oppressive character of the capitalist organization of production and thus allowed for a clear distinction between profits – i.e., unpaid labour – and the wage of superintendence. We develop this argument in the following section.

The Hypothesis of the Becoming-Rent of Profit in Marx

The situation described by Marx in which both functioning capital and the profit of enterprise play an active role in the development of the forces of production is – by Marx’s own intuition – limited to the early and middle eras of capitalist development. Already in his own time, when capital concentration and the appearance of professional managers was deeply transforming the organization of production, he foresaw the development of credit and joint-stock companies as the key element leading towards the separation between the property and the

management of capital (see Galbraith, 1967; Chandler, 1993) and, accordingly, towards the exhaustion of the historical role of profit in stimulating both growth and innovation. By doing so, he anticipated that the role of capital owners in the transition from early to late industrial capitalism – and lately, from industrial to cognitive capitalism – would have followed the same path of land-owners in the transition from feudalism to early industrial capitalism (Marx, 1993a: 935–40). In this phase ‘the landowner, such an important functionary in production in the ancient world and in the Middle Ages, [became] a useless superfetation in the industrial world’ (Marx, 1969: 458). As such, he correctly envisaged what is now happening in the realm of distribution, that is, that shareholders seize significant shares of surplus value without playing any role in the organization of production.

The exhaustion of the positive role of functioning capital in the history of the CMP can be schematically divided in two phases, the first culminating in the ‘golden age’ of Fordism and Taylorism – where real subsumption, mass production and the separation of conception and execution reached their maximum – and the second culminating in the transition from industrial to cognitive capitalism.

In the first phase, the property and management of capital progressively divide, up to the point where ‘there remains only the functionary, and the capitalist vanishes from the production process as someone superfluous’ (Marx, 1993a: 512). Here, profit and rent are still clearly separated, as the organizational and conceptual tasks that used to be performed by the capitalists are now simply delegated to their functionaries. In this period, capitalists could still appear as sharply different from the rentiers from whom they borrowed their monetary and physical inputs, as the managers fulfilling their functions were directly inserted within a relation of production which, in itself, targeted the scarcity of capital and fostered the development of the forces of production. Within this framework, the purely despotic functions of surveillance and discipline which exclusively belong to the capitalist organization of production continued to be confused with ‘the work of supervision and management [which] necessarily arises where the direct production process takes the form of a socially combined process’ (Marx, 1993a: 507). This particular configuration somehow corroborated the organizational role of functioning capital – regardless of who executed the associated tasks – and paradoxically justified the tyranny of the factory system, as the latter seemed to promote the development of the forces of production.

With the exhaustion of the Fordist mode of regulation, however – for a definition see Boyer (1990) – and the development of the KBE, a great reskilling process started to challenge Taylor’s division of labour, along with the specific functions that managers and supervisors perform in production. In the Marxian line of reasoning recalled earlier, when the collective worker reappropriates their skills to manage and organize production, managerial supervision becomes both superfluous and purely despotic, and functioning capital ceases

to play its necessary role in the development of the productive forces, while it continues to fulfil its despotism through the functions of monitoring and surveillance. This is something of which Marx was well aware, as witnessed by the following quotation from Hodgskin:⁴ ‘the wide spread of education among the journeymen mechanics of this country diminishes daily the value of the labour and skill of almost all masters and employers by increasing the number of persons who possess their peculiar knowledge’ (quoted in Marx, 1993a: 513). Within such framework:

[t]he last pretext for confusing profit of enterprise with the wages of management was removed, and profit came to appear in practice as what it undeniably was in theory, mere surplus value, value for which no equivalent was paid, realized unpaid labour. (Marx, 1993a: 514)

Profit thus appears as a mere expropriation of unpaid labour, performed – just like rent – without playing any real function in the production process.

The trend towards the ‘becoming-rent’ of profit, however, is not limited to the reconfiguration of the knowledge–power relations following the development of the KBE, but is further reinforced by a specular transformation in the management of innovation and in the reinforcement of the intellectual property rights regime. Within the KBE, in fact, the labour time of execution becomes far less relevant than the social time of conception and capital, and in order to preserve profits, must forcedly develop institutional mechanisms to limit supply and thus maintain the predominance of exchange-value over use-value. The capture of surplus value, in this way, partially disappears from the locus of its production and reappears downstream of the latter. To recognize the interplay between these two elements – i.e., between the new setup of the capital–labour relations and the reinforcement of the IPRs – a conjoint reading of the volumes of *Capital* and the *Grundrisse* is required. In the latter indeed, Marx formulates some preliminary considerations regarding the twofold character of the General Intellect – at the same time, living cognitive labour and dead knowledge incorporated in fixed capital – which have been further acknowledged by several workerist interpretations (Negri, 1979; Virno, 2001; Toscano, 2007; Vercellone, 2007).

The conjoint articulation of such insights shows Marx’s tremendous foreseeing ability, which addressed both the objective and the subjective conditions of production. Marx himself could not explicitly formulate such articulation in full, although he was able to identify a trend which could have developed over time. Its full rationalization became possible only when the dialectic development of the KBE and the modalities of its exploitation gave birth to what neo-workerists called cognitive capitalism. For almost 150 years after Marx’s death, the main pillars of industrial capitalism have been those recognized by Marx, namely: (i) the implementation of the logic of profit, (ii) the deepening of real subsumption and (iii) the active and – to some extent – necessary role of functioning capital.

PROFIT AND RENT FROM INDUSTRIAL TO COGNITIVE CAPITALISM

The Hegemony of Profit over Rent in Fordism

The Keynesian–Fordist mode of development – for a definition see Boyer (1990) – was based on the relation between labour organization and profit of enterprise, which not only stimulated the development of the force’s production but additionally kept the shareholders’ interests in the background of corporate governance. In this framework, the Galbraithian (Galbraith, 1967) technostructure used to play a key role in the organization of both production and innovation and the ‘non-productive’ modes of capital valorization – e.g., those related to finance and the reinforcement of IPRs (Chevalier, 1977) – played a minor role in the accumulation process.

The purely oppressive power of the capitalist to exploit the scarcity-value of capital was further constrained by a cluster of complementary institutional arrangements. The tight regulation of financial markets, the progressive taxation of high incomes and the conduct of expansive monetary policies, for instance, sustained an inflationary process which kept the interest rate at very low or even negative levels. In addition, the national-based regime of IPR protection – whose internationalization in between the 1980s and 1990s gave birth to today’s knowledge monopolies – and the clear-cut distinction between radical and incremental innovation contributed to limit the power of money-capital in itself. Finally, the development of the welfare institutions, which partially socialized the conditions of labour reproduction, subtracted a considerable amount of resources to the logic of capitalist valorization. In this framework, the Keynesian project concerning the ‘euthanasia of the rentier’ partially fulfilled, and profit imposed, its hegemony over rent. Such configuration depleted with the latest transformations of the CPM and the development of the KBE, which altogether allowed the emergence of what neo-workerists call cognitive capitalism (see Chapters 83 and 84, this *Handbook*), along with its neoliberal mode of regulation. We analyse such changes in the following section.

The Capital–Labour Relation in Cognitive Capitalism

The trichotomic articulation between commodification, privatization and corporatization which characterized the emergence and development of cognitive capitalism stimulated forms of capital valorization which may be labelled as ‘unproductive’ or ‘rentier’ (Chevalier, 1977). The historical meaning of the social crisis of Fordism, in fact, did not only consist of the decomposition of industrial capitalism but also the very demise of its mode of development. Such transformation originated from the great season of social struggles initiated in the 1960s, which led to the tremendous boost in the amount of services provided by the welfare state and to the partial redistribution of the highly taxed profits in

the form of an increase in the social fraction of the wage. Over the same period, the widespread diffusion of schooling led to a reskilling process which profoundly altered the knowledge–power relations between capital and labour and, simultaneously, to an adjustment of the ratio between the tangible and intangible (R&D, schooling, health) assets owned by the representative firm. Knowledge rather than physical capital thus became the major determinant of competitiveness and growth. To challenge the classical way in which mainstream economics analysed such transformation, we advance the following remarks:

- 1 The social conditions of existence of a KBE are not laid within the private R&D laboratories, but rather within the collective productions 'de l'homme par l'homme'.
- 2 As knowledge diffuses in the society as a whole, its role in the organization of production becomes more prominent, so that the dead knowledge incorporated in fixed capital and in the hierarchical form of a firm's organization increasingly becomes 'a useless superfetation'.

As knowledge spreads over society as a whole, we begin to observe the emergence of novel patterns or horizontal labour cooperation, as well as new forms of common propriety – e.g., copyleft – which altogether identify a tendency towards a new organizational model which differs both from private and from public organization, from the firm and from the state. The free software experience constitutes the clearest example of such trend, though it only represents the tip of a much wider 'iceberg of the Common'. The novel forms of horizontal labour cooperation prove more productive – in terms of product quality and innovation – of large corporations. By doing so, they show the contradictions of the hierarchical organization of labour and simultaneously question the social scope of production. The histories of both radical and incremental innovation in the ICTs sector are filled with examples of this sort (Vercellone et al., 2015).

More generally, the combination between the massive diffusion of knowledge and the ICT revolution fulfils – to an extent which Marx himself could not imagine – the hypothesis of the General Intellect and provides it with a rationale to question the law of value/labour time (Vercellone, 2010). In addition, it also allows the critique of the social relation of ownership and exploitation in cognitive capitalism. Since the productive forces of the KBE develop autonomously from the factory system, both processes of capital valorization and accumulation must rely upon processes where capital parasitically subsumes the collective conditions of knowledge production and thus suffocate the potential of emancipation of the General Intellect society.

This trend is further manifested in the financialization of the economy, which – at least in advanced capitalism countries – fetters productive investments up to a point where it becomes possible to speak about a regime without capital accumulation. The very relation between dividends and interests, on the one hand, and profit, on the other, seems somehow reversed, as if the requirements of financial capital were to limit the profit of enterprise. Active profits, in this framework, are nothing but a remainder after passive capital has been paid.

While the history of the CMP cyclically featured the expansion of various forms of unproductive capital valorization (Arrighi, 1994: 416), often a forewarning about an incoming great crisis of both modes of regulation and development, the re-emergence of rent in cognitive capitalism assumes a qualitatively new character. This can be witnessed by the key role played by finance in the stock-exchange evaluation, where the eminently fictitious nature of the so-called immaterial capital – considered by Gorz (2010) as an oxymoron – is fully manifested. Furthermore, as argued by Marazzi (2009), finance is pervasively present in the whole cycle of the extraction–distribution–realization of the surplus value, making it increasingly difficult to distinguish between functioning and money-capital and, thus, between profit and rent. Thus, it would be a mistake to reduce the financialization of the economy as a mere overturning in the power relations between managers and shareholders. In fact, it largely derives from an endogenous change – already initiated at the end of the 1970s (Revelli, 1988) – in the firms’ valorization strategy. The trend towards the becoming-autonomous of labour thus seems to perversely couple with the becoming-autonomous of capital, as the latter assumes the eminently abstract, flexible and mobile form of money-capital.

The Hegemony of Rent over Profit in Cognitive Capitalism

Given the stylized facts recalled earlier, it is now possible to characterize theoretically what we call the becoming-rent of profit. As labour becomes increasingly capable of self-organizing and knowledge production is under-valorized under hierarchical forms of work organization, functioning capital ceases to play any active role within the productive realm and profit. Just like rent, it appears for what it actually is, that is, ‘mere surplus value, value for which no equivalent was paid’ (Marx, 1993a: 514).

Within a cognitive division of labour, in fact, productive efficiency no longer depends upon the decomposition of the labour process into highly routine and repetitive tasks. Rather, it results from the complementarity among the tacit and highly dispersed pieces of knowledge that workers use in production to adapt to the ever-changing condition of the outside economic environment. Given such a historical change, workplace surveillance can no longer be based upon the traditional authority relation where supervisors coerce ordinary workers to exert effort. Conversely, it must rely on a new cluster of managerial practices where the disciplinary power characterizing the scientific organization of labour is replaced by a ‘managinaire’⁵ form of command which forces workers to self-control and self-exploit. This is done by compelling employees to internalize the firm’s values and objectives, thus aligning their *ego ideal* with capital’s. The ‘discipline and punish’ paradigm of Taylor’s organization, where workers are subordinated to the force of the hierarchy and perform their duties submissively, is thus replaced by a control-apparatus of Deleuzian (1992) memory, where

the workers' libido is transformed into an energy which is directly productive (De Gaulejac and Mercier, 2012).

As for the production of value, control over labour shifts before and beyond the productive activity and starts filling the entire spectrum of individual subjectivity. Nowadays, it is the worker who must find the one best way to achieve the goals set by the management of the firm.⁶ The purpose is to push workers to exploit their knowledge and reach their goals and, simultaneously, to internalize the guilt of being unable to do so in full. As control becomes self-control, the subordination to an external discipline transforms into subordination to an internal expectation.

Cognitive capitalism does not simply ratify the irreversible decline of the idyllic Weberian entrepreneur who is, at the same time, the owner and the manager of the firm. It additionally entails the demise of the Galbraithian technostructure whose legitimacy was derived from the key role that managers fulfilled in the organization of both production and innovation. This is reflected by the fact the old class of method engineers and managers who were born and raised in the cult of technical competence is now being replaced by a new generation of professionals who trained in the great business schools, where a novel managerial culture completely extraneous to the mechanism of production is taught and diffused (Negri and Vercellone, 2008). The key abilities of this new class of managers are in the field of finance and consist in the creation of value for shareholders, while the organization of production is increasingly delegated to low-level workers empowered with discretion and autonomy. As the managers' visible hand loses relative importance, functioning and money-capital become one and cease to play any function in the development of the forces of production.

While affecting the intra-firm organization of labour, this trend also has major implications for the way in which firms interact in the outside economic environment, since competitiveness is now increasingly dependent upon network economies among firms rather than upon internal economies within firms – i.e., of scale or scope. As argued by Hardt and Negri (2010), Taylor's division of labour is thus replaced by a social organization based on the network and spillover effects of knowledge production, which have intensified in large cities due to the existence of economies of agglomeration. As capitalists play no role in the formation of these clusters, the part of surplus value they are capable of extracting from these economies of agglomeration is similar in all respects to the higher differential rent that land-owners owning more fertile properties are able to extract. A society's collective knowledge appropriated by capital is nothing but a 'free gift' resulting from 'the general progress of society' (Marshall, 2013: 365, 353). Even Marshall, one of the founders of modern mainstream economics, would have classified such appropriation as rent.

There are, of course, many other forms for the hollowing out of the capitalist functions in the organization of production, related, for instance, to the high-tech renewal of the putting-out system or to the diffusion of the 'open innovation'

model. As the great corporations of cognitive capitalism realize the innovative potentials of the commons of knowledge, they either try to imitate or integrate such abilities within their cycle of valorization, for instance by externalizing their R&D to capture society's collective creativity. This is made possible by the non-mercantile character of the Common, as commoners do not derive any financial support from their activities. Within a capitalist economy, in fact, wage labour is the only social form guaranteeing income stability to those who are devoid of alternative revenues. By exploiting this condition, the great corporations of knowledge manage to subsume the commoners, as the increasing dependence of Linux upon the financial support of the great oligopolies of the digital economy clearly exemplifies.

While profit is taken up in its becoming-rent through the mechanisms described hitherto, the conflicting logics of exchange and use-value finally take part and cognitive capitalism expresses, as remarkably argued by Gorz (2010), the crisis of capitalism 'in its epistemic foundations'. With the crisis of the law of value recalled earlier, in fact, the logic of exchange ceases to trigger the development of the forces of production which, as a by-product, historically acted as a stimulus for the satisfaction of needs. Under the latest developments of algorithmic automatization, we are getting closer to the moment when labour time becomes an 'indispensable but subordinate moment, compared to general scientific labour' (Marx, 1993b: 700) and 'exchange value must cease to be the measure of use value' (Marx, 1993b: 705). Of course, Marx was well aware that this shift would have prompted capitalists to find strategies to impose the hegemony of exchange-value over use-value. This is mainly reflected in the following stylized facts.

First, it reflects in the cognitive corporations' attempt to tighten IPR regulation and in the massive increase in patent filings started in the mid 1980s, up to a point where it is now difficult to trace the boundaries between incremental and radical innovation and between basic and applied research. As the appropriation of knowledge becomes a core element of corporate success – both in the new and in the 'old' economy – a true 'tragedy of the commons' (Hardin, 1968) results, as knowledge remains underutilized because of its fragmentation and privatization related to the enforcement of the new IPR regime (see also Chapter 85, this *Handbook*).

Second, the high fixed cost of designing, inventing or studying many of the knowledge-intensive goods of today – such as software, cultural goods, meds, etc. – relate to the production of the first unit, while the marginal costs of producing the following units tend to zero. In order to secure profits and maintain the primacy of exchange-value over use-value, capital commands high prices in order to limit supply and create an artificial scarcity of resources. The very principle upon which the founding fathers of political economy used to justify private property as a means to fight the scarcity of resource is thus violated. Nowadays, it is the defence of the hegemony of exchange-value which generates scarcity, while wealth – as Marx himself would have argued – is associated with use-value.

As a proof, it may be worth recalling that the tremendous increase of patent filing recalled above did not result in a correlated boost in the pace of innovation or productivity (Vercellone et al., 2015) – as it has always been during the golden age for Fordism.

Finally, the privatization of the welfare institutions seems to follow an affine logic. Health, schooling and public research, in fact, may be easily inserted in the circuit of capital valorization, with the high risk of lowering the social efficiency of such institutions because of the increased inequality which matches any wave of privatization. The final outcome of such processes is to spoil both the quality and quantity of the so-called ‘intangible’ capital, which constitutes the key element for the development of the KBE.

Cognitive capitalism manifests a major contradiction between the social character of production and the private character of appropriation. Its logic – that we have labelled with the name ‘becoming-rent of profit’ – highlights the tight connection between ordinary and primitive accumulation, thus reflecting a situation of increasing conflict between the social relations of production and those of distribution and between the objective and subjective conditions of existence of the KBE, which, in itself, contains the seeds for a potential overcoming of the capitalistic market economy as a whole.

CONCLUSION

In this chapter, we resumed the neo-workerist hypothesis of what we call the becoming-rent of profit. Further, we presented such hypothesis against the background of the contradiction characterizing the contemporary phase of capitalism, which we call cognitive capitalism. In our view, this is in line with a Marxist understanding of the present, where the capital–labour antagonism expresses the deeper opposition between two conflicting logics about the social organization of production, the former relating to the democracy of the Common and the latter to the logic of rent of cognitive capitalism. As Marx (1993a: 1024) rightfully argued:

The sign that the moment of ... a crisis has arrived is that the contradiction an antithesis between, on the one hand, the relations of distribution, hence also the specific historical form of relations of production corresponding to them, and, on the other hand, the productive forces, productivity, and the development of its agents, gains in breadth and depth.

Notes

- 1 On the notion of the *becoming-rent of profit* with respect to the new forms of exploitation, see Vercellone (2008a) and Negri and Vercellone (2008). With respect to (a) the interpretation of the crisis and (b) the *democracy of the Common*, see Vercellone (2008b), Fumagalli and Mezzadra (2010), Hardt and Negri (2010) and Lebert and Vercellone (2011).
- 2 On the nexus between cooperation and the capitalist organization of production, see chapter 13 in part 4 of Marx’s (1982: 439–54) first book of *Capital*; on the work of supervision and its relationship

- with the distinction between profit of enterprise and interest (rent), see chapter 23 in part 5 of Marx's (1993a, 493–514) third book of *Capital*.
- 3 Elsewhere Marx (1993a: 503–504) specifies the division between these two figures by asserting that 'interest-bearing capital ... does not have wage-labour as its opposite, but rather functioning capital; it is the capitalist actually functioning in the reproduction process whom the lending capitalist directly confronts, and not the wage labourer who is expropriated from the means of production precisely on the basis of capitalist production ... In the reproduction process, the functioning capitalist represent capital against the wage-labourers as the property of others and the money capitalist participates in the exploitation of labor as represented by the functioning capitalist'.
 - 4 The influence of Hodgskin's ideas on the development of the General Intellect hypothesis has been terrific.
 - 5 Contraction between the term 'management' and the French 'imaginaire'. Also labelled *management par (by) illusion*.
 - 6 Remarkably, a recurring motto in French neo-managerial practices is 'Débrouillez-vous!', that is, 'Manage yourself!'

Value

Tommaso Redolfi Riva

INTRODUCTION

The concept of value has obtained different degrees of consideration in the course of the history of economic thought. While classical political economy and the first advocates of marginalist economics considered value as the essential subject of their scientific discourse, modern economic reflection generally rejects the theory of value as a metaphysical residual (Robinson, 1962: 29) or a prescientific normative vision of the economic process (Myrdal, 1953: 57) that can only be used to mark the different epochs of the history of economic analysis. Only few economists today, chiefly interested in the epistemological foundation of their science, consider value and value theory something to address. At the beginning of the 1980s, Robert Heilbroner stated that ‘the questions raised by value are not antiquarian but perennial’ after having noticed that ‘most economists today do not even see the need for a “theory” of value, as distinct from a theory of price, and would in fact be hard pressed to explain the difference between the two’ (Heilbroner, 1983: 253). Philip Mirowski, only seven years later, confessed that ‘the problem with modern economic discourse is that it doesn’t take value seriously; it veers increasingly between denying its importance altogether and asserting a complete comprehension of its contours’ (Mirowski, 1990: 691).

Even if the scepticism towards the theory of value can be traced back to what is known among Marxists as the period of the ‘Disintegration of the Ricardian

School', and especially to the criticism developed by Samuel Bailey against Ricardo (Bailey, 1825), it was only when the theory of value completely was conflated with the theory of exchange ratios and prices that value lost its place in the field of economic science. In 1923, Gustav Cassel could state that it was possible 'to do away with the whole of the old theory of value as an independent chapter of economics and build up a science from the beginning on the theory of prices' (Cassel, 1923: vii). Such a dismissal had its roots in the psychological character assumed by the theory of value after the marginalist revolution and in the problems related to the possibility of the measurement of such psychological states.

The descending parabola of value in the constitution of economic theory represents the progressive mutation of its object of research. In classical political economy, the theory of value aimed to explain both exchange ratios between commodities and the cause of such ratios: exchange and absolute value, to use the words of Ricardo's famous manuscript (Ricardo, 1823). In marginal utility theory, even if it was not possible to talk about an absolute value, the exchange ratios were functions of utility increments. In both theories, the theory of value was the isolation of an independent variable by means of which one could express all the other dependent variables – that is, ground 'their structure on a quantity which lay outside the system of price-variables, and independent of them' (Dobb, 1946: 12). It was exactly when economic theory dismissed the issue of the 'search for processes or structures that impart orderly configurations to empirical world' (Heilbroner, 1983: 255) that value lost its central place. The suppression of the problem of value is the suppression of the inquiry into the fundamental structures of a society, hence the restriction of the economic science to the boundaries of a system of price equations. It is for this reason that modern economics has to presuppose a peculiar ontological dimension in which things have a price tag and are exchanged according to it. Such an assumption, when discussed, is brought back to human nature, to the relationship between Human Being and Nature, or, as Robbins put it, to 'the relationship between ends and scarce means which have alternative uses' (Robbins, 1932: 15). The suppression of value in economic science turns out to be the naturalisation of price and of the (unexamined) social relationships on which it is grounded.

Marx's critique of political economy represents a fundamental moment of discontinuity in the history of economic thought. The concept of value he introduces breaks with classical and neoclassical economic discourse.

His critique is not a simple collection of criticisms of different economic doctrines: it is a critique of the economic science as a whole, and by means of such a critique it is a critique of the society from which political economy develops. From this point of view, the famous description Marx gave of his work as 'a Critique of Economic Categories or [...] a critical presentation [*Darstellung*] of the system of the bourgeois economy [...] a presentation [*Darstellung*] and, by the same token, a critique of the system' (Marx, 1858: 270, translation modified) is to be read together with Hegel's claim that political economy is 'one of the sciences which have arisen out of the conditions of the modern world' (Hegel, 1821: 187).

Political economy represents the science of civil society, both as a science whose object is the economic system and as a science which cannot free itself from the standpoint of the economic system itself. The critique of political economy is therefore the comprehension of the conditions of possibility of such an economic system, the critique of the system itself and, by the same token, the critique of the science of political economy.

THE THEORY OF VALUE AND THE TRANSFORMATION PROBLEM

Marx's theory of value is the cornerstone of his critique. The reception of the critical nature of Marx's theory of value represents the possibility of disclosing the *differentia specifica* of his work in comparison with economic science as a whole. The reception of Marx's theory of value, both inside and outside Marxism, has often been inadequate and contributed to conflate Marx's scientific discourse with Ricardo's labour theory of value. Moreover, the consistency of Marx's theory of value has been made dependent on the procedure of the transformation of labour-values into prices of production, to the detriment of the complexity of Marx's system.

According to classical presentations of Marx's theory of value, commodities are exchanged on the basis of the quantity of labour expended in their production, and surplus-value comes from the exploitation of the labour-power of the workers, who work a higher number of hours than the number necessary to produce their wages. Surplus-value can be brought back to the surplus-labour of wage-workers. The rate of surplus-value, as the ratio between the mass of surplus-value and variable capital, represents the rate of exploitation of labour-power and shows the actual origin of surplus-value in surplus-labour. Nevertheless, given the competition among particular capitals, surplus-value assumes the form of an average rate of profit issued among different capitals not in proportion to variable capital but in proportion to the whole advanced capital (variable + constant): commodities are not exchanged on the basis of their value but on the basis of their price of production. Here lies what is known as 'the transformation problem' (see also Chapter 10, this *Handbook*). In *Capital* volume three, Marx explains that the formation of a general average rate of profit and the transformation of commodity values into prices of production did not put into question the link between prices and labour expended, consequently making valid the concept of exploitation. Exploitation shows that the whole mass of profit is equal to the whole mass of surplus-value; even though the commodities are not exchanged according to their values, they are nevertheless linked, by means of the prices of production, to the labour (value) and surplus-labour (surplus-value) expended in production. The link between the single commodities produced and direct labour is replaced by the link between the whole sum of prices of production and the whole labour expended: labour remains the only source of value.

A few years later, Bortkiewicz (1907) revealed a problem in Marx's transformation procedure, a problem already noted by Marx himself.¹ The transformation of values into prices of production presupposes the average rate of profit, and in order to calculate it Marx divided the whole surplus-value produced by the total amount of capital expressed in labour-values. What Marx transforms into prices is only the output, but, since the elements composing capital are commodities, their values should be transformed into prices. Bortkiewicz proposed a simultaneous process of determination by a system of equations: the logical passage from values to prices through the average rate of profit was dismissed, and the aim of the theory was now the simultaneous determination of the prices of production and of the average rate of profit. If the object of Marx's theory could be limited to a system of equations in which it was possible to develop a simultaneous determination of prices of production and average profit, once such a system of equations was possible without any reference to labour-values (as in the system developed by Sraffa (1960) in *Production of Commodities by Means of Commodities*), it would be possible to reach the conclusion that 'value magnitudes are at best redundant in the determination of the rate of profit (and prices of production)' (Steedman, 1977: 202).² What characterises this reception of Marx's theory is the presupposition that the theory of value and the theory of prices represent two different systems of determination, which have to be applied to different hypothetical or historical conditions. The conceptual development of Marx's theory is understood as a progression of models with successively less limiting hypotheses and greater correspondance with reality.

The interpretations of Meek (1973) and Sweezy (1942) played an essential role in the reception of Marx's theory of value in the Anglophone world, and they share the idea of values and prices as different models. Building his interpretation on Engels' 'Supplement' to the third volume of *Capital* (1895), Meek argues that the theory of value has to be referred to a hypothetical simple commodity production. In the words of Meek, simple commodity production, like Adam Smith's 'early and rude' society, is not 'intended to be an accurate representation of historical reality': it is rather a 'mythodology', a sort of 'tool' which has to be distinguished from the 'results of analysis' (Meek, 1973: 303–4). While the theory of value is a tool, the theory of prices of production is the result of the analysis. Sweezy explicitly depicts Marx's method in *Capital* as 'what modern theorists have called the method of successive approximations' (Sweezy, 1942: 11). It is a step-by-step development from a hypothetical condition in which different capitals have equal organic composition to a more concrete analysis in which the hypothesis is removed. It is a gradual approximation to the reality of capitalist production which starts from the theory of value and arrives at the theory of prices and which has as a corollary the fact that 'the results achieved in Volume I have a provisional character' (Sweezy, 1942: 18).

MARX'S (AND NOT MARXIST) THEORY OF VALUE

All the above readings of the theory of value assume the connection between labour and value either as a hypothesis that has to be verified by means of the transformation procedure or as a demonstration by Marx in the first two sections of the first chapter of *Capital* volume one. A classical example of this last interpretative tendency comes from Böhm-Bawerk, who criticises the theory of value, emphasising the merely assertive character of Marx's reasoning relating exchange-value, value and labour as substance. Böhm-Bawerk concentrates his criticism against what he describes 'a purely logical proof, a dialectic deduction from the very nature of exchange' (Böhm-Bawerk, 1896: 68). He discusses Marx's identification of the exchange with an equation in which two commodities are put into relation as equal 'congealed quantities of homogeneous human labour, i.e. of human labour-power expended without regard to the form of its expenditure' (Marx, 1873: 127). Nevertheless, Marx's problem comes first and regards the condition of possibility of the commensurability of the objects in the exchange, the condition of possibility of a dimension in which the commodities are compared and equated once monetary exchange is the fundamental institution by means of which 'social metabolism' is accomplished.

Marx does not proceed according to what Dobb considered one of the fundamental 'requirements of a theory of value' – that is, stating the independent variable by means of which all the other variables of the system of exchange equations can be expressed (Dobb, 1946: 5–6) and therefore finding the dimension of commensurability between commodities in the exchange. On the contrary, the starting point of Marx's presentation is the commodity as a '*concretum*' (Marx, 1880: 538), as unity of use-value and value – that is, of natural and social forms of wealth. Marx's distinction, that at first sight seems to be equal to the classical one between use-value and exchange-value, shows that the starting point of the presentation is not a logical analysis of general concepts, as Böhm-Bawerk stated, but an analysis of historically determined abstractions. The commodity is the specific form assumed by products of labour; it is the 'elementary form' assumed by 'the wealth of societies in which the capitalist mode of production prevails' (Marx, 1873: 125), where objects of utility become commodities only because they are the products of the labour of the wage-workers employed by capitalists in private and autonomous processes of valorisation. The question is formulated for the first time at the end of Notebook VII of the 1857–8 Manuscripts: 'how does use value become transformed into commodity?' (Marx, 1857–8: 881). Marx's analysis comes before the doubling of the product of labour in use-value and value – that is, before the naturalisation of social determinations on which the reflection of political economy is based: Marx's theory has to understand the conditions of possibility of such a doubling.

ABSTRACT LABOUR AS THE SOCIAL SUBSTANCE OF VALUE

Marx's argument presupposes a conception of value as the specific form assumed by the product of labour under specific social relationships of production. It is not only the question about the substance of value: on the contrary, from the beginning, what is at stake is the question 'why do the products of labour assume the form of value?', and it is necessary to address labour and to analyse the specific form it assumes in order to answer it. For Rubin, 'the point of departure for research is not value but labour, not the transactions of market exchange as such, but the production structure of the commodity society' (Rubin, 1928: 62). More than a labour theory of value, Marx's theory can be defined, using a suggestion from Elson (1979), a 'value theory of labour'.

According to Marx, 'as soon as men start to work for each other in any way, their labour also assumes a social form' (Marx, 1873: 164). What is the specific form labour assumes in the society where the capitalist mode of production prevails?

For Marx, the capital relationship is grounded on the structural separation of objective and subjective conditions of production: on the one side there are the owners of the means of production, on the other the workers, the owners of labour-power. The process of production is a process of valorisation achieved through the appropriation by capital of the surplus-labour expended by workers. Therefore, under capitalist conditions, the whole production and reproduction of society is determined by means of labours expended by private autonomous and independent processes of valorisation – that is, 'living labour of the wage workers organized by capitals in competition' (Bellofiore, 2009: 183).

Labour expended by wage-workers is immediately private and becomes an element of the social total labour [*gesellschaftliche Gesamtarbeit*] only through the mediation of the exchange of commodities on the market, when products of labour become mere 'things of value' [*Wertdinge*] equated with one another in the exchange, and, consequently, the concrete private labours expended in their production become *abstract*.

The capitalistic enterprises enter into a relationship by means of the exchange of the commodities produced, and labour privately expended 'manifests itself as an element of the total labour of society only through the relations which the act of exchange establishes between the products' (Marx, 1873: 165). The abstraction of labour is not a mental generalisation put forth by an economic or social scientist who abstracts from the concrete acts of production: it is an abstraction practically achieved when the products of labour are exchanged. As Marx states, 'the reduction of various concrete private acts of labour to this abstraction of equal human labour is only carried out through exchange, which in fact equates products of different acts of labour with each other' (Marx, 1871–2: 41).

The concept of abstract labour has often been conflated with other concepts of labour, not directly ascribable to Marx. Even if Marx himself is not always

coherent in its presentation,³ it is necessary to acknowledge Marx's awareness of the originality of the concept of abstract labour in respect of the concept of labour developed by classical political economy⁴ and recognise with him that since 'commodities possess an objective character as values only in so far as they are all expressions of an identical social substance, human labour' and 'their objective character as values is therefore purely social', 'not an atom of matter enters into the objectivity of commodities as values' (Marx, 1873: 138–9).

In order to understand such a pivotal concept of Marx's system, it is necessary to distinguish it from other concepts of labour. Abstract labour is not the concept of labour Marx develops in the section dedicated to 'the labour process' in chapter seven of *Capital* volume one, like Sweezy suggests when he equates abstract labour with labour in general as 'what is common to all productive human activity' (Sweezy, 1942: 30). While in chapter seven Marx addresses 'the general character of the production' underlining the moments characterising labour in every form of society in which it appears, abstract labour is a historically specific form assumed by labour when the product acquires the form of commodity.

Abstract labour is not de-concretised or deskilled labour as interpreted by Braverman (1974), since abstract labour is not a technical but a *social determination* of labour depending on the specific form in which socialisation of labour is accomplished. Finally, since abstract labour is a specific form of labour, it is not physiological labour – that is, the expenditure of human bodily energy that can be observed in every form of society regardless of the specific social form of the expenditure of labour.

The concept of abstract labour is linked to the exchange as the specific form of the socialisation of labour. The socialisation of labour by means of private exchanges of commodities is not the exclusive form in which socialisation of labour can be achieved. Under different social conditions, as Marx shows (Marx, 1873: 169–72) – for example, in medieval Europe or in an association of free men in which the means of production are in common – the expenditure of labour is immediately social, and private labour is part of the social total labour already in the production phase. Private labours assume the social character without the process of abstraction put forth by means of the equalisation of commodities in the exchange.

In order to avoid the false dichotomy of value coming from production or being created in the exchange, it is important to turn again to Rubin and his replies to criticisms against his interpretation of abstract labour. Such a dichotomy is possible only if production and circulation are understood as opposite and independent moments. As Rubin notes, 'exchange is the social form of the production process itself, the form which stamps its mark on the course of the production process itself', and 'labour only takes the form of abstract labour, and the products of labour the form of values, to the extent that the production process assumes the social form of commodity production, i.e. production based on exchange' (Rubin, 1927: 123).

THE MAGNITUDE OF VALUE

When Marx addresses the question about the magnitude of value of the commodity produced, he introduces the category of ‘socially necessary labour time’. To fully understand the notion of ‘socially necessary labour time’ it is necessary to understand it in its immanent relationship with the concept of abstract labour. If abstract labour is private labour expended in production that becomes social by means of the exchange of the commodity on the market, it is obvious that a technical interpretation of ‘socially necessary labour time’ is inadequate. In the classical reception of Marx’s theory of value, the concept of socially necessary labour time has been interpreted as the time necessary to produce a specific commodity under the current average technical methods of production. Such an interpretation takes into consideration the concrete expenditure of labour but not the process of socialisation as the *conditio sine qua non* of the realisation of abstract labour expended. Marx clearly states that in order to produce a commodity the producer ‘must not only produce use-values, but use-values for others, social use-values [...] Finally nothing can be a value without being an object of utility. If the thing is useless, so is the labour contained in it; the labour does not count as labour, and therefore creates no value’ (Marx, 1873: 131).

Abstract labour and value presuppose socialisation. If it is possible to measure directly the concrete labour time expended in the production of the commodity, the same cannot be said of abstract labour, the constitution of which lies in the unity of production and circulation. As Tony Smith convincingly states, since ‘concrete labour is done by private individual units of production [...] these units produce with the hope, rather than the assurance, that the labour they perform will turn out to be socially required’ (Smith, 1990: 69). The inclusion of private labour expended in total social labour ‘is only preliminary and tentative’ (Rubin, 1927: 124). Even though capitalists can ideally anticipate the process of socialisation and on that basis impose on workers a specific organisation of the process of production directed towards concrete labour-time saving,⁵ the socialisation is realised only in the monetary exchange of the commodities produced.⁶

VALUE-FORM, MONEY AND THE FETISH CHARACTER OF THE COMMODITY

We have seen that the process of socialisation of private labours is realised through a system of private exchanges of commodities on the market. With the form of value, Marx wants to analyse the exchange as the fundamental structure of the process of socialisation and understand the form assumed by social relations of production. The section on the form of value has been underrated and

misinterpreted for a long time. With the exception of Rubin, only since the end of 1960s has the problem of the form been considered as a fundamental part of the presentation of the theory of value.

In West Germany, the recovery of the problem of the form took place through the efforts of a group of several pupils of Adorno and Horkheimer. Schmidt's essay (1968) and the seminal contributions by Backhaus (1969) and Reichelt (1970) opened new perspectives on the reception of Marx's theory of value, stressing the weight of the problem of the value-form and money as well as the Hegelian heritage of Marx's presentation. At the same time in Italy, on the one side the works of Colletti (1968) and Napoleoni (1973) focused attention on the role of abstract labour and fetishism in the theory of value, and on the other Luporini (1966, 1972) and Calabi (1972) put in question the historicist reading of Marx's *Capital*, while Rodolfo Banfi (1965) showed that Marx's theory of value should not be understood as the basis of equilibrium prices but rather as a phenomenology of exchange-value, an analysis of the ways in which value expresses itself. In France, the attention to the problem of the form initially came from Rancière's (1965) analysis of fetishism in his contribution to *Lire le Capital*. Later, and from a different perspective, the question of the form and the immanent link between value and money was proposed by de Brunhoff (1973). In the English-speaking world, the problem of the form assumed a relevant role with the translation in 1973 of Rubin's book and later with the contributions by members of the Conference of Socialist Economists (CSE) collected in the book edited by Elson (1979).

The belated attention interpreters gave to the problem of the form of value does not do justice to the consideration Marx himself gave to the problem, as testified by the number of successive presentations of the subject (Marx, 1859, 1867a, 1871–2, 1873).

Marx begins his presentation with the twofold nature of the commodity. While the use-value of the commodity lies in the bodily concreteness of the commodity itself, value cannot be seen or touched; it is only in the exchange that value assumes a concrete existence: the objects assume a form of value distinguished from their own body.

In his analysis of the value-form, Marx addresses the exchange and focuses attention on the reflexive relationship between natural and social determinations of the commodity. Differently from classical political economy, which recognised in the exchange a symmetrical relationship, Marx shows the polarity of the relationship between the two commodities and highlights the process of reflection of one determination into the other. In the exchange, Marx distinguishes the commodity in the 'relative form of value' from the commodity in the 'equivalent form', showing that the commodity in the relative form of value expresses its value in the body of the commodity in the equivalent form.

Marx begins his analysis with the 'simple form of value'. The expression

20 yards of linen = 1 coat. (Marx, 1873: 139)

has to be understood not only as the commodities changing places (the owner of linen obtains the coat and vice versa), nor only as the equivalence between two commodities having the same value. In Marx's analysis of the exchange, use-value and value dimensions are understood in their *reciprocal relation*. The linen can be equated with the coat since as values they are equal quantities of abstract labour, but, at the same time, the coat becomes the form of value of the linen, which can now differentiate its own value from its bodily concreteness. Marx is well aware of the originality of his analysis of the exchange. In the first edition of *Capital* he writes:

It is relatively easy to distinguish the value of the commodity from its use-value, or the labour which forms the use-value from that same labour insofar as it is merely recognised as the expenditure of human labour-power in the commodity-value. If one considers commodity or labour in the one form, then one fails to consider it in the other, and vice versa. These abstract opposites fall apart on their own, and hence are easy to keep separate. It is different with value-form which exists only in the relationship of commodity to commodity. (Marx, 1867a: 21)

Classical political economy had been able to develop the analysis of the exchange from the point of view of value. Nonetheless, it failed in understanding the process of manifestation of value in the use-value of the commodity in the equivalent form. This failure is the reason why Ricardo establishes, beside money, an accounting system in labour time, a simple juxtaposition of his theory of money beside the theory of value.

In Marx's analysis of the exchange:

The use-value or commodity-body is here playing a new role. It is turning into the form of appearance of commodity-value, thus of its own opposite. Similarly, the concrete, useful labour contained in the use-value turns into its own opposite, to the mere form of realization of abstract human labour. *Instead of falling apart, the opposing determinations of the commodity are reflected against one another.* (Marx, 1867a: 21, italics mine)

Value now has a concrete existence in the body of the commodity in the equivalent form. The immanent opposition between use-value and value found its expression in the doubling [*Verdopplung*] of the commodity in the relative form of value and the equivalent form. In such a doubling, 'the one commodity, *whose own* value is supposed to be expressed, counts directly only as a use-value, whereas the other commodity, *in which* that value is to be expressed, counts directly only as exchange-value' (Marx, 1873: 153). It is important here to recall the three peculiarities characterising the equivalent form: (i) its use-value is the form of manifestation of value, (ii) the concrete labour expended in its production is the form of manifestation of abstract human labour and, finally, (iii) private labour expended for its production takes the form of labour in its directly social form.

In the simple form of value, what is at stake is the relation between two commodities. Labour expended in the production of linen is put into relation with labour expended in the production of coat. But, as seen above, in order to count

as abstract labour, concrete labour expended for the production of a commodity has to count as an element of total labour of society. The relative form of value passes in the ‘total or expanded form of value’:

20 yards of linen = 1 coat or = 10 lb. tea or = 40 lb. coffee or = 1 quarter of corn or = 2 ounces of gold or = ½ ton of iron or = etc. (Marx, 1873: 155)

Here linen is put into relation with the whole world of commodities. The labour expended in the production of linen is put into relation with all other production processes, but these last are not in relation with one another. Every single commodity expresses its value in all the other commodities, but there is not a common expression of value: ‘the only equivalent forms which exist are limited ones, and each of them excludes all the others’ (Marx, 1873: 157).

The total form of value passes in its own reverse, the ‘universal form of value’:

1 coat	}	= 20 yards of linen
10 lb. of tea		
40 lb. of coffee		
1 quarter of corn		
2 ounces of gold		
½ ton of iron		
x commodity A etc.		

(Marx, 1873: 157)

All the commodities express their value in the body of linen that becomes the universal equivalent. Now the commodities relate to one another as values insofar as they are definite as quantities of linen:

Through its equation with linen, the value of every commodity is now not only differentiated from its own use-value, but from all use-values, and is, by that very fact, expressed as that which is common to all commodities. By this form, commodities are, for the first time, really brought into relation with each other as values, or permitted to appear to each other as exchange-values. (Marx, 1873: 159)

The last passage of Marx’s presentation of the form of value is the money form, obtained by that specific kind of commodity in the equivalent form that now becomes the money commodity. The analysis of the form of value, as long as it is the development of the expression of the value of a commodity in the body of another commodity, is the deduction of money. It is starting from this perspective

that Backhaus characterises Marx's analysis of the form of value as a 'critique of the pre-monetary theories of value'. According to Backhaus, not only the classical theory of value but the traditional interpretation of Marx's theory of value and the neoclassical theory of value are subject to Marx's critique. All these theories of value share the idea that money is a phenomenon that has to be put aside in order to catch the essence of the exchange. As Backhaus states, they 'conceive as structurally identical the laws of the "exchange" in pre-monetary and monetary exchange economies: for them the "natural exchange economy" [*Naturaltauschwirtschaft*] is the "essence" of monetary economy. They want to know what is hidden behind prices mediated by money' (Backhaus, 1978: 147). What classical, neoclassical and Marxist political economists do not take into consideration is the process that goes from the essence to phenomenal manifestation, from value to money – that is Marx's analysis of the form of value.

Backhaus reconstructs the passage from total to universal form of value as the demonstration of the impossibility of a generalised exchange of commodities without money. Since for Marx the same commodity cannot simultaneously appear in relative and equivalent forms in the same expression of value, Backhaus understands the total form of value as the model of a pre-monetary commodity economy and concludes that such a model '*cannot be thought*, because each commodity should be thought at the same time in both the forms' (Backhaus, 1979: 285). For Backhaus it is necessary to distinguish between a general and transhistorical concept of exchange from the specific historical forms it assumes as barter or monetary circulation and, finally, recognise the essential monetary character of Marx's theory of value.

It is now clear that from the perspective of Marx's theory of value, money cannot be thought as a technical means, something devised by exchangers in order to facilitate the process of the exchange. On the contrary, money represents for Marx an underlying moment of the relations among commodity owners, the specific material [*sachlich*] form assumed by the socialisation of labour under capital social relations, specifically its fetish character. For a long time, the section on the fetish character of the commodity has been understood as something separate from Marx's theory of value. It was interpreted more as a philosophical appendix dedicated to expressing the historical nature of capitalistic relationships than an essential part of Marx's presentation. Things have changed since the problem of the form of value has acquired the attention it deserves and the role of money has been considered as a fundamental moment of the theory of value.

As seen above, the relationship between labour expended by private processes of valorisation and total social labour [*gesellschaftliche Gesamtarbeit*] is not a direct one. In the form in which capitalist society is organised, private expenditure of labour has to count as value in order to be an element of total social labour, and the form of the socialisation of labour is determined through a process of private exchanges between the commodities produced and money. What Marx names as 'the mysterious character' of the forms in which the process of

socialisation is achieved lies in the fact that ‘the social relation of the producers to the total labour [*Gesamtarbeit*]’ is reflected to social agents ‘as a social relation between objects, a relation which exists apart and outside the producers [*als ein außer ihnen existierendes gesellschaftliches Verhältnis von Gegenständen*]’ (Marx, 1873: 164–5). The fetish character assumed by capitalistic social relations is the reason for the fetishism of political economy. Since social relations assume the form of exchanges among objects, the specific characters of capitalist production appear as if they were features of products of labour, the ‘socio-natural properties of these things’ (Marx, 1873: 165).

A social relationship between human beings exists as something outside them: ‘the relation between their own private labour and the social total labour appears [*erscheint*] to them in exactly this perverted form [*verrückten Form*]’ (Marx, 1873: 169, translation modified). The displacement of the social relation of the producers in the social relation between objects represents in Marx’s words ‘an inversion [*Verkehrung*] and causes relations between people to appear [*erscheinen*] as attributes of things and as relations of people to the social attributes of these things’ (Marx, 1861–3: 507). The perversion [*Verrücktheit*] and the inversion [*Verkehrung*] of a social relation of people in a relation between objects create the irrational situation according to which objects are the bearers of social attributes. In the sphere of simple circulation, the object, insofar as it is a commodity, ‘changes in a sensuous supersensible thing [*in ein sinnlich übersinnliches Ding*]’ (Marx, 1873: 163).

The naturalisation of the capitalist mode of production put forth by political economy lies in the ‘objective semblance possessed by the social characteristics of labour’ [*den gegenständlichen Schein der gesellschaftlichen Charaktere der Arbeit*] (Marx, 1873: 167). Such a semblance is objective insofar as it is an aspect of the reality itself and not simply a subjective misunderstanding of the nature of value; it is objective because the semblance is determined by the objects themselves in the system of exchanges between commodities and money; and, finally, it is objective insofar as the social relation exists ‘apart and outside’ social agents as objects. According to Marx, political economy is trapped in fetishism because it cannot recognise the social constitution of the objects on which it operates. Political economy presupposes the ‘economic objects’; it presupposes a natural dimension in which objects are exchanged with one another and have a price that can be calculated. It is the presupposition of an ontological dimension in which objects, not differently from having length or weight, have value and can be exchanged. Marx can reason that social dimension in which objects have an objectivity of value only because he can recognise the contradiction between the private expenditure of labour and the superindividual process of socialisation determined by means of individual acts of exchange between commodity and money. While private expenditure of labour is something individual, something that can be recognised in the conscious consideration of the producer, the process of socialisation of private expended labour is something achieved in the sphere

of circulation. It is a superindividual process. It is something that imposes itself behind the backs of economic agents as an ideal average acting after and independently of private processes of valorisation. It is the law of value as a specific mechanical social relation.

CONCLUSION

Marx's theory of value is not only an economic theory of value: it is a theory of the social constitution of the objects which economic theory presupposes. Marx's critique of political economy deduces the presupposition and the naturalisation of social relationships put forth by political economy as an aspect of the social reality itself, depending on the fetish character that social relationships assume under capital. Marx's theory is therefore the understanding of the social constitution of political economy as a science and at the same time a critique of the hypostases of that science. Finally, and most importantly, revealing the social constitution of the objects of political economy, Marx's critique shows the specific historical determinacy of capitalistic social relationships hidden under the perversion of 'material [*dinglich*] relations between persons and social relations between things' (Marx, 1873: 166).

Notes

- 1 See, for example, Marx (1861–3: 351–2).
- 2 A critique of 'simultaneist Marxism' (Freeman and Carchedi, 1995: xxi) comes from the temporal single system interpretation (TSSI). Such an approach refuses the dual (value-price) system of determination and, against the simultaneous determination of input and output, introduces the temporal dimension in the study of the process of production and realisation. See also Kliman (2007).
- 3 See Marx (1873: 134). A deep discussion of the question can be found in Murray (2000). In the last years, the debate on Marx's concept of abstract labour has seen a new youthfulness: see Kicillof and Starosta (2007, 2011), Bonefeld (2010, 2011) and Carchedi (2011).
- 4 See Marx (1873: 132; 1867b: 407; 1868: 514).
- 5 De Angelis proposes a reading of abstract labour starting from the imposed nature of the labour process: the worker is forced to the execution of an activity whose organisation lies outside the realm of his 'sensuousness'. The labour is abstracted both from 'pain, suffering, human brutalisation, boredom, stupidity, etc, that work may imply' (De Angelis, 1995: 110) and from 'the forms of organised production' (De Angelis, 1995: 111). If such an interpretation has the merit of pointing out power relations in capitalistic labour processes, on the one side it introduces a concept of abstract labour as de-concretised labour (a specific form of concrete labour), and on the other, stressing the imposed nature of labour, abstract labour becomes a transhistorical category that can be applied wherever we find forced labour.
- 6 A deep critique of the idea of the possible measurement of value accounting labour hours expended is put forth by Michael Heinrich. Since abstract labour is a social substance for Heinrich, there is no possible measurement other than the process of socialisation itself (Heinrich, 2014: 219). Roberto Fineschi distinguishes the concept of measure from the concept of measurement: while commodity has an immanent measure in socially necessary labour time, the measurement of socially necessary labour time can be established only in the exchange with money, the measurer. Wanting to

determine the magnitude of value measuring concrete labour expended confuses the immanent measure with the process of measurement (Fineschi, 2001: 81–3). The act of measurement presupposes the socialisation – therefore the relation of the single commodity with the other commodities. A different position comes from Bellofiore’s reconstruction of Marx’s theory of value. Building on the second and third peculiarities of the equivalent form, Bellofiore stresses the quantitative aspect of the universal equivalent in Marx’s presentation. Since the value production is presented in gold, as a product of labour, the concrete labour that is embodied in gold as a use-value is the only private labour that counts as immediately social labour, mirroring the abstract labour contained in the other commodities as their value content (Bellofiore, 1989, 2004).

Money and Finance

Jim Kincaid

Marx studied and wrote about money and finance at frequent intervals from his arrival in London in 1849 until late in his working life.¹ During his lifetime little of this material reached finished form or publication, apart from a short but important book (Marx, 1987 [1859]) and a brilliant section at the start of *Capital* Volume 1 on the connection between money and the labour theory of value. In recent decades our understanding of what Marx was trying to achieve in his work on money and finance has been transformed. The many thousands of pages of notes and draft texts in his manuscript archive have been the focus of intensive study. Wider discussion has been made possible by the publication of much of this material in the magnificent 114 volume *MEGA*² edition (Marx and Engels, 1975–), including especially Marx’s manuscript of 1864–5 (in German, Marx (1992); in English, Marx (2016)). This contains the crucial, but rather disorganised, section on finance, which Engels drastically re-edited and published in 1894 as Section 5 of his edition of *Capital* Volume 3. The research work which is tracing the evolution of Marx’s monetary thought is inevitably marked by controversy. But it is now clear that Marx was painstakingly constructing a coherent and unique theory of the role of money and finance in capitalist development.

Early in *Capital* Marx lists the functions of money in the many forms of human society which have used money. Notably: as means of exchange, as store of wealth, and as means of payment (i.e. debt settlement). But he argues that, as capitalism emerges, money develops a new and fundamental role – as *measure of value*. By this he means that there is a strong, though indirect, link between money and the labour which is required to produce commodities.

In the first three chapters of *Capital* Volume 1, Marx explores the basic categories which he believes are essential for a political economy which aims to analyse a system dominated by the production of commodities for sale. As commodities are exchanged, what is being bought and sold is the labour which went into producing them. The fundamental role which is required of money in a capitalist system is to be the form of expression and the measure of the quantity of abstract labour required to make commodities.

Until the 1970s, most students of Marx considered that his account of money was hopelessly outdated because he generally uses gold as his example when discussing money. Since then, however, his central arguments have been explained and clarified by scholars, following the pioneering work of Suzanne de Brunhoff (1976 [1973]):

- 1 in capitalism, the fundamental function of money is to act as measure of value, and therefore it is linked to abstract labour;
- 2 this remains true not just for a commodity form of money like gold, but for the other major forms of money such as paper notes issued by the State, or cheques and other forms of credit money supplied by banks.

By the standards of conventional economic theory these are strange propositions, and what is also unorthodox is the logical method Marx uses to explain and defend them. He asks: what must money be like if a capitalist economy is to function coherently? The reason for this roundabout approach, as Martha Campbell explains, is that:

Money is not transparent; it does not reveal value, which underlies it. Rather the concept of value had to be established independently in order to interpret money correctly. (1997: 97)

Commodities, Marx argues, have two sorts of value: the qualities that make them useful to those who buy them, and the price they will fetch when sold. Capitalism is a decentralised system in which producers are independent and only find out if the labour they put into making commodities is socially valid by the price they get as they sell in competitive markets. But the range of different kinds of labour is infinite. Marx argues that there is only one way in which such a system could work – if there is a single substance which will allow the prices of commodities to be expressed on a uniform general scale, independently of the use value of those commodities. Money converts labour into abstract labour, measured as socially necessary labour-time.

Money as a measure of value is the necessary form of appearance of the measure of value which is immanent in commodities, namely labour-time. (1976: 127)

Early in Volume 1 of *Capital* Marx patiently spells out the logic by which, in a society where commodity production has become general, money develops its basic function as measure of value. In and through the everyday buying and

selling of commodities, the labour of individual producers comes to be assessed as a proportion of the total labour of a given society in a given period:

The value of a commodity expresses that it is a component of the total labour of a society and that it embodies some fraction of the total labour of a society. (1976: 127)

This is Marx's solution to what he calls 'the riddle of money' – his explanation of why and how, as commodity exchange becomes generalised in a society, money *must* emerge with the monopoly power to buy whatever is for sale.²

Gold is costly to excavate and to use; protecting it from theft is expensive. Thus gold has been displaced by cheaper forms of money such as bank cheques and currency supplied by central banks. Increasingly these are, in turn, being replaced by forms of money based on electronic recording and transfer. Most money today is no more than strings of digital code, inscribed in computer memories. But this is still a *material* form of money, and necessarily so, as Marx argued, if it is to act as a stable medium of calibration and calculation. Every dollar has to be kept equal to every other dollar – just as metres and temperature degrees need to be of a uniform length. There is as much strictness today in the recording and tracking of digital money, as there was when gold coins were being added up in the nineteenth-century counting house. Hackers and computer theft are as much of a menace to orderly commerce as were counterfeiters or bank robbers in an earlier period.

FUNCTIONS OF MONEY IN A CAPITALIST ECONOMY

- 1 *Money as measure of value.* As already noted, this, for Marx, is fundamental in a capitalist economy, and from it he reconstructs the other main functions of money. A secondary form, which is directly derived from money as measure of value, is *money of account*, i.e. when a price is stated but in abstraction from any actual transaction.
- 2 *Money as means of exchange.* Money used to buy and sell commodities.
- 3 *Money as store of value.* Money can be saved rather than spent. Marx's term for a cash reserve is *hoard* (*Schatzbildung*). One of the distinctive elements in Marx's vision is that money is power – not just the power to buy commodities, but more fundamentally, the power to set labour in motion, and therefore the power to secure surplus-value for whoever owns money which can be used as capital. When money is used as a store of value, what is involved is the preservation of the power of money over *time*, and the ability to transmit that power across geographical space, different currency zones, and through changes of ownership.
- 4 *Money as means of payment* (i.e. debt settlement). When credit is given and buyers are allowed time to pay, money acts as a means of settling the debt so created. Here money serves as a medium in which contracts are expressed and discharged. This is the basis for the major form of money in modern societies – credit money. Cheques are IOUs issued by banks, and the central bank supervises the system so that convertibility at par is maintained between bank credit money and the notes and coins issued by the central bank.³
- 5 *World money.* Marx is unusual in treating money's international role as a separate function. Since the Gold Standard ended, the currencies of the major economic powers, led by the US dollar, have been used internationally to borrow, invest, hold reserves, and pay off debt.

Money becomes *capital* when used in ways which make more money for its owner. Central in Marx's political economy is the circuit of industrial capital.⁴ In this an initial sum of money is used to buy means of production and pay wages. As commodities are produced, workers are paid only for part of their labour-time. The rest – unpaid labour-time – is surplus-value. When commodities are sold their value is converted back into money – and, after costs of production have been met, the remaining surplus-value is retained as profit. Marx notes how credit processes become an element in the circuit of productive capital. People with money to invest can lend it to an industrial capitalist who, in return, will pay over part of the profit to the lender in the form of interest. Marx distinguishes between the rentier who supplies interest-bearing capital and the functioning capitalist who needs capital to expand operations, and who repays borrowed money, with interest, out of profits.

Starting from this deceptively simple foundation Marx constructs an increasingly complex analysis of capitalist finance. His first move is to explain why banks are a necessary development.

WHY BANKS?

Central to Marx's account of banks and other financial institutions within the capitalist system is the argument that some of the functions they perform allow overall rates of profitability to be greater than they would otherwise have been. He stresses the double role which finance plays in the accumulation process. The disruptive and larcenous power of the financial system is rooted in the equally powerful cost-cutting, profit-enhancing contribution it can make to the circuit of capital reproduction. Thus, for example, Marx's analysis of banks has two dimensions. They are seen as a necessary and inevitable development in capitalist economy because of the positive contribution they make to lowering costs of production and increasing profits. But banks and other firms in the financial system are able to develop the power to siphon off more than their due share of profits, to engage in lucrative swindles, and, on occasion, to expose the productive system to highly damaging crises.

It is important to stress, as Marx does, the difference between capital employed in the business of banking, on the one hand, and interest-bearing capital, on the other. Historically banks developed from what Marx calls *money-dealing capital* – specialised capital which emerged in centres of early capitalism such as Amsterdam and Hamburg and whose business was to provide financial services for industrial and commercial capitals. These included the holding of working reserves of cash, making and receiving payments, and keeping accounts. The money dealers also developed an important role in the making of international payments and in managing the gold and silver used to settle debts abroad. Thus Marx portrays the category of money-dealing capital (initially a branch of

commercial capital in his account) as evolving into the banking system, which is a necessary element in a fully developed capitalism. Banking capital carries out key functions in the phases of exchange which are part of the circuits of production and reproduction of capital. These are, for example, the maintenance of accounts, the making of payments, the safe keeping of deposits, and the international exchange of currencies. Because these functions are indispensable, and because of the large economies of scale which specialised banks can achieve, banking capital shares in the distribution of total surplus-value and is subject to the same processes of equalisation of profit as operate for industrial capital.

The banking system also develops a crucial function in the allocation of capital. Firms build up stocks of idle money at various points in the circuit of capital. For example, they may accumulate cash in order to finance occasional large investment projects. Instead of lying dormant until required, the cash reserves of companies can be passed over to the banks, on-lent by them, and thus converted into active money capital. Capitalism abhors idle capital as much as idle employees, and by centralising the cash reserves of firms, the banking system can reduce to a minimum the proportion of total reserves which individual companies need to keep available in liquid form to meet their working requirements.

Banks also create linkages between the circuit of productive capital and other sectors of the economy. Marx notes that banks make available for investment the temporarily unoccupied money, not just of companies, but of all social classes. He writes (1981: 529) that, 'small sums which are incapable of functioning as money capital by themselves are combined into great masses and thus form a monetary power'.

Marx repeatedly underscores the centralising function that banks play in relation to the savings and reserves both of capitals and individuals, and the power which this role gives to banks as allocators of capital:

The business of banking consists ... in concentrating money capital for loan in large masses in the bank's hands, so that, instead of the individual lender of money, it is the bankers as representatives of all lenders of money who confront the industrial and commercial capitalists. They become the general managers of money capital ... they concentrate the borrowers vis-à-vis all the lenders, in so far as they borrow for the entire world of trade. (1981: 528)

The financial system allows industrial capitals to increase their rate of profit by accelerating turnover. A firm need not wait until the commodities it produces are sold to realise the money value of its output.⁵ It can borrow from a bank, using as collateral the IOUs supplied by its creditors. These were called *bills of exchange* in Marx's period and, as he explains, the monetisation of these commercial debts was then a major element in banking profitability. Marx's analysis of bills of exchange can now be seen as a pioneering study of *securitisation* – the techniques of debt commodification which in recent years have made possible a huge increase in the size and profitability of finance, but have also made the system vulnerable to new and highly damaging forms of crisis, as for example in 2007–12 in the USA and Europe.

Credit can drive an acceleration in the scale of productive operations. Note the summary by Engels of a longer text which Marx added to the French edition of *Capital* Volume 1 in 1872:

Not only is [the development of the credit system] itself a new and mighty weapon in the battle of competition. By unseen threads it also draws the disposable money, scattered across the surface of society, into the hands of individual or associated capitalists. It is the specific machine for the centralisation of capitals ... In its turn centralisation ... shortens and quickens the transformation of separate processes of production into processes socially combined and carried out on a large scale ... the productivity of labour is made to ripen as in a hothouse. (1976: 778)

Marx saw credit mechanisms as central in the internationalisation of capitalism and in technological development. He writes that:

The English, for example, are forced to lend their capital to other countries in order to create a market for their commodities. Overproduction, the credit system etc., are means whereby capitalist production seeks to break through its own barriers and to produce over and beyond its own limits ... Hence crises arise, which simultaneously drive it onward and beyond [its own limits] and force it to put on seven-league boots, in order to reach a development of the productive forces which could be achieved only very slowly within its own limits. (1972: 122)

FICTITIOUS CAPITAL

Marx notes that central to the operation of a financial system is the creation of contractual obligations to be discharged in the future. Such contracts Marx refers to as *fictitious capital*. There are two major forms. First, *shares*, which represent a permanent transfer of money capital to a firm to finance its activities. In Marx's period, joint-stock companies were developing, especially for large-scale enterprises in mining, banking, railways, and in international trade, all of which required the tying up of capital for long periods of time. Second, *bonds*, IOUs given by a borrower to a lender, promising to repay money at some date in the future, and indicating a rate of interest, this being usually fixed rather than floating.

Fictitious capital is created as companies raise capital by issuing shares or by giving bonds in exchange for money borrowed. Shares and bonds are the form of legal entitlement which owners of interest-bearing capital receive as they commit money which they own to finance the operations of companies. Both shares and bonds are legal claims on part of the stream of future income to be generated by a company. Shares are also titles of *ownership* of part of the productive assets operated by the company, but Marx argues that such titles must still be considered as fictitious, since the owner of a share is not able to realise it directly in the form of any part of the real capital which he or she nominally owns. The owner of shares in a railway company cannot trade them in for a few rails or a wagon. A share is no more than a piece of paper. The money paid over when the share was first issued has long ago been spent. What remains are what Marx calls:

[p]aper duplicates of annihilated capital ... the ownership titles to joint-stock companies, railways, mines, etc are genuinely titles to real capital. Yet they give no control over this capital. The capital cannot be withdrawn. They give only a legal claim to the surplus value that this capital is to produce. (1981: 608)

Marx speaks of a *paper world* consisting of securities in the form of legal contracts entitling their owner to part of future flows of surplus-value in the form of interest or dividends (1981: 622).

He argues that the contribution which the banks make to profitability by reducing the costs of the reproduction of capital are closely associated with the many ways in which the financial system plays a parasitic role in relation to productive capital. For example, the productive system is exposed to damage as speculative movements of finance distort valuations on whose accuracy efficient allocation of capital depends. The many swindles which flourish, especially in a speculative boom, are noted in *Capital*. Marx comments that the development of the joint-stock company allowed the emergence of:

[a] new financial aristocracy, a new kind of parasite, in the guise of company promoters, speculators and merely nominal directors – an entire system of swindling and cheating with respect to the promotion of companies, issue of shares and share dealings ... private production unchecked by private ownership. (1981: 569)

Marx argued that, as money capital accumulates in a society, and the banking system develops by collecting money capital and directing it to capitals in the productive circuit, there are two important consequences. First, as I have noted earlier, a division develops between two sorts of capitalists. Those who own money capital, the *rentiers*, and those who lend it to the functioning capitalists, namely those who operate businesses in production or commerce. Thus Marx makes a clear distinction between capital as *property* and capital as *function*. The money capitalist secures a share in surplus-value in the form of interest or dividends, entitlement to which is based on *contract*. Marx anticipates later discussion of the managerial revolution, as, ‘the transformation of the actual functioning capitalist into a mere manager, in charge of other people’s capital, and of the capital owner into a mere owner, a mere money capitalist’ (1981: 567).

The second consequence of the development of money capital on a large scale, is that certain illusions become widespread. Money is deposited in a bank; a year later the money is still there, it seems, but has grown in the meanwhile by the amount of interest paid by the bank to its owner. It becomes easy to forget what has happened in the interim – that (in the paradigm case) the bank has lent the money to a functioning capitalist, and that the interest paid to the bank on this loan is a share of the profits made by the active use of the money as productive capital. But in the calculations of the rentier who has lent money to the bank, its active use as capital is readily obscured. It becomes easy for the rentier to think of the growth of money capital via interest payments as an *automatic* process. In interest-bearing capital, Marx writes, the relationship between capital and labour,

‘reaches its most superficial and fetishised form’. Money capital appears as a mysterious and self-creating source of interest and so generates its own increase. It comes to seem, ‘as completely the property of money to create value, to yield interest, as it is the property of a pear tree to bear pears’ (1981: 516):

Interest-bearing capital is the consummate automatic fetish, the self-expanding value, the money-making money, and in this form it no longer bears any trace of its origin. The social relation is consummated as a relation of things (money, commodities) to themselves. (1972: 455)

Marx considered the distinction between fictitious capital and real capital to be vital, and the failure to make that distinction clearly to be a major source of ideological mystification. For the individual who holds it, the government bond represents capital. The right to a flow of interest which it embodies can be sold to someone else and the bond thus realised as money capital. But what is capital for the individual owner, is not capital for the state, which pays the interest out of tax revenue. ‘The capital of the national debt remains purely fictitious’ (1981: 596). The influence on security prices of prevailing interest rates, and of judgments about future interest rate levels, and (in the case of shares) about future flows of dividends, means that the prices of assets on financial markets move independently of the value of the underlying real assets. Marx argues that this fact has strong ideological consequences. ‘The independent movement of the values of these ownership titles – not only those of government bonds, but also of shares – strengthens the illusion that they constitute real capital besides the capital or claim to which they may give title’ (1981: 598). From the point of view of their owners, these paper claims are saleable commodities and can therefore be transformed into capital in the money form. But from a social point of view, claims on surplus-value are not capital, but a deduction from the total of available value. This kind of *inversion* between appearance and underlying reality is a characteristic product of interest-bearing capital, which is, writes Marx, ‘the mother of every insane form, so that debts, for example, can appear as commodities in the mind of the banker’ (1981: 596).

Marx notes the power which the centralisation of capital allocation in the banking system gives to those who control that system. He carefully studied how the 1844–5 Bank Acts had the consequence that, in the credit shortage of the 1847 crisis, interest rates could be forced up to very high levels. The passage of this legislation reflected the power of the bankers in and around the Bank of England who stood to profit from high interest rates. Marx comments bitterly on the power given to banks and other financial capitals by the centralising mechanisms of credit:

The credit system, which has its focal point in the allegedly national banks and the big money-lenders and usurers that surround them, is one enormous centralisation and gives this class of parasites [*dieser Parasitenklasse*] a fabulous power not only to decimate the industrial capitalists periodically but also to interfere in the actual production in the most

dangerous manner ... The Acts of 1844 and 1845 are proof of the growing power of these bandits [*dieser Banditen*], added to whom are the financiers and stockjobbers. (1981: 678)

Marx also stresses the ways in which the role of the financial system varies through the business cycle, and how finance acts to magnify the oscillations of the cycle. It is here that he identifies a deeper level at which the financial system implements the law of value – in encouraging the build-up of financial fragility, the subsequent bankruptcies of weaker companies, the destruction of less competitive and profitable capitals, and a general devaluation of existing industrial capital. This allows recovery from recession and a renewed upsurge in profits and growth.

Marx sees capitalism as originating in an already internationalised economy, and credit processes as playing a central role in the successive rise of leading economies:

Along with the national debt there arose an international credit system, which often conceals one of the sources of primitive accumulation in this or that people. Thus the villainies of the Venetian system of robbery formed one of the secret foundations of Holland's wealth in capital, for Venice in her years of decadence lent large sums of money to Holland. There is a similar relationship between Holland and England. By the beginning of the eighteenth century, Holland's manufacturers had been far outstripped. It had ceased to be a nation predominant in commerce and industry. One of its main lines of business, therefore, from 1701 to 1776, was the lending out of enormous amounts of capital, especially to its great rival England.⁶

The same thing is going on today between England and the United States. A great deal of capital which appears today in the United States without any birth-certificate, was yesterday, in England, the capitalised blood of children. (1976: 920)

Marx never forgets that, beneath the fetishised surface, the ultimate source of financial wealth and profitability is the exploitation of workers. Sometimes this is made directly explicit – as here, in the reference to child labour.⁷

CONTEMPORARY EMPIRICAL RESEARCH AND CONTROVERSIES

I have space only for a brief review of some of the ways in which Marx's work on money and finance has been developed and debated in the recent literature. The influence of Hilferding's *Finance Capital*, published in 1910, continues to be pervasive. The organisational structure of capital is generally very different now in comparison with the Central European pattern analysed by Hilferding – a distinctive fusion of financial and industrial companies into conglomerates controlled by the banks. But Hilferding updates Marx's account of financial markets in perceptive ways, and poses questions about the power of finance which are as relevant now as in his period.

François Chesnais makes the term *finance capital* central to a recent book which can be commended as one of the most comprehensive Marxist studies of

finance now available. Banks and industrial firms remain separate enterprises in most countries today and are not merged into single enterprises, but as Chesnais perceptively explains:

Contemporary capitalism confronts us with the *simultaneous and combined* centralisation/ concentration of money capital, industrial capital and merchant or commercial capital ... The parasitic traits of interest-bearing capital intuited by Marx and later emphasised by Lenin permeate the operations of all money, commercial and industrial capital alike. (2016: 8)

Defined in this way *finance capital* refers to the interlinked operations and collaborative power of the largest corporations and banks in the major economies. Chesnais notes, however, that it is the smaller firms which are more exposed to the predatory power of banks and the threat of leveraged buy-out by private equity companies. Hilferding's treatment of power in relation to the organisational configuration of finance and industry continues to have a wide influence in current research.⁸

FINANCIALISATION VS RATE OF PROFIT AS CAUSE OF STAGNATION AND CRISIS

This question continues to be a major focus of controversy. The work of Gérard Duménil and Dominique Lévy combines careful statistical research with a broad historical sweep, and focuses mainly on the USA. Their data indicates that four major economic crises have hit the USA since Marx's period. They argue (2011) that the crises of the 1890s and the 1970s were caused by a fall in the rate of profit in the USA as well as other major economies. However, they strongly hold that the Great Depression of the 1930s, and the crisis of 2008, were not caused by profit decline, but rather by a previous rapid over-expansion of the financial sector. In both of these cases, the concentrated power of finance had been used by the owners of capital – the rentier class – to drain money capital out of the productive system. Investment in the productive economy became insufficient to support a vast increase in financial claims of all sorts, and crisis ensued. Like many other researchers, Duménil and Lévy stress *shareholder value* in the run-up to the 2008 crisis – the ways in which, from the 1980s onwards, the owners of companies developed the organised power to force companies to pay out high dividends and to buy-back shares rather than expand investment and production. Lavish salaries and stock options were used to persuade executives to implement these processes of value extraction from the corporate sector.

As against this type of explanation, a number of influential Marxist researchers hold that all major capitalist crises have a single underlying cause – a decline in the rate of profit. Michael Roberts, for example, writes that:

Each crisis of capitalism has its own characteristics. The trigger in 2008 was the huge expansion of fictitious capital that eventually collapsed when real value expansion could no longer

sustain it, as the ratio of house prices to household income reached extremes. But such 'triggers' are not causes. Behind them is a general cause of crisis: the law of the tendency of the rate of profit to fall. (2016: 26)⁹

No one questions that the 2008 crisis was financial in an *immediate* sense. US banks had lent far too much in mortgages to several million home owners who were not in a position to sustain repayments if house prices began to fall – as they did in the USA in 2007. The mortgage-originating banks had created vast numbers of securities based on the future flow of mortgage repayments and these had been widely sold to other banks and investment funds in Europe as well as the USA. As mortgage defaults soared, the value of these securities tanked and the fact that some major banks were facing imminent collapse caused the global banking system to seize up – with a traumatic and immediate impact on trade credit, international trade, and employment. Household finance played a crucial role in the causation of the crisis. Here Atif Mian and Amir Sufi (2014) have provided an outstanding study of the role of mortgage default in the USA as the cause of a crash in house prices and resulting large fall in consumer demand. This, in turn, resulted in an increase in unemployment and a hit to profits. Thus, the implication of their analysis is that falling profits were a consequence, not an underlying cause, of crisis.

Research has also focused on why there was a huge increase in the supply of what Marx called *loanable capital* flowing into the banks in the pre-2008 period. The size of these inflows – together with central bank easy money policies – resulted in historically low levels of interest rates and huge pressure on the banks to find borrowers. The billions of dollars lent in subprime mortgages in the USA was one result of this pressure. The tide of loanable capital had three main sources: corporate cash reserves as profits stayed high and investment fell; the money capital of the rising numbers of the ultra-wealthy; and the financial flows which were the counterpart to international trade deficits, especially that of the USA. For an exploration of the role of surplus loanable capital as one of the underlying causes of the crisis, see Jim Kincaid (2016).

On the specific logics at work in the financial crisis, Simon Mohun (2016) offers a lucid explanation of how international banks had become highly interdependent via the repo system in which banks borrowed securities from each other on a huge scale. Mohun explains how, as the interbank market began to seize up in 2008, feedback and amplification processes came into play which rapidly deepened the crisis into one of exceptional severity.

But what caused the huge increase in the size and weight of the financial system which underlay the disastrous shock wave of 2008? Here writers such as Michael Roberts (2016) argue that the key driver of financialisation was the inadequacy of profit rates in the productive sector. Firms found they could get a better return by using their capital to speculate in financial markets and these grew explosively. In the run-up to the crisis, shareholder value pressures were of secondary importance. Its underlying and decisive cause was low profitability. The same applied to the Eurozone crisis of 2010–12.¹⁰

The thesis that the basic cause of financialisation was a low profit rate in industry has been criticised from a number of different directions – and, in my opinion, convincingly. For example, estimates of profitability in the USA are based on National Accounts data which cannot cover tax evasion and thus does not take account of the trillions of profits laundered by companies through tax havens.¹¹ Current research is tracing the ways in which tax avoidance operations have been central to contemporary financialisation in the global corporate sector. This is an important strand in the powerful account which Cédric Durand has developed in a recent book (2017). Profitability world-wide, he argues, is more than high enough to support much greater investment than present levels. He finds evidence that institutional investors have been using their power of control to compel companies to set very high hurdles for return on prospective investment, and to distribute to shareholders the spare capital released by restricting investment. Durand also argues that financialisation and tax evasion are central to the siphoning off, by companies based in the rich countries, of much of the value created by a doubling, in recent decades, of the global workforce available for surplus-value extraction – an extra 1.5 billion workers, mainly in poor countries, and mostly paid low wages. Here Durand's account takes its place in a large literature in which finance is analysed as a key element in patterns of global domination by the advanced countries, led by the USA.¹²

Costas Lapavitsas has also strongly attacked the low profit explanation for financialisation. He argues that to see the explosive growth of the financial system as only a kind of overspill from the productive sector is to fatally underplay the dynamism of finance, its greed, and its effectiveness at extracting profit from lending to households as well as to industry.¹³ Lapavitsas notes that, since the early 1990s, there has been a profound change in the world banking system. Increasingly, the corporations have cut down on borrowing from banks having found it more profitable to raise capital by issuing bonds. Short-term corporate reserves are lent out more lucratively on the money markets, not kept in banks. Yet most big banks have remained amazingly profitable. They have achieved this by tapping into two other sources of revenue: (1) the extraction of cash from businesses through fees, notably via an advisory role in takeovers and other forms of restructuring of ownership of companies; and (2) lending on a vast scale to the household sector. In both of these activities the banks have proved endlessly fertile in developing ingenious swindles.

The explosive growth of bond markets and of derivatives has provoked renewed interest in Marx's analysis of fictitious capital. The two dimensions of Marx's account are given due weight in the literature. On the one hand, financial markets as parasitic – developing according to their own speculative logic and imposing damage on the productive system, jobs, and living standards. On the other, finance as implementing a form of capitalist rationality – a system of regulation imposing Marx's *law of value*, his term for the competitive pressures on firms to use means of production efficiently and to maximise the extraction

of surplus-value. Consider, for example, the debt crises and exchange rate crises of the emerging economies starting with Mexico in 1982, through the East Asian crisis of 1997 to Argentina in 2001. The IMF provided rescue finance, but, in alliance with the banks and financial markets, imposed the agenda known as the Washington Consensus. This forced an abandonment of import-substitution strategies of development, and effected a currency depreciation which cut wages and state welfare. Governments were compelled to open their borders to capital flows and to allow local resources of labour and means of production to be bought up by international firms at bargain-basement prices.

One form of fictitious capital has been crucial as a source of both the profitability and the instability of the modern banking system. Dick Bryan and Michael Rafferty (2006) have produced a path-breaking Marxist analysis of derivatives, suggesting that they have become vital in allowing capital to establish a single dimension of commensurability for a wide range of risks that might affect future operations. The pricing of derivatives acts as a system of capitalist calculation which in turn enables risk to be commodified. The trading of risk via derivatives allows firms to insure against future price changes which would affect their profitability – a change in exchange rates, for example, or in interest rates, or in the prices of raw material inputs. Here Bryan and Rafferty have opened up a large agenda for further research. See, for example, an ambitious book by Sotiropoulos et al. (2013) in which derivatives and risk management are central to the analysis. They use insights from Althusser (on ideology) and Foucault (on governmentality) to develop Marx's thesis of fictitious capital as fetish, and argue that pricing in financial markets acts as a disciplining technology of class power. Two final chapters usefully help to qualify their sometimes exaggerated view of the capitalist rationality of derivatives trading.

CONCLUSION

I have briefly illustrated some of the wide range of ways in which Marx's theorisation of money and finance is being deployed in the current literature. The many differences of emphasis, and the disagreements, I hopefully believe to be an indicator of the vitality of the research agenda. Among contributors to the literature there is general agreement about some key points. Despite the efforts of governments and central banks to reform and control the financial system, the present situation remains deeply unstable. Debt levels around the world continue to rise. The rate of growth in output, productivity, and investment is insufficient to validate the mounting mass of bonds, equities, and other forms of fictitious capital. Inequalities of wealth and income continue to deepen. Financialisation is not about how the City or Wall Street abuse productive capital. What is at stake is a deeper process in which governments and finance capital combine to transfer the costs of crisis onto labour and the less powerful sections of society – in wage and welfare cuts, increased unemployment, and the destruction of communities.

Notes

- 1 For comments on this chapter and on allied work, thanks to Pete Green and Demet Dinler.
- 2 There are lucid accounts of Marx's complex argument about money and value in *Capital* Vol. 1 in Itoh and Lapavitsas (1999) and Harvey (2010). Note however some differences of emphasis. The two former authors do not believe that Marx has convincingly established a money-abstract labour-time connection. Harvey argues that he has. For two rigorous accounts of the logic Marx uses in his analysis of money, see Campbell (1997) and Murray's brilliant (1990) book. However, neither of these writers say much about Marx's linkage of money with labour-time. See also Moseley (2005). How far Marx's theory of exploitation requires that money reflects labour-time remains a controversial question.
- 3 Thus modern money is a hybrid form interlinking state currency and private bank credit (Lapavitsas, 2013, 2017). There is a continuing debate between the chartalist school who sees the role of the state as fundamental, and those who stress, as Marx did, the roots of modern money in private capitalist transactions. See Shaikh (2016: 667–723) for a lucid discussion of Marx's monetary theory in relation to other theoretical currents both mainstream and alternative.
- 4 *Industrial* here refers to the production of services as well as goods.
- 5 The large effect of turnover time on the rate of profit is analysed at length in Marx (1992: 233–424).
- 6 Arrighi (1994) builds on these insights into the role of international credit in his fascinating account of successive cycles in the development of capitalism, those led by Genoa, Venice, Holland, the UK and the USA.
- 7 Marx even finds a place in the text of *Capital* to record the names and voices of exploited children. William Wood, for example, 9 years old, who starts work at 6 am in a pottery kiln – 'I work till 9 o'clock at night six days in the week'. Or J. Murray, 12 years of age, who says: 'I turn jigger and run moulds. I come at 6 am. Sometimes I come at 4 am. I worked all night last night, till 6 o'clock this morning. I have not been in bed since the night before last' (1976: 354).
- 8 Notable examples include Durand (2017), Sotiropoulos et al. (2015), and Marois (2012) in his outstanding study of emerging finance capital in Mexico and Turkey.
- 9 For similar arguments, see Carchedi (2011), Callinicos (2014), and Freeman (2016). See also Harvey (2016) for a robust challenge to what he condemns as the monocausality of the falling rate of profit position – and the reply by Roberts in the same book.
- 10 On the causes of the Eurozone crisis, strong evidence to support financialisation rather than falling profits is presented by contributors to two outstanding books edited by Lapavitsas in 2012.
- 11 This is explicit in the US National Accounts, in which the particular tables which are the major source for the US rate of profit calculation cover only profits domestically generated. The concealment of corporate profits via transfer through tax havens is examined in an important book by Zucman (2013).
- 12 See, for example, Desai (2013), Guttman (2016), Harvey (2003), Norfield (2016), Panitch and Gindin (2012), and Panitch and Konings (2008). See also the value chain analysis in Smith (2016), though this book has been criticised because it portrays exploitation as operating between rich and poor *nations*, rather than classes.
- 13 But see the critique of Lapavitsas' analysis in Fine (2010).

Labour

Guido Starosta

INTRODUCTION

The centrality of the notion of ‘labour’ in Marx’s critical social theory and in particular its determining character as the key to his materialist perspective on human society and its historical development, seem to be beyond dispute.¹ It is also quite uncontroversial, at least on the basis of textual evidence, that Marx presented the simplest or most general determination of labour as consisting in the conscious and voluntary transformation of external nature by human beings in order to appropriate its potentialities for the satisfaction of human needs. Controversies arise, however, when it comes to establishing if Marx was right, whether in his views on the essential determinations of labour or concerning its defining role in the constitution and development of the forms of existence of human subjectivity.

Against the backdrop of these debates, this chapter will provide a comprehensive discussion of the notion of labour in Marxian social theory, with the aim of providing a systematic reconstruction of the ‘unity of its many determinations’, which appear scattered in Marx’s own writings. In order to do so, it will address the multiple dimensions and aspects associated with this essential concept, both as they were originally formulated by Marx and in some of the main subsequent debates outside and within Marxism to which the former gave rise. Taking as the point of departure the simplest determination of human labour

as conscious life-activity, this chapter will probe further into the different, more concrete determinations which comprise the material character of production and its changing historical modes of existence. Through this close scrutiny of the concept of labour, the chapter will make two fundamental points. In the first, and substantively, it will bring out the centrality of the material determinations of human productive subjectivity for the comprehension of the content and historical trajectory of society. Second, and formally, it will show that it is possible to find an underlying ‘systematic’ unity which articulates those different determinations of the Marxian concept of labour into a ‘concrete whole’.

MARX’S DISCOVERY OF LABOUR, OR CONSCIOUS LIFE-ACTIVITY, AS HUMANITY’S ‘SPECIES-BEING’

Marx’s discovery of the centrality of labour to social life can be traced back to the *Paris Manuscripts* of 1844 (Marx, 1992a [1844]) and was a direct result of Marx’s first attempt at the critical investigation of the specific nature of modern society through the critique of Hegel’s *Philosophy of Right* (1991 [1821]), i.e. through an analysis of bourgeois political forms. As Marx himself tells us in the short intellectual ‘autobiography’ found in the *Preface to the Contribution to the Critique of Political Economy* (1992b [1859]), the main conclusion he reached was that the key to the comprehension of the specific nature of capitalist society was not to be found in the critique of the doctrine of the state. Instead, the critique of modern society had to start with the critique of political economy in order to, then, continue into a critique of the state (1992b [1859]: 425–6). The former was the science that was able to penetrate the ‘internal physiology’ of the modern world to be found in ‘civil society’ and, more precisely, in ‘private property’.

In light of this conclusion, in the *1844 Manuscripts* (1992a [1844]) Marx turns his attention to the material reproduction of human life as the key to the understanding of society and its historical development. As Arthur points out, in that early text Marx ‘for the first time ... attributes fundamental ontological significance to *productive activity*. Through material production humanity comes to be what it is ... material production is the “*mediation*” in which the unity of man with nature is established’ (1986: 5). In other words, Marx identifies labour or productive activity as the specific form in which humanity reproduces its existence as part of nature.

This means that although the human life-process undoubtedly possesses its qualitatively differentiated ‘species-character’, constituted by ‘the nature of its life activity’ (Marx, 1992a [1844]: 328), it nonetheless remains a concrete form of the natural *life-process in general*. In this sense, labour realizes in its own peculiar fashion the determinations entailed by *any* form of life-activity, namely: being a natural process of *self-reproduction* through the material interchange with ‘inorganic nature’, which is ‘life-producing-life’ (Marx, 1992a [1844]: 328).²

Consequently, in order fully to account for the specificity of labour, Marx also needed to further uncover its *immanent* more abstract determination as a mode of existence of ‘life activity in general’, of ‘species-life’ as such.

Marx’s clearest rendition of this immanent natural content in the determination of human productive activity can be found in a passage from the third of the *Paris Manuscripts*, in the context of his critique of both idealism (Hegel) and (abstract) materialism (Feuerbach) from the viewpoint of what he calls at this stage ‘consistent naturalism or humanism’, which is the ‘only [perspective] capable of comprehending the process of world history’ (1992a [1844]: 389):

Man is directly a natural being. As a natural being and as a living natural being he is on the one hand equipped with natural powers, with vital powers, he is an active natural being; these powers exist in him as dispositions and capacities, as drives. On the other hand, as a natural, corporeal, sensuous, objective being he is a suffering, conditioned and limited being, like animals and plants. That is to say, the objects of his drives exist outside him as objects independent of him; but these objects are objects of his need, essential objects, indispensable to the exercise and confirmation of his essential powers. (Marx, 1992a [1844]: 389–90)

As with any living natural being, the relation of the human being to nature consists of a process whereby the individual actualizes its own bodily ‘vital’ powers (i.e. what a few years later Marx and Engels in the *German Ideology* (1976 [1845]) would term its ‘corporeal organization’), with the purpose of appropriating the objective potentialities immanent in their natural environment. This is the material process that, later in his life, Marx would refer to as the ‘metabolism between man and nature’ (Marx, 1976a [1867]: 133). Moreover, as with every animal life-form, this involves the material expenditure of the living individual’s corporeality in order to act upon external nature in a particular fashion corresponding to its species-determination, whose end result is the appropriation and consumption of the ‘essential objects’ that satisfy its needs, thereby reconstituting and transforming the materiality of its bodily existence.

Thus, the defining qualitative attribute of the living individual lies in the material potential to self-reproduce; that is, to posit through their own activity the renewal of the conditions for their continued existence as an ‘objective natural being’. This material potential for self-reproduction is expressed in their *cognitive capacity*, which is constituted by their vital, living power to recognize the mutual ‘affinity’ between their own material potentialities and those of their objective environment (Iñigo Carrera, 2007: 43–4). Through the exercise of their cognizing activity, the living individual has therefore the power to satisfy their own needs by organizing and regulating the actual unfolding of their bodily action upon external nature. On the basis of all these determinations, the living individual is determined as *subject*, they are endowed with *subjectivity* (as opposed to the sheer objectivity of non-living forms of nature).

According to Marx’s discussion in the *Paris Manuscripts*, in its simplest expression the distinctiveness of the human species-being (hence of *human* subjectivity proper) appears at first sight to involve a merely *quantitative* difference

from animal life-forms, one *of degree of universality* in the *scope* of its appropriation of inorganic nature (Marx, 1992a [1844]: 329). However, Marx stresses that underlying this quantitative difference there is a *qualitative* specificity in human subjectivity, which he finds in the fact that the human being has *conscious life-activity* (1992a [1844]: 328). Hence, Marx saw the specifically *human form* of the natural life-process in the fact that human beings regulate the appropriation of the objective powers of the natural environment through the organization of the externalization of their own vital powers by means of *thought, conscious cognition or knowledge*, that is, by *ideally* appropriating nature's potentialities as the necessary first step before its real appropriation through the effective unfolding of action. In other words, human beings are not simply bearers of subjectivity, but also *know or recognize themselves as subjects* in the process of affirming their species-powers, thereby 'making life activity itself an object of [their] will and consciousness' (1992a [1844]: 328).

Now, as Marx and Engels clarified some years later in *The German Ideology* against the backdrop of the Young Hegelians' 'empty phrases about consciousness devoid of any material premises' (1976 [1845]: 37), this conscious subjectivity is but the expression of the fact that human beings 'can be distinguished from animals by consciousness, by religion or anything else you like', but 'they themselves distinguish themselves from animals as soon as they begin to *produce* their means of subsistence' (1976 [1845]: 31). In other words, in this text Marx and Engels want to throw into relief the *immanent material connection* between the determination of consciousness as a distinctively human attribute and the fundamentally *mediated* character of the human being's life-process. Their emphasis on the production of means of subsistence is therefore meant to stress the distinctively *transformative* mode of the process of metabolic exchange with nature as the *simplest content* of the human species-being which takes on a more developed mode of existence in the *form* of their conscious and voluntary being.

As Sayers (2007: 434) aptly emphasizes, the primordial and most general determination of human labour, which qualitatively distinguishes it from the broadly *unmediated* character of the life-process of non-human animals, is to be 'form-giving' life-activity.³ Thus, in *The German Ideology* Marx and Engels stress that the conscious and voluntary form taken by the human life-process is not a dogmatic 'philosophical postulate' but a determinate, 'empirically verifiable', objective natural expression of the 'corporeal (or bodily) organization' of 'living human individuals and their consequent relation to the rest of nature' (Marx and Engels, 1976 [1845]: 31). Although in the latter text Marx and Engels do not 'go into the actual corporeal nature of man' (1976 [1845]: 31), it is clear, as Fracchia (2005) remarks, that this 'corporeal organization' entails, in the first place, the evolutionary emergence of the human brain as the bodily instrument whose functioning is expressed in the form of consciousness. But, in the second place, Fracchia rightly adds that it is also evident that the development of the specific configuration of the human brain has been in turn the outcome of

prior evolutionary changes in the corporeal organization of hominids eventually leading to the *Homo Sapiens*, all of which made possible the transformative or productive character of its mode of life based on labour: opposable thumbs, bipedalism, binocular vision, etc. (Fracchia, 2008: 39). This emphasis on the 'corporeal roots' of human beings and their subjectivity might seem at first sight a self-evident triviality, yet it is not if, as Fracchia (2017) notes, familiarity ends up breeding neglect, as is arguably the case in much contemporary social theory. Thus, the relevance of this reminder about the natural and evolutionary dimensions of human subjectivity can be said to transcend the historical context of Marx and Engels's polemic against the Young Hegelians and has become very contemporaneous.⁴

In this sense, consciousness is the most potent evolutionary development that eventually emerged to regulate the greater cognitive complexity entailed by the growing instrumental, spatial, temporal and personal separation between the initial action that sets into motion the process of human metabolism with nature and its end result, which is achieved with the material reproduction of the corporeality of an individual human being through the consumption of the product of labour (Iñigo Carrera, 2007: 45). In other words, as available paleoanthropological scientific evidence confirms, consciousness evolved as a result of the *increasingly mediated character* assumed by the forms of practical transformative activity of our *hominid* predecessors, and which eventually led to the emergence of strictly human (in the sense of the modern *Homo Sapiens*) modes of life.⁵

In light of the determinations of human labour unfolded so far, we can now proceed to further specify the way human beings distinguish themselves from animals and why they do so. As we have seen, according to Marx the simplest difference consists in the capacity to produce its means of subsistence. This is the specific determination of the human life-process seen, as it were, from a synchronic point of view. However, that simple specificity manifests itself also in a further determination when grasped from a *developmental* perspective. That is, when seen from the perspective of the way in which human beings *expand* the potentialities of their process of metabolism in contradistinction to other animal life-forms (Iñigo Carrera, 2007: 44). Due to their more limited ability to modify external nature to make it apt to satisfy their needs, non-human animals can only develop their capacity to appropriate natural forms by means of a genetically induced mutation of their own corporeality, which allows them to *adapt* to what they confront as *given* conditions of existence, i.e. by *evolving* into another species (Fracchia, 2017). Conversely, in having developed the capacity to alter their life conditions through conscious productive practice, human beings have also *qualitatively* 'sublated' the way in which, as living subjects, they expand the powers of their metabolic process with nature. The key to those developmental dynamics of the natural life-process no longer only resides in further biological speciation through the modification of bodily organs. Instead, humans can 'change their own nature' (Marx, 1976a [1867]: 283) through the development

of the transformative powers of their life-process, i.e. *of the productive powers of their own labour*. The development of the ‘material forces of production’, Marx thus concluded, becomes determined as the most general *qualitative content* that gives underlying unity to the ‘history of humanity’ (Marx and Engels, 1976 [1845]: 43).

As a result of these specific developmental dynamics, human beings can not only universally expand the areas of nature which become determined as concrete forms of their activity, but they can also complexify the mediations involved before the final appropriation of natural objects as use-values that are immediately apt for the satisfaction of human needs, thereby consuming properly ‘human objects’. In other words, they can extend and deepen the ‘humanization of nature’ (Marx, 1992a [1844]: 329, 352–4; Marx and Engels, 1976 [1845]: 39).

Furthermore, this applies to all kinds of human need, whether they spring from the ‘stomach or the imagination’ (Marx, 1976a [1867]: 125). Thus, the materiality of the satisfaction of human needs involved in the ‘metabolic exchange with external nature’ by means of labour does not only refer to ‘those of the individual ... reduced to a natural subject’ (Marx, 1993 [1857–8]: 528), but also to ‘historic needs ... created by production itself, social needs’ (Marx, 1993 [1857–8]: 527). Moreover, they are not just of a ‘physical’ nature (Marx, 1976a [1867]: 275, 341) but also include ‘intellectual and social requirements’ whose extent and number ‘is conditioned by the general level of civilization’ (Marx, 1976a [1867]: 341). In a similar vein, the product of labour to be consumed comprises not only ‘goods’ but also so-called ‘services’, whose result may not be a ‘useful object’ but still involves a *material* ‘useful effect’ which also changes the form of external nature (Marx, 1978 [1885]: 135). As Sayers (2007: 444–8) perceptively notes, the same could be said about the ‘symbolic’ and ‘affective’ content of use-values that is so central to contemporary theories of ‘immaterial labour’ (Hardt and Negri, 2005). In *all* cases, the satisfaction of those needs is the necessary material form for the reproduction and/or expansion of the productive powers of individuals (Marx, 1993 [1857–8]: 717fn), that is, of the ‘aggregate of those mental and physical capabilities existing in the physical form, the living personality, of a human being, capabilities which he sets into motion whenever he produces a use-value *of any kind*’ (Marx, 1976a [1867]: 270, *emphasis added*; see also 717). In other words, there is no satisfaction of ‘physical’ and intellectual needs through the consumption of use-values which is not determined as an inner moment of the development of the specific attributes or powers of the human being as an essentially *labouring* or *productive* subject, i.e. of the development of the ‘human mastery over the forces of nature, those of so-called nature as well as of humanity’s own nature’ (Marx, 1993 [1857–8]: 488).

By virtue of these determinations in their synchronic and diachronic unity, Marx argued in an obvious ‘activist’ twist to Feuerbach’s (2008 [1841]) ‘contemplative’ argument in the first chapter of his *The Essence of Christianity*, the human being does not simply *have* a determinate species-character but actually

is a *species-being*, ‘a being which treats the species as its own essential being or itself as a species-being’ (Marx, 1992a [1844]: 329).⁶

At this juncture, it might be worth remarking that this early discovery of the specific determination of the human being as a *productive* subject, or of human individuality as an expression and mode of development of her/his *labouring activity*, would remain unaltered throughout the rest of Marx’s works. The exposition by the ‘mature Marx’ of the general determinations of the labour process in chapter 7 of *Capital*, Volume I, does not involve any substantive change in comparison with the discussion of the human species-being by the ‘young Marx’ of the *Paris Manuscripts* (1992a [1844]) or by Marx and Engels in *The German Ideology* (1976 [1845]). Labour is thus defined as follows:

A process between man and nature by which man, through his own actions, mediates, regulates and controls the metabolism between himself and nature. He confronts the materials of nature as a force of nature. He sets into motion the natural forces which belong to his own body, his arms, legs, head and hands, in order to appropriate the materials of nature in a form adapted to his own needs. (Marx, 1976a [1867]: 283)

Additionally, what gives labour ‘a form in which it is an exclusively human characteristic’, transcending those ‘instinctive forms ... which remain at the animal level’, is the fact that ‘at the end of every labour process a result emerges which had already been conceived by the worker at the beginning, hence already existed ideally’ (Marx, 1976a [1867]: 283–4). This result, Marx continues, emphasizing the form-giving character of the human metabolic process, ‘is a use-value, a piece of natural material adapted to human needs by means of a change in form’ (1976a [1867]: 287), whose transformation is furthermore effected *via* ‘the use and construction of instruments of labour’, which, ‘although present in germ among certain species of animals, is characteristic of the specifically human labour process’ (1976a [1867]: 286). In sum, all the determinations of human labour as conscious, transformative life-activity are maintained by Marx in the most developed version of the critique of political economy unfolded in *Capital*.⁷

THE IMMANENT SOCIAL CHARACTER OF LABOUR AND HUMAN PRODUCTIVE SUBJECTIVITY: ‘SOCIAL BEING’ AND CONSCIOUSNESS

The ‘*fashioning* of inorganic nature’ (Marx, 1992a [1844]: 328–9) in a form ‘adapted to human needs’ does not exhaust the intrinsically mediated character of human life-activity underpinning the necessity of its conscious form. A further mediation that adds to the complexity of the human process of metabolism lies in the necessary *social* character of productive activity (Marx, 1993 [1857–8]: 83–4). For, although human productive powers are borne by each particular individual, the development and actualization of these potentialities characterizing the

species – i.e. the realization of the transformative powers of the human being – can only affirm themselves through the organic unity of individual lives, through social life. In effect, as Iñigo Carrera points out (2007: 47–8), individually borne human productive powers can only be constituted socially, that is, they can only develop as a result of the productive action of other individuals (who, for instance, have participated in the production of the use-values whose consumption resulted in the productive attributes borne by the former individual's labour-power). Moreover, the individual labourer produces use-values not solely for her/his own consumption, but for others, that is, *social* use-values. As Marx puts it in the *Paris Manuscripts*:

We have seen how ... man produces man, himself and other men; how the object, which is the direct activity of his individuality, is at the same time his existence for other men, their existence and their existence for him ... Activity and consumption ... in their content are social activity and social consumption. (1992a [1844]: 349)

Note, however, that this does not simply mean that human productive activity always presupposes a 'social context' within which it takes place (e.g. socio-logically conceived social 'institutions' that 'structure', 'condition' or 'constrain' human 'agency'). Thus posed, the relation between the social and individual character of human productive activity is rendered completely external. This is why a few lines later, through the example of the *seemingly* isolated activity 'in the field of science', Marx throws into relief the *immanent* social character of labour as an individual action, i.e. its determination as a material expenditure of *individually borne yet socially constituted* corporeal powers to transform external nature, consciously, into a means for human life:

It is above all necessary to avoid once more establishing 'society' as an abstraction over against the individual. The individual *is* the *social being*. His vital expression – even when it does not appear in the direct form of a communal expression, conceived in association with other men – is therefore an expression and confirmation of *social life*. Man's individual and species-life are not two *distinct things*. (1992a [1844]: 350)

Thus, the organization and regulation of the individual process of human metabolism with external nature acquires an additional qualitative and quantitative cognitive complexity. It needs to affirm itself as an organic 'element of the total labour of society' (Marx, 1976a [1867]: 165), i.e. to posit its underlying *general social unity* through its material articulation with the life-processes of other human individuals. To put it differently, the production of life through the expenditure and development of the *productive powers or forces* of the human individual, i.e. a material or natural relation, takes on necessary concrete shape (and is thereby necessarily mediated) in and through *social relations*, which are therefore determined as social relations of *production*:⁸

The production of life, both of one's own in labour and of fresh life in procreation, now appears as a twofold relation: on the one hand as a natural, on the other as a social relation – social in the sense that it denotes the co-operation of several individuals, no matter under what conditions, in what manner and to what end. (Marx and Engels, 1976 [1845]: 43)

The essential *most general* determination at stake in all social forms of the human life-process is therefore the organization of the unity of the social character of individual labours, that is, the social regulation of the allocation of the total labour of society in its different individual concrete forms in order to reproduce and expand the materiality of the productive powers of human beings. The *historically changing character* of the social relations of production is given by the specific form in which each society mediates ‘the participation of the individual in general production’ or the positing of ‘the labour of the individual ... as social labour’ (Marx, 1993 [1857–8]: 171–2).⁹

On the other hand, this means that in its material condition as the specifically human capacity to organize the life-process, consciousness always entails a twofold determination as much as the labouring activity that it organizes and regulates (Iñigo Carrera, 2007: 43–9). Consciousness thereby does not simply undertake the regulation of the individual appropriation of the potentialities of external nature in order to transform it, but must also mediate the establishment of individual labour’s immanent unity with the socially general metabolic process of which it is an organic element. In other words, consciousness needs to articulate the determination of individual productive activity as part of the general social division of labour. As an attribute borne by the individuality and corporeality of each human being, consciousness is thus the personal power or capacity to partake in the establishment of the unity of social labour through individual productive action, i.e. to regulate the social character of individual labour.

In this sense, consciousness, and along with it language (hence, *human subjectivity* proper), are also ‘evolutionary’ products of the development of the *social* character of labour:

Language is as old as consciousness, language is practical, real consciousness that exists for other men as well, and only therefore does it also exist for me; *language, like consciousness, only arises from the need, the necessity, of intercourse with other men.* Where there exists a relationship, it exists for me: the animal does not ‘relate’ itself to anything, it does not ‘relate’ itself at all. For the animal, its relation to others does not exist as a relation. Consciousness is, therefore, from the very beginning a social product, and remains so as long as men exist at all. (Marx and Engels, 1976 [1845]: 44, *emphasis added*)¹⁰

The determination of consciousness by the social character of labour not only pertains to its natural genesis. It also underpins its subsequent modes of existence and development, so that, as Marx and Engels stress in their well-known aphoristic statement, ‘consciousness [*das Bewusstsein*] can never be anything else than conscious being [*das bewusste Sein*], and the being of men is their actual life-process’ (1976 [1845]: 36). Moreover, insofar as this actual life-process is *form-determined* in *historically changing* social modes of existence, so will be the concrete forms of human subjectivity that, in turn, mediate the establishment of the unity of the social relations of production through the conscious and voluntary action of individuals. In other words, all concrete social forms assumed by human conscious and voluntary subjectivity are the way in which individuals see both

themselves and the historically determined modes of existence of their social relations, which are two sides of the same coin once the apparent exteriority between society and individual is overcome. Through the different forms of subjectivity, human beings therefore organize the unfolding of their individual actions as organic moments of the material reproduction of the *socially mediated* unity of their metabolic process with nature, i.e. their consciousness is always determined as ‘consciousness of existing practice’ (Marx and Engels, 1976 [1845]: 45).

It follows that the point of Marx’s materialism is not to conceive of social being as a self-subsistent existence that externally ‘causes’, ‘conditions’ or ‘functionally moulds’, from such exteriority, an equally self-subsisting consciousness. Such severance and consequent external relation of social being and consciousness, with the latter floating in mid-air in an ontologically conceived ‘superstructure’ of society, would certainly be idealist. Analogously to the relationship between productive forces and social relations discussed earlier, the key to overcoming such dualistic representations is to grasp social being or social relations of production as the inner material and social *content*, which is necessarily realized, and therefore exists, in the *form* of the determinations of the consciousness of the human individual.¹¹ As Marx bluntly and succinctly puts it in the *1861–63 Manuscripts*, ‘social relations only exist between human beings to the extent that they think’ (1988 [1861–3]: 232). In other words, there are no social relations of production or forms of human productive practice (and, *a fortiori*, no material productive forces of labour) whose determinations could be conceived of in abstraction from (i.e. not *immanently* mediated by) consciousness. Productive powers of social labour, social relations of production and forms of consciousness constitute the indissoluble unity between the content and form of the determinations of human productive subjectivity and practice in the process of ‘natural history’, that is, of human labour and its historical development.

CONTROVERSIES OVER MARX’S PERSPECTIVE ON HUMAN LABOUR

A first strand of critiques of Marx’s notion of labour emerged outside Marxism in the second half of the twentieth century and are of sociological or philosophical origin. Thus, Habermas (1971 [1968], 1987 [1985]) argues that Marx’s conception of labour one-sidedly conceives of human practice as ‘monological’ or merely instrumental activity, and fails to throw into relief the constitutive ‘interactional’ or ‘communicative’ dimensions of human action. In other words, Marx is read as unable to grasp the difference between ‘labour’ and ‘interaction’ or, in Habermas’ later formulation, that between ‘instrumental’ and ‘communicative’ action, which allegedly lies at the basis of the social life-process. For her part, and in a similar vein, Arendt (1998 [1958]) considers that Marx confuses or conflates the threefold distinction that constitutes the human being’s *vita activa*, that is,

‘labour’ (as animal-like, merely biological metabolic activity with nature), ‘work’ (as purposeful activity that humanizes nature in a lasting, non-ephemeral way), and even more starkly, ‘action’ (as radically self-initiating, necessarily collective and ‘public’, end in itself). In light of the earlier discussion, one could argue that these critiques are predicated on a misreading of Marx’s perspective on the determinations of labour (particularly serious in the case of Arendt) (Holman, 2011), insofar as they overlook the irreducible *immanent social character of productive activity*. Thus, it is these authors who actually, and wrongly, reduce labour to an asocial, purely individual material interchange with nature. As a consequence, they then need to come up with other dimensions of human action, which are therefore rendered ‘autonomous’ from the material reproduction process, in order for social life to attain unity. In other words, in Habermas’ and Arendt’s respective approaches, the intrinsic unity between the different determinations of human labour become ‘fossilized’ into extrinsically related ‘dimensions’ of human action or, worse still, into plainly distinct forms of human action.¹²

In the second place, some Marxists themselves have raised certain objections that partly take issue with (the early) Marx’s own treatment of labour, insofar as it involves an ‘affirmative’ view of labour as the ‘transhistorical’ essence of human life which would be emancipated with the overcoming of capital. Instead, they put forward a negative critique of the historically specific self-mediating or ontological role of labour in capitalism, which must actually be abolished under communism. Paradigmatically, this is the case of Postone’s (1996) more broadly discussed work and of the lesser-known but similar approach by Kurz and the German *Wertkritik* (Jappe, 2014; Larsen et al., 2014). More concretely in the case of Postone, he argues that whereas in non-capitalist societies ‘the social distribution of labour and its products is effected by ... manifest social relations’, in ‘commodity-determined society’ (i.e. capitalism) ‘*labour itself constitutes a social mediation in lieu of overt social relations*’ (Postone, 1996: 149–50). According to Postone (1996: 148), this socially self-mediating role of labour in capitalism in turn derives from the dual character that it acquires, by virtue of which it not only produces use-values for others as intentional activity that transforms nature in a determinate fashion (what Marx terms *concrete labour*) but also acts as a means of acquisition of the products of others. And since ‘there is no intrinsic relation between the specific nature of the labour expended and the specific nature of the product acquired by means of that labour’, that *historically determinate function* of labour as ‘means of acquisition’ must be done by abstracting ‘from the specificity of ... its own concrete form’ and on the basis of its character as labour in general (i.e. as abstract labour) (Postone, 1996: 151–2). Social interdependence in capitalism, Postone concludes, is not achieved by means of overt social relations but specifically by (abstract) labour itself (1996: 151–2). As a further corollary, Postone (1996: 58–68) states that the ‘traditional Marxist’ notion of labour that sees its socially constitutive role as a generic or transhistorical determination leads of necessity to the naturalization of the

capitalist form of labour and, *a fortiori*, of the alienated or objectified forms of social mediation (and concomitant impersonal forms of domination) to which the former gives rise.

Now, there are several and wide-ranging problematic and controversial issues in Postone's undeniably thought-provoking contribution; here I can only mention two which are of immediate relevance to this chapter. In the first place, and at a formal argumentative level, one could say that Postone's rejection of the generic determination of labour as the specific form of action that is socially constitutive of human subjectivity is based on a combination of terminological conflation (between 'labour' and 'abstract labour') and *non-sequitur* reasoning.¹³ Leaving aside other shortcomings in his discussion of the socially mediating function of labour in capitalism,¹⁴ all that he manages to demonstrate is that in this society the social positing of labour is uniquely established on the basis of its abstract or general character. But this does not necessarily mean that labour as such, broadly understood as human transformative activity upon nature, does not play this social function in non-capitalist societies. It might as well mean, as Marx himself argues in *Capital*, that in those other societies the intrinsic social character of individual labour is established on the basis of its particular, concrete character (Marx, 1976a [1867]: 170–1), which still is an immanent determination of the organization of social *labour*, and not of other, undetermined forms of social relations lacking in material, productive content, whatever those might be.

This leads us to a second, substantive weakness of Postone's approach. Postone (1996: 56) does not seem to disagree with Marx's view that 'the entire productive activity of man, through which his metabolic interchange with nature is mediated' (1991 [1894]: 954) 'is a condition of human existence which is independent of all forms of society' (Marx, 1976a [1867]: 133). Moreover, he concedes that 'labour, of course, has a social character in all social formations' (Postone, 1996: 150). However, on closer inspection it transpires that for Postone this *social character* is not *immanent* in the very materiality of labour. Instead, Postone submits that 'in noncapitalist societies, laboring activities are social by virtue of the matrix of overt social relations in which they are embedded', the latter being 'the constituting principle of such societies', so that the 'various labors are imbued with meaning by the social relations that are their context' (Postone, 1996: 150). The very choice of terms in Postone's formulations ('embeddedness', 'social context') betrays the irreducible externality in the relation that he posits between 'labouring activities', which are represented as a sheer material process lacking in immanent social content and, on the other side, 'manifest social relations', whose inner purpose and general unity (i.e. their *raison d'être*) is never *positively* spelt out by Postone (they are only *negatively* defined as not grounded in labour), but which are nonetheless said to impose, from such exteriority, their (self-grounded?) meaning and significance to labour and its products (Postone, 1996: 171–3).

Lastly, the other significant controversy among Marxists which I shall mention in this section concerns the essential developmental dynamic which,

according to Marx, underlies and gives unity to the historically evolving modes of existence of human subjectivity, namely the development of the material productive forces of labour. In the view of certain critical commentators, this perspective can only lead to a 'technologically determinist' materialist philosophy of history, in which, the 'exogenous' development of productive forces (understood as instruments of production or as a particular 'combination' of means of production and labour-power required by a certain technique of production, i.e. in both cases as 'things') acts as the motor that mechanically engenders a linear succession of 'corresponding modes of production' in a rigid evolutionary chronological sequence. As a result, these critics conclude, the Marxian 'materialist conception' implies an 'objectivistic' view which downplays or simply ignores the role of human subjectivity and action in the development of history (Gunn, 1992). As Clarke (1980: 21–2) points out, however, a first problem with this line of thought is that such a crude 'technological determinism' is completely alien to Marx's ideas and is more a reflection of its codification into a dogmatic philosophy of history by the orthodox Marxist tradition, in particular that which was consolidated as the state ideology of the former Soviet Union.¹⁵ More specifically, Clarke forcefully shows in his pioneering critique of structuralist Marxism, a crucial shortcoming of the orthodox reading of Marx's thought lies in the very notion of production, which the Marxist orthodoxy represented as an abstractly 'technical' process, with social relations brought down to relations of *distribution* constituted by ownership of means of production, and *extrinsically* superimposed onto the direct labour process (Clarke, 1980: 21–2).¹⁶

In contradistinction to this orthodox reading, we have seen that Marx's account of the determinations of the labour process involves the indissoluble and contradictory *intrinsic* unity between the material relation between human beings and nature and its socially mediated character (hence between productive forces, social relations of production and their actualization in and through the conscious practice of individuals). We have also seen that 'productive forces' do not simply belong in a world of objects or 'things' (i.e. the instruments of production), abstractly external to human subjectivity, with their mutual relation represented as mechanistic causality or functional/structural correspondence. Or rather, they do comprise the world of things but to the extent that the latter are grasped as 'products of human industry; natural material transformed into organs of the human will over nature, or of human participation in nature. They are *organs of the human brain, created by the human hand*; the power of knowledge, objectified' (Marx, 1993 [1857–8]: 706). Moreover, we have argued earlier that there is no conceivable shape of the productive forces which does not exist in and through the form-determinations of consciousness. The former's historical development is, of necessity, that of the *consciousness of human beings*, albeit materialistically grasped as essentially productive subjects. In sum, the development of the forces of production is tantamount to the development of the materiality of *human productive subjectivity*. In this sense, 'productive forces' belong in the

innermost realm of human individuality and, more precisely, of the specifically human capacities or powers for conscious transformative action. So this view can hardly lead, as implied by the critical commentators referred to earlier, to an ‘objectivistic’ denial of subjectivity and action in the unfolding of history. What it does deny, however, is the rendition of human consciousness and will (hence of human subjectivity and action) as idealistic constructs, which can only thereby be grounded on an abstract natural freedom of the individual, and therefore deprives the very specificity of the conscious human subject that it purports to extol of any material foundation in the movement of its life-activity as a ‘sensuous objective being’. By contrast, Marx’s view that the development of the productive forces of labour constitutes the essential content of history uncovers the immanent (as opposed to mechanistic) material determination of human subjectivity and its conscious and voluntary activity in the social life-process.¹⁷

Notes

- 1 In this chapter, and following Marx’s usage in his later writings, I will use the term ‘labour’ (*Arbeit*) as denoting human *productive activity* in general, that is, as broadly as possible as ‘formative activity’ upon nature (Sayers, 2007). The terminology was different in the early writings such as the *1844 Paris Manuscripts* or the *German Ideology* (Arthur, 1986: 12–19). In these latter texts, the term ‘labour’ was sometimes equated with *alienated* productive activity under the rule of capital, whereas ‘self-activity’ or ‘practical human activity’ tended to denote the conscious transformation of nature by human beings. This is the reason why it is possible to find various passages in the early writings in which Marx states that human emancipation and the supersession of alienation entail the ‘abolition of labour’ (e.g. Marx and Engels, 1976 [1845]: 87).
- 2 On the Hegelian lineage of this perspective on the determinations of the natural life-process, as well as on the ‘organic/inorganic nature’ distinction, see Foster and Burkett (2000).
- 3 As Sayers (2007) also notes, this broad view of labour as form-giving activity upon nature can be traced back to Hegel (cf. 1977 [1807]: 118; 1991 [1821]: 56, 196–7). This is not to deny that other species are capable of ‘objectification’ (albeit mostly instinctually rather than intentionally), in the sense of ‘transforming what is naturally given into worlds made in the image of their own needs and capacities’ (Fracchia, 2005: 44); a phenomenon of which Marx was perfectly aware (Marx, 1976a [1867]: 283, 1992a [1844]: 329). However, not only is the transformative power of non-human animals very limited and one-sided (Fracchia, 2017), but its human forms entail not just a quantitative difference (i.e. one of degree) but a qualitative self-differentiation of the natural life-process beyond its *merely* ‘animalistic’ modes of existence (and this includes whatever incipient ‘mental’ powers for ‘reasoning’ could be found among non-human animals).
- 4 In effect, as McNally suggests (2001: 79), with the advent of post-modernism as the dominant form of self-proclaimed radical social thought, any reference to natural determinations in human life is usually seen as an old-fashioned ‘modernist prejudice’. On the other hand, the question gets even more compounded by the ideological use of evolutionary theory made by ‘sociobiology’, which naturalizes existing forms of domination by locating their source in our genes (McNally, 2001: 79). However, the post-modern reaction that stresses the ‘cultural production of the body’ could be said to be its mirror image, substituting a ‘sociological/cultural’ reductionism for a biological one. In other words, the mere reversal of the terms of the relationship between nature and society does not do away with the inevitable externality of their connection thus conceived. Instead, the challenge for a critical materialist standpoint is to overcome the *dualism* in the relationship between nature and society, which means recognizing their ‘unity-in-difference’.

- 5 See on this McNally's stylized but well-informed account of the evolution of human thought and language, which shows that crucial in this process has been the 'use of intermediary objects (such as tools) to affect the environment to determined ends' (2001: 93).
- 6 An insightful and pioneering discussion of this point can be found in Colletti's *Marxism and Hegel* (1973 [1969]), who also traces the intellectual lineage of Marx's discussion of the human being as a species-being further back than Feuerbach's (2008 [1841]) *The Essence of Christianity* (Colletti, 1973 [1969]: 234–43). Of particular significance is Colletti's discussion of the qualitative specificity of human beings as natural living subjects vis-à-vis other natural life-forms, which gives them the character of a *genus*, vis-à-vis the rest of the animal *species* (Colletti, 1973 [1969]: 244–6). For this reason, as the translator of *Marxism and Hegel* rightly notes, 'generic-being' is actually a more adequate English rendition of the German *Gattungswesen* (Colletti, 1973 [1969]: 233, fn. 76).
- 7 For a contrary reading, see Wendling (2009: 62–6, 83–8, 96–7), who submits that Marx changed his views (albeit with ambiguity), from an initial 'vitalist' perspective in which labour was seen as the self-actualization and form-giving objectification of human subjectivity in the natural world, to an 'energeticist paradigm' adopted from the thermodynamic science of the scientific materialists.
- 8 Thus, social relations of production are not for Marx simply 'economic' but encompass the unity of the human life-process in all of its moments (Marx, 1977 [1847]: 212).
- 9 That is the gist of Marx's oft-quoted letter to Kugelmann (Marx, 2010 [1868]: 68).
- 10 Again, as McNally (2001: 100–3) reports, contemporary scientific evidence from evolutionary theory validates Marx and Engels' insights on the qualitative specificity of the social character of tool-making (or 'co-operative heterotechnic toolmaking' as this author puts it) as a distinctively human phenomenon, on the one hand, and on its intrinsic material connection with the emergence of consciousness and language, on the other.
- 11 In this sense, Marx's whole discussion of the fetish-like character of the commodity could be seen as the *simplest* expression of the historically specific mode of existence of the immanent unity between productive forces of human labour, social being and forms of consciousness in the capitalist mode of production (Starosta, 2017). That is why Marx can claim *both* that value is the thing-like form of existence of social relations between people (Marx, 1976a [1867]: 166) *and* that the reduction of the 'material thing to the abstraction, *value* ... is a primordial and hence unconsciously instinctive operation of their brain' (Marx, 1976b [1867]: 36).
- 12 For an early Marxist reply to Arendt, see Suchting (1962). A more recent methodologically minded Marxist assessment of the weaknesses of Arendt's threefold distinction can be found in Holman (2011). For a Marxist critique of Habermas along the lines suggested above, see Reichelt (2000), Elbe (2017) and Sayers (2007: 446). Postone (1996: 231) also develops an insightful Marxist critique of Habermas, albeit based on his idiosyncratic rejection of the generic constitutive role of labour in the development of human subjectivity.
- 13 This terminological conflation between 'labour' and 'abstract labour' is also key to the German *Wert-kritik*'s 'Manifesto against Labour' (Krisis Group, 1999).
- 14 For instance, he ambiguously and interchangeably posits *labour* or the *product of labour* as performing the function of social mediation (Postone, 1996: 150).
- 15 The standard source for this codification is Stalin's *Dialectical and Historical Materialism* (2013 [1938]). However, a more recent and methodologically more sophisticated and cogent statement of the orthodox 'traditional historical materialism' can be found in Cohen (2001 [1978]).
- 16 As Clarke notes, this notion of production is characteristic of Althusser's early work as well.
- 17 For a substantiation of this general methodological argument through a detailed exposition of the developmental dynamics of the historically specific contradictory unity between materiality and social form of capitalist production (i.e. *the real subsumption of labour to capital*), which also underlies the immanent ground of modern forms of subjectivity (both capital-reproducing and capital-transcending), see Starosta (2016).

Automation

Jason E. Smith

INTRODUCTION: TWENTY-FIRST-CENTURY AUTOMATION

During the 2010s, there was a torrent of discussions and debates regarding the possibility and prospective effects of a new wave of automation across the ‘advanced’ capitalist economies of Europe, North America, and East Asia. Invariably, these discussions took as their point of departure an earlier wave of automation that took place in many of these same economies beginning in the 1950s, unfolding unevenly across the globe over the course of three decades or more. That wave largely affected the global manufacturing sector. Industries such as petrochemicals, steel, automobiles and, later, those producing household consumer goods, became increasingly more automated, and therefore more efficient in their use of labor inputs. These labor-saving innovations meant that, over time, these industries shed workers. Some of these workers would eventually be absorbed by an ever-expanding ‘service’ sector, a process that picked up rapidly in the USA beginning around 1970. The service sector was able to absorb some of those workers displaced by automating labor processes in the manufacturing sector while also accommodating the large-scale entry of women into the workplace.¹ Today, workers employed in this sector, such as it is defined by national accounting statistical methods, make up well over 80% of employment in many countries in North America and Europe.

The service sector incorporates vastly different types of concrete labor processes, and enormous divergences exist in skill and wage levels. What many of

these jobs have in common are labor processes that can be called labor-intensive, meaning they are carried out without the use of large amounts of complex and expensive machinery, at least relative to the levels of capital-intensity prevailing in the manufacturing sector. During the 2010s, however, there were a number of books and studies, many of which received significant attention in the popular media, that predicted advances in automation would soon make possible the use of machinery to perform a significant number of the tasks carried out by service sector workers in restaurants, retail stores, hospitals, warehouses, and schools.² Were this to take place, these studies claimed, many workers currently employed in these industries would find themselves unemployed and, cut off from the wage, unable to survive in a society in which access to a share of the social product requires prior access to money, which most people obtain by working for wages. One particularly well-known study suggested that almost half of current US jobs are ‘vulnerable’ to being automated by the end of this decade (Frey and Osborne, 2013).

Importantly, the 2010s, during which these discussions took place, was also one of unrelenting economic crisis. There was a deep disconnect between projections of a near-future replacement of a significant fraction of the workforce by machines and the actual performance of these economies over the same decade. The period from the onset of the crisis in 2008 forward has been marked by intractable stagnation for most of these high-income countries, whether the indicator is growth in GDP, the rate of business investment, or, most importantly, labor productivity gains. Indeed, the Bank of England recently published a report contending that the crisis decade exhibited the lowest gains in productivity growth since the eighteenth century (Lewis, 2018). Business investment in fixed capital, which we would expect to explode in a decade during which rapid advances in automation are occurring, was reported to be roughly one-tenth of what it was in the 1990s, when the richest economies experienced a modest surge in the computerization of certain retail operations and business services (Steward and Atkinson, 2013). I have elsewhere examined the full extent of this divergence between the rhetoric of automation typical of this crisis decade – a decade marked by the rise of social media, smart phones, and ‘the algorithm’ – and the actual performance of the economies of the USA, the UK, and other high-income nations (Smith, 2020).

In what follows, I will be concerned neither with the performance of the advanced industrial economies during the 2010s, nor with the claims made by automation theorists and promoters regarding the potential effects – on labor productivity, GDP growth, and unemployment – a top-to-bottom mechanization of large sections of the service sector might bring about. Instead, I want to turn to the theorization of automation proposed in Marx’s *Capital*, in particular the first volume. For though the term ‘automation’ itself was only coined in 1946 by Del Harder (a Ford vice president), the *principles* of automation were clearly formulated by the early nineteenth century. It is no accident, for example, that the Scottish industrialist Andrew Ure could describe and attempt to theorize ‘the

automatic factory' in the 1830s, in the capitalist mode of production's infancy (Ure, 1835). The debates occasioned by the thoroughgoing mechanization of particular industries are as old as capitalism itself; in many ways, contemporary discussions of the phenomena mark either a repetition of, or regression relative to, the debates of the nineteenth century. Marx's *Capital* represents the culmination of this discourse, insofar as his value-theoretical reflection on the 'laws of motion' of the capitalist mode of production can account for the emergence of the 'contradictions and antagonisms inseparable from the capitalist application of machinery' which confounded the political economy of his time (Marx, 1992: 568). In particular, Marx's analysis addresses the relationship between the mechanization of particular industries and its effect on labor productivity, unemployment, and wage levels in terms pertinent to any discussion of automation today. Marx also ties capitalism's drive toward the replacement of labor with machinery to the immanent tendency toward systematic crisis. As we shall see, Marx's fundamental argument in *Capital* is that rising labor productivity in core industries will, for most workers, result not in unemployment, but in displacement toward other, less capital-intensive industries. Many of these jobs (which we today might identify as 'service sector' employment) will entail labor processes that resist ('by their nature', as Marx puts it) automation; many are also activities that produce neither value nor, *a fortiori*, surplus-value. This concentration of labor in industries that merely circulate value, rather than produce it, will have crippling effects on the accumulation of capital itself.

MARX AND THE AUTOMATIC FACTORY

Scottish industrialist Andrew Ure first used the expression 'automatic factory' (as well as 'automatic plan' and 'the automatic system of machinery') in the mid-1830s to describe the changes in manufacturing labor processes occurring in certain industries – textiles, especially – in England. Marx devoted the longest chapter of *Capital* to analyzing the nature of this 'automatic factory', and relied a great deal on the technical descriptions of the factory system by Ure, whom he dubs the 'Pindar of the automatic factory' (Marx, 1992: 544).³ He did so in order to examine, in turn, any number of effects brought about by the introduction of machinery into production processes: on wages and employment, on the division of labor, on the composition of the working class, on the time and intensity of work itself.

The first section of Marx's chapter on machinery and large-scale industry is devoted to what he calls the 'physical constituents of the factory', the technical and material features that distinguish it from the manufacturing system. A defining feature of the automated factory, he writes, is a power source that is 'entirely under man's control', a 'prime mover capable of exerting any amount of force, while retaining perfect control' (Marx, 1992: 499, 506). Marx's emphasis here

is on the notion of control, or power, over nature (the energy source) and also over the labor process itself, and therefore over the labor-power employed by the factory owner. The invention of the double-acting steam engine exemplifies such a prime mover. Not only does it permit 'perfect control' over the speed at which production unfolds, its mobility means factories can be concentrated in cities, rather than dispersed across the countryside, in rural and often remote locations near rivers.⁴ The application of the 'automatic principle' in industry, in turn, implies a radical reformatting of the division of labor within the labor process itself. In the system of manufacture, the increasingly refined division of labor imposed by the capitalist still had its basis in the old 'hierarchy of specializations' inherited from the guild system. It could be defined as a 'combination of specialized workers' brought together by a business owner, yet who continue to maintain a great deal of control over the labor process itself. Much of the knowledge required to carry out production is still *subjective* in nature, as Marx puts it, insofar as it is the result of extensive craft training and embodied in the person of the laborer. This modicum of control over the labor process permits such workers a wide range of resistance to capitalist discipline: work slowdowns, the withdrawal of labor, even sabotage.

In the automatic factory, in contrast, the technical division of labor is 'objective' insofar as it is no longer founded on a pre-existing system of specializations, but on the application of the principles of 'mechanics, chemistry and the whole range of the natural sciences' (Marx, 1992: 590). The division of labor in the automatic factory is now objectified, as it were, in the machinery itself. The articulations of the labor process are now based on the application of scientific principles, rather than on distinct and stratified skill levels. The physical activity of machine operators is made to conform to the precise movements of the machines themselves, ones they no longer command. Under such conditions, the distinction between skills rapidly erodes, with workers performing simplified tasks that are increasingly interchangeable. As work becomes increasingly deprived of 'content', workers themselves become interchangeable; they can be moved around, from workstation to workstation, from factory to factory, and from one industry to another. Since machine operators no longer require skills obtained over years, traditional barriers preventing women and children from entering the workforce break down as well. Such 'deskilling' lowers, in turn, the value of labor-power; so, too, does the lower cost per unit of articles necessary for the reproduction of labor-power, as labor productivity gains are wrung from the increased use of automatic machinery in certain industries (food, clothing, etc.).⁵

CAPITALIST AND COMMUNIST USES OF MACHINERY

What is the relationship between the automatic factory and the capitalist organization of social production? Does the technical and material configuration of the

former express, in some way, the social relations prevailing under the latter? In the passages I have cited, Marx's emphasis is on the real subordination of factory laborers to the machinery they serve and operate. The implementation of a division of labor based no longer on the old specializations of the craft system but on the application of scientific knowledge meant that workers ceded significant control over the labor process to a configuration of machines driven by a central power, and whose functioning was largely automatic, 'self-regulating'. Marx cites Ure's description of this subsumption of human labor activity to the automaton in both *Capital* and the *Grundrisse*: 'a vast automaton, composed of various mechanical and intellectual organs, acting in uninterrupted concept for the production of a common object, all of them being subordinate to a self-regulated moving force' (Marx, 1992: 544, 1993c: 690). Marx's commentary on this passage underlines the emphasis he has placed, so far, on the way in which the means of production can also be a means of domination and control. Ure's system of machinery is not simply 'an automaton', he stresses, 'but an autocrat' as well. The automaton in Ure's description is characterized by Marx as a 'dominant subject', commanding a self-regulating process in which workers are reduced to 'merely conscious organs'. Yet the mere subordination of the combined collective worker to the objective constraints of the labor process does not, for Marx, mean the mode of production embodied in the system of automatic machinery is *inherently* capitalist in nature. Indeed, at the center of Marx's reflection on the automation factory is his consideration of the specifically capitalist 'use' or 'application' of machinery.⁶

It is in the *Grundrisse*, rather than *Capital*, that Marx offers his most extended account of the relation between the factory 'in its most developed form' and what he calls the 'concept of capital'. In these notebooks, Marx succinctly defines capital as the 'appropriation of living labor by objectified labor' (Marx, 1993c: 694); later, in the posthumously published 'Results of the Immediate Production Process', he will revise this formulation, characterizing the 'actual function specific to capital' as '*the appropriation of unpaid labor* in the course of the actual process of production', unpaid labor whose objective form is surplus-value (Marx, 1992: 978). Capital is not content, however, merely to appropriate a given quantity of unpaid labor; it has an inner drive or 'tendency' to reduce to an absolute minimum the labor necessary for the reproduction of the worker. This tendency compels capital constantly to increase the productivity of labor through the transformation of the means of production. 'In the machine', Marx writes, 'and even more in machinery as an automatic system, the use value, i.e. the material quality of the means of production, is transformed into an existence adequate to fixed capital and to capital as such' (Marx, 1993c: 692). In its infancy, capital could only take over or 'adopt [*aufnehmen*]' existing labor processes and means of labor, inherited from an earlier mode of production and its social relations. The craft system entailed a relation between the laborer and the means of labor defined by the laborer's mastery

over his ‘instrument’, who makes it ‘his organ with his skill and strength, and whose handling depends on his virtuosity’. The historical development of capital is marked by the progressive abandonment of this readymade labor process; the inner tendency of capital is to ‘posit’ a material form of production ‘adequate’ to its own concept (‘the most adequate form of capital as such’ (Marx, 1993c: 694)), and therefore capable of ‘actualizing’ its tendency: the automatic factory. The automatic factory is made in the image of capital.

The automatic factory, as the fully developed material form of the means of production posited by capital, brings into being a production process in which the laboring activity of the worker is ‘subsumed’ as a mere moment in an autonomous process, a ‘conscious organ’ of a self-regulating activity it merely ‘supervises and guards against interruption’ (Marx, 1993c: 692). Capital therefore gives itself its adequate form in the material shape of the factory and its large-scale machinery. And yet this use-value, this technical and material configuration, is not ‘identical’ to capital, Marx cautions, no more than money that circulates as capital should be confused with capital: ‘This is no way means this use-value – machinery – is capital, or that its existence as machinery is identical with its existence as capital’ (Marx, 1993c: 699). The automatic factory is the mode of production most capable of serving the needs of capital: the production of surplus-value or, more precisely, an ever higher rate of exploitation (expressed in the ratio of necessary to surplus labor).

Yet Marx, following Robert Owen, equally saw the ‘factory system ... to be theoretically the point of departure for the social revolution’ (Marx, 1992: 635n46). Such a ‘revolution’ – this is one of the very few appearances of this term in *Capital* – would not necessarily break with the material form of the factory, above all *not* in view of restoring a new version of the handicraft system. The social revolution would mark instead a rupture with the ‘capitalist application of machinery’, the capitalist use of its use-value. In his only reference to a communist society in Volume 1 of *Capital*, Marx insists that ‘the field of application for machinery [that is, the automatic factory, its developed form] would therefore be entirely different in a communist society from what it is in bourgeois society’ (Marx, 1992: 515n33).

In the opening lines of his chapter on the automatic factory, Marx cites an observation made by John Stuart Mill in 1848: the plethora of labor-saving devices deployed in English industry over the past half century, though they brought about enormous increases in the productivity of workers, had not ‘lightened the day’s toil of any human being’. Instead, they intensified the labor process for many workers, while extending, rather than reducing, the length of the working day.⁷ Why is this? The objective of the ‘capitalist use of machinery’, as Marx puts it, is not to reduce the time of work *tout court*, but to shorten that part of the day during which the worker labors to reproduce his or her own status as a wage-laborer – so-called necessary labor – in order to prolong that part of the working day during which the capitalist is able to appropriate unpaid or surplus

labor. This is what Marx calls an immanent ‘tendency’ of capital: ‘the greatest possible negation of necessary labor’ (Marx, 1993c: 693). But the apparent contradiction between the labor-saving capacities of large-scale machinery and the extension of the working day in the first decades of the factory system of production is one among a host of contradictions that Marx identifies as originating with the ‘capitalist use of machinery’:

Machinery in itself shortens the hours of labor, but when employed by capital it lengthens them; ... in itself it lightens labor, but when employed by capital it heightens its intensity; ... in itself it is a victory of man over the forces of nature but in the hands of capital it makes man the slave of those forces; ... in itself it increases the wealth of the producers, but in the hands of capital it makes them into paupers. (Marx, 1992: 568–9)

By distinguishing between machinery ‘in itself’ and its capitalist application, Marx has two objectives: to analyze the ‘contradictions and antagonisms’, as he puts it, that arise as a result of this peculiar use of machinery, and to hold open the possibility of what we have already identified as another, speculative, ‘communist’ use of machinery. The prospects for this alternative use lie beyond the limits of his critique, but its core objective is clear: raising labor productivity in order to reduce the ‘day’s toil’, so that the time and intensity of work are lessened. In the *Grundrisse*, Marx spells out the potential effects of ‘the general reduction of the necessary labor of society to a minimum’: the ‘free development of individualities ... the artistic, scientific, etc. development of the individuals in the time set free’ (Marx, 1993c: 706).

THE ‘ABSOLUTE LAW’ OF AUTOMATION

It is only on these few occasions that Marx’s analysis of the capitalist mode of production brushes against the speculative possibilities of another, non-capitalist, application of machinery. For the most part, he is content to track down and formalize the ‘contradictions and antagonisms’ that arise from the capitalist use of the automatic system. He emphasizes, as we have seen, the way in which the revolutionized means of production represented by large-scale industry actualizes an inner drive of the capitalist mode of production: it is the ‘form’ of production most adequate to the ‘concept’ of capital. Marx’s primary concern in his reflections on the automatic factory, however, is the effect its widespread implementation has on a number of economic and social phenomena: on wages and unemployment, on the division of labor, on control in the workplace, and on the nature of work itself (its duration and intensity).

By definition, the use of labor-saving machinery will produce a given output with fewer workers than a labor process that does not employ such machinery. At the level of the individual corporation, or in some cases an entire industry, labor process innovations do not necessarily entail a reduced demand for

labor. Because machine-produced articles are cheaper than those made with less advanced techniques, in many cases the lower costs of these articles will spur demand for them, compelling producers to increase output. If output rises more quickly than labor productivity increases, the effect at the firm or industry level is to 'attract' rather than 'repel' labor. If we abstract from particular cases (firms, industries) and observe capital as a whole, however, we can formulate an overarching pattern regarding the effect of labor-saving machinery on patterns of employment. It is reasonable to assume, Marx notes, that any diminution of demand for labor in one industry due to the introduction of advanced production techniques will be offset by increases in employment in other, often related, industries. Workers will be displaced, forced to migrate from one line of production to another.

When the textile industry developed 'automatic' factories that substituted machine operations for what were once manual actions performed by wage-laborers, the net effect over time – abstracting from the fluctuations of the business cycle – was a reduction in the size of that industry's labor force. But the introduction of such machinery led to increased employment in other, related industries. Because more capital-intensive, efficient factories could produce cheaper articles, their output often rose to meet rising demand. This increased output required, in turn, more raw materials, such as cotton, the production of which required more labor in this industry (in this case, primarily slave labor in the US South). More output also required more coal to run the steam engines that powered the looms; and more steam engines required, in turn, more laborers employed in still other factories that produced these machines etc. Higher output will in turn draw in more workers in the circulation phase of the capital circuit, in transport and warehousing, in telecommunications, and in what today we would call 'business services' (accounting, law, etc.).

Whatever might be the offsetting effects of the increased demand for labor in ancillary industries, however, Marx insists that by definition there is no simple compensation mechanism that automatically reallocates the labor replaced in one industry to others where demand for labor is rising. At the level of the entire social process, Marx formulates what he calls an 'absolute law' regarding the effect of machinery on employment, 'if the total quantity of the article produced by machinery is equal to the total quantity of the article previously produced by handicraft or by manufacture, and now made by machinery, then total labour expended is diminished'. As a result, the compensating effect of absorbing labor rendered redundant in one industry or sector 'must be less than the reduction in labor achieved by the employment of machinery: otherwise the product of the machine would be as dear as, or dearer than, the production of manual labor' (Marx, 1992: 570). The effect of the introduction of labor-saving machinery in a particular industry will necessarily be a net reduction in the overall demand for labor employed by capital.

The immediate effect of the introduction of labor-saving devices in certain core industries will often be a contradictory one. If the ‘automation’ of production in one industry results in a declining demand for labor, these workers must seek work elsewhere in the economy. This flooding of the labor market with workers desperate for any work, whose skills are often tied to now obsolete production processes, means that employers will in some situations be able to offer wages that fall below the established value of labor-power. When this occurs, employers will be less inclined to introduce machinery that might raise labor productivity and, as Mill puts it, ‘lighten the day’s toil’. Such conditions, Marx writes, actually ‘prevent’ the use of machinery in [these] other branches and, from the standpoint of the capitalist, makes the use of machinery superfluous, and *often impossible*, because his profit comes from a reduction in the labor paid for, not in the labor employed’ (Marx, 1992: 516; my italics)

While Marx understands the increasing mechanization of production to be an invariant, long-term, developmental trend of the capitalist mode of production, he also insists that capitalists do not pursue increases in labor productivity for their own sake, but rather to reduce the costs per unit of the items they produce. If they can do so by decreasing what they spend on labor inputs, rather than on a more efficient use of the labor they employ, they will forego investing in expensive machinery that depreciates over years in favor of a cheap and fungible supply of labor.

Marx offers a poignant image of this phenomenon when he observes that in England, the home of the Industrial Revolution, wage-laborers are often encountered performing dreadful labors that are elsewhere carried out either by machines, or by beasts of burden. ‘In England’, he writes, women:

[a]re still occasionally used instead of horses for hauling barges, because the labour required to produce horses and machines is an accurately known quantity, while that required to maintain the women of the surplus population is beneath all calculation. Hence, we nowhere find a more shameless squandering of human labour-power for despicable purposes than in England, the land of machinery. (Marx, 1992: 517)

This paradoxical condition, in which machines are not employed even when doing so would greatly alleviate the ‘toil’ imposed upon workers employed to carry out onerous, dangerous or otherwise inappropriate activities, *is itself an effect of the capitalist application of machines*: a sudden surge in technological innovation in one sector will produce, ineluctably if unevenly, technological stagnation in another. This feature has enormous contemporary significance, particularly when considering the fragmentation of global labor markets. One of the immediate effects of relocating manufacturing from high-income nations to low-income countries with ready supplies of cheap labor is that there is less urgency for manufacturing firms to economize on labor inputs by increasing the productivity of that labor. While private companies will always be forced to reduce their costs of production in competitive markets, in many industries the availability of a seemingly endless supply of labor across the globe makes the

pursuit of ever cheaper labor costs a more viable option than considerable outlays for fixed capital.

AUTOMATION, CAPITAL COMPOSITION, AND CRISIS

Marx's analysis of the role ancillary industries play in absorbing the labor shed by core industries that employ 'automation' requires the introduction of a concept that will assume a special importance in the later unfolding of his theory. Marx writes:

How far employment is thereby found for an increased number of workers [in ancillary industries] depends ... on the composition of capital, i.e. on the ratio of its constant to its variable component. This ratio, in its turn, varies considerably to the extent by which machinery has already penetrated, or is engaged in penetrating, those trades. (Marx, 1992: 570)

As a general rule, these ancillary industries supplying inputs to core industries will, at least initially, have a lower capital composition than the most advanced sector. Machine production, Marx notes, was originally carried out primarily by specialized craft workers who did not employ large amounts of machinery. But eventually, as demand for such machinery increased, the transformations of the labor process carried out in textile production by the use of machinery was in turn applied to machine production itself: machines making machines.

When Marx speaks of the composition of capital, he has two distinct but inseparable notions in mind. The first is the use-value or 'technical' composition of capital. Technical composition refers to the 'mass of means of production' a given employee can operate or process in a given labor process (Marx, 1992: 762ff.). Such a 'mass' of machinery and raw materials is measured either in individual units, whether the unit is a given machine or, as in the case of raw materials, in units such as yards, square feet, pounds, and so on. To say that a given firm or industry has introduced machinery in order to raise the productivity of its employees is, in turn, to speak in use-value terms: a new combination of machinery and labor will produce more hammers in a given period of time than another, more labor-intensive combination. The technical composition of capital is, however, only half the story. In the capitalist mode of production, use-value is inseparable from exchange-value; so, too, the *technical* composition of capital is intimately related to what Marx calls the *value* composition of capital, that is, the relation between the value (rather than the mass) of the means of production to the value of the labor employed. These ratios often, but do not always, move in concert. If workers in the coal industry go on strike, driving up the cost of the fuel necessary to run a factory's steam-powered machinery, the technical composition of capital prevailing in this factory or industry will not change – the

same amount of coal, measured in physical units, is used – but the rising costs of energy will change the ‘value’ composition. By the same token, when coal mines introduce new machinery that makes the cost of coal cheaper, the value composition will once again change (the value of the constant capital drops), even if the quantity of coal used in the factory or industry employed remains constant. Marx is therefore compelled to construct another concept, the *organic* composition of capital, to describe those situations in which changes in the value composition of capital reflect changes in its underlying use-value or technical composition, and vice versa.

The concept of the organic composition of capital provides in turn the foundation for Marx’s crisis theory, which he clumsily describes as the ‘law of the tendency of the rate of profit to fall’ (Marx, 1993c: chapter 13). The argument, in its simplest form, is this: As businesses compete with one another to cut their costs of production, they will often do so by increasing labor productivity, that is, by increasing their capital composition. By doing so, they increase the amount of capital they invest in the means of production relative to what they invest in labor. At the level of the individual firm, this indeed results in low production costs; but at the level of the economy as a whole, rising organic composition of capital tends to reduce the rate of profit, that is, the surplus-value produced across society as a whole relative to the total capital advanced. Increased labor productivity means that the rate of exploitation, understood as the ratio of necessary to surplus labor, also rises. The net effect of rising labor productivity, however, is a reduction in the mass of labor employed per unit of capital. And because surplus-value is produced only through the exploitation of labor in the production process, the rate of profit – understood as surplus-value divided by total capital advanced – will fall as capital composition rises.

In the manuscript of what was posthumously published as the third volume of *Capital* (1993b), Marx enumerates a number of tendencies that might counteract the tendency of the rate of profit to fall. Some of these counteracting factors can be seen as extrinsic effects that depend on the actions of capitalists or on ‘temporary’ changes in the labor market brought about by the automation of a particular industry or sector. On the one hand, capitalists can raise the rate of exploitation by simply intensifying the labor process, working their employees harder to generate more output per labor hour, with no change in either technical composition or wages. On the other, as I have already pointed out in the case of the ‘women of the surplus population’, the displacement of laborers from a recently automated sector can drive wages below their value in other sectors, as unemployed workers flood the labor market, willing to take jobs at low wages to get by. Here, too, the rate of exploitation is augmented, not by any change in the labor process, but simply by a fall in wages.

Among the factors Marx enumerates, however, one in particular stands out, namely the automation of labor processes. Once these production techniques spread to ancillary industries that supply the means of production – the

production of raw materials and machinery itself – they will ‘cheapen the elements of constant capital’. When machines begin to produce machines, the application of labor-saving methods to the production of constant capital means that the value composition of capital will tend to rise more slowly than its technical composition:

[t]he same development that raises the mass of constant capital in comparison with variable reduces the value of its elements, as a result of the higher productivity of labor, and hence prevents the value of the constant capital, even though this grows steadily, from growing in the same degree as its material volume. (Marx, 1993c: 343)

‘INCOMPLETE SUBORDINATION OF LABOR TO CAPITAL’ OR, THE RESISTANCE TO AUTOMATION

This core countervailing tendency, by which the spread of labor-saving devices across the economy reduces the cost of constant capital, however, is supplemented in Marx’s account by another, seemingly less prominent, feature of industrialized economies. Or, rather, two related phenomena that Marx groups under a single heading – ‘the relative surplus population’ – but whose connection he does not fully elaborate. There are ‘many branches of production’ which, ‘by their nature, oppose’ significant resistance ‘to the transformation of manual work into machine production’. What are the reasons for this ‘more or less incomplete subordination of labor to capital’ in these branches?

Marx suggests two primary reasons. The first is a version of the factor I have already discussed: ‘the cheapness and quantity of available or dismissed wage-laborers’ formerly employed by newly mechanized or automated industries. The prevailing ‘cheapness’ of this labor makes it unlikely that business owners will invest in labor-saving machinery that would otherwise be employed if wages were higher. But the ‘resistance’ to automation Marx also points to has a technical or use-value aspect as well. Some labor processes, *by their nature*, are hard to mechanize to such an extent that the labor process performed is entirely dictated by capitalist methods and imperatives. Marx does not give any examples. He notes, however, that the automation of core industries that produce necessities like food, clothing, and so on leads to the creation of new ‘branches of production ... particularly in the field of luxury consumption’. Indeed, these branches of production ‘take this relative surplus population as their basis, a population often made available owing to the preponderance of constant capital in other branches’ (Marx, 1993b: 344). By luxury consumption Marx does not mean, of course, the purchasing of yachts, mansions, and other expensive material goods available to the wealthy. He means instead what we would now call ‘personal services’, performed by what he designates elsewhere as ‘domestic servants’. The services provided by this class of employees tend to require person-to-person interactions (cooking and serving meals, care for children and

the elderly, cleaning and grooming activities, etc.) that do not produce a discrete material good to be sold on the market. These are the sorts of laboring activities that oppose a ‘greater resistance ... to the transformation of manual work into machine production’ than industries such as textile manufacturing, machine production, or, in the twentieth century, the making of automobiles, steel, or consumer electronics. The first key insight that Marx’s elliptical formulations suggests here is that these ‘new branches’ of production resist the total subordination of labor to capital and exhibit relatively low capital compositions, such that ‘both the rate and mass of surplus-value in these branches of production are unusually high’ (Marx, 1993b: 337).

There is another implication of Marx’s argument here that is only hinted at. When Marx suggests that new branches of production devoted to ‘luxury consumption’ arise with the automation of the manufacturing sector, he is also suggesting that these activities are to be understood as ‘unproductive’, that is, they do not produce surplus-value. But he equally suggests by the use of this phrase that these activities are paid for not out of capital but out of the private income of the wealthy. As a result, the unproductive nature of these activities will have no effect on the profit rate, since they do not function as a ‘cost’ to capitalist firms, but only to wealthy individuals and families who consume them. Yet in Volume 2 of *Capital*, Marx devotes an important set of reflections to *another* kind of unproductive labor: not luxury consumption paid out of private income, but ‘circulation’ and ‘supervisory’ activities that are necessary for the realization, in the exchange process, of the surplus-value captured in the immediate production process (Marx, 1993b: chapter 6).

UNPRODUCTIVE LABOR AND THE CRISIS TENDENCY

In the Introduction I began by describing a rapidly expanding service sector in contemporary capitalist economies, now making up as much as 80% of employment in the USA and UK. Given the confused nature of the concept of ‘services’ as used by traditional economists, this situation is better described as a shift of a larger and larger share of labor activities toward ‘unproductive’ activities, be they activities of circulation or supervisory and managerial functions that ensure the efficient use of labor, materials, and machinery.⁸ In Marx’s terms, these activities are unproductive: they do not produce a product, whether good or service, that can be sold for a profit. While a masseuse working for a massage parlor produces massages that produce more value than is required to reproduce his or her labor, and hence generates a profit for his or her employer, a security guard merely ensures that a certain article of property remains private; both his or her labor and the security firm’s profits are paid for out of profits generated at the enterprise he or she guards. In the same way, financial and retail activities are unproductive, as are activities that produce goods and services but are not sold

on the market, such as household production and government services. From Marx's point of view, 'productivity' in capitalism properly refers to the production of value and surplus-value; an increase in supervisory and circulation labor means a decline in the amount of labor consumed productively and so capable of generating profits for business owners.

Marx's approach has the virtue of clarifying that the rising proportion of the labor force working in circulation and supervision represents an increasing cost to the system as a whole. This introduces an added complication to Marx's theory of the tendency for the average profit rate to fall. What if a significant portion of the wage bill includes personnel who perform activities that do not produce value, as is the case with circulation and supervisory labor? Since these workers do not produce surplus-value, and even sufficient value to provide for their own reproduction, their wages must be paid out of surplus-value produced by productive workers elsewhere in the economy, thereby drawing down the total surplus-value available to capitalists for new investments. Since this total surplus value must be shared between productive and unproductive enterprises, the rising ratio of unproductive to productive labor represents an additional downward pressure on the profit rate. The increasing productivity of labor, in Marx's sense of a rising rate of exploitation, must therefore compensate not only for the reduction in the total demand for labor relative to the capital mobilized but also for the increasing costs of circulation and supervision, as more and more labor is allocated to non-productive activity.

But why do the costs of circulation and managerial labor increase? Aren't they just as susceptible to labor-saving innovations as productive activities, such as those in industries like manufacturing, mining, and agriculture? In an important commentary on this question formulated 40 years ago, Paul Mattick underlined the growing 'disproportion' between labor allocated to productive activities and to those representing costs of circulation. The increase in these costs is:

[a] consequence of the increasing productivity of labor, for the growing mass of commodities, produced with less and less labor, requires a disproportionate increase of the labor employed in distribution. This disproportionality has its source, on the one hand, in the enlargement and extension of the market and, on the other hand, in the *as yet unresolved fact* that the increase of productivity in the distribution process proceeds at a slower pace than in the production process ... The slower advance in the productivity of the so-called service sector of the economy depresses the rate of profit. (Mattick, 1983: 117)

Mattick's argument here depicts the economy as a whole as divided between two sectors, one subject to ongoing and rapid labor productivity increases, the other defined by a 'slower advance' in the deployment of labor-saving technologies. Mattick's argument here tends to identify the ('so-called') service sector, not simply as a technologically stagnant sector, but one composed in no small part by activities that do not produce value or surplus-value. As capitalist economies produce larger amounts of goods and services, the argument goes, more labor must be consumed by private businesses that do not directly produce value. The two most important types of activity are supervisory and circulation labor.

Since these activities are by definition unproductive, they are a cost to capital, rather than a source of new value; they are paid for out of the profits other productive businesses generate, rather than producing profit themselves.

Why do labor productivity increases in the distribution process (or the so-called service sector) proceed at a slower rate than those in the productive segment of capital's circuit? Why wouldn't the antidote to the growing disproportion in the allocation of productive to unproductive labor be found in accelerating the productivity gains of circulation and supervisory labor directly, primarily through automating them? Mattick speaks in this passage of an 'as yet unresolved fact', as if the disproportion were not a structural feature of capital accumulation but a contingency that might be overcome in the future. But he also suggests – echoing Marx's suggestion that 'many branches of production ... by their nature, oppose' significant resistance 'to the transformation of manual work into machine production' – that the limits to raising the productivity of workers tasked with circulating value in particular reflect a crucial change in the relation between production activities and the distribution process. 'Whereas the production process becomes increasingly more centralized into fewer and bigger enterprises', he writes, 'the distribution process is increasingly "decentralized"'. Here, the laws of motion regulating the accumulation of capital are elaborated in terms Marx only left implicit: if productive activities tend to be concentrated and centralized in fewer and larger firms, distribution activities are by necessity dispersed in space and carried out in a large number of, by definition, smaller workplaces, at least relative to those companies focused on productive activities.

CONCLUSION

This pattern, in which enormous productivity gains captured through economies of scale in certain core sectors of the economy are offset by the expansion of more labor-intensive activities in the circulation process, appears to be a structural feature of global capitalist production. What it suggests is that the central dynamic shaping the crisis tendency of advanced capital economies – those economies whose manufacturing sectors were 'automated' to a large extent in the post-war period – is the growing disparity between labor productivity gains in the productive and unproductive segments of the capital circuit. Since circulation labor, to take the primary example among unproductive uses of capital, is a cost to private businesses – necessary to realize surplus-value extracted in the production process yet paid out of profits – the enduring disparity in labor productivity gains between these two 'sectors' of the economy will continue to exert downward pressure on the profitability of private businesses across the economy as a whole. This pressure will manifest itself, periodically and with increasing frequency, in the form of systemic crises. The question raised by this highly abstract model of the growing ratio of unproductive to productive labor is

whether breakthroughs in automation can close the gap in productivity gains between the productive and unproductive segments, despite what Marx calls the 'greater resistance' the labor activities associated with circulation labor pose to automation. Were such a breakthrough possible, it would most likely restore the profit rate, while shedding enormous quantities of labor. This newly redundant labor would either swell the ranks of the unemployed, or be absorbed into the low-wage, low-skill 'personal services' sector (including what Marx called 'domestic servants').

If such a breakthrough is not possible, the only recourse for capital will be to intensify labor processes, while keeping wages as low as possible, at times even below the value of labor-power. The grim future automation theorists and advocates have projected, in which a surge in labor productivity in the vast service sector will force a significant fraction of the workforce onto unemployment rolls, will likely be replaced with another, equally grim, scenario. A modest rise in unemployment is likely enough, even if it goes unreported in official statistics, or is reflected instead in a declining labor participation rate (a trend since the turn of the century). But most workers affected by automation in core industries will find themselves forced to find employment in other lines of work that consist largely of low-paid, low-skill activities. This sector of the economy will continue to expand in the coming decades, but the combination of low wages, and the inherent difficulties these specific labor processes present to attempts to introduce labor-saving machinery, will most likely pose insurmountable obstacles to their automation in the near future. These conditions will drag down aggregate labor productivity gains across the workforce, as more and more labor is allocated to low-productivity employment. As labor productivity gains taper off, the capacity for workers to win higher wages will in turn be closed off, since without such gains any increase in wages would reflect an increase in the labor share of income and therefore a reduction in employer profits. Companies have historically fought such scenarios tooth and nail, in defense of their profit margins. But even as they continue to hold down wages, while increasing productivity through heightened workplace discipline, the tendency for mature capitalist economies to increase the ratio of unproductive to productive labor will exert further pressure on their bottom lines, launching future rounds of wage suppression and the intensification of labor processes. Since the mid-1970s, this is precisely what has happened in the advanced economies of the world. Since 2008, despite the rhetoric of automation that dominated the crisis years, the situation has only deteriorated.

Notes

- 1 Black workers in the core manufacturing industries were particularly affected by the automation wave beginning in the mid-1950s. See in particular Boggs (1963).
- 2 Two prominent 'popular' accounts addressing recent advances in automation and their potential economic and social effects are Brynjolfsson and McAfee (2014) and Ford (2015).

- 3 Ure was writing at a key historical transition, one marked by a struggle undertaken by the industrialist class against a fading, landowning, aristocratic elite, on the one hand (the Corn Laws of 1832), and an emerging, still-maturing industrial working class, on the other.
- 4 The transition from water- to steam-powered factories in England is discussed at great length in Andreas Malm (2016).
- 5 On the relationship between mechanization of labor processes and ‘deskilling’, see Braverman (1974).
- 6 On the notion of the capitalist ‘use’ or ‘application’ of machinery, see Panzieri (1980: 44–58). My approach to the question of automation here owes much to Panzieri’s groundbreaking essay.
- 7 The 10-hour workday, a central demand of the labor movement, was only implemented in 1847, and only for women and children between 13–18.
- 8 For criticism of mainstream economics’ theorization of the ‘service’ sector from a Marxist perspective, see Walker (1985) and Tregenna (2018).

Patrick Murray

INTRODUCTION

Karl Marx thought deeply about matters of method throughout his life; nonetheless, he wrote few general reflections on it. He chose not to publish his chief text on method, the Introduction to the *Grundrisse*. He told Engels that in the first volume of *Capital* (1867), method would be much more hidden than in the *Contribution to the Critique of Political Economy* (1970b) [1859]. Marx made enigmatic comments, declaring himself to be Hegel's pupil, then complaining: 'With him it [the dialectic] is standing on its head. It must be inverted, in order to discover the rational kernel within the mystical shell' (Marx, 1976b: 103). Years earlier, Marx had written to Engels, 'If there should ever be time for such work again, I would very greatly like to make accessible ... what is *rational* in the method which Hegel discovered but at the same time enveloped in mysticism' (Marx, 1955a: 102). That time never came.

Marx claims originality for the method of his critique of political economy and cautions readers as to its difficulty: 'the method of analysis which I have employed, and which had not previously been applied to economic subjects, makes the reading of the first chapters [of *Capital*] rather arduous ... There is no royal road to science' (Marx, 1976b: 104). Reflecting on reviews of *Capital*, he voices disappointment 'that the method employed in *Capital* has been little understood as is shown by the various mutually contradictory conceptions

that have been formed of it' (Marx, 1976b: 99). Late in life, Marx wrote 'Notes on Adolph Wagner' (Marx, 1975), an important manuscript that criticizes the German economist's understanding of Marx's method in *Capital*.

James Collins writes of the 'insistency of the sources' in interpretive work: 'There is *the research opening toward the sources* on the part of the historian. . . . This effort at understanding is encouraged and sustained by *the originative opening from the sources* themselves' (Collins, 1972: 52). Our understanding of Marx's method has been aided by the openings to texts by Marx unpublished in his lifetime. Christopher Arthur observes of the 'new dialectic' interpretation of Marx's method: 'What is involved in the first place is simply a return to sources, making a serious study of what Hegel and Marx really achieved with respect to dialectic' (Arthur, 2002: 2). Among the important posthumous texts of Marx for a discussion of method are the *Critique of Hegel's 'Philosophy of Right', Economic and Philosophic Manuscripts of 1844, Grundrisse, Urtext (Original Text of 'A Contribution to the Critique of Political Economy')*, 'Notes on Wagner', 'Results of the Immediate Production Process', *Economic Manuscript of 1861–3* (1988a, 1989a, 1989b, 1991), and *Economic Manuscript of 1864–5* (2015). There is much to digest.

THE INSEPARABILITY OF FORM AND CONTENT: WHY MARX WROTE FEW REFLECTIONS ON METHOD

We can trace why Marx wrote sparsely on method to his encounter with Hegel. As a 19-year-old student, Marx writes to his father that, while trying to compose a Kantian–Fichtean book of jurisprudence, a turbulent reading of Hegel rocked his thinking. In the aftermath, he reflects on his first effort: 'My mistake was that I believed one could and must develop the one [form] apart from the other [content], with the result that I achieved no genuine form but a desk with a number of drawers I subsequently lettered with sand.' (Marx, 1967a: 43). We recognize Marx's debt in Hegel's statement:

Form and content are a pair of determinations that are frequently employed by the reflective understanding, and, moreover, mainly in such a way that the content is considered as what is essential and independent, while the form, on the contrary, is inessential and dependent. Against this, however, it must be remarked that in fact both of them are equally essential. (Hegel, 1991: 202)

This demand is the root of dialectic; it opposes *a priori* thinking. In this sense, Marx is an empiricist. But for Marx, as for Aristotle, experience includes form, notably, social form. From this understanding of form and content, we see (1) there is little to say in general about method, and (2) matters of method and substance are inseparable. Getting Marx right on method and getting the substance of his views right are two aspects of one task.

In the *Critique of Hegel's 'Philosophy of Right'* (1843), Marx turns the inseparability of form and content against Hegel. Marx charges Hegel with forcing

modern society to fit an *a priori* logic: ‘However, this comprehension [*Begreifen*] does not, as Hegel thinks, consist in everywhere recognizing the determinations of the logical concept [*des logischen Begriffs*], but rather in grasping the proper logic of the proper object’ (Marx, 1970a: 92). To grasp ‘the proper logic of the proper object’ is the soul of Marx’s method; this is the key to the present interpretation. A ‘proper logic’ cannot be known *a priori*; it requires experience-based investigation. Hegel fails to meet his own standard with respect to the inseparability of form and content. As Marx charges, ‘he does not develop his thought out of what is objective [*aus dem Gegenstand*], but what is objective in accordance with ready-made thought which has its origin in the abstract sphere of logic’ (Marx, 1970a: 14). Years later, Marx would criticize Ferdinand Lasalle’s attempt at a Hegelian presentation of political economy: ‘to bring a science by criticism to the point where it can be dialectically presented is an altogether different thing from applying an abstract ready-made system of logic to mere inklings of such a system’ (Marx, 1955b: 102). Marx returns often to this accusation of imposing ‘ready-made thinking’. Christopher Arthur finds this kind of imposition in Soviet Marxist Diamat: ‘This lifeless formalism proceeded by applying abstract schemas adventitiously to contents arbitrarily forced into the required shape’ (Arthur, 2002: 3). This is no way to reach ‘the proper logic of the proper object’.

Because he fails to engage the dialectic of form and content, Hegel falls into both *idealism* and *positivism*. Imposing logical forms ‘necessarily has as its result that an empirical existent is taken in an uncritical manner to be the real truth of the Idea’ (Marx, 1970a: 39). Marx finds the source of this two-fold failure in Hegel’s *Phenomenology of Spirit*: ‘there is already latent in the *Phenomenology* as a germ, a potentiality, a secret, the uncritical positivism and the equally uncritical idealism of Hegel’s later works – that philosophic dissolution and restoration of the existing empirical world’ (Marx, 1964: 175–6). In failing to grasp ‘the proper logic of the proper object’, idealism has bad empirical and political consequences. Thirty years later, Marx returns to this point. When dialectical thinking misfires, it turns conservative: ‘In its mystified form, the dialectic became the fashion in Germany, because it seemed to transfigure and glorify what exists’ (Marx, 1976b: 103). In ‘interpreting’ the world, failed dialectical thinkers only entrench it.

ASSESSING CONCEPTUAL HORIZONS

To arrive at his method, Marx first examines existing conceptual horizons. Marx concludes the *Economic and Philosophic Manuscripts of 1844* with a ‘Critique of Hegelian Dialectic and Philosophy in General’. He regards that critique ‘to be absolutely necessary, a task not yet performed’ (Marx, 1964: 64). Marx concludes that Hegel lapses into the same Enlightenment dualisms that he sought to

overcome. He praises Hegel for grasping ‘*labor* as the *essence* of man’ yet protests that ‘the only labor which Hegel knows and recognizes is *abstractly mental* labor’ (Marx, 1964: 177). With Hegel, ‘the rich, living, sensuous, concrete activity of self-objectification is therefore reduced to its mere abstraction ... sheer activity’ (Marx, 1964: 189), just as value is the objectification of *abstract* labor. Marx then pays Hegel a left-handed compliment:

Hegel’s positive achievement here, in his speculative logic, is that the *definite concepts*, the universal *fixed thought-forms* in their *independence vis-à-vis* nature and mind are a necessary result of the general estrangement of the human essence and therefore also of human thought. (Marx, 1964: 189)

Because Hegel reduces human consciousness to ‘*abstractly mental* labor’, he *necessarily* generates ‘fixed thought-forms’ opposite nature and spirit. Anticipating his view that value (congealed abstract labor) necessarily is expressed in money, Marx says of Hegel: ‘Logic is the money of spirit’. Thus, in his *Encyclopedia of the Philosophical Sciences*, Hegel puts logic ahead of nature and spirit, so that ‘the whole of nature merely repeats the logical abstractions in a sensuous, external form’ (Marx, 1964: 174). Just as commodities are carriers of value, Hegel treats the wealth of nature and society as bearers of logical abstractions.

In *The Poverty of Philosophy* (1847), Marx engages in a simultaneous critique of philosophy, political economy, and bourgeois socialism: ‘economists express the relations of bourgeois production, the division of labour, credit, money, etc., as fixed, immutable, eternal categories’ (Marx, 1963a: 104). Proudhon waxes Hegelian and is ‘forced to attribute the origin of these thoughts to the movement of pure reason’ (Marx, 1963a: 105). Though he considers Proudhon to be a poor Hegelian, Marx reasserts his critique of Hegel:

It is of this absolute method that Hegel speaks in these terms: ‘Method is the absolute, unique, supreme, infinite force, which no object can resist; it is the tendency of reason to find itself again, to recognize itself in every object’ (*Logic*, Vol. III). All things being reduced to a logical category, and every movement, every act of production, to method, it follows naturally that every aggregate of products and production, of objects and of movement, can be reduced to a form of applied metaphysics. (Marx, 1963a: 107)¹

Proudhon, in his turn, wants to derive ready-made economic categories from a ready-made metaphysics.

BEYOND THE BOURGEOIS HORIZON

In criticizing Proudhon, Marx complains that he ‘does not rise above the bourgeois horizon’ (Marx, 1963b: 190). The bourgeois horizon, which is shared by idealism and materialism, fails to recognize the inseparability of subject and object, form and content. Marx targets that phenomenological failure in the first of the ‘Theses on Feuerbach’:

The chief defect of all previous materialism (that of Feuerbach included) is that things [*Gegenstand*], reality, sensuousness are conceived only in the form of the *object*, or of *contemplation* [*Anschauung*], but not as *sensuous human activity, practice* [*Praxis*], not subjectively. Hence, in contradistinction to materialism, the *active* side was set forth abstractly by idealism – which, of course, does not know real, sensuous activity as such. (Marx, 1976c: 3)

The fault underlying idealism and the ‘previous materialism’ is the split between subject and object, activity and passivity. Practical, sensuous human activity, which repels any split between subject and object or activity and passivity, is Marx’s phenomenological corrective to the bifurcations of the bourgeois horizon.²

Marx attributes classical political economy’s failings to its confinement to the bourgeois horizon: ‘Yet even its best representatives remained more or less trapped in the world of illusion their criticism had dissolved, and nothing else is possible from the bourgeois standpoint’ (Marx, 1981: 969). The bourgeois horizon splits the social provisioning process from the historically changeable social forms and purposes that constitute it – a false phenomenology of the provisioning process. Consequently, generally applicable categories such as wealth, labor, and instrument of production get conflated with socially specific ones, such as the commodity, value-producing labor, and capital. Marx observes:

The whole profundity of those modern economists who demonstrate the eternity and harmoniousness of the existing social relations lies in this forgetting. For example. No production possible without an instrument of production, even if this instrument is only the hand. No production without stored-up, past labour, even if it is only the faculty gathered together and concentrated in the hand of the savage by repeated practice. Capital is, among other things, also an instrument of production, also objectified, past labour. Therefore it is a general, eternal relation of nature; that is, if I leave out just the specific quality which alone make ‘instrument of production’ and ‘stored up labour’ into capital. (Marx, 1973: 85–6)

Here we see the apologetic character of the bourgeois horizon: capital is presented as permanent.

IMMANENT CRITIQUE AND MARX’S CRITICAL SOCIAL EPISTEMOLOGY

Marx’s critique of the bifurcations of the bourgeois horizon owes much to Hegel’s critique of the unreconciled dualisms of the reflective understanding (*Verstand*). Likewise, Marx’s practice of immanent critique is indebted to Hegel, who wrote: ‘the genuine refutation must penetrate the opponent’s stronghold and meet him on his own ground’ (Hegel, 1969: 581). In the notes to his doctoral dissertation, Marx directs that thought at Hegel:

If a philosopher has accommodated himself, his disciples have to explain *from his inner essential consciousness* ... his essential form of consciousness is constructed, raised to a particular form and meaning, and at the same time superseded. (Marx, 1967b: 61)

We saw that Marx turns Hegel against himself in the *Critique of Hegel's 'Philosophy of Right'* and in the final Paris manuscript: Hegel relapses into bifurcations that he meant to overcome. As Georg Lukács comments, '[Marx] measured Hegel's philosophy by the yardstick he had himself discovered and systematically elaborated, and he found it wanting.... Marx's critique of Hegel is the direct continuation and extension of the criticism that Hegel himself levelled at Kant and Fichte' (Lukács, 1971: 17). Immanent criticism requires the sort of concentrated textual study that Marx undertook throughout his life.

In *Capital*, Marx returns to his critique of the bourgeois philosophy of right by showing that the principles of liberty, equality, and respect for persons in the marketplace present the cheery face of a mode of production that is based on the exploitation of wage workers and the domination of all by the price system and endless capital accumulation. Marx explains how workers can be paid a wage equal in value to the labor power that they sell to capitalists – meeting the demands of bourgeois justice – and still be exploited. In arguing that the continuous functioning of the market presupposes production on a capitalist basis, he reveals that commodity circulation is driven by capital's drive for profits and that even the apparent justice of the wage contract is a fraud since workers are paid from surplus-value previously extracted. The liberty and equality of the marketplace mask realities that thwart the aims of bourgeois right.

Marx argued that the tendency of the rate of profit to fall was immanent to the capitalist mode of production, though not due to external factors, as David Ricardo thought. Capital's inherent drive to increase the productive power of labor and reap relative surplus-value tends to make production less labor-intensive, but that reduction – abstracting from immanent countertendencies – diminishes the source of profit. Marx observes:

It comes to the surface here in a purely economic way – i.e., from the bourgeois point of view, within the limitations of capitalist understanding, from the standpoint of capitalist production itself – that it has its barrier, that it is relative, that it is not an absolute, but only a historical mode of production corresponding to a definite limited epoch in the development of the material requirements of production. (Marx, 1981: 259)

For Marx, the ultimate immanent critique of bourgeois society is that capital is its own barrier.

Marx's method, rooted in historical materialism, is not only to make immanent critiques of key thinkers but also to grasp their form of consciousness in relation to the mode of production. For Marx, a form of consciousness is not a thing apart; it belongs to a form of social life: 'consciousness can never be anything other than conscious being, and the being of men is their actual process of life' (Marx and Engels, 1976: 36). The study of consciousness and its forms, including philosophical and scientific thinking, belongs to historical materialism. The social form of the provisioning process always has implications for consciousness. As Moishe Postone puts it, 'the *form* of social relations' must be treated 'as an epistemological category' (Postone, 1993: 176), as a way of understanding

ideology. Marx speaks of the bourgeois horizon because he views it as a form of consciousness that fits and reinforces the social relations constitutive of capitalist society. Critical social epistemology falls within the method of historical materialism. It calls for self-reflexivity on the part of the investigator.

THE 1857 INTRODUCTION TO THE *GRUNDRISSE*: SIX KEY POINTS

The 1857 Introduction to the *Grundrisse* is the single most fruitful source on Marx's method; six points may be highlighted with respect to its contribution.

- 1 Historical materialism is the heart of Marx's method: 'Individuals producing in society – hence socially determined individual production – is, of course, the point of departure' (Marx, 1973: 83). Social determination is not an add on; individuals do not pull on sociality on like a sweater. Historical materialism tells you *that* production is socially determined but not *how*. It paves no royal road to explanation.
- 2 Marx distinguishes between *general* and *determinate* abstractions. Generally applicable categories have a role to play in Marx's method: 'There are characteristics which all stages of production have in common, and which are established as general ones by the mind', but 'no real historical stage of production can be grasped' with them (Marx, 1973: 88). Determinate categories, such as the ones Marx develops in *Capital*, are needed for that. Marx is careful to distinguish between a legitimate, though limited, use of general categories and the notion that we can speak of production-in-general: 'If there is no production in general [production without a definite social form], then there is also no general production. Production is always a *particular* branch of production' (Marx, 1973: 86). We talk about widgets to make general points about production, but there are no widget factories.
- 3 Marx distinguishes two senses of 'concrete'. One contrasts the actual world from concepts; the other distinguishes among concepts. One concept is more concrete than another if it is conceptually more developed: 'the concrete ... is the concentration of many determinations' (Marx, 1973: 101). Capital, for example, is a more concrete concept than that of the simple commodity.
- 4 Marx distinguishes between the method of inquiry [*Forschungsweise*] and the method of presentation [*Darstellungsweise*]. The *method of inquiry* works from the concrete (in the first sense) to categories that are abstract (not conceptually concrete), while the method of presentation, roughly, works from the conceptually abstract to the concrete.³ Henryk Grossman (1992) introduced the idea of *successive approximations* to interpret Marx's *method of presentation* in *Capital*.⁴ Grossman's influential successive approximations interpretation has largely given way to a systematic dialectical interpretation of Marx's method of presentation in *Capital*.⁵ The two interpretations share a conception of *Capital* as having different stages of analysis moving from higher to lower levels of abstraction, but they differ importantly. First, levels of approximation are taken to exist independently. In systematic dialectics, by contrast, all the stages in the presentation refer to levels of abstraction from the same object of inquiry – not to independently existing stages. Second, in the successive approximations approach, later stages presuppose the earlier ones but not vice versa. If they did, they would not be independent. In systematic dialectics, conceptual levels are mutually presupposing; they belong to a totality. Third, in the successive approximations approach, what is claimed at earlier stages of approximation is shown by later stages of approximation to be false. In a systematic dialectical approach, by contrast, the claims made at the higher levels of abstraction, that is, in the earlier stages of the presentation, are true (though conceptually incomplete) and remain true throughout. Two key examples are the claims that the price of the total heap of commodities – but not of commodities taken

individually – is determined by its value and that the total surplus-value (interest plus profit of enterprise plus rent) – but not the profit realized by the sale of individual commodities – is determined by the amount of surplus labor represented in that heap.

- 5 Marx insists on the phenomenological point that the different aspects of a mode of production are distinguishable but inseparable. They belong to a totality: 'production, distribution, exchange and consumption ... all form the members of a totality, distinctions within a unity' (Marx, 1973: 99). In chapter 51 'Relations of Production and Relations of Distribution' of volume 3 of *Capital*, Marx returns to the phenomenological point that production and distribution are inseparable. This important truth has consequences – for example, value cannot be strictly a category of production or distribution.
- 6 *Capital* is about capital from start to finish: 'capital is the all-dominating economic power of bourgeois society. It must form the starting-point as well as the finishing-point' (Marx, 1973: 107). The determinate categories of *Capital* 'express the forms of being, the characteristics of existence, and often only individual sides of this specific society' (Marx, 1973: 106). Marx adds that this is 'decisive for the order and sequence of the categories' (1973: 106), which belies the 'logico-historical' interpretation of the ordering of *Capital*.

GRASPING SOCIAL FORMS IN THEIR COMPLEXITY

Marx explains how the method of the political economists alternately collapses complex social forms into simple ones and abstracts altogether from specific social forms:

There are two points here which are characteristic of the method of the bourgeoisie's economic apologists. The first is the identification of the circulation of commodities with the direct exchange of products [barter], achieved simply by abstracting from their differences. The second is the attempt to explain away the contradictions of the capitalist process of production by dissolving the relations between persons engaged in that process of production into the simple relations arising out of the circulation of commodities. (Marx, 1976a: 209–10, n. 24)

Reduce capital's circuit to simple commodity circulation, then reduce circulation to barter: specific social forms vanish. Capitalism is then represented as the residue, the immutable economy-in-general.

METHOD AND SUBSTANCE IN MARX'S CRITIQUE OF POLITICAL ECONOMY

Marx is not a political economist but rather a critic of political economy, as the subtitle of *Capital* tells readers. Marx's critique is at once methodological and substantive. As Guido Starosta comments, 'a proper grasp of the substantive *content* of commodity fetishism can only result from a correct understanding of the very *form* of Marx's process of cognition' (Starosta, 2017: 104). Attending to specific social forms and purposes is central to the method of Marx's critique of political economy. In *Capital*, that critique begins with the opening sentence. He identifies the object of his inquiry as capitalist societies, where wealth is

produced in the commodity form. Marx calls out Adam Smith, who, in the *Wealth of Nations* (1776), makes claim to a science of wealth without any social form or purpose – as if wealth existed and was produced in general.

Value and its Necessary Form of Expression

Reasoning from commodities to value, Marx examines not only the *substance* (congealed abstract labor) and *magnitude* (labor time) of value but also its necessary *form of expression* (money) – value’s three inseparable aspects. Marx’s investigation of the value-form sets his labor theory of value apart from the classical one: ‘Even its best representatives, Adam Smith and Ricardo, treat the form of value as something of indifference, something external to the nature of the commodity itself’ (Marx, 1976a: 174, n. 33). Confined to the bourgeois horizon, the classical political economists neglect matters of form: ‘With all later bourgeois economists, as with Adam Smith, lack of theoretical understanding needed to distinguish the different forms of economic relations remains the rule in their coarse grabbing at and interest in the empirically available material’ (Marx, 1963c: 92). Value is a consequence of the social form of labor.

Adapting Hegel’s logic of essence – *essence must appear as something other than itself* – Marx shows that value necessarily appears as money (price), and he traces that necessity to the peculiarly asocial social form of labor in capitalism. Classical political economists employ a pre-Hegelian notion of essence and appearance; they take value to be the independent variable and price to be the dependent variable. Demonstrating that value (essence) is inseparable from money (appearance) is a way that Marx shows value to be historically specific. Consequently, embodied labor (classical political economy) and utility (neoclassical economics) are the wrong kind of concepts to explain value.

Two Sore Points: Commodity Money and the ‘Transformation Problem’

Two reasons commonly given for rejecting *Capital* are: (1) Marx claims that money must have intrinsic value; and (2) the theory of value in *Capital*, volume 1 cannot be reconciled with the prices of production introduced in *Capital*, volume 3. In other words, the ‘transformation problem’ has no satisfactory solution. Expanding on work by Suzanne de Brunhoff (1976), Martha Campbell (2017) explains the method of *Capital* to show how Marx argues in the chapter on money in *Capital*, volume 1 that money need not have intrinsic value, thereby laying the basis for his argument in *Capital*, volume 3 that money in capitalism is credit-money. Fred Moseley (2016) argues there is no ‘transformation problem’ because there is nothing to transform. In both arguments, how Marx’s method is understood is key.

In the first argument, three functions of money are examined in chapter 3 of *Capital*, volume 1 – measure of value (and standard of price), medium of

circulation, and money as money. These are inseparable: each depends on the other. What matters is not money's materiality but that it is socially established as the universal equivalent. Money is hoarded for that reason, not for its intrinsic value. None of money's functions require it to have intrinsic value.

In the second argument, when Marx introduces the circuit of capital, $M - C - (M + \Delta M)$, in chapter 4 of *Capital*, volume 1, he calls ΔM surplus-value. Both the M that begins the circuit and ΔM , which is the goal of the circuit, are sums of money. The M introduced in chapter 4 equals c (constant capital) + v (variable capital). Since in capitalism individual commodities sell not at their individual values but rather at their prices of production, Moseley (2016) reasons, the actual prices at which the elements of constant and variable capital are purchased are prices of production, not individual values. The commodities are not paid for in volume 1 and again in volume 3. So, the prices of the commodities represented by c and v need no transformation. But Marx could not develop the categories needed to say that until *Capital*, volume 3. Individual commodities and capitals in *Capital*, volume 1 are aliquot or representative parts of the total heap of commodities and the total social capital. The M and ΔM introduced in chapter 4 are the same quantities that appear at the beginning of *Capital*, volume 3, where Marx develops the concepts of profit, cost price, and price of production (cost price plus profit as determined by the average rate of profit). Since the price of a commodity always was a portion of the money capital expended, that money capital always purchased commodities at their price of production. So, there is nothing to transform in *Capital*, volume 3 – no problem to solve. Moseley notes how method and substance align: 'if Marx's logical method is interpreted in this way, then there is *no* "transformation problem" in Marx's theory' (Moseley, 2016: 4). The problem created by the successive approximations interpretation is dissolved.

If correct, these two arguments demonstrate the significance of grasping the inseparability of method and substance in Marx's critique of political economy.

GEORG LUKÁCS: METHOD AS MARXIST ORTHODOXY

In 'What is Orthodox Marxism?', Georg Lukács (1885–1971) offers this answer: 'Orthodox Marxism ... refers exclusively to *method*'. That method is historical materialism: 'Marx's dictum: "The relations of production of every society form a whole" is the methodological point of departure and the key to the historical understanding of social relations' (Lukács, 1971: 9). Marxist method is materialist, dialectical, and revolutionary. Historical materialism may hold 'the key to the historical understanding of social relations', but, as a method, it is thin, a 'point of departure', not a royal road to science.

In separating method from its object, Lukács makes method inviolable, while every individual thesis is disposable. Deflecting criticism of Marx's critique of political economy, this approach distorts Marx's understanding of method. Marx

rejects the separation of method from its object. Already in his early manuscripts, Marx develops his understanding of method in step with his ideas on how capital constitutes the modern world. The conceptual build-up of *Capital* is laced with methodological considerations: we understand *Capital*'s structure better only by examining its method and its theses jointly. Moreover, decoupling method from substantive judgments does not fit Lukács' own account. He writes of Marx's early critique of Hegel: 'it is at reality itself that Hegel and Marx part company. Hegel was unable to penetrate to the real driving forces of history. ... In consequence he was forced to regard the peoples and their consciousness as the true bearers of historical evolution' (Lukács, 1971: 17). Lukács' transition 'in consequence he was forced to' ties Hegel's substantive shortcoming to his idealist method. This better matches Marx.

Lukács' seminal contribution to Marxist method lies in the light he put on *form*, especially social forms and their dialectic with forms of thought. Lukács learned to appreciate form through his early associations with Max Weber, Georg Simmel, and Emil Lask, and from the two thinkers who most influenced him, Hegel and Marx. Marx begins *Capital* with the commodity form because, in Lukács' words, 'at this stage in the history of mankind there is no problem that does not ultimately lead back to that question [of the commodity form] and there is no solution that could not be found in the solution to the riddle of commodity-structure' (Lukács, 1971: 83). The ghostly objectivity of value, the commodity's fetish character, 'stamps its imprint upon the whole consciousness of man' (Lukács, 1971: 100). Form matters.

Lukács finds the imprint of the commodity form on modern philosophy: 'Modern critical philosophy springs from the reified structure of consciousness. The specific problems of this philosophy are distinguishable from the problematics of previous philosophies by the fact that they are rooted in this structure' (Lukács, 1971: 110). The indifference of value toward use-value that comes with the commodity form – value's ghostly objectivity – is the social basis of the antinomies of bourgeois thought. These antinomies result from factoring out from experience an empty subject and an unknowable residue – the thing-in-itself. Lukács renews Marx's rejection of the factoring philosophy of Kant and Fichte: Lukács insists, 'every object exists as an immediate inseparable complex of form and content' (Lukács, 1971: 126). Marxist method pushes past the bourgeois horizon.

Lukács turns to Marx's philosophy of praxis to overcome the antinomies of bourgeois thought: 'the essence of praxis consists in annulling *that indifference of form towards content* that we found in the problem of the thing-in-itself' (Lukács, 1971: 126). Lukács identifies the proletariat as the subject of that praxis, 'the identical subject-object, the subject of action; the "we" of the genesis: namely the proletariat' (Lukács, 1971: 149). The proletariat, says Lukács, occupies the class position that enables it to overcome the antinomies of bourgeois thought. Lukács looks to the proletariat.

GALVANO DELLA VOLPE: AGAINST THE *A PRIORI*

Galvano Della Volpe (1895–1968), like Marx, was a convert from idealism to materialist dialectics. He writes of the *Critique of Hegel's 'Philosophy of Right'*, where Marx criticizes Hegel for imposing logical universals on social particulars, 'it is already clear how the knowledge of that new dialectical materialist *method* comes into being here' (Della Volpe, 1979: 166). That '*method*' is directed at what Marx called 'the *proper* logic of the *proper* object' (Marx, 1970a: 92). This aim shifts inquiry away from *a priori* methods. Della Volpe followed this lead. Marx worried that the conceptual development in *Capital* 'may appear as ... a mere *a priori* construction' (Marx, 1976b: 102) – though it is not. Della Volpe's passion was to keep Marxist method free of the *a priori*. For Della Volpe, there is one scientific method, the experimental method. Marx directs the experimental method at society:

Marx's critique demonstrated a fortiori that apriorism, Hegelian or otherwise, is sterile and illegitimate in philosophy in general, and therefore also in the so-called moral sciences. The prospect of a new science was thereby opened: philosophy as a historical, experimental science of humanity. (Della Volpe, 1980: 124)

What Galileo was to natural science, Marx is to social science.

Della Volpe locates Marxist method in the history of Western philosophy. Plato's theory of forms, which splits the intelligible from the sensible, is seminal for *a priori* thinking. Aristotle improves on Plato, but Della Volpe regards Aristotle's essences as residuals of Platonic forms. Like the empiricist John Locke, Della Volpe rejects the innate ideas of the rationalists. He praises Immanuel Kant for upholding sensibility as a separate and positive cognitive faculty: 'Kant strikes a decisive blow against Leibniz's Platonism and affirms modern science's insistence on experience. Against Leibniz, Kant maintains ... that "an intuition and a concept are representations wholly distinct in kind"' (Della Volpe, 1980: 5–6). But Kant disappoints Della Volpe with his '*formalization*, or intellectualization, of transcendental logic'. For Della Volpe, that is 'fatal, for any attempt to resolve the problem of experience adequately' (1980: 15). Kant 'replaces the *metaphysics of being* ... with a *metaphysics of knowledge*': the soul is replaced with the 'I think' (Della Volpe, 1980: 123). Kant lost touch with Aristotle's discursive reasoning, wherein judgments are simultaneously analytic and synthetic.

Della Volpe sees Hegel as regressing from Kant to Plato's purely intelligible forms. Hegel's method, as Marx revealed, is hypostatization and inversion of subject and predicate. Speculation reduces reality to logical ideas, which it then treats as subjects whose predicates are the particulars. The Idea is the subject; family, civil society, and the state are its predicates. Marx plays Aristotle to Hegel's Plato, except that Marx thoroughly eliminates the *a priori*.

Neither Della Volpe nor Marx is against abstractions; that would be to reject thinking. It is the kind of abstractions that matters. Della Volpe cites Lenin

approvingly: ‘Marx ... discarded all these arguments about society and progress in general and produced a scientific analysis of one society and of one progress – capitalist’ (quoted in Della Volpe, 1980: 131). Marx sees the futility in attempting to do social science with generic categories. This is the genius of Marx’s method:

This specific conception of philosophy as science is synonymous with the ‘determinate’ or ‘precise’ abstraction, the rigorous scientific abstraction, which Marx discovered and employed in the particular ‘moral discipline’ of political economy. He counterposed this determinate abstraction to the ‘speculative’, generic, or ‘forced’ abstraction employed by traditional economists, who affirmed that there were ‘natural’ and eternal economic laws. (Della Volpe, 1980: 183–4)

Marx’s concepts, for example, the commodity, value, money, capital, and wage labor, are determinate and historical; they hold for capitalist society, not society in general. They are hard won.

ANALYTICAL MARXISM: ANALYSIS WITHOUT PHENOMENOLOGY

Analytical Marxism, like analytical philosophy, fails to recognize that method requires analysis *and* phenomenology. Analysis draws distinctions, but phenomenology consults experience to determine when the distinguishable is not separable. The failure reaches back to David Hume, who allows no place for phenomenology. He recognizes only two types of knowledge: *relations of ideas* and *matters of fact or existence*. Hume makes phenomenological judgments nevertheless, and his conception of a ‘distinction of reason’ requires them (Hume, 1978: 25). Hume’s classification of perceptions into impressions and ideas based on their force and vivacity relies on this phenomenological judgment: perceptions always have some degree of force and vivacity. Because, like Hume, analytical philosophy sees no warrant for phenomenological inquiry, it treats the distinguishable as the separable. In following suit, Analytical Marxism operates within what Marx called the bourgeois horizon.

Marx’s theory of value has phenomenological roots. First, labor is inseparable from its specific social form: value is purely social; it arises from the social form of labor in capitalism. Second, value is inseparable from money: price is value’s necessary form of expression.⁶ Value and price are distinguishable but not separable: value is not the independent and price the dependent variable. Analytical Marxists interpret Marx’s theory of value along Ricardian, Sraffian, or neoclassical lines, each of which ignores the social form of the labor that produces value. Consequently, value is either taken to be a transhistorical reality or dismissed, and the necessity for value to be expressed as money cannot be thought.

Analytical Marxism treats the historical materialist concepts that underlie Marx’s critique of political economy – forces of production, relations of production, superstructure, and forms of consciousness – as separable, though interacting, elements. For Marx’s phenomenology, these distinguishable aspects of

social life are not separable. Technological determinism, which treats the forces of production as separate and dominant, is not an option for Marx: forces of production are always constituted by social forms and purposes that make a mode of production a way of life.

The concepts that Marx identifies as constitutive of the capitalist (or any other) mode of production are ethically, socially, and politically charged. They challenge the analytical divide between description and prescription. *Capital* begins with wealth in the commodity form. Commodity exchanges – buying and selling – are undertaken voluntarily by persons equal before the law. Who counts as a person and what counts as a voluntary exchange are normatively contested judgments. Allen Wood is wrong to claim that Marx's ideas about value are 'not in any sense normative or "evaluative" ideas' (Wood, 1981: 225). For the law of value holds only where wealth is generally produced in the commodity form. For Marx, value is bound up with capitalist liberty, equality, property, and egoism – and with capitalist alienation, fetishism, domination, and exploitation. These are all normatively charged. Since to be a productive laborer in capitalism is to be exploited as a source of surplus-value, Marx observes, 'To be a productive worker is therefore not a piece of luck, but a misfortune' (Marx, 1976a: 644). Marx's phenomenology of a mode of production repudiates the analytical bifurcation between description and prescription.

HORKHEIMER AND ADORNO: FROM 'TRADITIONAL AND CRITICAL THEORY' TO THE 'NEUE MARX LEKTÜRE'

On the 70th anniversary of the publication of *Capital*, volume 1, Max Horkheimer (1895–1973) published 'Traditional and Critical Theory'. The objectivity sought by critical theory, Horkheimer writes, is not indifferent to the plight of humanity: 'the self-knowledge of present-day man is ... a critical theory of society as it is, a theory dominated at every turn by a concern for reasonable conditions of life' (Horkheimer, 1972: 198–9). Horkheimer is sympathetic to traditional theory's aspiration to objectivity: 'Mind [*Geist*] is liberal. It tolerates no external coercion, no revamping of its results to suit the will of one or other power', but mind 'is not cut loose from the life of society; it does not hang suspended over it' (Horkheimer, 1972: 223). No theory of society is without political motivations, so objectivity requires self-reflexivity and humane judgment.

Against the naturalizing empiricism of traditional theory, Horkheimer insists on the historical character of theory and its object: 'The facts which our senses present to us are socially preformed in two ways: through the historical character of the object perceived and through the historical character of the perceiving organ' (Horkheimer, 1972: 200). Critical theory must be open to historical changes, for example, a shift from liberal capitalism to forms of monopoly or politically steered capitalism.

Referring to Marx, Horkheimer traces the critical theory of society to ‘the dialectical critique of political economy’ (Horkheimer, 1972: 206). We live, Horkheimer laments, in a world that is ‘the world of capital’ (1972: 208). Since the social world ‘in principle should be under human control and, in the future at least, will in fact come under it’, Horkheimer observes, ‘these realities lose the character of pure factuality’ (1972: 209). Marx had insisted on the transitory character of the capitalist mode of production. Likewise, Horkheimer’s critical theory insists that social relations can be changed. Critical theory is ‘an element in action leading to new social forms’ (Horkheimer, 1972: 216).

Like Lukács, Horkheimer looks to the development of the consciousness of the proletariat; like Lukács, he cautions, ‘even the situation of the proletariat is, in this society, no guarantee of correct knowledge. ... Even to the proletariat the world superficially seems quite different than it really is’ (Horkheimer, 1972: 213–14). The critical theorist’s function is to create ‘a dynamic unity with the oppressed class’, to become ‘a force ... to stimulate change’. But the ‘possibility of tension between the theoretician and the class which his thinking is to serve’ is ever present (Horkheimer, 1972: 215).

Critical theory cannot settle, as traditional theory does, for general categories. Horkheimer notes: ‘The primary propositions of traditional theory define universal concepts under which all facts in the field in question are to be subsumed’ (1972: 224). Such general concepts are not scientifically adequate. The determinate categories that critical theory demands belong to a totality: ‘The Marxist categories of class, exploitation, surplus value, profit, pauperization, and breakdown are elements in a conceptual whole’ (Horkheimer, 1972: 218). When Horkheimer moves to articulate the structure of *Capital*, however, problems arise.

Though Horkheimer criticizes traditional theory’s reliance on universal concepts, he asserts that ‘the critical theory of society also begins with abstract determinations; in dealing with the present era it begins with the characterization of an economy based on exchange’ (1972: 225). But the concept of a society based on exchange is not a universal. It is not even ‘relatively universal’ (Horkheimer, 1972: 226). For, Marx argues that a society of generalized exchange of commodities is a capitalist society. That Horkheimer does not see this indicates that he is adopting the discredited logico-historical interpretation of *Capital*.⁷ He goes on to say that it ‘is because of its inner dynamism that the exchange relationship, which the theory outlines, dominates social reality’ (Horkheimer, 1972: 225). But that inner dynamism is capital’s, so the conceptual relationship between ‘an economy based on exchange’ and production on a capitalist basis needs to be worked out. Horkheimer has trouble with that.

When Horkheimer speaks of critical theory’s principles as ‘established by the special discipline of political economy’ (1972: 226), he confirms Moishe Postone’s judgment that ‘in 1937 Horkheimer proceeded from the assumption that “labor” transhistorically constitutes society’ (Postone, 1993: 119).

That makes Horkheimer a traditional Marxist in Postone's sense. Postone links traditional Marxism to the Weberian turn to instrumental reason:

Lacking a conception of the specific character of labor in capitalism, Critical Theory ascribed its consequences to labor *per se*. The frequently described shift of Critical Theory from the analysis of political economy to a critique of instrumental reason does not, then, signify that the theorists of the Frankfurt School simply abandoned the former in favor of the latter. Rather, that shift followed from, and was based upon, a particular analysis of political economy, more specifically, a traditional understanding of Marx's critique of political economy. (Postone, 1993: 119)

In *Time, Labor, and Social Domination*, Postone does not make a case that Theodor Adorno is a traditional Marxist, as he does for Horkheimer. More recent research finds in Adorno continuity with Marx's focus on the social forms that constitute capitalist society (Braunstein, 2011). Adorno's critique encompasses class antagonism and the precarious historical dynamism of capital's accumulation process. Methodologically insightful reinterpretations of Marx by scholars such as Michael Heinrich, Werner Bonefeld, and Moishe Postone, termed '*die neue Marx Lektüre*' in Germany, understand him to be a critic of political economy rather than a radical political economist.⁸ This promising stream of research represents an underappreciated Frankfurt School tradition descending from Adorno and his students Hans-Georg Backhaus, Helmut Reichelt, and Hans-Jürgen Krahl.⁹

Classical political economy, traditional Marxism, and the critique of instrumental reason share the bourgeois conceptual horizon, which excludes the topic of labor's social form. Marx's methodological brilliance lies in surpassing that horizon.

Notes

- 1 Marx claims that reason's *recognizing* itself in all things *reduces* everything to logical categories. Does it?
- 2 I use 'phenomenology' in a broad sense, not specifically Hegelian or Husserlian, to mean experience-based inquiry into when the distinguishable is separable.
- 3 On the method of inquiry see Ollman (2003).
- 4 Grossman begins: 'until today no one has proposed any ideas at all, let alone any clear ideas, about Marx's method of investigation'.

The Transformation Problem

Riccardo Bellofiore and Andrea Coveri

MARX BETWEEN 'VALUE' AND 'LABOUR'

In *Capital*, Volume 1, Marx breaks with Ricardo's labour theory of value turning it into the foundation of capitalist exploitation. Gross profits are a share of the new value added in the year, which is nothing but the monetary expression of the direct labour which has been spent by the working class. We define as direct (or present) labour the objectification of the living labour extracted by the capitalist class from the human labour power bearers in the hidden abode of production. As we will see, in Marx's theory of value (versus Ricardo's) it is crucial to distinguish conceptually the determinate direct labour resulting after production (a given amount) from the living labour expended within production (a fluid, which is indeterminate until the end of production). It is equally fundamental to clearly have in mind that labour power is 'attached' to wage workers as human beings, and that living labour is the 'use' of that labour power: it is, therefore, the 'consumption' of workers themselves.

For the discussion that follows, it is useful to look at some categories of the Marxian theoretical framework in an analytical form, from a macroeconomic perspective. For this purpose, we start by defining the total direct labour, *DL*, which is the crystallisation of the living labour, *LL*, performed by all the workers. The advanced money capital is composed by two parts: (a) variable capital, *V*, monetarily exhibiting the so-called 'necessary labour' (the labour required

to generate the commodities needed to reproduce the labour power within the period, NL); (b) constant capital, C , monetarily exhibiting the means of production (for simplicity, we assume only circulating capital). Since V is the means by which capital as a whole makes workers its 'internal other', the living labour spent by wage workers is the only source of surplus value, SV , monetarily exhibits the surplus labour, SL . SL originates from the prolongation of LL over and above NL . Looking at the crystallised magnitude of labour, DL , we can write:

$$mDL = V + SV \quad (1)$$

with mDL as the exhibition of the money value added in the period, MVA . The rate of surplus value, sv' , is the ratio of SV over V . In this first abstraction, we are assuming that V and SV are proportional to the amount of labour 'contained' in the means of subsistence (NL) and in the surplus product (SL). Hence, the rate of surplus value is also equal to the rate of exploitation, e' :

$$e' = \frac{DL - NL}{NL} = \frac{mDL - V}{V} = \frac{SV}{V} = sv' \quad (2)$$

In *Capital I*, e' is expressed in the labour quantities corresponding to SL and NL . It is clear from the above, however, that any discussion about Marx's theory of value as a theory of exploitation cannot avoid dealing with Marx's theory of value as a system of evaluation of commodities in 'price' terms.

THE TRANSFORMATION PROBLEM AND EXPLOITATION

Since the beginning of the twentieth century the so-called *dual system* interpretation has been the 'mainstream' view of the labour theory of value. Such an approach conceives two distinct evaluation criteria for commodities, one in terms of what were then called 'labour values' (sometimes labelled as 'exchange values') and the other one in terms of 'production prices'. Marx is built on the possibility of 'transforming' the first one into the second one. The metric of values and prices was in labour units, disregarding the monetary dimension, which is instead essential in Marx since he always expressed value and price magnitudes as hours exhibited in some money unit.

Shaikh (1977) defined as 'direct prices' the prices proportional to the quantities of labour contained in the commodities exchanged on the market; de Vroey (1981) used the term 'simple prices'. In the 'value' accounting, if the rate of surplus value is equal among industries and the ratio of constant capital over variable capital is not, the rate of profit differs; hence, the need to determine the 'prices of production' (i.e., the prices embodying a uniform rate of profit among industries). For the dual system interpretation two fundamental equivalences must hold for the system as a whole: (a) the equality between the gross product evaluated

in simple prices and the gross product evaluated in prices of production; (b) the equality between the total surplus value and the total (gross) profits. The latter equality was seen as a confirmation of exploitation.

The dual system approach stumbled upon analytical difficulties questioning its logical consistency. The articles by Ladislaus von Bortkiewicz ([1907] 1952) followed the early contributions by Dmitriev ([1904] 1974) and Tugan-Baranowsky (1905), and turned Marx's transformation from a sequentialist to a simultaneous derivation. Sweezy (1942) claimed that Bortkiewicz's method provided the bridge from the 'value system' to the 'price system'. Further contributions within so-called 'Traditional Marxism' – like the ones by Winternitz (1948), Dobb (1955) and Meek (1956) – declared the transformation problem 'solved'. This conclusion seemed to be confirmed by a 'conclusive' article by Seton (1957), who set price determination in fully disaggregated terms; the given data were amounts of labour. However, this solution was rather a dissolution. Very soon it became clear that in the description of the economic system labour played the role of a mere 'technical' unit of measurement and could be substituted by other physical kind of units. This negative verdict seemed confirmed by the fact that a few years later, in 1960, Sraffa published *Production of Commodities by Means of Commodities*, where the given 'methods of production' are defined immediately in use value terms: level of output as well as labour and non-labour inputs are taken as known. If the distribution has a degree of freedom, either the wage or the rate of profit must be fixed 'from outside'. According to Steedman (1977), the results reached in Sraffa's book prove the redundancy of the Marxian labour theory of value, since the values of commodities cannot be considered the essential starting point for the determination of prices of production, and thus cannot be regarded as theoretically prior compared to them: value theory must be jettisoned because Sraffa would have demonstrated the futility of the transformation problem.

The arguments proposed by Michio Morishima (1973) and Anwar Shaikh (1977) were very different. Morishima proposed the Fundamental Marxian Theorem, according to which the positivity of the rate of surplus value is a sufficient and necessary condition for the rate of profit to be positive. The labour theory of value is a tool to reveal exploitation as the hidden reality of the capitalist mode of production. In Shaikh's approach, Marx's theory of value is a theory of relative price determination, where Marx's original transformation 'is only the first step in an iterative transformation from "direct-prices" to "prices of production"' (Shaikh, 1997: 109). The iteration must be pursued until the two forms of price converge. The conclusions on exploitation were convergent with Morishima.

Most of the neoclassical interpreters reached conclusions not so different from Steedman. Paul Samuelson (1974) stigmatised the transformation procedure as a useless *detour*: 'Contemplate two alternative and discordant systems. Write down one. Now transform by taking an eraser and rubbing it out. Then fill in the other one. *Voilà!* You have completed your transformation algorithm'

(Samuelson, 1971: 400). In fact, the rejoinder by another neoclassical, William Baumol (1974), can be taken as an effective way to demystify all the prior debate on the link between the ‘transformation’ and exploitation that we have already surveyed, as well as most of the future contributions on the same topics by friends and foes of Marx’s labour theory of value:

The point of the value theory may then be summed up as follows: goods are indeed produced by labor and natural resources together. But the relevant *social* source of production is labor, not an inanimate ‘land’. Thus profits, interest, and rent must also be attributed to labor, and their total is equal (tautologically) to the total value produced by labor minus the amount consumed by labor itself. The competitive process, that appears to show that land is the source of rent and capital the source of profits and interest, is merely a distributive phenomenon and conceals the fact that labor is the only socially relevant source of output. This is the significance of the value theory and the transformation analysis to Marx. (Baumol, 1974: 59)

There is no point in seeing in the determination of individual prices a proof or disproof of Marxian theory of exploitation: the error comes, Baumol convincingly argues, to see in Marx the analogue of Ricardo, where the labour theory of value was seen as an (approximate) good model for fixing individual prices.

Two delicate points remain open, however: why labour is the only socially relevant source of output, and why Marx’s argument moves from simple prices to prices of production. There needs to be a theoretical justification why commodities are reduced to a labour content in a way that allows us to assess ‘surplus value’ as a monetary exhibition of nothing but surplus labour. A conclusion like this implies the resolution of all the value magnitudes (including the ‘value of labour power’) to nothing but objectification of living labour, and this proposition cannot be taken for granted. This problem does not seem to bother the Neo-Ricardian approach, i.e., the followers of Sraffa. According to Garegnani (1984) and his school exploitation is due to the fact that, for institutional reasons, workers do not get back the whole net product. Napoleoni (1963, 1976) provided a radical critique of this position. Assuming a given ‘productive configuration’ as the starting point, like in *Production of Commodities* (Sraffa, 1960), does not provide an answer on how a surplus is born.

THE NEW INTERPRETATION(S)

From the beginning of the 1980s, Duménil (1980, 1983), followed by Lipietz (1982) and Foley (1982) suggested an alternative interpretation of labour theory of value, known as the New Interpretation (NI).¹ The value of net product of the economy is the monetary expression of the labour time socially necessary to produce it. This *value* of the net product is postulated to be equal to the *price* of the total direct labour.

Denote by $\lambda = [\lambda_j]$ the row vector of the labour contained in commodities, while $y = [y_j]$ is the column vector of net products in physical terms, $p = [p_j]$ is

the row vector of commodity prices of production and j is the subscript denoting the n industries of the linear production model.² What we have argued implies that $\lambda y = DL$. Therefore:

$$py = m\lambda y \quad (3)$$

with $m = 1/\mu$.

m is the ‘monetary expression of [socially necessary] labour time’ ($MELT_{sn}$), i.e., the amount of money produced by a unit of labour time. It is defined by the ratio between the MVA in the period and the DL objectified within production in the same time span. $MELT_{sn}$ would express quantitatively ‘what Marx calls the “price form” of the total value created during the period’ (Duménil and Foley, 2008: 9). It is the inverse of μ , which is what the NI calls the ‘value of money’: that is, the amount of labour time ‘exhibited’ in circulation by a unit of money. It is defined as the ratio between DL over MVA .

The NI endorses a ‘generalisation’ of μ beyond the case of ‘money as a commodity’,³ such that it can be employed both for the ‘commodity law of exchange’ (simple prices are proportional to the ratio between the labour contained in the commodities exchanged) and for the ‘capitalist law of exchange’ (for production prices that proportionality does not hold). For NI, Marx’s theory of value is compatible with any price determination mechanism. Insofar as the price rule comes to vary, what does change is simply the allocation among commodities of DL . When the proportionality between simple prices and the labour contained ratios applies, each commodity will ‘command’ (i.e., obtain) in circulation an amount of *objectified* labour just like the one required to produce it. Instead, when prices systemically diverge from the simple prices (like in the case of prices of production), each commodity will ‘command’ (i.e., obtain) in circulation an amount of *objectified* labour different from the one required to produce it. In other words, this means that – at a microeconomic level – some commodities will ‘command’ an amount of labour greater than the one contained in them, and some commodities will ‘command’ less. The divergences are compensated in the aggregate: equation (3) can be rewritten as $(p - m\lambda)y = 0$, showing that the aforementioned ‘distortions’ offset each other.

The problematic point we want to inquire is that the capitalist law of exchange applies to a world where MVA (equal to the national income if all workers are productive) is divided into the wage bill plus gross profits, with these latter magnitudes quantitatively distinct from variable capital and total surplus value. It is not difficult to understand why, but this requires us to pursue another direction than NI. The wage bill goes to workers as a monetary amount. The NI redefines the notion of NL as the labour time *commanded* (i.e., obtained on the market) by the money wages, and modifies accordingly the notion of the ‘value of labour power’ that we find in *Capital I*. These changes affect the quantitative determination of V , thereby SV becomes tautologically equal to gross profits: both exhibit in money

the *SL* which is *commanded* (obtained) on the commodity market by gross profits. Through these terminological classifications the NI reinstates on the one hand the formal equivalence between gross profits (*II*) and the surplus value (SV_μ), and on the other hand the one between the sum of wages (*W*) and the value of labour power (V_μ), with SV_μ and V_μ referring to surplus value and value of labour power according to the NI definitions. Thus, e'_μ is the NI exploitation rate:

$$e'_\mu = \frac{SV_\mu}{V_\mu} = \frac{py - W}{W} = \frac{II}{W} \quad (4)$$

where $SV_\mu = \mu II$ and $V_\mu = \mu W$.

The reason for the result is that the difference between *Capital I* and *Capital III* is overcome by reading *Capital III* into *Capital I*. Conversely, we think that *Capital I* and *Capital III* must be articulated moving from Volume I to Volume III, and fully recognising the difference. The NI transformation procedure takes μ as a constant, and to do that NI has to read the value of labour power *immediately* in terms of prices of production, not giving any special role to simple prices. An unbiased reading shows instead that in *Capital I* Marx defined the value of labour power as the labour required to produce the subsistence real wage, and took it as a *given*: more precisely, as it becomes crystal clear in section seven on 'Reproduction', the 'given' is in fact the real wage of the working class. This aspect – which, according to us, is integral to the *macroscopic* dimension of Marx's value theory – is thrown out without any argument by NI, but also in general by most of the new approaches. The NI admits the possibility that the composition of the wage goods, which workers buy once the money wage has been fixed, may vary, and holds constant the value of money as the numeraire of the prices of production system. That is in fact the reason for the label *Unallocated Purchasing Power (UPP) approach* as in Duménil and Foley (2008: 8, 9). As a consequence, the rate of surplus value is the same in *Capital I* and *Capital III*, regardless of the ruling law of exchange, because the money value added (due to the 'postulate') and the value of labour power (due to the definition of 'necessary labour') are unchanged. The rate of exploitation seems fully reclaimed in a Marxian fashion. Looking deeper, however, many theoretical puzzles emerge, the main one being that the value of money, the value of labour power and therefore the exploitation rate can be quantified only *ex post*. The discourse, wanting to be 'operational', is entirely predicated within the circulation sphere, except for the assumption (without any theoretical justification) that *MVA* is the monetary exhibition of labour quantities. The risk is that we are left with a postulate and a series of tautologies, plus a dismissal of Marx's macro view of class reproduction.

Another approach, not too different from the one discussed earlier and which pretends to emphasise the macro-monetary aspects of the Marxian theory of value with the aim to wholly restore the original Marxian 'conservation value'

equivalences, is the one given by Moseley (2015). Moseley suggests extending the NI re-evaluation of the value of labour power (by means of the value of money) to the value of constant capital, expressing the latter as the labour time equivalent of the monetary value of the means of production used as inputs. Following this procedure, the Marxian framework is confirmed and the rate of profit matches the quantitative definitions in *Capital*. However, Moseley's pretence that his approach is different from the Sraffian simultaneous approach,⁴ since the rate of profit is given before the determination of prices, is based on assuming the value of money as given. This indeed replicates Marx, who assumed money as a commodity, though. Moseley's attempts to escape this conclusion are fragmentary and unconvincing (Moseley, 2005).

A 'LIVING LABOUR' ALTERNATIVE

Some contributions to the Italian debate help overcome this *impasse*. Marcello Messori was probably the first who argued for a normalisation condition based on the invariance of the social net product when it is computed in production prices or in simple prices (proportional to *DL*, i.e., to the objectification of living labour). In the very last pages of the appendix to his book titled *Sraffa e la critica dell'economia dopo Marx* [Sraffa and the critique of economic theory after Marx] (Messori, 1978), he argued that:

the dual equivalence between total values [i.e., simple prices] and total prices, and between the overall surplus value and the overall gross profits, must give way to the equivalence among the so-called surpluses (the [sum of] the value of labour-power and surplus labour⁵), measured in terms of labour values [i.e., simple prices] and prices of production.

The basis of this equivalence is that 'there is, in fact, no argument able to justify a variation in the amount of living labour expended as a consequence of changes in the distribution of surplus value, and then of the level of [money] wages and of the value of constant capital' (Messori, 1978: 115).

A few years later Augusto Graziani ([1983] 1997) published a long article titled 'Let's rehabilitate the theory of value'.⁶ The crucial point by Graziani is that a truly macroeconomic perspective has to be assumed to grasp the meaning of the Marxian theory of value: we need to look at valorisation 'not from the point of view of an individual capitalist struggling against his competitors but in a macro perspective that sets the entire class of capitalists against the class of workers' (Graziani [1983] 1997: 24; translation has been edited). The reason lies in the fact that 'any advantage that the individual capitalist might eventually derive from the exchange with other capitalists would be offset by an identical loss suffered by his counterpart, and the two items would cancel each other'. It follows that 'the valorization of capital for capitalists as a class can come only from exchanges that capitalists effect outside their own class, and hence in the only external exchange possible, which is acquisition of labor power' (Graziani [1983] 1997: 24).⁷

The class perspective is the only one appropriate to catch that logical priority of the value dimension compared to the price dimension. Value theory discloses exploitation as the engine of capitalist valorisation:

[if] the profit of capitalists as a class is born solely from the relation established between capitalists and workers ... it can only come into being as a product of the difference between the total sum of labor extracted and the sum of labor that returns to the workers in the form of the real wage. (Graziani [1983] 1997: 24; translation has been edited)

Sraffa's price determination cannot contradict the Marxian theory of value, since 'the relative prices of commodities are ... formed in exchanges among capitalists, governed by the rules of competition, a phenomenon that is relevant exclusively to capitalists in their reciprocal relations' (Graziani [1983] 1997: 25) and that does not involve their relationship with the working class.

In a number of contributions, Riccardo Bellofiore (1989, 2003 with Realfonzo, 2004) has refined and extended this interpretation of Marx's 'Monetary Labour Theory of Value'.⁸ The cycle of money capital is articulated within a monetary circuit framework borrowed from Graziani (2003), showing how the capitalist process of valorisation is parallel and integral to capital's monetary sequence within the period. This perspective was the 'hidden Marxian core' beneath the monetary heresies of Wicksell, Schumpeter, and the Keynes of the *Treatise on Money*.

The circuit is 'opened' by a transaction which takes place within the capitalist class: industrial capitalists (i.e., the firm sector as a whole) have a preferential access to the initial finance provided by financial capitalists (i.e., the banking system) who create money *ex nihilo*. This money is advanced as capital by the entrepreneurs as a class to include workers as the living labour power bearers within the capitalist labour processes, and thus to get hold of workers' labour power as potentiality of living labour. The money capital advanced is the 'initial finance' allowing the production process to begin – in a true basic macro-monetary outlook (where the economy is 'closed', the firm sector is vertically integrated and there is no state), initial finance condenses into the money wage bill. In this approach, the capitalist class autonomously decides not only the level but also the composition of output, and then the allocation of the workers employed. This 'fixes' the amount of commodities made available to workers as the 'given' class real wage. Most of the time Marx assumed that capitalists have to guarantee workers a 'subsistence' real wage, whose determination is subjected to a historical and moral element, and stems from class struggle.⁹

Since production prices diverge from simple prices, this 'subsistence' real wage for the working class must be accounted for in terms of the former and not of the latter price rule. The money capital advanced (i.e., initial finance as the flow of banking loans to firms, equal to the money wage bill) in *Capital III* must be re-evaluated so that workers are allowed to buy the same subsistence class real wage which has been fixed in *Capital I* by class struggle. If we assume, as Marx, that the ex post real wage which is determined on the commodity market

at the end of the circuit confirms the real wage expected by workers when they bargain the money wage on the labour market at the opening of the circuit (i.e., if wage earners' price expectations are fulfilled), then it is possible to precisely calculate the total value of the labour power even before final circulation. Indeed, if we divide the money wage bill for the expected (and, given the assumption, the realised) price of the wage-basket, we have N , the number of workers employed within the period:

$$\frac{W}{pb} = N \quad (5)$$

Note that p is the row vector of the production prices of wage goods and $b = [b_j]$ is the column vector of the wage goods basket; thus $pb = w$ is the individual money wage thanks to which every worker buys his/her lot of the wage-bundle (if we assume as Marx a given subsistence real wage). It is important to understand, however, that we are not 'adding up' the individual wage-bundles to get the class real wage: logically it is the opposite, and we just assume for the sake of simplicity that the 'given' class real wage is allocated uniformly among workers.

(Bank credit-)money as initial finance to production, i.e., the money wage bill, translates into a determinate number of workers. These workers all together must secure from capital the class real subsistence wage. Therefore, what at first sight seems to be a valueless advanced money capital hides a labour content corresponding to the labour required to produce the class real subsistence wage. This means that the advanced money capital is *not* valueless at all. This makes it possible to quantify the total 'necessary labour', even outside the 'money as a commodity' case, as follows:

$$NL = (\lambda b)N \quad (6)$$

Total variable capital (V) exhibits NL in simple prices. *This definition of 'necessary labour' is not erased when the price rule changes, as long as we still maintain the assumption of a given class real subsistence wage and a macroscopic viewpoint.* Marx is crystal clear in the 'Results of the Immediate Process of Production':

The buyer of labour power is nothing but the personification of *objectified* labour which cedes a part of itself to the worker in the form of the means of subsistence in order to annex the *living labour-power* for the benefit of the remaining portion, so as to keep itself intact and even to grow beyond its original size by virtue of this annexation. It is not the worker who buys the means of production and subsistence, but the means of subsistence that buy the worker to incorporate him into the means of production. The *means of subsistence* are a particular form of material existence in which capital confronts the worker before he acquires them through the sale of his labour-power. (Marx, [1867] 1976: 1003–4; italics are in the text; underlining is ours)¹⁰

Initial finance acts as the *monetary ante-validation* of the forthcoming expenditure in the sphere of production of living labour by living bearers of labour power.

In other words, it is the *monetary imprinting* of labour power as potential labour in motion when workers are incorporated in the capitalist labour process through the buying and selling of labour power. Class struggle within the immediate process of valorisation results in an actual extraction of (both concrete and abstract/homogeneous) living labour, which is then crystallised in the objectified direct labour monetarily exhibited through the price tags that capitalist firms append to the output. Marx very often assumes – though it is crucial to the critique of political economy that this cannot be taken for granted – that the *ex ante* expectations of capitalist entrepreneurs about the extraction of living labour are confirmed *ex post*. The resulting expected money value added corresponds to a determinate amount of abstract/homogeneous labour turned into actual social labour in final commodity circulation. Marx also assumes – and it is crucial to the critique of political economy that this too cannot be taken for granted – that the *ex ante* expectations about selling the commodity output are fulfilled *ex post*. It is then possible to quantify the money value added.

We follow Marx's *Capital III* in assuming that 'ordinary demand' drives production, an assumption which corresponds to Keynes' hypothesis that firms' short-term expectations are fulfilled. We are therefore assuming that the new money value expected *before* the final exchange on the commodity market will (eventually) be *validated*. The abstraction of labour from the socialisation in immediate production is confirmed by the *ex post* socialisation on the market. The equality between supply and demand is due to effective demand driving production (like in Luxemburg and Kalecki), not to supply creating its own outlets. It is a kind of principle of effective demand which is present in Marx, not Say's Law.

At the closure of the circuit, industrial capitalists realise the money profits from the sale of commodities on the commodity market and return back the initial finance to the banking sector. At the same time, the employed workers – finding their expectations fulfilled – get a 'subsistence' real wage. Since capitalist prices – the prices of wage goods and profit goods as well¹¹ – are in general not proportional to simple prices, the *objectified* labour time *commanded* (obtained) on the market by the money wage bill cannot but be different from the labour content of the total value of the labour power (i.e., from the labour contained in the means of subsistence) *evaluated in simple prices*, just like the *objectified* labour time *commanded* (obtained) on the market by gross profits cannot but be different from the labour content of the total surplus value (i.e., from the labour *contained* in the profit goods). Such divergences will be offset by definition because of the posited equality between the money new value evaluated in simple prices and the money new value evaluated in prices of production (or any other kind of prices).

We will try to clarify this point in a formal framework, remembering the analytical categories already introduced and denoting by $z = [z_j]$ the column vector of surplus goods. From the moment that the price of the social net product is only the monetary expression of direct labour time, at the macroeconomic level we have:

$$py = m\lambda y \quad (7)$$

which is the same as Equation (3). Accordingly, as long as the 'law of exchange' is such that:

$$pz > m\lambda z \quad (8)$$

which of course can be rewritten as

$$\mu pz > \lambda z \quad (9)$$

the capitalists as a class in circulation will command an amount of objectified labour (the labour-equivalent of gross profits, given the value of money) greater than the labour contained in surplus goods extorted through exploitation in production. In the final exchanges on the commodity market, workers will correspondingly command an amount of objectified labour value smaller than the labour contained in the means of subsistence:

$$pb < m\lambda b \quad (10)$$

which of course can be rewritten as

$$\mu pb < \lambda b \quad (11)$$

Hence, at the aggregate level, it follows that:

$$\frac{\Pi}{W} = e'_\mu > e' = \frac{SV}{V} \quad (12)$$

where $\Pi = pz$ and $W = pbN$. On the contrary, if the 'exchange rule' is such that the following inequalities hold:

$$pz < m\lambda z \quad (13)$$

$$pb > m\lambda b \quad (14)$$

which of course can be rewritten as

$$\mu pz < \lambda z \quad (15)$$

$$\mu pb > \lambda b \quad (16)$$

we get a macroeconomic situation which is ‘upside down’ compared to the previous one:

$$\frac{\Pi}{W} = e'_{\mu} < e' = \frac{SV}{V} \quad (17)$$

In other words, the surplus value *seems* redistributed – but it is not! This redistribution is just an *illusion* – by the ‘law of exchange’ not only between industries, but between the two social classes. The fact that the objectified labour *commanded* (obtained) on the market by a commodity diverges from the labour *contained* in it does *not* affect the *macro-class* distribution, just the amount of labour allotted to the firms through prices, which is a *micro-individual* perspective. This is the quantitative reflection of the Marxian ‘logical priority’ of the macro foundation over the micro appearance. The rate of surplus value originates from class struggle on the length of the working day and the intensity of effort, and therefore it is accurately represented by the labour *congealed* in the surplus goods over the labour *congealed* in the wage goods: the perspective, here, is that of the *macro* and *class struggle in production*. The ratio of the labour-equivalent of gross profits over the labour-equivalent of the money wage bill does depend, on the contrary, on the microeconomic price rule, which – in turn – relies on a multitude of institutional factors and mostly on the form of competition among capitals. As a consequence, the second ratio *distorts* and *dis-simulates* the exploitation of labour in production. From a class perspective the *only* adequate measure of class exploitation remains, in *Capital III* as in *Capital I*, the rate of surplus value e' (monetarily exhibiting the labour *contained*), that at the highest level of abstraction is invariant with respect to the ‘ups and downs’ of the distribution and circulation. The NI rate of exploitation e'_{μ} represents the surface *displacement* and *distortions* on e' resulting from the *individual* price rule affecting circulation.

We may further clarify this point referring to one of the very few authors who came near to understanding the issue: Eduard Heimann in his *History of Economic Doctrines: An Introduction to Economic Theory* (Heimann, 1945: 151–2). He wrote that with production prices being different than simple prices, the capitalists employing more labour per unit of capital do not get the full surplus value produced by their workers (relatively to the capitalists of the more mechanised industries, who instead receive more than the surplus value produced by their workers). The ‘transfer’ however is effected *in circulation*, where capitalists and workers consume different kinds of commodities. If workers are the main consumers of commodities tagged with prices of production lower than simple prices, it may *seem* that they get a ‘refund’ equal to the labour-equivalent which is lost by gross profits relative to surplus value; and it also may *seem* that if they are instead the principal consumers of commodities whose ‘prices’ exceeds their ‘values’, they are, so to speak, super-exploited.

Unfortunately, Heimann concluded that the labour theory of value is thereby ‘invalidated’. Nothing of the sort, of course, since in our reconstruction *the real wage of the working class is given*. What is going on is just a redistribution of the value added in the period *among capitalist producers*, so that total gross money profits may end up being less or more than total surplus value. The *paid labour* (as we call the ‘[objectified] labour *commanded*’ by the money wage bill) to wage workers diverges from *necessary labour* (as we, like Marx, call the *contained* labour, required to produce the class real wage). The ‘living labour’ alternative view we are putting forward maintains that the total living labour *actually* extracted from the working class and the total amount of labour required to produce what *actually* is consumed by workers – the two magnitudes determined by the conflictual/antagonistic ‘capital relation’ in *Capital I* – do *not* change. Hence, also the surplus labour *contained* required to produce the surplus does *not* change. The price dimension adds to the fetishism of bourgeois society and cancels any trace of exploitation, since *the labour exhibited by the money wage bill is ‘displaced’ relative to the (unchanging) labour content of the real wage for the working class*. These ‘displacements’ and ‘distortions’ should not be ironed out. They are integral to Marx’s analysis of capitalism as governed by what Hans-Georg Backhaus (2011) calls (following, again, Marx himself) the *Verrückte Formen* so typical of value, money, capital as fetishes.

WHAT ARE WE TALKING ABOUT WHEN WE TALK ABOUT EXPLOITATION?

A proper understanding of Marx’s notion of exploitation must distance itself from a merely mathematical terrain of discourse and from the spurious connection with the so-called transformation problem. All the discussions have been tainted by the idea that exploitation has to do, first of all, with the possibility of ‘solving’ surplus value in surplus labour. This point is surely important, and it is maintained also in the perspective we endorse, but it reveals a limited, Ricardian understanding of the specificity of exploitation in Marxian theory. The point may be clarified with a reference to a quote by David Schweickart in polemic with Ian Steedman:

[t]he feature that distinguishes labor power from all other input commodities is that *technical conditions do not determine the mass of use-values* (days of labor) that the capitalist receives when he purchases a unit of commodity (a worker for the production period). Given a specified technology, when a bushel of corn is purchased as an input for a particular industry, the quantity of other inputs and the quantity of output is determined. *When a unit of labor power is purchased* (e.g., a worker for the production period), *the quantity of other inputs required and the quantity of output remains indeterminate*, ‘a circumstance [that] is without doubt, a piece of good luck for the buyer’. (Schweickart, 1989: 295; our italics; the quote in the quote is from Marx, *Capital I*, chapter 7)

Following this lead, we claim that the notion of exploitation that is appropriate to Marxian theory cannot be reduced to a merely *distributive* matter, whether that

be understood as a *physical surplus* over and above workers' consumption or as the *surplus labour* behind gross money profits. Both these aspects are *secondary*, in the sense that they derive from a more essential and fundamental factor. The Marxian notion of exploitation is founded on the peculiar feature that, under capitalism, the *whole* of the *living labour* extracted from 'free and equal' wage workers is a 'forced' and 'abstract-alienated' performance of labour as activity. It is in this pumping out of living labour of capital as a vampire that we find the most important meaning of Marxian exploitation: the *direct* compulsion to do labour and surplus labour. Capital must secure for itself labour *in actu* from *potentially* 'recalcitrant' workers, who somehow can still claim control over their own activities. This 'Other' from Capital must be 'embodied' – namely, *made internal* and controlled, as part of the capitalist 'machine' – so that value begets (more) value, money brings about (more) money. The new value, even before surplus value itself, springs from nothing but an 'exploitation' of workers: exploitation here means the *use* of their labour power. Exploitation is therefore *co-extensive with the whole working day*. It is not – we insist – a 'distributive' conception, and it does not change much if this distribution is of amounts of use values or of labour time. Exploitation of this kind cannot but inherently affect the same *nature* of labour *as activity*, and it cannot be altered by any price rule. Exploitation should be understood as the direct and indirect imposition and control that affects *all* labour, in its quantity and nature. *Abstraction and exploitation become virtually co-extensive* especially when the 'machine and big industry' stage is reached (i.e., at the stage of the 'real subsumption of labour to capital').

It is paradoxical that one finds a correct understanding of the meaning of Marxian exploitation where one would least expect it. In the early 1940s Piero Sraffa, on his path to *Production of Commodities by Means of Commodities*, wrote a note entitled *Use of the Notion of Surplus Value* (Bellofiore, 2014). Sraffa realised that in explaining the origin of surplus value Marx has to start from a hypothetical situation (which, however, expresses something very real and significant in capitalism) where the *living labour* extracted from wage workers is equal to the *necessary labour* needed for the production of the historically given *subsistence*. Then Marx proceeds, in a second logical moment, to imagine a (or, rather, reveal the actual) *lengthening* of the working day beyond necessary labour. Exploitation, Sraffa sees very well, is nothing but a *prolongation* of living labour relative to necessary labour.

The paradox is compounded by the fact that Sraffa's understanding of surplus value is the same as that proposed by one of the most rigorous critics of Neo-Ricardianism (and of its assumption of given productive configuration, which we unfortunately find replicated in contemporary Marxism). Bob Rowthorn wrote:

variable capital is fundamentally the worker himself, or rather his labour-power. It is true that Marx used the term to describe the wage fund, but such a use is derivative and by no means fundamental. Thus, variable capital is labour-power – the living or subjective element in the labour-process ... By calling labour-power 'variable' capital, Marx established a conceptual

connection between the creation of surplus-value and the despotic nature of the capitalist production process. The surplus-value created by workers in this process is not determined simply by the means of consumption needed to sustain them, but also by the amount and intensity of the labour they are compelled to perform. By increasing the amount or intensity of labour his workers perform, the individual capitalist is able to extract additional surplus-labour. If powerful enough, therefore, he can vary the amount of surplus-value his workers create. Thus, the term 'variable' draws attention to the fact that the surplus-value actually created varies according to the relative power of combatants within the production process. (1974: 87; author's italics)

The distinction in the notion of 'labour' between the three aspects of living labour power, labour power and living labour, on the one hand, and the insistence on the 'variability' of the living labour made liquid by capital within the period, on the other, are the fundamental keys to the return to Marx on exploitation: an interpretation which is far away from neoclassicism, Neo-Ricardianism, but also from the old and new Marxist approaches.

Notes

- 1 Scholars who support this approach nowadays describe it as a *Single system labour theory of value* or, more precisely, as the *Price of the net product-unallocated purchasing power labour theory of value*. See Duménil and Foley (2008: 8).
- 2 Cf. Passarella (2009).
- 3 We use the expression 'money as a commodity' for Marx's theory of money to distinguish it from the 'commodity money' typical of Ricardo's theory of money.
- 4 Similar conclusions were reached by Wolff et al. (1982), who however knew that they were converging with Sraffian determination of prices. According to the *Temporal Single System Interpretation* advanced in Freeman and Carchedi (1996), the labour theory of value should instead be framed in temporal terms, rejecting the simultaneous method within a general equilibrium context.
- 5 It should be 'surplus value' and not 'surplus labour': it is either a typo or a slip. In the quote, 'labour values' must be interpreted as what we call simple prices. What Messori calls 'surplus' reflects what usually (and in this work) is defined as 'net product'. Unfortunately, the book by Messori is not translated into English.
- 6 The article is translated into English in a special issue edited by Riccardo Bellofiore for the *International Journal of Political Economy* (cf. Graziani [1983] 1997).
- 7 We have here a *proper* 'macro-monetary' interpretation of Marx. It not only (like Messori's) converges with key aspects of the NI, at the same time overcoming its deficiencies. It is also alternative to Fred Moseley's perspective which, seen from this viewpoint, is neither 'macro' nor 'monetary'.
- 8 Bellofiore now prefers to define this reconstruction of Marxian theory as a 'macro-monetary theory of capitalist production', grounded in a 'value theory of labour'.
- 9 Paradoxically, here Marx may be less radical than the monetary heretics. It may well not be the case that capitalists' choices respect the expected subsistence real wage. Nonetheless, Marx works with this kind of 'neutral' hypothesis to stress how, in a capitalist mode of production, valorisation as the systematic extraction of surplus value occurs not because of 'injustice' or (moral) 'unfairness'.
- 10 The translation has been modified. In this Penguin Classics edition we are using, the error is particularly important: where we have underlined the English translation by Ben Fowkes gives 'means of production'. The original German for the phrase in question is: 'Es ist nicht der Arbeiter, der Lebensmittel und Produktionsmittel kauft, sondern die *Lebensmittel* kaufen den Arbeiter, um ihn den Produktionsmitteln einzuverleiben' (quoted from the MEGA2, II/4.1: 78, 16–18, the italics are ours). The Lawrence and Wishart translation is correct: 'It is not a case of the worker buying means of

subsistence and means of production, but of the means of subsistence buying the worker, in order to incorporate him into the means of production' (MECW, volume 34: 411, our underlining). We find the same idea, expressing a macro-monetary 'circuitist' perspective, also in *Capital I*: 713: 'The illusion created by the money-form vanishes immediately if, instead of taking a single capitalist and a single worker, we take the whole capitalist class and the whole working class. The capitalist class is constantly giving to the working class drafts, in the form of money, on a portion of the product produced by the latter and appropriated by the former. The workers give these drafts back just as constantly to the capitalists, and thereby withdraw from the latter their allotted share of their own product. The transaction is veiled by the commodity-form of the product and the money-form of the commodity. *Variable capital* is therefore only a *particular historical form of appearance* of the fund for providing the means of subsistence, or the *labour fund*, which the worker requires for his own maintenance and reproduction, and which in all systems of social production, he must himself produce and reproduce' (Marx's italics, our underlining).

- 11 For simplicity's sake, we assume here that surplus goods reduce to profit goods, i.e., to the commodities appropriated in real terms by the capitalist class. This assumption must be relaxed when the analysis goes beyond a two-class society.

Class

Beverley Skeggs

INTRODUCTION

What is class made to do? How is it put to use, by whom, for what reasons? Marx argued for this assessment: ‘It is a question of *what the proletariat is*, and what, in accordance with this *being* it will historically be compelled to *do*’ (Marx, 1845/1975: 36–7, emphasis added). As we will see, class is made to do a lot of work. In this chapter, I will show how the concept of class takes shape in Marxist debates such as abstraction versus empiricism, structuralism versus humanism, logics versus difference, epochs versus actual history and in disciplinary divides such as the one separating sociology and philosophy. Class also becomes something else entirely through the notion of stratification even when it retains the name class.¹ Class carries simultaneously economic explanations and political forces. It is at once historical, contemporary and shapes different futures, while driving major debates that pit class against, or articulate with, categories like race and/or gender. Class works through state institutions, different discourses and representations, while being saturated with attributions of moral value. As a representation, class has its own symbolic economy, where value is inscribed on bodies *as if* their classed character were a form of property. Class is also paraded *as if* it were an identity, when, as I will show, identity is its most significant *constitutive limit*. And it is lived; class is a sensuous categorisation, embodying powerful affects such as shame and hate, a repository of ‘ugly feelings’ (Ngai, 2005).

In all, it is not surprising that class is given a wide berth by many. Class likely fractured under the weight of its explanatory force, as its home – Marxism – was destabilised, ruptured by schisms, and other categories of social classification, such as gender, sexuality and race, fought for political attention. Yet class lingered, carrying the legacies of its earlier formation.

I'll begin with Marx, explore the most significant Western Marxist debates on the making and shaping of class and examine how this has influenced analysis since in the key areas of race and difference, and gender and social reproduction. Capital's state institutions will be examined leading to an argument for understanding class through history and methods of articulation. I'll then draw on two research projects on living class which point to the significance of the symbolic in order to understand abstraction *and* experience in their historical conjuncture. I'll be treading a thin provincial line, not referencing every debate about class in Marxism (an impossibility), pulling out some illuminating fundamentals in order to argue that class is not a singular categorisation but names a dynamic process that positions people in struggles for value and life.

MARX ON CLASS

The problem with the analytical specificity of class began with Marx. He was never very clear on how to define class, using the concept rhetorically as well as analytically, a problem that has beset any analysis ever since. Marx stressed that it was not himself but French counter-revolutionary historians who originally developed class analysis. In a letter to Joseph Weydeymeyer (1852),² he argues that what he did was to prove that the *existence of classes* is only bound up with *particular historical phases in the development of production*, namely with the emergence of surplus value, whereby one class benefits from the exploitation of another. Exploitation establishes a conflict between classes: the *fundamental antagonism* in *all* class relationships.

In a useful overview, Bertell Ollman³ compiles and analyses most of Marx's uses of the term 'class'. Needless to say, Marx is not consistent. Sometimes, in the 'classic' case, there are two classes, bourgeoisie and proletariat. Sometimes these are modified with adjectives, the *petty* bourgeoisie, the *lumpen* proletariat. Other groups are included, such as landowners, while rural workers are sometimes included in the proletariat, sometimes not. Ollman notes how class is used interchangeably with the terms 'group', 'faction' and/or 'layer'. And he details how Marx struggles with the representatives of the bourgeoisie, the ideological class, which exist through their relationship to power, promoting political interests rather than wielding social power through their relationship to production. Marx is particularly vitriolic about the lumpen proletariat, considering them to be a dangerous class because of their ability to destroy working-class interests (see below). Ollman concludes: 'Marx cannot escape the more serious accusation of

having a litter of standards for class membership and of changing them without prior warning' (ud.np).

Nevertheless, Ollman does note some consistency with a tripartite class division across Marx's writings into capitalists, proletarians and landowners, defined through their relationship to forms of revenue: respectively wages, profit and ground rent. The analysis is never finished, and Ollman notes further complications: doctors, for example, provide a definitional challenge as Marx begins to differentiate between 'rank' – key to a Weberian analysis of class that has blurred the lines between class analysis and stratification ever since. What is also worth noting is how Marx re-signified the term 'proletariat'. Developing from the Roman *proletarius*, historically associated with derogatory connotations, as Nick Thoburn (2002) shows, Marx valorised it into a category of dignity and revolutionary force.

What is significant is that for Marx: (1) class is produced through struggle over the means of revenue either through labour, ownership of capital and/or land; (2) class definitions depend on the groups' relationship to the means of revenue production, and hence to one other; and (3) classes are locked into a dependent relationship to each other, where one class is always a source of revenue for another, in terms of profit and/or rent. It is always the *relationship of exploitation* – developed by Marx through his theories of wage labour, labour-power, labour value and surplus value – which defines classes. This is a straightforward and fundamental definition of class, as *an exploitative dependent dynamic relationship*. This crucial class relationship is social but premised on people's location in a fundamental economic relationship. In his classic quote: 'Men [sic] make their own history, but they do not make it as they please; they do not make it under self-selected circumstances, but under circumstances existing already, given and transmitted from the past'.⁴

Peter Goodwin (2018) also provides a useful excavation of Marx's use of class. Drawing on the analyses of Löwy (2005) and Draper (1977), he notes how Marx's definitions were informed by his encounters with workers in turbulent times and how as a result class consciousness became fundamental to Marx's definitions. Marx saw workers coming to an awareness of the conditions to which they were subject and organising to change them. As a result, Marx noted how they transitioned from a 'class in itself' to a 'class for itself'. Observation and participation in European workers' struggles led Marx and Marxists to attribute responsibility to the working class for social transformation of the whole of society and human life. Karl Kautsky (1892) and Rosa Luxemburg (1900) viewed the emancipation of the proletariat as a step towards total social transformation.

Marx's writings over time about class, using a variety of tropes and rhetorical flourishes, depend on how he is putting class to use – as a dynamic force for revolution (the working class and/or the proletariat), the competitive innovators of industrialisation and exploitation (the bourgeoisie), objects of derision and contempt (the lumpen proletariat) or later as the bearers of abstract labour, the personifications of capital in *Capital*.

Not all classes are considered to have agency; some are simply marked by their position, such as the lumpen proletariat. Subject to all the venom that Marx can muster in his journalistic writings (rather than *Capital*), his descriptions of the lumpen proletariat echo the contempt expressed for the contemporary working class on British reality TV, but with more flair:

Decayed roués with dubious means of subsistence and of dubious origin, ruined and adventurous offshoots of the bourgeoisie, rubbed shoulders with vagabonds, discharged soldiers, discharged jailbirds, escaped galley slaves, swindlers, mountebanks, lazzaroni, pickpockets, tricksters, gamblers, maquereaux, brothel-keepers, porters, literati, organ-grinders, ragpickers, knife grinders, tinkers, beggars – in short, the whole of the nebulous, disintegrated mass, scattered hither and thither... (Marx, 1978: 73)

But as Thoburn (2002) points out, in the 27 different uses by Marx and Engels of the lumpen proletariat they are not easily identified, taking on various forms – for instance, ‘the financial aristocracy is nothing but the *lumpen proletariat reborn at the pinnacle of bourgeois society*’ (Marx, 1973: 38–9, emphasis added). However, Marx’s descriptions of the lumpen proletariat usually cohere around expressions like ‘social scum’, ‘dangerous classes’, ‘mob’, ‘swell-mob’, ‘ragamuffin’, ‘ragged-proletariat’. Thoburn sees the lumpen proletariat as, by definition, a non-class. Others have re-signified their relationship to the category into a positive rendition – for example, the Black Panthers (Pulido, 2006).

In the writing of *Capital* class seems to go missing. Balibar (1994) asks: why is the proletariat – the radical representative of the motor of history – absent from *Capital*? Because, he answers, Marx focuses instead on the detailed workings and structure of capital. His political analysis continued elsewhere. *Capital* develops a logic by which classes perform their roles in the theatre of capitalism, carrying specific functions, as value becomes the central actor. Who then becomes the subject of capitalism? Jappe (Chapter 30, this *Handbook*) proposes that it is not the ruling class, nor the proletariat, but *value itself*. Value as a logic reduces human actors to the executors or bearers (*Träger*) of its orders. The subject of capitalism is an abstraction, a process that makes subjectivity itself possible. Jappe notes how Marx expresses this fact in the paradoxical and surprising formula that value is an ‘automatic subject’,⁵ or, as Marx noted earlier, in the *Grundrisse*, how value enters as subject.

Where did class go? We might say that these different definitions represent different forms of attention, to economics, to politics. Their difference is significant because they generate very different strands of analysis – especially in the bifurcation between class as a dynamic political force and class an abstraction, which I’ll explore below.

HISTORICAL EXPLANATION AND CLASS

One of the main schisms in Western Marxist understanding of class was staged in the debate that contrasted a historical explanation of experience with structuralism,

putting E. P. Thompson against Perry Anderson, Tom Nairn and Louis Althusser. The debate began in the 1960s, intensified in the 1970s and was extensive in its reach across disciplines; it has been well documented and continues to haunt, scar and shape debates in class analysis, especially debates about race and gender, as we will see. The debate was vicious, and to experience the British representatives of the debate speak was terrifying.⁶ Thompson had published *The Making of the English Working Class* in 1963, detailing the experience of the formation of class in opposition to Anderson and Nairn's analysis, which used a structuralist Marxism to understand the role of the labour aristocracy and the political quiescence of the English working class. Althusser, Anderson and Nairn were accused by Thompson of being ahistorical, ossified and reliant on obscure theoreticist models that were static and bore no relationship to how class was lived and made. Conversely, Thompson was accused of being atheoretical, not understanding structures, historical logic or capitalism itself. His analysis was faulted for being voluntarist and parochial, failing to understand empire and imperialism and working with categories that had no objective co-ordinates.⁷ The debate was political: where to locate change; theoretical: how to conceptualise class; and methodological: Thompson stressed indeterminacy, elasticity and provisional actions that could only be known through *observations over time*; Anderson and Nairn promoted a version of Marxist history prioritising structural logics over the empiricism of historical research; and Althusser, as a philosopher, stressed structures, logics, contradiction and overdeterminism of capitalist forms, relative autonomy and the significance of abstraction, all elements of a capitalist totality that could be known without reference to the experiences of people who inhabited its structures.

Thompson stressed the *making* of class and hence the making of capitalist forms 'from below'. He insisted on the agency of 'real people' and 'real context'. He did not see class as a structure, not even a category, but as 'something which in fact happens (and can be shown to have happened) in human relationships'; a 'historical phenomenon, unifying a number of disparate and seemingly unconnected events, both in the raw material of experience and in consciousness' (Thompson, 1963: 9). Concepts, for Thompson, arise out of empirical engagements; they exist in a dialectical relationship; they are 'structural actuation'. Later, he argued that concepts are not models but expectations that facilitate the interrogation of evidence (Thompson, 1978a). He maintained that people find themselves within structures, but not ones simply formed through relations of production as Marx, Anderson, Nairn and Althusser maintain. It is their *experience of exploitation* that leads people to become antagonistic towards those who exploit and control them. This generates a struggle through which they develop self-awareness and self-identification as a class. Thompson insists that 'class is not this or that part of the machine, but the way the machine works once it is set in motion' (Thompson, 1963: 357).

For Thompson, class is dynamic, relational, is lived and develops through struggles around the conditions made by abstract processes. But what is missing from Thompson's analysis is a model of how capitalism works (over time).

Nor can he explain the role of ideology, as explicated in detail by Althusser's analysis of the role of interpellation and misrecognition. There are no Marxist 'appearances', 'hieroglyphs', 'hauntings' or 'hidden abode' in Thompson's account. It is a transparent description of class as it is made and experienced. Class is singular, parochial, observable, yet gender and race are missing as analytical categories. Thompson was also accused of a lack of political complexity, romanticising creativity and failing to understand liberalism.

History from below continues to shape debates today over class through two intersections, of class and race and of class and gender, both of which have also spawned enormous debates to which justice cannot be done but from which key elements will be drawn in what follows.⁸

RACE, CLASS AND DIFFERENCE

For Marx (1967), slavery was a significant dimension of prior modes of production, a form of exploitation that was still residually present in nineteenth-century capitalism, a driver of primitive accumulation and part of different capital formations which enabled colonialism to develop. He was acutely aware of the 'barbarism', corruption, of the East India Company especially, and the horror of colonialism, by which surplus value production became the sole end and aim of humanity. Yet for Marx these are the brutal pre-conditions to industrial capitalism, ones that took place over a long period of time, from the enclosures in the fifteenth century, developing into *the conditions that led to the formation of classes*. His methods of abstraction were based on this history, yet he perceived these to be antecedents, precursors to a different beast – industrial capitalism. It is this 'epochal' analysis, when added to the debate between attention to historical events and an abstract understanding of the workings of capital, that has dogged the debates on race and class since. Put simply, it is a debate between those who consider empirical historical acts to be foundational and/or constitutive of capitalism, race and class in the present and those who consider that capital has particular logics that are not shaped by lived experience (see the journal *Race and Class* (Sivanandan, 2018) and the writings of Cedric Robinson (see Bhandar, Chapter 13, and Haider, Chapter 58, this *Handbook*)).

Lines are drawn among contemporary protagonists in the race and class debates between Adolph Reed Jr and David Roediger, on the side of historical significance, and Ellen Meiksins Wood as the champion of a view of capitalist class-formation that essentially abstracts from race.⁹ Roediger (1991) situates race not as incidental to US capitalism, but as a key organising principle. Roediger and Esch (2012) survey the history of race management in US corporations, arguing that the 'production of difference' has been absolutely integral to the efficient extraction of surplus value, so that race is not separable from the 'logic of capital' – it is integral to it. It is difference that makes capitalism. Likewise, and similar to Thompson,

Reed argues that capitalism exists not because of wilful efforts to create a system that conforms to a set of abstract characteristics; rather, it is the product of pragmatic struggles by individuals and groups to pursue concrete material interests and to improvise institutional frameworks that facilitate their pursuits.

Wood counteracts by positing that class is constitutive of capitalism in a way that race is not. She argues that capitalism is conceivable without racial divisions, but not, by definition, without class. For Wood, the question concerns the essential features of capitalism. She maintains that capitalism has no structural tendency towards racial inequality (a point she also maintains about gender inequality) because it does not depend on it for the extraction of surplus value. And unlike a slave mode of production or feudalism, capitalism does not depend on enslavement and domination. She argues that capitalism has a unique ability, via the ideology and institutions of liberalism, to create a form of exploitation that does not depend on direct coercive force. If capitalism depends on turning the capacity to labour (labour-power) into a commodity (through the wage), and turning abstract labour into the substance of value, then slavery is not capitalist, since what is bought at the slave auction is not labour-power but the body and life of the labourer, as property, as 'chattels'. But this does not take into account how the value made from difference was and continues to be built into many of capital's mechanisms. It is historical systems that illuminate capital's abstractions.

For Himani Bannerji, it is obvious 'that capital is a social practice, not just a theoretical abstraction' (Bannerji, 2005: 17) – note the word 'just'. For the historian of difference, the categorisation of labour into competitive difference has been *central to a capitalist logic* of depressing and controlling wage claims through establishing competition through divide and rule. Difference has been long mobilised for accumulation, as Balibar (1991) and contemporary studies of the migrant workforces show: hyper-precarity, criminalisation and deportability are often institutionalised features for migrant workforces, increasing their vulnerability by reducing their ability to claim protection and even wages. Convict and indentured labour was a central plank of racial capitalism (see De Giorgi, Chapter 12, and De Genova, Chapter 86, this *Handbook*).

Ruth Wilson Gilmore argues that racism 'is a practice of abstraction, a death-dealing displacement of difference into hierarchies that organize relations within and between the planet's sovereign political territories' (Wilson Gilmore, 2002: 16). She notes how processes of abstraction organise humans in relation to inhuman persons in a hierarchy that produces the totalising category of the 'human being'. This is a process of abstraction that pre-dates industrial capitalism and exists in every form of capitalism, spectacularly materialising through the sub-prime crisis that generated the 2008 financial crash. It is not epoch-limited; it is a logic.

Likewise, turning to an earlier history, in which the discourse of humanity had yet to be developed, Ian Baucom (2005) shows how the Atlantic slave trade's process of abstract classification was built into capital's institutions of valuation. Not classified as persons but only as bearers of value, slaves were

subject to calculation, domination and control. The calculation of their value was adjudicated in law, as in the infamous 1781 Zong case, where the sea captain threw overboard over 130 shackled slaves in order to realise their value through insurance. The issue was loss of value, not a matter of life and humanity (Krikler, 2007).¹⁰ This is abstract exchange, not based on labour but financialisation, of anticipated future value, built into capital's mechanisms.

As Brenna Bhandar and Alberto Toscano (2015) also note, building on the work of Cheryl Harris (1993), it is the commodification of difference *as* a process of abstraction that enables whiteness to have the status of property in relation to white people as full legal citizens. Harris shows how the creation of whiteness as a form of property that has 'income-bearing value' emerges as *forms of labour* come to be legally differentiated on a racial basis. White supremacy was enshrined in the social contract, for white workers as 'free' could not be enslaved, and, significantly, white workers come to identify as 'white workers' as a means of differentiating themselves from other workers, producing class as well as race difference (Roediger, 1991). Race is thus constitutive of capital's mechanisms.

Peter Linebaugh and Marcus Rediker (2000) chart two and a half centuries of extreme violence used to coerce people into providing the labour required to make capital. In England in 1606, colonisation was proposed as a solution to the unrest created by the 'surplus' population which had been thrown off common land. The Virginia company, of which the Lord Chief Chancellor was a member, legitimated colonisation of the Americas by claiming they were offering a public service by removing the swarms of 'idle persons' and setting them to work building the first American slave colonies. In 1899–1902 (the Boer War), Cecil Rhodes deported the destitute, criminalised and troublesome working class to build the imperial project of South Africa. Accumulation through dispossession and discipline through deportation have long legacies.

A significant understanding of how race, class *and* gender are articulated in capitalism comes from Harold Wolpe (1972), who showed how the historical and geographical specificity of South Africa produced a form of capitalism based on assemblages with pre-capitalist forms of raced and classed relations. Workers could be paid below social reproduction costs because these costs were being met in the parallel subsistence economy. The Apartheid state was used to prevent stability, ensure deportability and keep wages below reproduction costs. Bridging the division between history-making and abstraction, Wolpe further argues that theories which attempt to impose the abstract on the concrete cannot understand the relationship between race and class because classes are 'constituted concretely through practices, discourse and organisations. One might say that class unity, when it occurs, is a conjunctural phenomenon' (Wolpe, 1988: 51). He notes that opposition to white supremacy did not necessarily unite all Black classes against the regime.

It was Wolpe's concrete historical analysis of South Africa that enabled Stuart Hall to develop his model of articulation, which combines lived experience,

historical specificity and abstraction¹¹ to argue that racialised practices are not equally necessary to the concrete functioning of *all capitalisms*. He argues that it does not make sense to extrapolate a universal structure to race and racism: there is no ‘racism in general’; it is always historically and geographically specific (Hall, 1980: 341). Rather, we need to understand *how* race comes to be *inserted historically*, in the relations and practices that are *active structuring principles* of the present organisation of society and the forms of class relations. This is how Hall comes to make his famous point that ‘Race is thus also, the modality in which class is “lived”, the medium through which class relations are experienced’ (Hall, 1980: 341). This is an expanded view of race and racism that makes us sensitive to how it shapes all lives, not just those categorised as raced: ‘For racism is also one of the dominant means of ideological representation through which the white fractions of the class come to “live” their relations to other fractions, and through them to capital itself’ (Hall, 1980: 341). Hall insists upon the mutual articulation of historical movement and theoretical reflection.

Yet, as we have already noted, it is not only race that constitutes and disrupts class relations and formations: gender is also central. Gender is another articulation, a modality through which class and race are lived. Factors such as the continuing role of the mechanisms of primitive accumulation, the functions of the state, colonialism and labour migration are important, but at the heart of the intense debate that also raged throughout the 1960s was the question of social reproduction and the family. It paralleled many of the features of the historical specificity versus abstractions debate we’ve already considered, in particular asking what sort of value is produced by bio-social reproduction? Does women’s labour make a distinctive contribution to surplus value production or is it, as Marx considered, a cost to capital?

CLASS, GENDER AND HETEROSEXUALITY

Engels (1884/1933) was concerned with the role of women as private property through marriage and the family, just as Marx derides the bourgeois family as built on adultery, treating women as private property. But as Federici (2018) observes, women are never truly portrayed by Marx and Engels as subjects of struggle, as capable of fighting on their own behalf. This, she argues, is because Marx saw the industrial system as offering the possibility for more egalitarian relations. Marx’s blindness to the unpaid labour of women stems from his single-minded focus on waged labour, an exclusively productivist view. Therefore, for Marx non-paid women’s labour is concrete labour, and unpaid labour does not produce surplus value. It is this singular perspective that enabled Marx to ignore the largest occupational group at the time he was writing – servants (see Schwartz, Chapter 16, this *Handbook*). He also ignored the significance of sex workers’ labour (see Cruz and Hardy, Chapter 76, this *Handbook*).

The domestic labour debate (DLD) intended to rectify this omission. It began in the 1960s (Mitchell, 1966), culminating in ‘the unhappy marriage’ of Marxism and feminism in the 1980s (Sargent, 1981), establishing the foundations for the current resurgence of social reproduction analysis¹² (see Arruzza, Chapter 74, Ferguson et al., Chapter 3, Federici, Chapter 34, and Hensman, Chapter 78, this *Handbook*). The DLD was concerned to examine how unpaid domestic labour was in fact productive of surplus value. This highly theoretical debate took a direct political turn in 1972 through the Italian *Wages for Housework* campaign, with slogans such as ‘Class struggle and feminism are one and the same’ (see Federici and Austin, 2017). Proponents asked: why do we have a sexual division of labour? And do women operate as a reserve army of labour? (Breugel, 1979). Initially, a ‘dual-systems’ approach was developed to account for gender and class (patriarchy and capitalism), which was then challenged by Lise Vogel (1983), who proposed a ‘unitary theory’ based on social reproduction more generally.

The analysis moved between abstract theory and political campaigning, exemplified by Marxist studies of race and class that identified ‘super-exploitation’ (Boyce Davies, 2008), ‘domestic slavery’ and ‘triple jeopardy’ as central to capitalist reproduction (Davis, 1981). One of the most significant industrial disputes in the UK was led by South Asian women, the Grunwick strike (1976–8), which disrupted the politics and representations of feminism as white and middle-class. The central concept of feminism, ‘woman’, was also challenged by anti-racist studies of imperialism (Amos and Parmar, 2005) and slavery (Davis, 1981). Heterosexual privilege was brought into the critique by the Black lesbian Combahee collective,¹³ and Gayle Rubin (1975), who detailed how heterosexuality was fundamental to class reproduction. In the UK Marxist feminist understandings of class also turned to the significance of culture (as ideology, hegemony, discourse, as we will see below) and colonial history, via the *History Workshop Journal* (Skeggs, 2006). Global voices also challenged the spaces and places of value production: Maria Mies (1982) insisted on an understanding of the global constitution of value through the fragmentation and decomposition of work processes worldwide.

Understanding of gendered class divisions came from studies of labour, acknowledging that working-class women were always forced to work to survive; the family-household system and gender ideology (Barrett, 1980); and the state’s role in the institutionalisation of violence and family structures (Barrett and McIntosh, 1982). In a critique of Barrett, Johanna Brenner and Maria Ramas (1984) drew attention to how class cut through gender: how working-class heterosexual men and women joined forces to protect their families. They argued that campaigns for a ‘family wage’ (a male breadwinner) came about through struggle not external imposition, as the working class organised their own reproductive protections. Likewise, Hazel Carby (1982) argued that the family can be an important site of solidarity for both Black women and men, a legacy developed from slavery. The scope and variety of the debates was vast, but most positions assumed that

capital does benefit from women's unpaid socially reproductive labour and that Marxist theorists would benefit from not considering gender, race and sexuality to be epiphenomena. Debates amplified, expanded into new domains (for example, queer theory: see Drucker, Chapter 54, this *Handbook*) and intensified. Schisms formed as new struggles vied for political and theoretical attention.

Intersectionality emerged as a challenge to bourgeois white feminism and also tried to connect all these vast and unwieldy differences. Operating as a call-out to complacency, it is an important reminder against singularity. But as a concept it struggles to hold the enormous, diverse and conflicted areas of theoretical analysis, both inter and intra: capitalism, colonialism/post-colonialism, feminism, queer and trans theory, and how they operate very differently in different geopolitical domains. By conflating the very different logics that brought the 'sections' of the inter together it often obfuscates theoretical differences and political strategies: the logic of class is its abolition, the logic of gender is usually recognition and accommodation, the logic of race (depending where in the world, Marxist or liberal) revolution or rights, the logic of sexuality extinction or recognition. Intersectionality is an important intention and holds people to account, but it can also limit explanatory power and may occlude the power relations built into different classifications (see Lagalisse, Chapter 40, this *Handbook*). However, this in itself is another enormous debate, brilliantly articulated by Bohrer, 2019 and Chapter 75, this *Handbook*.

Fortunately, social reproduction theory has been revived and *Caliban and the Witch* (Federici, 2004) republished. Attention to the familial and domestic has been extended into all activities that are 'life making', recognising that workers exist beyond the workplace (see Farris, Chapter 15, this *Handbook*). Bhattacharya (2017) returns to Marx's understanding of social reproduction, which is not about the household but about the state, juridical institutions and the property-form, where for Marx 'every social process of production is at the same time a process of reproduction' (Marx, 1967: 711). Likewise, Nancy Fraser (2016) argues that the abstract separation of economic production from social reproduction is constitutive of capitalism itself.

Paul Cammack (2020) also maintains that Marx did provide a powerful framework for social reproduction in his analysis of how all 'natural' relations are turned into money relations. In *Capital*, vol. 1, Marx identified the fundamental contradiction of the individual capitalist who extends workers' production time by extracting every minute of energy and time, which ultimately shortens the life and use of the worker. Capital left to itself destroys life in its drive to extract value: 'Capital therefore takes no account of the length and life of the labourer, unless society forces it to do so' (Marx, 1967: 380). The logic of capital is to search for an inexhaustible supply of surplus-value-producing labour; capital does not care about preserving life. Rather, survival, as Marx notes, relies on the worker's drive for self-preservation and propagation (Marx, 1967: 718). While the working class struggles for protection against exhaustion and death, capital

exhausts the unprotected. As Cammack points out, there has always been a ready supply. In a radical move, he argues that capital does *not* need the family: it can always find plenty of exhaustible unprotected labour.¹⁴

These important renewals of class analysis are based on global perspectives, beyond the parochialism of Western Marxism, and draw on the relationship between informal and formal labour (Mezzadri, 2017). Pun Ngai and Chris Smith (2007) extend understandings of social reproduction in their studies of indenture through the dormitory labour regime in China, which uses a trapped residential workforce of permanently young, predominantly female workers. Sara Farris (2012) also notes that since the 1970s the number of women migrating has grown so much that half of the current migrant population in the Western world is now women, employed mainly in one branch of the economy: the care and domestic sector, notorious for its informality and lack of labour protections.

If class analysis is to be understood globally, moving beyond a productivist prejudice to consider total social reproduction, including forms of protection, this must include the processes of migration and racialisation that are *inseparable* from their class and gender dimensions (Ferguson and McNally, 2015). Susan Ferguson (2008) notes how understanding the spatialisation of labour enables us to see how race is inscribed on the labouring body. This means that racism and sexism are *not* historical aberrations that can somehow be separated from capitalism's 'real' or 'ideal' functioning; rather, they are integral to capital, actively *facilitating* processes of capital accumulation. As feminists and anti-racist theorists have shown, the state is a key player in this facilitation, having long institutionalised difference in the interests of capital.

CAPITAL'S INSTITUTIONS?

Capitalism has always required particular ensembles of regulatory institutions, governmental practices and socio-cultural norms in order to facilitate the general process of capital accumulation under specific historical and technological conditions (Jessop and Sum, 2006). It is not just national states, but capital's supra state organisations, such as the International Monetary Fund, the World Bank and the ECB, which through racist and misogynist policies, often termed 'structural adjustment programmes', not only maintain strict racial boundaries between countries and people but retrench class and national divisions, forcing the poorest states to subsidise the richest (Lapavistas, 2013).

Let's remember Stuart Hall's concept of articulations so we can understand how race *and* gender are *active structuring principles* of class relations: 'Race [*and gender* are] the modalities in which class is "lived", the medium through which class relations are experienced' (Hall, 1980: 341). The state, even when offering protections against capital's rapaciousness, often reproduces these modalities. Denise Noble (2015) notes how the establishment of the British welfare

state (nominally to protect against abject poverty) depended upon British women being allocated to the role of reproducing racism: *The Beveridge Report* (1942) proposed that mothers have vital work to do in ensuring the adequate continuance of the British race and of British ideals in the world. Robbie Shilliam (2018) details how Beveridge addressed the working class as if they were totally white, with a duty to ‘maintain their breed at its best’ (1942: 150). Eugenicist discourse has a long history and institutionalisation. All British working-class women were forced to attend ‘schools for mothers’ to be trained in how to produce cannon fodder for colonial wars waged by the British in South Africa and blamed when they didn’t (Davín, 1978). They were assumed to be deficient and so were taught ‘standards’, an imperative that shapes the architecture of most health, welfare and education systems (Duneier, 1992; Shilliam, 2018; Skeggs, 1997).

LIVING CLASS

Liberalism is central to state institutionalisation (Meiksins-Wood, 1986; Wilson Gilmore, 2002). Law promotes the liberal myth of ‘freedom’ that Marx identified as an essential illusion of capitalism by establishing an equivalence, a formal equality between the worker and the employer: both are supposedly free to exchange their property, but, unless protected, the working class are forced to exchange their labour in order to survive. What is key to the ideological myth of liberal freedom is how it shapes personhood, telling us who is *not* exchangeable. Carole Pateman (1988) notes how the social contract was devised on the basis of relationships between those who could *not* be imagined as property to each other. These are fundamental class and property relations with the working class as the *constitutive limit* to the possessive individual of the European social contract (Skeggs, 2004). In two different research projects, I have shown how these class relations are lived, through abstractions, in the realm of economic and symbolic value.

In a longitudinal ethnographic study I conducted in the 1980s and 1990s, *Formations of Class and Gender: Becoming Respectable* (1997) I used Hall’s framework to analyse the conjuncture of economic, state/institutional, historical, geographical, political and cultural articulations that shaped the conditions of possibility by which a group of white working-class women lived.¹⁵ The research examined how the subject positions produced by overdetermined structures shaped by capital’s history and logic were lived. What became significant to the women’s experience of class was how their lives were structured not just by labour and social reproduction but also by symbolic violence. They were ‘always already’ classed within an ideological and state institutionalised system that distributed cultural and moral value, which subsequently determined their access to economic spaces. They were made brutally aware that they were subject to continual classification and symbolic devaluation as ‘working-class’, but it was a term from which they dis-identified. The category ‘working-class woman’ was

so loaded with symbolic negativity that identification would be tantamount to symbolic suicide.

In defence, they developed their own class-antagonistic moral economy by resisting the pathological value judgements that were made of them in almost every encounter with middle-class people, especially representatives of the state (their teachers and health and social workers), and also through mainstream media. The 1980s began the contemporary demonisation of the working class in the UK, which has now developed into outright scorn, derision and hatred. This has been extensively documented elsewhere, in studies showing how the deregulated TV industry develops to profit from the symbolic denigration of working-class women (Skeggs, 2009; Skeggs and Wood, 2012).

Throughout the research many attempts were made by state representatives to force working-class women – to reform them – into accepting ‘standards’ of bourgeois familial ideology. The ‘caring courses’ they studied were the equivalent of ‘schools for mothers’, a remnant of the colonial project, in which working-class culture was institutionalised as deficient. The imposed ‘standards’ were strongly resisted, but this locked the young women into a defensive competition to be a better carer than middle-class women and thus subjected them to continual scrutiny. Being a better carer secured investment in a caring subjectivity and directed them towards ‘voluntarily’ entering caring jobs. Just like Paul Willis’s (1977) study of why working-class boys get working-class jobs, the women of ‘Formations’ generated dignity through gendered resistance to class degradation. By defending and claiming value from their own practices of respectability, caring for others became a positive ‘choice’, a protection against devaluation. They were located in and lived the abstract positions of capital’s logic, shaped by gendered and raced histories, as they struggled not to live with denigration, to ‘keep a floor on their circumstances’, to survive with some dignity.

The hinge between the symbolic and economic has a long history: as Linebaugh and Rediker (2000) show, Marx was aware of the symbolic inscriptions that were carved into people’s bodies, how in England from 1547 those made destitute were branded with the letter V and enslaved for two years, later to be transported for colonial exploits. In 1596, prisoners were branded on the face with a hot iron and called ‘the King’s Labourers’. Classifying and pathologising was central to the imprisonment and transportation policies that enabled the colonial project. The Lord Chief Justice of the King’s Bench from 1592 to 1604 developed his ‘theory of monstrosity’, listing 30 different types of rogues and beggars and classifying them for transportation into five main groups according to potential labour value. The use of working-class women as symbols of monstrous moral decay has a very long history in England, as Federici (2004) details and which Imogen Tyler (2020) charts through to the present. This symbolic economy mediates other capital and state forces, legitimating power, distributing im/moral values, controlling access to work and welfare, enabling exploitation and appropriation. In which through an accident of birth people are born into structural and subject positions.

In another study, *Class, Self, Culture* (Skeggs, 2004), I show how the middle class, through culture, become personifications of capital. Using Bourdieu to map the fields of exchange by which cultural capital can be converted into symbolic and economic capital, I detail how the appropriation of culture and *exclusion* of others from the ability to exchange enable the middle class constantly to accrue cultural value to themselves as a modern 'possessive individual'. This involves propertising the culture and affects of those who they appropriate. Unlike the working-class women above, the middle class are able, through access to Capital's institutions, to generate authority and convert their culture into economic and symbolic value, legitimating themselves. They shape a personhood from which the working class are excluded. If we see culture as a form of property that can be embodied in dispositions such as entitlement, we can also see how it becomes naturalised in the everyday order of things.

The culture wars that are now being waged have long legacies in liberalism and humanism. Also, as we should remember from Harris and Bhandar above, cultural property relations are not just classed, but always/already articulated with race and gender. As Bhandar (2014) shows, drawing on Bentham, the abstract ownership of property is not just based on physical possession, occupation or even use; it is based on the *expectation* of being able to use property as one wishes. Remember that the social contract is based on an expectation of not being propertisable, drawing stark divisions between those considered as abstract labour and those with personhood. The working class are unable to convert their symbolic degradation into property, unlike those who can accumulate cultural capital for its conversion. Unless they offer the opportunity for value extraction as labour, the working class in their many modalities regularly appear in front of the state as non-persons (Dayan, 2011), rendered wageless, disposable and superfluous (Denning, 2010). This is a cultural logic of capitalism, not Jameson's (1981) aesthetic postmodern form, but one based on amplifying and consolidating difference as competition over the value of one's culture: as signifier of abjection or as marker of distinction. It is a competition in which each class faces each other in regard to what counts, defensive versus entitled.

Althusser (1971) proposed interpellation and Gramsci (1971) proposed consent as mechanisms by which social reproduction is achieved. I want to add that it is realised through the antagonistic struggles for cultural value, mediated by a symbolic economy that guarantees the historic reproduction of capital through class, race and gender relations: for one group as protected entitlement, expectation and symbolic value propertised in the formation of personhood; for the other, exchangeable (or not) as labour, forced to defend themselves against degradation, a source for appropriation (Skeggs and Wood, 2012). These person formations are experienced daily as moral value struggles and set limits on how class can (not) be an identity for working-class women.¹⁶ Through the violence of the institutionalised symbolic economy lived through encounters with the middle class, they engage in a constant struggle for value, survival rather than accumulation.

IDENTITY

This is why class is not an identity: it is a relation, it is dynamic, it is a movement immanent to capitalist relations that compels a 'perpetual work of refutation, interpretation, and reformulation' (Balibar, 1994: 136). When class is located in the discourses of liberalism and humanism – namely in appeals for 'rights' or recognition – the working class operates as the constitutive limit, as symbolically pathological. To make a claim for recognition when recognition is always loaded with pathology makes no sense. Class is not the subject of capital; as Jappe noted, that subject is value. Class is an abstraction that is overdetermined in its articulation and only known through an understanding of positions within a system, immanent to it; these positions are lived through mediated symbolic formations. Class is therefore lived concretely as an abstraction, a position in a system of economic and cultural value.

Balibar (1991) develops this further, arguing that while the bourgeoisie remains as an abstract positional personification, the proletariat are concretised in practice because they are forced to sell their labour. This, he maintains, means that the logic of capital ensures that the antagonistic classes never come face to face, because they figure within the capital-relation in different ways. The bourgeoisie operate as a cypher, as the 'bearers' of capital. They stand in for functions that the logic of capital performs, above all accumulation. The proletariat, however, have a concrete reality as 'labour-power'. Balibar calls this a historical drama in which the bourgeoisie stand for economic personification and the proletariat do things *as a result*. I'd argue they both perform their positions. The occupation of the position of expectant, entitled, ever-accumulating bourgeois personhood is institutionalised in all ideological and state institutions. They encounter the working class through systems of punishment, exclusion and judgement, used to secure their distinction. These encounters make the working class do things, and feel things, *as a result*: living a life replete with exposure to violence, denigration and contempt, they often fight back. They try to protect themselves. The classed encounter is how the abstract is experienced as antagonism, but also as a value, part of capital's logic which reduces human actors to the executors or bearers (*Träger*) of its orders. Class is an abstraction of value, a symbolic space in which struggles to extract, defend and protect are dynamically shaped.

CONCLUSION

Class is made from relations and forces across and within apparent entities; race and gender are *active structuring principles* of class relations. They are formed in specific historical conjunctures, in articulation, overdetermined: be it by capital, labour migration, racialisation, medicalisation or criminalisation – through symbolic violence, the state and its representatives. These articulations shape all social reproduction; they make up the totality of capitalist relations. They can be

understood through abstractions of capital's logic made concrete as they are actualised in structures. As Hall (1980) notes, race is a modality in which class is 'lived', as are gender and sexuality.

The spurious 'freedom' of the liberal social contract has been extended from the exchange of labour in the economy into the exchange of culture, making it appear as if everyone is able to propertise their personhood and develop expectations of ownership and entitlement. For some groups, identity may be the mechanism by which they shape their struggle to make a claim on the state for protection, but as Barbara Fields (2001) showed, this will always lock them into a liberal frame, one built from the exclusions of those identified by difference. Re-signification only exists within the system of symbolic violence by which it is formed. The classifications developed from colonialism take on modern forms, no longer branded but still inscribed on the body. Personhood is still shaped through politically institutionalised forms of property, of entitlement and limit, enacted daily.

Class is no longer understood only through industrial production, but extends beyond labour into social reproduction and other forms of value extraction, where rent and financialisation have become dominant forces (Lapavistas, 2013), where intellectual property rights (see Rekret and Szadkowski, Chapter 85, this *Handbook*) and the institutionalisation of corruption are now drivers of value formation. If value is the subject of capital (Jappe, Chapter 30, this *Handbook*), we can see class as an abstraction of value. Just as class is an abstraction of labour, it now forms a symbolic space in which struggles to exploit, extract, appropriate, defend and protect are dynamically shaped. It is an overdetermined space, within a conjuncture, often contradictory, with the different logics of race and gender, offering vectors for struggle. Class is lived in a cultural logic of capitalism where value is the subject, class its manifestation, a relation and a representation that is lived through struggles over value.

Althusser (1971) noted that it is the apparatus of the state that secures capital's interests, enabling the reproduction of the social relations of production (now extended to value production through different forms). Yet to turn to the state for protection of class interests is a many-edged sword. Consider the state-sponsored genocide currently occurring across the world as governments prioritise profit over people. The necropolitics released as a result of the Covid-19 pandemic represents a policy of malevolent neglect by design where the extremes of social reproduction are made apparent; the unproductive, those subject to structural adjustment and austerity policies, those whose lives have already been subject to slow death and those who fight back are more likely to die quickly. This is the current conjuncture where class is made vividly apparent, as a struggle for value and life, in its many articulations.

- 15 In this historical/theoretical/political moment, at the beginning of the research in the early 1980s, I identified the women as white to racialise and de-normalise the race relations they inhabited: see Hazel Carby (1982) and CCCS (1982), who called on researchers to name their locations/articulations. This is very different from the current reactionary and racist (Bhambra, 2017) uses of 'white working class' to make white working-class people appear as if somehow indigenous, or 'left behind', without recourse to the history of colonialism by which they are located (Shilliam, 2018, 2020).
- 16 There have been historical moments when white working-class men have been made symbolically heroic, promoted as authentic, but these are short periods in the long history of degradation, fear and hate.

Punishment

Alessandro De Giorgi

INTRODUCTION

Since the early 1980s, global processes of capitalist transformation across Western societies have revolutionized both the field of production and the complex of governmental institutions, practices, and technologies that, in the aftermath of World War II, had consolidated into the Keynesian welfare state (Jessop, 1996, 2016; Mishra, 2014). The neoliberal paradigm of governance that has come to dominate Western societies through the last quarter of the twentieth century has resulted in a drastic redistribution of social wealth toward the top of the racial and class hierarchy, a vertical increase in economic inequalities, an acute precarization of work within increasingly segmented labor markets, a massive attack on workers' rights, and a systematic dismantling of the social safety net that had been instituted in the wake of the Keynesian compromise between capital and labor (Bonefeld, 2017; Harvey, 2005; Schram, 2015). In this sense, the neoliberal revolution has involved an organized assault against the economic relevance and political centrality of industrial labor – and, specifically in the USA, against the radical struggles for racial justice that had emerged from the civil rights movement (Camp, 2016; Flamm, 2005; Parenti, 1999: 3–44).

These transformations, legitimized through the neoliberal dogmas of absolute flexibility, ruthless competition, and rugged individualism, have significantly reshaped the field of social and penal control in much of the Western world.

Indeed, the same decades that witnessed a reconfiguration of the industrial paradigm of capitalist production were also characterized by the unfolding of a 'global lockdown' (Sudbury, 2005) resulting – although with different degrees of intensity between the USA and Europe – in a steady expansion of penal powers across late-capitalist societies (Garland, 2001; Pratt et al., 2005; Wacquant, 2009a, 2014).

The increasing centrality of punitive practices in the governing of contemporary societies signals a decisive deviation from the trend toward penal moderation that had characterized the second half of the twentieth century – particularly in the USA, where by the early 1970s incarceration rates had reached historical lows and the rehabilitative ideal had become the dominant philosophy, at least within the nation's more progressive correctional systems (Allen, 1981; Simon, 2014; Tonry, 2004).¹ In addition to the increased prominence of carceral institutions in the governance of racialized social marginality, neoliberal societies have also witnessed the simultaneous proliferation of different technologies of social control, often operating outside the formal boundaries of the penal field: practices of extra-penal detention and surveillance targeting specific categories of people and largely immune even to the residual constitutional protections in place within the criminal justice system. One obvious example is the administrative detention of migrants from the global South within the large archipelago of camps and detention centers surrounding the heavily militarized borders of Europe, Australia, and the USA: dystopic non-places governed through a permanent state of exception and functioning as engines for the processing of the racialized human surplus generated by the new international division of labor (De Genova, 2016; Mezzadra and Neilson, 2013).

As these global processes precipitate locally in the form of cyclical urban crises within the postindustrial metropolis, late-capitalist societies have also witnessed the multiplication of technologies of control specifically aimed at the punitive governance of segregated urban spaces. One could think here of the endemic diffusion of electronic surveillance – from the omnipresent CCTV cameras to the deployment of drones by police departments across major US cities – but also of the fracturing of the urban landscape along heavily policed boundaries of race and class that mirror the functioning of national borders within the current global division of labor (Davis, 2006; De Genova, 2005, 2013; Hill-Maher, 2003). The dynamics of capitalist accumulation characterizing the neoliberal city – such as the rampant gentrification of former inner cities and the ensuing displacement of entire poor communities of color, or the proliferation of securitized gated communities that effectively obliterate any notion of the city as a public space – offer clear examples of a neoliberal paradigm of social regulation that unfolds simultaneously at the urban and the global level, geared in both cases toward the neutralization of disposable surplus populations created by the predatory dynamics of capitalist accumulation (Blakely and Snyder, 1997; Herbert and Brown, 2006; Smith, 1996).

The neo-Marxist criminological tradition known as the political economy of punishment provides a critical framework to dissect the developments just described and a lens to observe the evolving relationships between racial capitalism (Robinson, 1983) and the rise of punitive strategies for the governing of social marginality (for a review of this literature, see De Giorgi, 2006: 1–40, 2012). In what follows, I will attempt to reconstruct the trajectory of the political economy of punishment as it has unfolded since the publication of Georg Rusche and Otto Kirchheimer's seminal work *Punishment and Social Structure* (2003 [1939]). First, I will offer a brief materialist narrative of the origins of modern punishment and of the prison as its central institution, outlining the politico-economic conditions that prompted the transition from the bloody corporal punishments prevalent in pre-capitalist social formations to the disciplinary institutions of penal confinement that would become hegemonic across Europe and the USA at the dawn of industrial capitalism (Foucault, 2015; Spierenburg, 1984). Second, I will use the theoretical tools forged by the political economy of punishment to offer a critique of contemporary penal practices in relation to the neoliberal restructuring outlined earlier. Finally, along the path laid out by some recent critiques of the carceral state that have productively integrated the classic materialist analysis with an emphasis on the racialized dynamics of capitalist accumulation, I will suggest some possible new directions for a structural critique of punishment that might avert the economic reductionism of traditional Marxist criminology.

POLITICAL ECONOMIES OF PUNISHMENT

The political economy of punishment focuses on the relationships between penal transformations and the evolution of the capitalist system of production. Although materialist analyses of crime and punishment inspired by the writings of Marx and Engels had already appeared since the early twentieth century (see Bonger, 1916), the foundational moment in neo-Marxist criminology is represented by the 1969 publication of the second edition of Georg Rusche and Otto Kirchheimer's classic *Punishment and Social Structure*, followed within a few years by a wave of critical 'revisionist histories' of punishment, including Michel Foucault's *Discipline and Punish* (1977 [1975]), Dario Melossi and Massimo Pavarini's *The Prison and the Factory* (1981 [1977]), and Michael Ignatieff's *A Just Measure of Pain* (1978).² According to these revisionist histories, penal practices perform a very different task than protecting society from crime. The latent functions of punishment can only be grasped by situating institutions of penal control within the broader economic dynamics and structural contradictions intrinsic to capitalist societies. From a materialist standpoint, penal change is always connected to historically specific relations of production and hegemonic forms of racial and class power. In the classic definition of Rusche and Kirchheimer (2003 [1939]: 5):

Every system of production tends to discover punishments which correspond to its productive relationships. It is thus necessary to investigate the origin and fate of penal systems, the use or avoidance of specific punishments, and the intensity of penal practices as they are determined by social forces, above all by economic and then fiscal forces.³

The epistemological objective of the political economy of punishment is thus to overcome the dominant theoretical paradigm of criminology as a science of criminality and as a state-sponsored form of power/knowledge over the causes of crime and to replace it with a historically and economically grounded critique of the formation and evolution of different systems of penal control. Penal historiography thus becomes a social and economic history of the repressive apparatuses that have contingently emerged to regulate and reproduce existing relations of racial and class power. It becomes, again in Rusche's own words, 'more than a history of the alleged independent development of legal "institutions"'. It is the history of the relations of the 'two nations', as Disraeli called them, that constitute a people – 'the rich and the poor' (Rusche, 2014 [1933]: 258).

In outlining the main theoretical elements of the materialist critique of punishment, Rusche advances two main hypotheses. The first descends from utilitarian penal theories: any penal system is ultimately governed by a logic of deterrence – that is, by the objective of discouraging potential lawbreakers from violating the law. Second, the contingent manifestations of this logic of deterrence evolve in relation to existing relations of power, as shaped in particular by the development of capitalist labor markets:

Experience teaches us now that most crimes are committed by members of those strata who are burdened by strong social pressures and who are relatively disadvantaged in satisfying their needs when compared to other classes. Therefore, a penal sanction, if it is not to be counterproductive, must be constituted in such a way that the classes that are most criminally inclined prefer to abstain from the forbidden acts than become victims of criminal punishment. (Rusche, 2014 [1933]: 254)

Therefore, different articulations of penal power will emerge on the basis of the material conditions faced by the most marginalized social classes. In order to be effective, penal practices and institutions will need to impose upon those who violate the existing social order worse conditions of life than those available to those who – despite their subordinate position in society – nonetheless accept to conform to its norms. This means that the living conditions of the most marginal sectors of the proletariat will define the coordinates of penal policy and the regime of 'legal suffering' to be endured by those who are punished. The average standards of living at the bottom of the racial and class structure will thus determine the upper limit beyond which no penal reform can go without undermining the deterrent role of punishment. Borrowing again from Rusche, 'All efforts to reform the punishment of criminals are inevitably limited by the situation of the lowest socially significant proletarian class that society wants to deter from criminal acts. All reform efforts, however humanitarian and well meaning, which attempt to go beyond this restriction, are condemned to utopianism' (Rusche,

2014 [1933]: 255–6). In this sense, penal evolution is clearly not the outcome of humanitarian penal reforms. Instead, the structural limit to any process of reform and civilization of punishment is represented by the principle of *less eligibility*, just described, to which any penal system must ultimately conform (see also Sieh, 1989).

In pre-capitalist economic formations – as well as in capitalist economies characterized by the persistence of slave labor, such as the USA until the end of the civil war – living conditions for the proletarian classes were largely the result of extra-economic factors derived from feudal sociopolitical arrangements or existing regimes of labor enslavement. With the consolidation of capitalist relations of production, and the partial abolition of slavery with the Amendment to the US Constitution, the living standards of the proletariat become a direct consequence of capitalist processes of division and organization of labor. The invisible dynamics of the market now assign workers a ‘fair price’ for their labor on the basis of preeminently economic standards: the larger the supply of labor, the lower its cost, and the worse the material conditions endured by those who own nothing but their labor-power. As a consequence, historical periods characterized by a large surplus of labor will also witness a toughening of penal practices targeting society’s poorest classes:

Unemployed masses, who tend to commit crimes of desperation because of hunger and deprivation, will only be stopped from doing so through cruel penalties. The most effective penal policy seems to be severe corporal punishment, if not mass extermination ... In a society in which workers are scarce, penal sanctions have a completely different function. They do not have to stop hungry masses from satisfying elementary needs. If everybody who wants to work can find work, if the lowest social class consists of unskilled workers and not of wretched unemployed workers, then punishment is required to make the unwilling work, and to teach other criminals that they have to content themselves with the income of an honest worker. (Rusche, 2014 [1933]: 257–8)

Across Europe, the birth of the prison is inscribed within the historical transition from a penal regime based on the destruction of the body of the condemned through the staging of torturous ‘spectacles of suffering’ (Foucault, 1977 [1975]; Garland, 1990: 213–247; Spierenburg, 1984) meant to display the absolute power of the monarch, to a system that spares the body of the criminal, so that through its productivity can shine the economic power of the capitalist. A new conception of time as a measure of labor (Thompson, 1967), together with the generalization of the principle of exchanges of equivalents, explains the parallel consolidation of the legal contract as a stipulation of worktime and of the criminal sentence as a determination of prison time (Pashukanis, 1978).

At first across northern Europe, and later in the USA – but in the latter with the significant exception of slave labor in the South, where discipline was largely imposed by the slave-owning class through state-tolerated racial violence, vigilantism, and lynchings (Berg, 2011) – this new philosophy would inspire the construction of the early disciplinary institutions for the poor: workhouses, poorhouses, houses of correction, bridewells, and later penitentiaries. Confinement thus started

to become the dominant practice for the control of marginal classes – paupers, vagrants, beggars, prostitutes, alcoholics, lunatics, criminals, etc. The body of the punished was now treated as a productive entity and as a potential source of value: the new systems of control would increasingly focus on correcting the attitudes, reshaping the morality, and disciplining the souls of those punished. Detention would gradually emerge as the hegemonic form of correctional intervention on any kind of social deviance, thus inaugurating what Michel Foucault would define as the age of ‘great confinement’ (Foucault, 1988 [1961]: 38–64).

Ultimately, Rusche and Kirchheimer’s analysis builds upon the notion of primitive accumulation elaborated in the first volume of *Capital*, where Marx (1976 [1887]) describes the historical moment in which a nascent capitalist system needs to create the conditions for its own development – that is, it must subsume preexisting relations of production and forcibly transform free labor into wage labor (Marx, 1976 [1887]: chapters 26–28). The constitutive contradiction of this process is that on the one hand, capital freed labor from the feudal ties of personal servitude that had entangled it until then, while on the other, it immediately recaptured this productive potential through a more abstract form of subordination. The ‘liberation’ of work thus unfolded through an expropriation of producers, which ultimately consigned them to a higher level of subjugation. In England, masses of destitute peasants expelled from the countryside following the enclosure of common lands that had effectively deprived them of the subsistence economy on which they had survived under the feudal system, were now forced to migrate toward the industrializing cities of northern Europe, where they would fill the ranks of the new urban poor. Dispossessed of its means of subsistence and brutally separated from its land, this proletarian workforce in the making would initially appear unable to adapt to the new conditions of production and reluctant to subject itself to the new organization of labor in the emerging factories. In the last pages of *Capital*, Marx reconstructs the violent fate awaiting this proto-proletariat: ‘The fathers of the present working class were chastised for their enforced transformation into vagabonds and paupers. Legislation treated them as “voluntary” criminals, and assumed that it depended on their own goodwill to go on working under the old conditions that no longer existed’ (Marx, 1976 [1887]: 896).

A comparable historical trajectory of subjugation through emancipation would characterize the fate of former slaves after the partial abolition of slavery in the USA. Indeed, if on the one hand the XIIIth Amendment abolished ‘slavery and involuntary servitude’, on the other it created the conditions for the perpetuation of slavery by constitutionalizing it ‘as a punishment for crime whereof the party shall have been duly convicted’. This new form of enslavement would materialize across the Southern states through the enactment of ‘Black Codes’ which criminalized vagrancy, unauthorized assemblies, lack of a known address, and miscegenation, among other behaviors, and then sanctioned them with penal (re)enslavement in the form of convict leasing, forced labor, and even the auctioning of ‘black criminals’ (Childs, 2015: 57–92). As the bloody history of capitalism would illustrate

again and again, similar dynamics of violent penal discipline would cyclically reemerge whenever the engine of capital valorization would again set in motion masses of impoverished populations deprived of their means of subsistence by capital's ongoing movement of 'accumulation by dispossession' (Harvey, 2004).

NEO-MARXIST CRIMINOLOGY AND LATE CAPITALISM

Toward the second half of the 1970s, radical criminologists extended the materialist framework of the political economy of punishment to the critique of penal systems in contemporary capitalist societies, particularly the USA. The effects of the 1973 oil crisis had started to materialize across the main industrial centers of the US 'steel belt' in the form of a significant increase in unemployment rates – especially among the African American working class, which in the wake of the Great Migration from the South had filled the ranks of the industrial workforce during the previous four decades (Wacquant, 2008: 13–132; Wilson, 1987, 1997). This labor force, rendered superfluous by processes of technological innovation, industrial downsizing, and productive relocation, emerged as the postindustrial rendition of the Marxian reserve army of labor: a mass of low-skilled, modestly educated workers consigned to economic redundancy by the restructuring of the productive cycle, and yet highly exploitable as a lever for the control of labor struggles over working conditions and wage demands by the active workforce. Famously defined by William J. Wilson (1987) as 'the truly disadvantaged', this racialized human surplus now found itself at the bottom of the US labor market, where it would embody once again the 'lowest socially significant proletarian class' described by Georg Rusche (2014 [1933]: 255).

In the wake of these profound socioeconomic dislocations, incarceration rates, which had been relatively stable between the late 1920s and the end of the 1960s, started to grow steadily around the mid 1970s, initiating an upward trend that would continue unabated for the next 40 years (see National Research Council, 2014). Faced with these developments, some radical criminologists in the USA formulated the hypothesis that the simultaneous increase in unemployment and incarceration rates signaled a broader restructuring in the governing of social marginality. In the words of Richard Quinney:

Criminal justice, as the euphemism for controlling class struggle and administering legal repression, becomes a major type of social policy in the advanced stages of capitalism. Emerging within the political economy of late capitalism is a political economy of criminal justice. (1980: 107–108)

The first systematic attempt to elaborate an empirically grounded materialist critique of the US penal system was developed by Ivan Jankovic (1977) in an early article published in *Crime and Social Justice*. Jankovic's starting hypothesis was twofold: the first, which he called the 'severity hypothesis', was that the

worsening of economic conditions at the bottom of society's class structure – as signaled by growing unemployment rates – would prompt a toughening of penal sanctions and a significant increase in incarceration rates. The second hypothesis was that higher incarceration rates would also perform the indirect economic role of regulating the size of the labor surplus, thus becoming a tool in the reproduction of the Marxian reserve army of labor. After examining the case of the USA between 1926 and 1974, Jankovic came up with ambivalent findings. On the one hand, the severity hypothesis was broadly confirmed by his statistical analyses, which showed that unemployment and imprisonment rates followed parallel trajectories. On the other, however, he could not find evidence of any impact of incarceration rates on the labor market: although a significant fraction of the prison population was (and indeed had been since the invention of the penitentiary) constituted by unemployed and underemployed people, the overall size of the prison population was not large enough to exert a significant impact on the size of the industrial reserve army of labor.

Between the late 1970s and the early 1990s, other neo-Marxist scholars would attempt to test Rusche and Kirchheimer's hypotheses by analyzing the relationship between unemployment and incarceration. Again, while the severity hypothesis was repeatedly confirmed, the utility hypothesis was not (for comprehensive reviews of this literature, see Chiricos and Delone, 1992; De Giorgi, 2006). The fact was that during the historical conjuncture in which these analyses were elaborated, the penal system had not yet become the current 'black hole into which the detritus of contemporary capitalism is deposited', to borrow from Angela Y. Davis (2003: 16). Indeed, at that time the restructuring of the industrial economy and the demise of the Keynesian welfare state had not yet produced the dramatic social dislocations that would fully materialize, particularly at the heart of the racially segregated US inner cities, during the 1990s. The neoliberal assault on the welfare state was only at its inception – respectively under the Reagan and Thatcher regimes on each side of the Atlantic – and it had not yet wrought its havoc on the most marginalized fractions of the racialized poor. In this context, both the welfare state and what Loïc Wacquant would later call the 'penal state' (Wacquant, 2009b: 111–191) still complemented each other in the governing of social marginality, along the lines of a rough division of labor between social and penal policies. A sizeable fraction of the surplus population was still managed through the welfare system – although in increasingly punitive ways throughout the 1980s and 1990s, as attested by the toughening of conditions for access to social assistance, the shrinking of welfare benefits, the imposition of demanding conditions on welfare beneficiaries, and the introduction of stigmatizing sanctions for recipients who could not satisfy them (Katz, 2013; Soss et al., 2011). The boundary along which such division of labor operated was mostly a gender-based one, with penal strategies focusing specifically on racialized poor male residents of the inner city, and an increasingly disciplinary welfare system regulating racialized poor women and their children.

Along similar lines, Marxist criminologist Steven Spitzer argued that the surplus population emerging from capitalist restructuring could be subdivided into two relatively separate components, which he respectively defined as *social junk* and *social dynamite*. The first term identifies those sectors of the sub-proletariat that represent a disposable social detritus, harmless to power elites and to the dynamics of racialized capital accumulation, and thus manageable through welfare measures. The second term connotes instead the potentially riotous fractions of the surplus population, which represent a looming threat to the existing structures of capital accumulation and must therefore be governed by penal means: marginalized youth of color, young unemployed residents from the inner cities, ghetto hustlers, drug dealers, etc. (Spitzer, 1975).

The difficulty to demonstrate any measurable impact of incarceration rates on the US labor market, particularly in view of Spitzer's theorization of a structural division of labor between welfare and punishment in the governing of the poor, seemed to disprove the more orthodox hypothesis, initially elaborated by Rusche and Kirchheimer, of a direct role of penal politics in the management of the industrial reserve army of labor (see also Chiricos and Bales, 1991; Wallace, 1981). Yet, this would later prove to be a premature conclusion: during the next 30 years, incarceration rates in the USA would increase to reach historical records, leading the country to become the world's most punitive democracy. At the same time, the ongoing neoliberal assault on the welfare state – effectively symbolized by Clinton's campaign to 'end welfare as we know it' – would drastically reshape the configuration of the social and penal arms of the state, prompting the metamorphosis of the US welfare state into a hypertrophic penal state (Wacquant, 2009b).

In the wake of these later developments, at the end of the 1990s Bruce Western and Katherine Beckett (1999) would again attempt to test the hypothesis of a direct role of penal policies in the regulation of US unemployment rates. According to their analysis, the relatively low official rates of unemployment observed in the USA – compared to European countries – between the 1980s and 1990s were not the result of high levels of flexibility and labor market deregulation (as argued by the apologists of neoliberalism on both sides of the Atlantic), but rather a consequence of the vertical increase in incarceration rates, which effectively rendered a sizeable fraction of the surplus population invisible to official statistics. Observing the intersection of race and class in the composition of the US prison population, Western and Beckett showed that if official statistics were to include the incarcerated population, overall US unemployment rates would automatically increase by an astonishing 7.5% among African Americans, whose average rates of joblessness had 'remained around 40% through recessions and economic recoveries' (Western and Beckett, 1999: 1044). On the other hand, the study also shows that in the longer run mass incarceration tends to raise unemployment rates by crippling the employment prospects of former prisoners upon their release. In the end, continued penal expansion becomes the condition to maintain lower unemployment rates, thus generating a downward spiral

of punitive regulation that signals the complete transition of the governance of racialized social marginality from the Keynesian state's penal-welfare hybrid to the neoliberal state's carceral archipelago.

RACIALIZED SOCIAL STRUCTURE AND PENAL DISCIPLINE IN THE USA

The recent literature in the sociology of punishment has focused on the punitive turn that has affected the USA during the last quarter of the twentieth century – a penal experiment that has resulted in draconian penal policies, historically unprecedented imprisonment rates, and a widespread emphasis on the penal incapacitation of the new 'dangerous classes' (see Garland, 2001; Simon, 2007; Tonry, 2004). In this direction, Loïc Wacquant has described the transition of US society toward a post-Keynesian paradigm of social regulation as the shift from a social state charged with mitigating the effects of economic inequality among marginalized populations to a penal state in charge of enforcing the neoliberal economic order through the punitive regulation of racialized urban poverty:

Thus the 'invisible hand' of the unskilled labor market, strengthened by the shift from welfare to workfare, finds its ideological extension and institutional complement in the 'iron fist' of the penal state ... The regulation of the working classes through what Pierre Bourdieu calls the 'Left hand' of the state, that which protects and expands life chances, represented by labor law, education, health, social assistance, and public housing, is *supplanted* (in the United States) or *supplemented* (in the European Union) by regulation through its 'Right hand', that of the police, justice, and correctional administrations, increasingly active and intrusive in the subaltern zones of social and urban space. (Wacquant, 2009b: 6)

As a result of these shifts, and despite some modest decreases in the aftermath of the Great Recession of 2008, at the time of this writing the incarcerated population in the USA hovers around 2.2 million individuals, distributed across a penal network of 1,719 state prisons, 102 federal penitentiaries, 901 juvenile correctional facilities, 3,163 local jails, and 76 Indian Country jails. With close to 3% of the population living under some form of correctional supervision, the current 'productivity' of the US penal system is historically unprecedented and unequalled by any other country in the world (see Kaeble and Glaze, 2016; Wagner and Rabuy, 2017).

Against the dominant law and order rhetoric unleashed by US politicians to justify penal expansion, often in the wake of media-generated racialized moral panics about crime, anti-prison scholar activists have developed the notion of the 'prison industrial complex' in an attempt to unveil the structural sources of carceral buildup (1995; Davis, 2003: 84–104; Parenti, 1999: 211–244; Schlosser, 1998).⁴ According to this perspective, prison expansion in the USA has been driven not by an attempt to curb crime, but rather by a mixture of structural racism and corporate profit-seeking. Particularly since the late 1980s, the skyrocketing

costs of the expanding US prison system have worked as a magnet for private actors involved in the business of private detention and related prison services, such as health care, phone services, transportation, food catering, and so on. Multinational corporations like Corrections Corporations of America (founded in 1983) and GEO Group (founded in 1984) have consistently lobbied federal and state legislators to gain access to the alluring business of incarceration-for-profit. Although not always successful in these efforts, these companies have managed to establish and control a profitable market in correctional services, particularly at the federal level and in corporate-friendly states like Florida, Texas, New Mexico, Georgia, and California (Galik and Gilroy, 2015: 4). As the cost of mass incarceration began to be felt by taxpayers in the form of massive reallocations of funds from welfare, health care, education, and other public services toward criminal justice and incarceration (see Beckett and Western, 2001), the private prison business gained increasing traction with the promise of reducing costs while improving efficiency – a dynamic compounded by the anti-tax sentiments of the 1980s and 1990s. Thus, between 2000 and 2013, the number of federal prisoners incarcerated in private facilities grew by 165%, with the share of federal prisoners privately detained rising from 10% to 19%; over the same time span, the number of state prisoners held in private prisons grew by 33.8% (Galik and Gilroy, 2015: 1). As of 2012, after several years of continuous expansion, CCA could count on 91,000 beds across 20 states and the District of Columbia, whereas GEO Group had 65,700 beds available in domestic correctional facilities – a total number of private prison beds in the USA higher than the combined prison populations of Germany and France (Lee, 2012).

It is important to note here that despite this significant increase, the fraction of US prisoners detained within private penal facilities is still limited: as of 2013, more than 90% of the country's prison population was held in government-run institutions, and although an increasing share of prisoners do time in for-profit prisons, the profit motive – and prison privatization more generally – cannot be considered as the main cause of mass incarceration in the USA. Instead, as Marie Gottschalk has suggested, 'mass incarceration helped transform the private prison sector into a powerful and nimble political player that today poses a major obstacle to dismantling the carceral state' (Gottschalk, 2015: 65). The profit-generating motive is only one of the three types of surplus that, according to Ruth Wilson Gilmore (2007: 58–86), who writes specifically about California, have prompted the emergence of the penal state as a major tool for the punitive governance of racialized poverty: (1) a surplus of agricultural land linked to water shortages and to the centralization of agribusiness in the 1960s and 1970s, (2) a surplus of capital linked to financial speculation and regressive fiscal policies in the 1980s, and (3) a surplus of state-bureaucratic capacities linked to the demise of the Keynesian state in the 1990s. In such conjuncture, according to Gilmore, mass incarceration provides 'partial geographical solutions to political economic crises, organized by the state, which is itself in crisis' (Gilmore, 2007: 26).

In any case, whether delivered through public or privatized penal institutions, the impact of hyper-incarceration has been felt disproportionately by poor and racialized communities residing in the most segregated urban areas of the USA. Among the African American population, one in every three males aged 20 to 29 lives under some form of correctional supervision; an astonishing 3.1% of Black men in the nation reside in a state or federal prison (compared to 0.5% for Whites and 1.3% for Latinos), and 7.3% of Black men aged 30 to 34 are currently serving a prison sentence of more than one year. At current rates, an African American man born in 2001 has a 32% chance of ending up in prison during his lifetime – a probability that goes down to 17% for Latino males in the same age group, and to 6% for Whites (Mauer, 2006: 137). As Bruce Western (2006) has argued in his work on punishment and inequality in the USA, incarceration has been so intensely concentrated among poor urban communities of color, that imprisonment has become a modal life event for disadvantaged African American men.

Ultimately, the construction of the contemporary penal state is the result of what Jordan T. Camp (2016: 41) has defined as a ‘carceral counterinsurgency’ unleashed by US power elites against the social struggles of the 1960s. This politico-economic backlash provided a ‘revanchist solution’ to the crisis of hegemony prompted by the civil rights movement, and was aimed at buttressing the racial and class hierarchies that had been threatened by the radicalization of social movements against racism, capitalism, and imperialism. This broad project of political restoration through penal discipline was initially invoked by Barry Goldwater in the 1964 presidential campaign, later launched by Richard Nixon in the early 1970s, and finally carried out during the last quarter of the twentieth century by several presidential administrations under a bipartisan commitment to the neoliberal doctrine of privatization, deregulation, and precarization in the field of economic policy and to mass-criminalization, militarized policing, and punitive discipline in the field of social regulation. Emerging as a new governmental rationality in an age of capitalist restructuring, the US punitive turn has thus unfolded through the creation of a vast carceral net in charge of neutralizing a racialized ‘underclass’ whose ranks were expanded by the crumbling of the industrial economy and the neoliberal assault on the Keynesian welfare state. This shift toward an exclusionary model of regulation of the poor put an abrupt end to the reformist era defined by David Garland (2003) as ‘penal modernism’, during which the USA exhibited prison populations comparable to (and in some states even smaller than) those of most other Western democracies.

In particular, the rise of a racialized penal populism demonizing young African American men as dangerous and irredeemable ‘superpredators’ lent new legitimacy to a whole array of draconian penal practices: life imprisonment for youth of color routinely tried as adults; *Three Strikes and You’re Out* legislation mandating life in prison for repeat offenders; and sex offender laws imposing life-long bans from entire cities on individuals convicted of sex crimes. During the 1990s, this punitive shift would prompt the resurgence of chain gangs, prolonged

solitary confinement, ‘supermax’ prisons, chemical castration, and other extreme punishments which the reformist ethos of the 1960s seemed to have consigned to the past. In the same years, Clinton’s infamous *Personal Responsibility and Work Opportunity Reconciliation Act* (1996) imposed lifetime bans on food stamps, educational grants, and unemployment benefits for broad categories of mostly Black drug offenders. Meanwhile, draconian *One Strike and You’re Out* provisions implemented across urban areas during the 1990s by the US Department of Housing and Urban Development required public housing authorities to evict entire families and ban them for three years from federally subsidized housing for a single drug offense – even if just one member of the household was involved, the tenant was unaware of the illicit activity, or the incident happened off-site (Ewert, 2016).

The process of social excommunication of the ‘truly disadvantaged’ (Wilson, 1987) has not been limited to civil and social rights, but has extended to political rights as well. As of 2017, 14 states have imposed a temporary voting ban on individuals convicted of a felony (even after the sentence has been fully served), whereas eight states have imposed a lifetime ban. Forty years after the civil rights revolution (and less than 60 years after the beginning of desegregation), 13% of African American males are disenfranchised as a consequence of these voting bans. According to the Sentencing Project, as of 2016, an estimated 6.1 million people (2.5% of the total US voting-age population) could not vote as a result of a felony conviction – a 400% increase since 1976. Among African Americans alone, 7.4% of the population is affected by felony disenfranchisement (Manza and Uggen, 2008; The Sentencing Project, 2016).

It is worth emphasizing that the punitive turn described so far does not reflect actual changes in criminal activity. Trends in crime and in punishment have grown increasingly disconnected since the early 1990s: even as crime rates have declined steadily in this period, the number of people arrested, convicted, and incarcerated has continued to grow. The rhetoric of penal severity took roots even in the absence of any connection to the crime problem, and public discourses on social problems traditionally framed in the language of social policy and welfare were now translated into the language of crime and punishment. This paradigmatic shift emerged as a broadly successful attempt by US power elites to ‘police the crisis’ (Hall et al., 1978) of legitimacy created by the widespread social struggles of the 1960s and 1970s, and to build a new paradigm for the punitive governance of racialized poverty in a neoliberal society.

BEYOND THE POLITICAL ECONOMY OF PUNISHMENT?

This chapter has attempted to illustrate how a paradigmatic shift in the capitalist regime of accumulation has prompted significant changes in punitive practices across late-capitalist social formations. In societies such as the USA, which have traditionally leaned toward a *laissez-faire* model of capitalist development based

on deregulated markets and minimal public interventions in the economy, the dismantling of the Fordist–Keynesian paradigm has unfolded in an untamed neoliberal variant characterized by extreme labor market flexibility, a vertical decline in labor unionization, a drastic curtailment of welfare provisions, and soaring levels of race and class inequality (Piketty, 2014; Shipler, 2004). In European societies, stronger welfare states and a more established tradition of unionization have somewhat shielded the national workforce from the heaviest consequences of the capitalist restructuring of the 1970s and 1980s, which have instead concentrated on the migrant labor force set in motion by the new international division of labor (see Calavita, 2005; De Giorgi, 2010; Melossi, 2003).

In both cases, the transition to a new regime of accumulation has taken the form of a transnational capitalist offensive against the working classes, in a successful attempt to reestablish suitable conditions for capitalist profits in a globalized economy: stricter work discipline, higher levels of labor flexibility, more insecure working conditions, lower social protections, and increased competition for low-wage work among the racialized global poor (Schram, 2015). This process of capitalist restructuring has been successful in producing a dramatic shift in the balance of power from labor to capital, at the same time as it effectively reconfigured longstanding structures of race and class inequality. It is in the context of this larger realignment of power that a materialist analysis of contemporary penal change must situate its critique. Such critique must be able to tackle not only the quantitative shifts in the labor market – the main focus of the political economy of punishment between the 1970s and the 1990s – but also the political, institutional, and cultural transformations that have contributed to shape and solidify the neoliberal regime of capitalist accumulation (Lacey, 2008, 2012).

In order to grasp the theoretical implications of this paradigmatic shift, we may return once again to Rusche’s original formulation of the concept of less eligibility as the logic governing the relation between punishment and social structure. As was mentioned earlier, in his original 1933 article Rusche argued that ‘all efforts to reform the punishment of criminals are inevitably limited by the *situation of the lowest socially significant proletarian class* which society wants to deter from criminal acts’ (Rusche, 2014 [1933]: 255, my emphasis). I would like to suggest here that Rusche’s concept of ‘situation’ lends itself to a much broader theorization than the economic reduction to unemployment rates privileged by the quantitative political economy of punishment. If the relative power of the workforce in a capitalist economy is ultimately determined by the price of its labor, the overall *situation* of that workforce – its position within existing hierarchies of social power – is not simply the outcome of labor market dynamics. Instead, it is shaped by a range of non-economic factors that contribute to define the overall social value of the labor force and of the racialized social groups that fill its ranks. In this respect, the social value of labor is a function of the interaction between economic structures (e.g. relations of production, models of economic growth, labor market dynamics, wealth concentration or redistribution), governmental technologies of

social regulation (e.g. welfare/workfare systems, policies of state intervention in the economy, penal politics, immigration control regimes), and discursive strategies of cultural reproduction (e.g. hierarchies of social worth, public discourses on social deservingness or un-deservingness, dominant representations of crime and punishment, social constructions of racial difference). In other words, the overall *situation* of marginalized social classes is determined by their place in the economic structure as much as by their position within the ‘moral economy’ of capitalist social formations (see also Sayer, 2001).

Following this perspective, a non-reductionist political economy of the *fin de siècle* punitive turn should analyze the changing situation of marginal classes against the background of the economic and extra-economic processes that have repositioned the postindustrial proletariat within the structure of late-capitalist societies. Since the early 1980s, structural processes of capitalist transformation (deindustrialization, downsizing, outsourcing, etc.) have significantly reduced the economic value of wage labor and consolidated a tendency toward rising work insecurity, declining wages, longer working hours, and an overall increase in the socially acceptable levels of exploitability of the labor force (Ehrenreich, 2001; Ehrenreich and Hochschild, 2002; Harris, 1997; Schor, 1992). At the same time, a broad reconfiguration of governmental strategies of social regulation – such as the transition from welfare to workfare, the adoption of punitive immigration laws, the increasing commitment to privatization and market deregulation, and the consolidation of neoliberal governance in traditionally public areas like health care, housing, education, etc. – has dismantled the Fordist–Keynesian compromise, deepening social fractures along lines of class, race, ethnicity, and national origin. Finally, in the field of cultural signification the neoconservative hold on public debates about socioeconomic inequality, reinforced by racialized moral panics about street crime, immigration, drugs, welfare, etc., has legitimized dominant representations of the postindustrial poor – personified in particular by urban minorities in the USA and by migrants from the global South in Europe – as an undeserving and dangerous class (Gans, 1995; Handler and Hasenfeld, 2007; Quadagno, 1994; Standing, 2011).

A non-reductionist neo-Marxist framework informed by cultural studies and critical race theory, along the path originally laid out by Stuart Hall and his colleagues (Hall et al., 1978), and further developed more recently by interdisciplinary critical scholars like Jordan T. Camp (2016), Jodi Melamed (2011), Nikhil Pal Singh (2017), and Sarah Haley (2016), among others – allows the political economy of punishment to overcome its traditional emphasis on the instrumental side of penal powers. The materialist critique of punishment should of course still emphasize the instrumental outcomes of recent penal practices, illustrating their role in ‘imposing the discipline of desocialized wage work ... by raising the cost of strategies of escape or resistance that drive young men from the lower class into the illegal sectors of the street economy’ (Wacquant, 2009b: xvii). It should also analyze the widespread governmental effects of penal

technologies, particularly in conjunction with other tools of social regulation such as immigration control and welfare policies, and it should continue to work toward a structural critique of the symbolic dimensions of contemporary penalty, emphasizing how hegemonic representations of deserving/undeserving and laborious/dangerous classes resonate with – and provide ideological legitimation to – a regime of racialized capital accumulation grounded in the systematic devaluation of the poor and their labor.

Notes

- 1 This is not to suggest any nostalgia for some mythical ‘golden age’ of penal progressivism. In fact, despite its mainstream status in some northern regions of the USA during the 1950s and 1960s, the rehabilitative ethos was not nearly as prevalent within the country’s more overtly racist Southern correctional systems – as documented, for example, by Mona Lynch in her study of the evolution of Arizona’s corrections (Lynch, 2009); neither did the ‘rehabilitative prison’ necessarily constitute a less punitive alternative to the contemporary warehousing prison (see also Cohen, 1985).
- 2 More recent works have further enriched the materialist historiography of punishment by adopting a race and class lens that emphasizes the deeply racialized nature of capitalist development – including both dynamics of capitalist accumulation based on wage labor and processes of racialized dispossession through enslavement (Baptist, 2014) – as well as of the capitalist state’s penal practices and institutions (see Adamson, 1983; Childs, 2015; Haley, 2016; Hirsch, 1992; Lichtenstein, 1996; Mancini, 1996).
- 3 Despite this unnuanced definition, the fact that the complex connections between a society’s socio-economic structure and its punitive institutions could not be reduced to a deterministic relationship was clear to Georg Rusche, who already in his seminal 1933 article titled ‘Labor Market and Penal Sanction’, which laid the foundation for the larger work he would later coauthor with Otto Kirchheimer, wrote that ‘the dependency of crime and crime control on economic and historical conditions does not ... provide a total explanation’ (Rusche, 2014 [1933]: 254). Rather, the economic field simply contributes – although in a position of preeminence over other social forces – to define the historically determined configurations of specific punitive systems. This note of caution echoes the argument made by Marx and Engels themselves in some of their writings: ‘Political, juridical, philosophical, religious, artistic, etc. development is based on economic development. But all these react upon one another and also upon the economic basis. It is not that the economic situation is *cause, solely active*, while everything else is only passive effect. There is, rather, interaction on the basis of economic necessity, which *ultimately* always asserts itself’ (Marx and Engels, 1969: 502). Borrowing from Althusser (1967), we could also argue that capitalist relations of production operate as determinants of specific historical articulations of punishment, but only ‘in the last instance’.
- 4 The concept, first used by Mike Davis in a 1995 article in *The Nation* titled ‘Hell Factories in the Field: A Prison-Industrial Complex’ (Davis, 1995), and later popularized across activist circles through the writings of Angela Y. Davis and others, paraphrases the term ‘military industrial complex’, originally coined by former US president Dwight Eisenhower in the farewell address he delivered to the nation on 17 December 1961.

Race

Brenna Bhandar

INTRODUCTION

I want to suggest a different metaphor for theoretical work: the metaphor of struggle, of wrestling with the angels. The only theory worth having is that which you have to fight off, not that which you speak with profound fluency... [M]y own experience of theory – and Marxism is certainly a case in point – is of wrestling with the angels, a metaphor you can take as literally as you like. (Hall, 2019a [1992]: 75)

The place of ‘race’ in Marxism might be best understood through the struggles of various intellectuals to articulate the centrality of racism and racialisation to capitalism. The struggle lies in apprehending the complexity of the thing itself – the mutability of ‘race’ as a concept and its consistent presence in the multifarious modes of dispossession and accumulation that characterise the variegated forms of capitalism that emerged in the crucible of slavery and colonisation. But it also emerges in efforts to write against traditions of Eurocentric Marxist thought that failed to grasp that complexity. Rather than characterise these struggles as being situated ‘within and against’ Marxist traditions of thought, it may be more useful to consider the frameworks of analysis that scholars writing from non-Eurocentric vantage points have developed – to see them as driven by an urgency to grapple with the complex and unstable histories of race and capital as necessary to understanding the present, rather than as intellectual engagements confined to academic debates about the generative causes and effects of capitalist modes of production.

Another important aspect of how ‘struggle’ informs the field of scholarly work that has illuminated the relationship between race, racial formations and capitalism is that field’s connection to political histories and social movements – in a twofold sense. The long histories of rebellion and revolt by enslaved and colonised peoples globally inform scholarly reflections on race and capitalism. But the struggle against the resistance of anti-capitalist, left social movements and their intellectual touchstones in Europe and North America to incorporate an anti-racist politics into their organising and thinking has also informed the work of many militant scholars writing in black radical and anti-racist left traditions. This long-standing struggle has gained increasing poignancy in the current moment, when long-standing economic inequalities that have materialised in and through forms of racial subordination have rendered many black, brown and Indigenous communities particularly vulnerable to the ravages of the global Covid-19 pandemic (Nuorgam, 2020; Taylor, 2020; Younge, 2020).

The breadth of critical traditions of thought and activism that have sought to grapple with Marxism’s blind spots as to how colonialism, enslavement and imperialism have been central to the development of capitalism is truly expansive; and, in different ways, many of these critical traditions are cognisant to greater or lesser degrees of the place of race in these entanglements (James, 1989 [1938]; Spivak, 1999; Roediger, 2019). We can distinguish within these broad swathes of intellectual and political work scholars who have focused their attention on race in all its complexities, as part of their engagements with Marxism, or as central to their Marxian analyses of spatial configurations of capitalism (Wilson Gilmore, 2007); struggles for freedom from capitalism (Kelley, 2003); and capitalist state violence (Sivanandan, 1982), to name but a few examples.

In this chapter, I have chosen to explore the theoretical interventions of three very different scholars: Stuart Hall, Cedric Robinson and Angela Y. Davis. Hall’s early approach to questions of race and class engaged a trenchant re-working of Gramscian and Althusserian concepts in order to develop a conjunctural analysis of race and the manifold ways in which it is expressed through class. He re-oriented Marxist analyses of class composition and class consciousness to produce a comprehensive reconsideration of how politics, policing, labour relations, law and criminal justice and, eventually, media and cultural forms were fabricated with and through colonially inscribed histories of race and racism in the UK, the Caribbean and elsewhere. Cedric Robinson’s work, unlike Hall’s, presents a wholesale critique of Marx’s work; he developed the view that Marxism generally reflects an overly reductive understanding of the ways in which race is fabricated in conjunction with capitalist modes of appropriation and exploitation. He also challenged, at a foundational level, the Eurocentrism of Marx’s work and argued that by disregarding the many autonomous and pre-capitalist socialist movements, Marx and Marxist scholarship have unnecessarily narrowed the horizon of liberation to a schema overly determined by bourgeois epistemology. Finally, I turn to the work of Angela Y. Davis, whose very conceptualisation of

race as inherently gendered opened an entirely different space of engagement with Marxism and communist traditions of revolutionary change. We have, then, three towering intellectual figures who engaged, transformed, built upon or broke with Marxist theory in ways that deepened our understandings of the manifold ways in which capitalism is always racial, yet, at the same time, contradictory and uneven, replete with resistance and vulnerable or weak points in its formation. In the case of Hall, we encounter a re-working of Marxist concepts and methods to account for the ways in which race is expressed through class, albeit in a manner that is contingent on the particular conjuncture of economic, political and cultural forces at work. In Robinson, we have a theorist whose path-breaking work on racial capitalism situated him in the position of resolute critic of Marx. Finally, Angela Y. Davis is a committed communist intellectual who shows that, while for the purposes of analytical reflection 'race' is often hived off from 'gender' and even 'sexuality', in practice these axes of subject-making and subordination cannot be separated – thus the challenge for Marxian engagements with race is to understand how race, as a concept that is inherently gendered, moves through the fabric of social relations in capitalist societies.

STUART HALL: ARTICULATIONS OF RACE AND CLASS

Through his engagement with the work of Althusser and Gramsci, and as part of a larger and more sustained interrogation of Marx's *oeuvre* (Hall, 1974, 1983), Stuart Hall reconceived two concepts in particular that form the basis for his theorisation of the relationship between race and class. These two interrelated concepts – *articulation* and *correspondence* – are re-worked to embed an analysis of race and histories of colonisation and apartheid into the very way we understand social formations in a Marxian sense. Hall joins critics of an overly economic understanding of how class, specifically, takes shape and what it represents; but he goes much further in reinvigorating Marx's conception of what it means for social formations to be 'determined' by capitalist modes of production, by showing how race and racism can act as both destabilising and stabilising vectors – which are both contingent and necessary in some sense – to the formation of class relations.

How are different social formations articulated, and how does a pervasive economic reductionism in the way that 'class' is conceived of, for instance, oversimplify and flatten their complexity? In critiquing an economic reductionism whereby all social formations are reduced down to expressions of an economic base, Hall wrote:

[T]his simplifies the structure of social formations, reducing their complexity of articulation, vertical and horizontal, to a single line of determination. It simplifies the very concept of 'determination' (which in Marx is a very complex idea) to that of a mechanical function. It flattens all the mediations between the different levels of a society. It presents social

formations – in Althusser’s words – as a ‘simple expressive totality,’ in which every level of articulation corresponds to every other, and which is from end to end, structurally transparent... this represents a gigantic crudification and simplification of Marx’s work – the kind of simplification and reductionism which once led him, in despair, to say that ‘if that is Marxism, then I am not a Marxist.’ (Hall, 2019b [1986]: 28–9)

‘Conjunctural analysis’ as developed by Hall drew on Marxist lineages of the term (Gramsci and Althusser in particular), while also remaking it into one of the signature methodological concepts of the Centre for Cultural Studies at Birmingham. The articulation of a social formation occurs at different levels of abstraction, and the conjunctural analysis developed by Hall and others presents a means of focusing on a particular level of abstraction, thereby avoiding the tendency of some theoreticians to confuse terms and concepts operating on a (high) level of abstraction with more grounded, place- and time-specific registers of peoples’ lived realities. This is absolutely crucial to grasp, particularly in this moment where specific histories of racial oppression are often taken to levels of generality and abstraction that enable them to be misread as transhistorical and devoid of social and cultural differences, in ways that obscure their particularities and impede political lucidity. As Hall wrote:

We expose ourselves to serious error when we attempt to ‘read off’ concepts which were designed to operate at a high level of abstraction as if they automatically produced the same theoretical effects when translated to another, more concrete, ‘lower’ level of operation. (1983: 24)

We might query how such misreadings reflect a refusal or resistance to pay attention to class differences within a particular racial group, or to deal with political fractiousness or contradictions that inhere in any social movement, or to represent any particular history of subordination.

And indeed, choosing which level of abstraction from which to engage a conjunctural analysis involves ‘a strategic political choice’ (Grossberg, 2019: 42). Thus social formations are articulated through the political landscape of a given moment, its political economy and labour conditions, issues of poverty and unemployment, forms of cultural production and media representation; the conjunctural analysis adequate to grasping this complexity is inevitably partial, unfinished and contingent (Grossberg, 2019). The ‘articulation’ of social formations using a conjunctural analysis aims for maximal specificity of the ways in which race and racial subjectivities have been intercalated with class politics in a particular location and at a particular point of time, but always in relation to the *longue durée* framework of global colonial capitalism, and of modernity itself.

How do these different levels of abstraction relate to one another, how do we understand the specificities of a given moment and place them in the larger epochal scheme of things without making lazy connections between the two, and thereby falling into the perilous theoretical trap outlined above? Hall thought through the nature of the correspondence between different levels of abstraction

in analysing social formations. Drawing on the work of Althusser, he noted that there is no ‘necessary correspondence between one level of a social formation and another’ (Hall, 1985: 92). Race and racism may be the primary means through which class is expressed in a particular labour market, for instance, but this is not necessarily always or inevitably the case. Hall notes that ‘there are no guarantees’ that a given social group will respond to economic conditions in a particular way. As Hall put it, arguing against Paul Hirst (but also pushing against Laclau and Mouffe’s post-Marxism), ‘there is *no necessary correspondence*’ but also ‘no necessary *non-correspondence*’ (Hall, 1985: 92) between different levels of a social formation. Social relations of race, racism and class oppression do not (necessarily) adhere to a specific form across space and time.

Hall’s essay ‘Race, Articulation and Societies Structured in Dominance’, published in 1980, is a particularly clear expression of how a conjunctural analysis operates to identify the (non-) correspondences and articulations between different levels of abstraction; in this case, the specific racial and economic structures of South Africa are examined in order to ‘stretch’ and re-make both the ‘economic’ approaches to race that rely too readily on an economic determinism in their explanation of how race and racism operate under apartheid and, also, the ‘sociological’ approaches which, in using the economic approaches as their primary referent point, emphasise the non-reductive nature of racial oppression in South Africa. What is at stake in the contours of this debate, which Hall claims has characterised the larger field of social science in general? Hall emphasises that ‘[d]ifferences of theoretical analysis and approach have real effects for the strategies of political transformation in such societies’. Thus, an economistic approach leaves the racial dimension of apartheid reduced down to a question of ‘deeper, economic contradictions’ whereas the sociological position that race is autonomous from economic relations means that a change in the latter will not necessarily affect a political change in the former (Hall, 2019c [1980]: 174–5). The importance of political struggle was thus one of the key motivations for seeking to better theorise how racial domination and economic processes are connected to one another.

Political motivations also lay behind Hall’s creative appropriation of Althusserian interventions into the history of capital, stretching them in the direction of an analysis of race and racialisation that was largely not on their radar. As he observed:

The emergent theory of the ‘articulation of different modes of production’ [particularly in relation to the history of transatlantic slavery] begins to deliver certain pertinent theoretical effects for an analysis of racism at the social, political, and ideological levels. It begins to deliver such effects – and this is the crucial point – not by deserting the level of analysis of economics relations (i.e. modes of production) but by posing it in its correct, necessarily complex, form. (2019c [1980]: 193)

Hall’s argument about the more nuanced articulations of slavery as mode of production debates is not just relevant for the way it marks one of the key

moments at which advances were made in understanding the intercalation of race and capital as it pertains to unfree and free labour. It is of lasting relevance in terms of how Hall takes these developments and, in the conclusion of his essay on race and articulation, offers us a series of insights into the kind of complex methodology that remains of the utmost relevance to understanding race and capitalism today. In documenting

the emergence of a new theoretical paradigm, which takes its fundamental orientation from the problematic of Marx, but which seeks, by various theoretical means, to overcome certain of the limitations – economism, reductionism, ‘a priorism’ [and] a lack of historical specificity. (2019c [1980]: 210)

He proceeds to argue that race cannot be properly theorised in the absence of a complex, if partial, attempt to grasp each level of the social formation through ‘its own independent “means of representation”’ (2019c [1980]: 215). In other words, ‘class-structured modes of production’ appear and are rendered effective in distinct if interlocking economic, political and ideological registers (2019c [1980]: 215). Race is operative at each of these levels, and thus Hall concludes that ‘race is thus, also, the modality through which class is “lived”, the medium through which class relations are experienced, the form in which it is appropriated and “fought through”’ (2019c [1980]: 216) – an insight which was also at the core of his contribution to *Policing the Crisis* (Hall et al., 1978: 394). A collective effort, *Policing the Crisis: Mugging, the State and Law and Order*, was a series of essays that analysed how the criminalisation of predominantly black youth was at the centre of conservative efforts in the UK to create a moral panic, which then in turn was used to justify racist policing practices and carceral forms of governance.

By grappling with the most pressing debates within the Marxism of his own conjuncture, Hall argues that a newly emergent paradigm that builds on Marx’s own account of the complexity of articulation gives us a better chance of understanding how race operates in relation to class. But leaving the struggles with Marxist theory to the side for the moment, he also presents a view of race and racism as something that is mutable, changing and contingent on a wide range of other social forces. Race and racism cannot be understood separately or ‘in abstraction, from other social relations’ (Hall, 2019c [1980]: 212). In relation to transatlantic slavery in particular, he writes:

Racism within plantation slave societies in the mercantilist phase of world capitalist development has a place and function, means and mechanisms of its specific effectivity, which are only superficially explained by translating it out from these specific historical contexts into totally different ones. (2019c [1980]: 212; see also Marques, Chapter 14, this *Handbook*)

One might wonder what Hall would have made of the discourse of ‘global anti-blackness’ or other such terms that have the propensity to obfuscate the specific and differentiated forms that racism has assumed at different moments, and are thus predisposed to bolstering what he termed elsewhere as a ‘gestural’ politics

(Hall, 2019b [1986]: 48). Racism has been and continues to be constituted differently through distinct constellations of class domination, from the racisms of mercantilist theory and of chattel slavery; of conquest and colonialism; of trade and 'high imperialism; of popular imperialism and of so-called post-imperialism'. Racism, in each of these cases, was 'thoroughly re-worked', taking forms specific to that mode of extraction, appropriation and domination (Hall, 2019c [1980]: 217).

Margaret Thatcher's resounding electoral victory in 1979, followed a decade later by the fall of the Soviet Union, had a massive impact on the British left (Avtar Brah, in Bhandar and Ziadah, 2020: 36; Hall and Jacques, 1983; Hall, 1988). The oft-criticised turn by *Marxism Today* – the Communist Party of Great Britain's theoretical journal, for which Hall wrote numerous pieces – embodied in the title 'New Times' was part of a now forgotten period of intellectual ferment as the seeds of New Labour took root and socialist ideals apparently went into hibernation.¹ However, one may argue that as Hall's work turned more firmly towards media, culture and questions of representation, the conjunctural analysis he developed through his earlier engagement with Marxism retained an imprint on his thinking, as he continued to emphasise the complex structural and conjunctural nature of racism (Hall, 1992). The non-inevitable or contingent nature of race and racism as part of a larger social field was masked by its apparent rigidity and seeming historical continuity; ultimately, it is attention to what Raymond Williams termed the 'structure of feeling' – 'the attitudes, beliefs and conceptions that are always refusing to be so neatly stabilized and fixed' (Hall, 1992: 16) – which undermines the notion that race and racisms are trans or even ahistorical formations.

CEDRIC ROBINSON: RACIAL CAPITALISM AND THE BLACK RADICAL CHALLENGE TO MARXISM

The instability and mutability of race and racisms in the history of the emergence of capitalism is perhaps the main contact point between the work of Stuart Hall and Cedric Robinson. Both, albeit in very different ways, sought to explain how the contingent yet non-arbitrary character of race and racism revealed instabilities that could be utilised, exploited even, for political transformation. Cedric Robinson's conception of racial regimes as 'unstable truth systems' points to the contradictory (and, as discussed below, dialectical) nature of their formation (Robinson, 2007). Not unlike the conjunctural analysis elucidated by Hall, the idea of racial regimes frames the examination of the political-economic, cultural and juridical relations that give rise to particular instantiations of race and racial difference. Before elaborating on Robinson's materialist theory of racial regimes of power, a brief look at his critique of Marxism and its failures not only to adequately theorise race as fundamental to capitalist development, but also to transcend a partial narrative of European history is instructive.

Black Marxism: The Making of the Black Radical Tradition – a book whose arguably misleading title has led many commentators astray believing it to be Marxist! – sets forth the argument that race precedes the emergence of modern capitalism and that attention to the modalities of its operation in feudal Europe reveal the continuation of feudal social relations into the long emergence of capitalism. The critique of the absence of an understanding of how racialisation and forms of unfree, enslaved labour persisted throughout Europe from the Middle Ages onwards is enmeshed with the broader critique of the way in which European history is understood by Marx and his epigones. The import of this critique is manifold. Robinson sets out a critical alternative history of forms of free and unfree labour and racialisation in Europe, which draws on a wide range of historiography, as well as on the signal contribution of Oliver Cromwell Cox to a non-Marxian theory of the nexus of race and capitalism (Robinson, 2019a [1991]: 75–86). In doing so, he challenges the very basis of Marx’s theory of revolution, which remains affixed to the proletarian subject, the ‘working classes’, a concept that remains insufficiently differentiated in Robinson’s view. As Avery F. Gordon puts it, this ‘costly reductionism’ reveals how an ‘intellectual, moral and libidinal investment bound the development of Marxian socialism to nationalism, racism, and bourgeois epistemology in such a way as to create a blind field at the very center of the socialist vision’ (Gordon, 2019 [2001]: xvii). Robinson opens up a terrain for thinking about a Black radical tradition that is not grounded in reference (solely) to Marxist traditions of revolution. This sets the stage for his later engagement in *An Anthropology of Marxism* with a sustained critique of Marx and Marxism’s failure to adequately contend with pre-capitalist and non-proletarian socialisms in Europe itself.

Robinson argues that the ‘racialisation’ of different populations, including those of enslaved and indentured labourers, thoroughly imbued pre-capitalist social relations. These antecedents to, and ingredients of, contemporary forms of race and racism are transformed by a globalised ‘economy of difference’ (Robinson, 2007: 29) that sees already existing processes of racialisation change with the advent of a global colonial capitalism. Robinson, unlike others, is not of the view that race and racism emerge, *ex nihilo* as it were, with transatlantic slavery or European colonialism, but that their precursors can be found in pre-capitalist European social and political formations. In the opening pages of *Black Marxism*, Robinson marshals the history of enslavement within Europe that precedes transatlantic slavery to support his argument.

The Negro – whose precedents could be found in the racial fabrications concealing the Slavs (*the slaves*), the Irish and others – substantially eradicated in Western historical consciousness the necessity of remembering the significance of Nuba for Egypt’s formation, of Egypt in the development of Greek civilization, of Africa for imperial Rome, and more pointedly of Islam’s influence on Europe’s economic, political and intellectual history. (Robinson, 1983: 4; also Robinson, 2007: 5–6)

Contemporary forms of racialisation and racism may be understood as the inheritance of 500 years of colonial capitalism, but *modes* of racialising people and

populations – in conjunction with status, different forms of labour and ways of living – has a history that exceeds this period. Moreover, and relatedly, the omission of the deep intra-European histories of racial capitalism in Marxist lineages of thought obscures the profound entanglement of what comes to be called ‘Europe’ in modern political imaginaries with Islamic and African polities and states that were not merely acted upon by European imperial powers but were active agents in the making of modern history. This has, for Robinson, highly significant implications for how we understand the history of Black radicalism, and revolution more broadly:

Black radicalism, consequently, cannot be understood within the particular context of its genesis. It is not a variant of Western radicalism whose proponents happen to be Black. Rather, it is a specifically African response to an oppression emergent from the immediate determinants of European development in the modern era and framed by orders of human exploitation woven into the interstices of European social life from the inception of Western civilization. (1983: 97)

Robinson elucidates what is specific and particular about a Black radical tradition that has a global presence, but does so by wrenching the very meaning of ‘radical’ out of an unnecessarily narrow and parochial, Eurocentric and liberal-bourgeois formation, and by imbuing the idea of ‘Blackness’ with concrete historical meaning. Robinson thus challenges both conventional and Marxian understandings of the formation of race, racism and racial difference, while also ‘provincialising’ Marx and Marxist understandings of European and world history.

In *Black Marxism* – building on his critical studies of C. L. R. James, Richard Wright and especially W. E. B. Du Bois, whose 1935 *Black Reconstruction in America* is arguably the most significant single work on the nexus of race and class – Robinson critiques the notion of the proletariat as the true revolutionary subject but also dismantles the idea that there was in fact a British working class that was sufficiently united by class consciousness potentially to provide a solid basis for international class solidarity. He points to the existence of an ideology of English nationalism from the mid 19th century onwards which hampered the ‘development of a united working class’, with the racialisation of the Irish during this period, including by Engels himself, as a primary example of the racial divisions among workers (1983: 44). The formation of a labour aristocracy by the mid 19th century (1983: 50) emerges in the context of a British colonialism that saw the destruction of the livelihoods of workers throughout the empire in the service of British manufacturing and industry. It is arguable that the heterogeneity of the British working classes, both in terms of what Robinson calls the ‘mistaken fixation on industrial and manufacturing centres of capitalism’ (1983: 4) but also as regards those classes’ racial composition, is a problem that continues to plague left views of the labouring classes, particularly evident in the discourse surrounding the Brexit referendum (Virdee and McGeever, 2018).

Yet another aspect of ‘European’ history that is often ignored in understanding both its development and the place of what Robinson calls ‘racialism’ within it is the ‘almost entirely exogenous phenomenon of Islamic domination of the

Mediterranean' (1983: 83). Muslim rule throughout Europe, and the *reconquista* that saw the unleashing of virulent anti-Semitic and anti-Muslim violence, 'leave tell-tale marks on Western consciousness' including the 'demonization of Islam' (1983: 83). It is in this historical context that a 'native racialism' proves its value, argues Robinson, 'by its transformation into an instrument of collective resistance and a negation of an unacceptable past' (1983: 125); European 'whiteness' is shored up in order to diminish the significance of centuries of Muslim rule over vast parts of what would become 'Europe'. These insights have more than a passing relevance for the resurgence of contemporary forms of xenophobia and Islamophobia, a pervasive if not unifying political ideology across much of Europe.

Robinson's critique of Marx and Marxism is further and, in some ways, more systematically elaborated in *An Anthropology of Marxism*. Robinson goes beyond what has become a widely recognised critique of the concept of primitive accumulation, for instance, and deconstructs the very epistemological bases of Marx's historicism and his reliance on a certain empiricism. Taking the three fundamentals of Marx and Engels' philosophical writings – political economy, German idealism and socialism – each in their turn, Robinson points to the ways in which each of these pillars of their theorisations were unnecessarily narrowed by 'the presumption that a field of knowledge, a science, could be an expression of a particular *national culture*' (Robinson, 2019b [2001]: 5). Marxism bears the hallmarks of modern European thought – empiricism, positivism and historicism – hardwired into its basic premises, with the result that 'Marxism crafted a historical pedestal for itself by transmuting all previous and alternative socialisms into poorly detailed blueprints or dead-end protoforms of itself' (2019b [2001]: 17).

As one of the most astute and original critics of Marx and Engels, and indeed, of the Marxist tradition of scholarship and vision of socialism that their work gave birth to, Robinson developed a very different concept of the dialectic, one that did not fall prey to precisely the kind of reductionism that he discerned in the work of Marx and in later Marxist scholarship. In particular, he rejected the idea that contemporary racism could be understood as originating in one moment or set of processes, such as the commodification of African bodies during the slave trade; rather, he was intent on elaborating how racial regimes are complex, sometimes contradictory, and contingent, even as they operate as clear forms of domination. Moreover, Robinson was intent on tracing the specific histories of how race is produced, in order to reveal their complexity. This complexity involved foregrounding how forms of resistance and the refusal of racism's violence were and remain an integral part of racial regimes (Robinson, 1997).

Robinson was preoccupied with understanding how the 'coincidences of *different* relations of power' might collide, interfere with or 'generate resistance' (Robinson, 2007: xi). He urged us to be attuned to contingencies, 'the intentional and unintended', the fractured and fragmented means by which relations of power and cultural forms coalesce in racial regimes. To that end, particularly in his last book, *Forgeries of Memory and Meaning* (2007), he reads across domains of

technology, capital investment, infrastructure, cultural practices, political economy and science to uncover the formation of a new racial regime that emerges at the tail end of the 19th century. Taking the development of film and the motion picture industry in the USA as the object of study, Robinson also looks to the use of exhibitions and fairs to fetishise the cultural production of racist commodity caricatures, as well as to the economic and infrastructural developments that provided the scaffolding for this racial regime; in this way film – and emblematically D. W. Griffith's *The Birth of a Nation* – could become a site for the newly consolidated figure of the 'Negro' (Robinson, 2007: 82–126).

Robinson ultimately creates a materialist framework of analysis that fuses sociological, philosophical and political-economic trajectories of inquiry into the long history of the making of race and capital; in doing so, he systematically provincialises Marx and Engels' epistemological assumptions, revealing the costs of a reductionism rooted in an attachment to a fundamentally Eurocentric vision of labour, revolt and resistance. Robinson's dialectical thought stretches the concept of negation to account for the neglect and deterioration of different forms of power and resistance; it is a dialectical form of analysis that is influenced by a thorough deconstruction of Marxism and thus in no way confined by it. It is thoroughly materialist in its composition, but not bound to a historicism that emerged with the signature baggage of modernity; namely an attachment to empiricism, positivism and rigidified conceptions of what constitutes political subjectivity. Whether one is fully persuaded or not, Robinson breathes new meaning into the idea of a 'black radical tradition' while also forging a way of thinking about capitalism as inherently bound to race and racialism that remains unparalleled and continues to inspire new thought and research (Johnson and Lubin, 2017).

ANGELA Y. DAVIS: BLACK FEMINISM, FREEDOM AND THE BLUES

Robinson's focus on the medium of film in *Forgeries of Memory and Meaning* sits within a larger body of contemporary radical Black thought that identifies art and artistic and cultural production as a key site through which to explore histories of resistance and ways of being that exceed conventional understandings of history, agency and politics. Music, film, literature, photography and popular culture are the central foci of Black radical theory that has identified the aesthetic dimension of life as a fundamental site of both racially inflected ontological regulation and subordination, and also refusal and resistance. Writing a review of Fred Moten's (2017) trilogy *consent not to be a single being*, whose complexity and brilliance resist easy recapitulation, David Lloyd writes that, for Moten,

the black radical tradition is (above all) an aesthetic tradition...Moten's claim is not that the black radical tradition *has* its accompanying musical forms, but that black music – by extension, black aesthetic practice in general – *is* and cannot be separated from black radicalism, even by so slight a difference as resemblance entails. (Lloyd, 2020: 79)

This body of work, along with those of Robin D. G. Kelley, Saidiya Hartman and others, has elaborated the aesthetic dimension of Black histories and Black life in ways that build upon and critically engage the work of Davis, Hall and Robinson, among others.

In the introduction to her path-breaking study of blues music and black working-class feminist consciousness, *Blues Legacies and Black Feminism* (1998), Angela Y. Davis quotes Stuart Hall, on black popular culture:

In its expressivity, its musicality, its orality, in its rich, deep, and varied attention to speech, in its inflections toward the vernacular and the local, in its rich production of counternarratives, and above all, in its metaphorical use of the musical vocabulary, black popular culture has enabled the surfacing, inside the mixed and contradictory modes even of some mainstream popular culture, of elements of a discourse that is different – other forms of life, other traditions of representation. (Davis, 1998: xix–xx)

Davis' remarkable study, which includes her own transcriptions of the entire bodies of Gertrude 'Ma' Rainey and Bessie Smith's available lyrics, presenting the reader with a rich archive of material, uncovers a different mode of listening to the first recordings of blues music and also of interpreting the history of black working-class women in the 1920s, 1930s and 1940s.

The mode of analysis that Davis develops in this work is one facet of decades-long work that has sought to interrogate how critical histories of slavery, work, resistance and struggle cannot be adequately grasped without accounting for the central role and agency of black women in these social, economic and political configurations. In a recently published interview, she points out that while the term 'racial capitalism'

as first used by Cedric Robinson was originally proposed as a critique of the Marxist tradition grounded in what he called the Black radical tradition, it can also be a generative concept for new ways of holding these two overlapping intellectual and activist traditions in productive tension. If we set out to examine the many ways in which capitalism and racism have been intertwined, from the eras of colonialism and slavery to the present... I think that we are not so much 'stretching Marxism' as we are continuing to build upon and critically engage with the insights. (Davis in Bhandar and Ziadah, 2020: 205)

Davis' engagement with critical theory has more in common with Hall than Robinson in several ways (Davis, 2005). Yet her style of thought stands out owing to a feminist consciousness that sets it apart from her contemporaries. Davis' earlier work showed the limitations of socialist and Marxist feminisms that failed to account for the racialised and gendered nature of work and the labour of women of colour, specifically black women in the USA. For instance, Davis argued that the Wages for Housework campaign that emerged in the 1970s (primarily in the USA, Italy and the UK), in conjunction with critical theoretical work on the place of social reproduction in Marx's labour theory of value, could not account for the history of black women's paid and unpaid labour in the domestic sphere. This was because that perspective on women and social

reproduction assumed a particular concept of gender, wherein the category or identity of ‘woman’ was defined through ultimately bourgeois, heteronormative family relations. Davis therefore challenged the idea that recognising and giving economic value to women’s reproductive labour would lead to the eventual emancipation of women from the strictures of capitalist heteropatriarchy. From the history of black women’s reproductive labour under slavery (and, crucially, its contemporary legacies) to the continued prevalence of black women domestic workers whose paid labour was sorely undervalued and exploited in the post-slavery era, Davis questioned fundamental assumptions of Marxism and Marxist feminist theory and associated political campaigns (Davis, 1972).

In *Women, Race and Class* (1983), taking the destruction of black family life under apartheid South Africa as her example, Davis showed how racial capitalism renders futile the argument that women ought to be paid wages for housework in keeping with capitalism’s internal logic. In other words, the extreme exploitation of black male workers and the ‘characterization of African women as “superfluous appendages”’ (Davis, 1983: 235) that saw their banishment from urban and industrial centres under laws of segregation showed that Black domestic life itself was deemed totally disposable or superfluous to the operation of capitalism under apartheid. Davis’ method of analysis was to take Black working-class women and to centre their realities and histories in unpacking the social, economic and political structures, processes and events produced in and through racial capitalism.

Relatedly, in her writing on Black women blues singers, Davis challenges conventional writing and scholarship on the blues which, with an implicitly sexist bias, has underplayed women’s contributions. She creates a framework for understanding the political nature of music that on its surface does not fall into conventional understandings of protest music; at the same time, it eschews what would be a reductive and rather boring exercise of ‘proving’ that the blues music of these women contained political content. Through her analysis of the lyrics and lives of three of the most important blues singers of the first half of the 20th century, she challenges the binary between the ‘personal’ and ‘political’ itself, revealing a much more complex and at times contradictory relationship between women, the communities they came from, and issues ‘emanating from racism and economic injustice – crime, incarceration, alcoholism, homelessness, and the seemingly insurmountable impoverishment of the black community’ (1998: 92). As she puts it:

Art may encourage a critical attitude and urge its audience to challenge social conditions, but it cannot establish the terrain of protest by itself. In the absence of a popular mass movement, it can only encourage a critical attitude. Then the blues ‘name’ the problems the community wants to overcome, they help create the emotional conditions for protest, but do not and could not, of themselves, constitute social protest. (1998: 113)

In the course of this work, Davis challenges existing scholarship on the blues and its gender bias, emphasising that ‘women’s blues provided a cultural space for community – building among working-class black women, and that it was

a space in which the coercions of bourgeois notions of sexual purity and “true womanhood” were absent’ (1998: 42). Sexuality and travel (1998: 67), the freedom of mobility and of asserting autonomy over one’s intimate relationships, were two hallmarks of the freedom grasped by Black working-class women in the decades after the end of slavery. For Davis, the proliferation of blues music that focused on the themes of love and sexuality reflect the ways in which ‘sexual love’ in the decades following the end of slavery ‘was experienced as physical and spiritual evidence ... of freedom’ (1998: 45). Blues music was the expression of this newly found and cultivated sense of autonomy.

Of course, this was not without complication and Davis does not shy away from analysing the sexist stereotypes that pervade some of the music she examines. The competition between women, and the representation of feelings of jealousy that sometimes dramatically reaches a violent pitch in its lyrical portrayal, was also accompanied by ‘advice songs’ that bound together women in an imagined community rooted in real and widespread experiences (1998: 46–56). These were different dimensions of a newly found freedom expressed through sexuality. As Davis notes:

Sexuality is not privatised in the blues. Rather, it is represented as shared experience that is socially produced. This intermingling of the private and public, the personal and political, is present in the many thousands of blue songs about abandonment, disloyalty, and cruelty, as well as those that give expression to sexual desire and love’s hopefulness. (1998: 91)

Women blues singers challenged norms about black women’s behaviour inherited from the era of enslavement, as well as from middle-class black women’s aspirations towards norms of respectability and propriety. Sexuality and mobility were two domains where working-class women asserted their independence and ‘fundamental humanity’ (1998: 44).

Ultimately, and drawing on the later work of Marcuse, and especially his notion of the ‘aesthetic dimension’ (Marcuse, 1978), Davis ‘propose[s] a conceptualisation of “aesthetic dimension” that fundamentally historicises and collectivizes it. Rather than a unique product of the solitary artist creating an “individual” aesthetic subversion’, she argues that ‘the “aesthetic dimension” of Billie Holiday’s work represents a symbiosis, drawing from and contributing to an African-American social and musical history in which women’s political agency is nurtured by, and in turn nurtures, aesthetic agency’ (1998: 164). This aesthetic dimension is also present in the ambivalent relation of spirituals and religious belief to blues music, which did not adhere to a strict bifurcation in the lived realities of many black women.

Davis’ work on Rainey, Smith and Holiday is a profound intervention into the very meaning of what constitutes ‘political’ work, Black feminist consciousness and the conditions for its emergence, the relationship between freedom and aesthetics, and why both Marxist and Black radical ways of seeing are necessarily reductive when they overemphasise race or class at the expense of gender

and sexuality. Taking social relations as a complex whole, rather than a set of deracinated vectors of race, class and gender, she challenges the very categories of analysis many radical scholars are habituated to relying upon. Ultimately, in turning our minds to contemporary movements for abolition, Davis' work holds invaluable lessons for how to see radical practices of freedom-making that might be otherwise hiding in plain sight.

CONCLUSION

The writings of Hall, Robinson and Davis are exemplary of the heterogeneity of the Black radical tradition and its engagements with Marxian and Marxist thought. Their bodies of work, so foundational for scholars engaged with thinking through histories and contemporary manifestations of racial capitalism and racial subordination, provide intellectual trajectories that simultaneously critique and exceed the limits of Marxist thought in these fields of study, while, in Hall and Davis especially, creatively appropriating Marxist concepts and methods. In this moment of rising fascisms in many parts of the world, enabled by the inequities wrought by decades of neoliberal austerity and the transformation of state apparatuses into conduits for the privatisation and marketisation of public goods, frameworks of analysis that enable us to map how race and racisms are encoded in the very fabric of liberal, capitalist democracies have never been so necessary.

Slavery and Capitalism

Leonardo Marques

Marx is unarguably one of our best guides for the understanding of capitalism. He also had a few things to say about slavery, and these can be extremely useful precisely because of his analysis of capital. His considerations on the relationship between capitalism and slavery, however, were made in different contexts and with different analytical goals, paving the way for diverse and frequently conflicting interpretations that continue to shape debates to this day. Frequently, his discussions of slavery appeared as a counterpoint to capitalism, in a strategy to highlight what he saw as the key dynamics of the system. At the same time, as Pepijn Brandon (2018) has recently argued, slavery at times was used by Marx as a way to distinguish his interpretation of ‘free’ labour from that of classical political economy. This could be seen as a variation of the first strategy, but instead of emphasizing differences, his discussion blurred the lines between the two categories. He also referred to the connections between slavery and capitalism in more systemic fashion, outlining mutual conditionings and influences, as in the famous section on so-called primitive accumulation at the end of *Capital*. In his description of the creation of the industrial capitalist, Marx (1990: 915) included the famous passage on the ‘idyllic proceedings’ of primitive accumulation, which were based on the extraction of riches from overseas territories with the coerced labour of native Americans, Africans, and Asians. Marx also did not have any problems in occasionally referring to US slaveholders in the antebellum South as capitalists, indicating the possibility of looking at specific slave enterprises or societies as capitalist. This position, however, came with important qualifications: in plantations,

where commercial speculations figure from the start and production is intended for the world market, the capitalist mode of production exists, although only in a formal sense, since the slavery of Negroes precludes free wage labour, which is the basis of capitalist production. But the business in which slaves are used is conducted by capitalists. The method of production which they introduce has not arisen out of slavery but is grafted on to it. (Marx, 1963: 302–3)

As Foster et al. (2020) have recently pointed out, a more developed political economy of slavery can be found in his late works, with environmental degradation playing a key role both in the expansion and eventual political crisis of the institution in the USA. At times, Marx (1990: 925) combined these different analytical strategies, as in his famous argument that ‘the veiled slavery of the wage-labourers in Europe needed the unqualified slavery of the New World as its pedestal’. The connection between wage labour and slavery is presented in a language that also blurs (but does not abandon) the distinction between the two categories.

It was left for twentieth-century scholars to reconstruct the world history of slavery based on those and other insights in different ways, also expanding on subjects that were not fully explored by Marx, such as abolition in the Americas or the role of race and gender in capitalist slavery (Davis, 1972; Robinson, 1983). At its best, this scholarship further explored and combined the different Marxian analytical strategies in creative ways; at its worst (leaving aside those who simply reject Marxism as a Eurocentric framework), it elected one of them as the legitimate Marxist take on the subject, creating orthodoxies that pervaded a large proportion of the scholarship. In any case, a vast scholarship of Marxian inspiration shaped most debates on the history of slavery at different times and places (Patterson, 1977). In what follows, I focus on Marxist and Marxist-inspired traditions that explored the history of slavery in the Americas between the sixteenth and the nineteenth centuries as part of the larger debate on the relations between capitalism and slavery. For reasons of space and time, this overview has to necessarily be schematic and selective. I have also chosen to put a slightly greater emphasis on authors who are less known in Anglo-American academia. I expect to show some of the most creative uses of the different insights offered by Marx in the study of slavery and capitalism, which have been further explored and combined by scholars in comparative, connected, and integrated ways.

FIRST EXPLORATIONS

In his 1903 *Der Moderne Kapitalismus*, Werner Sombart (1919) emphasized the central role of slavery in the New World for the development of capitalism, with a discussion of the profits of the African slave trade and slavery in the Americas accompanied by observations on the human and environmental costs of those enterprises (noting, for example, how sugar production led to the destruction of vast swaths of forests in the Caribbean). In European historiography, however, the issue of slavery and capitalism remained largely restricted to a few specific

chapters and footnotes. In his classic *Studies in the Development of Capitalism*, Maurice Dobb (1947) had a chapter on mercantilism and the primitive accumulation of capital, with a few references to slavery in the New World. Hobsbawm in turn, in his classic essay on the general crisis of the seventeenth century, argued that 'developed' areas were few and scattered in the aftermath of the crisis, with entrepreneurs needing a 'forced draught' in order to really revolutionize their production and ultimately produce an industrial revolution. Among other factors, 'a new colonial system, based mainly on the slave-plantation economy, produced a special forced draught of its own, which was probably decisive for the British cotton industry, the real industrial pioneer' (Hobsbawm, 1954: 56).

Not surprisingly, it was in the former slave societies of the Americas that the largest body of work on the issue of capitalism and slavery appeared. In the USA, W. E. B. Du Bois was the first to effectively explore the theme. Although initially not using the concept of capitalism, he argued in his 1896 book on the slave trade that the compromise with slavery in the aftermath of US independence led to 'the abnormal and fatal rise of a slave-labor large-farming system, which, before it was realized, had so intertwined itself with and braced itself upon the economic forces of an industrial age, that a vast and terrible civil war was necessary to displace it'. By the early decades of the nineteenth century slavery in the US South had become an 'industrial system' (Du Bois, 1954: 107). A few decades later the argument had become larger: 'black labor became the foundation stone not only of the Southern social structure, but of Northern manufacture and commerce, of the English factory system, of European commerce, of buying and selling on a world-wide scale' (Du Bois, 1956: 3). Not only did slavery in the antebellum South manifest many characteristics of industrial capitalism, it was one of the foundations of the global expansion of the system as a whole. Other works also pointed to the relationship between capitalism and slavery during that period, such as Philip Foner's *Business & Slavery* (1941), which showed the very strong connections between New York merchants and slavery in the South all the way up to the outbreak of the US Civil War and beyond.

Around the same time, Caribbean historians C. L. R. James and, especially, Eric Williams also put the connections between slavery and capitalism at the centre of their studies. In *Black Jacobins* (1938), whose main focus is in fact on Toussaint Louverture and his leading role in the Haitian Revolution, James not only argued that slavery in Saint Domingue was key to the development of various French industries and the enrichment of the French bourgeoisie, but also interpreted the British abolitionist attack against the slave trade as a strategy to beat French competition (which was made possible by the expansion of the British into India). Expanding on this argument, Williams took a step further and transformed the history of British capitalism into the history of slavery. In his famous argument, 'the commercial capitalism of the eighteenth century developed the wealth of Europe by means of slavery and monopoly. But in so doing it helped to create the industrial capitalism of the nineteenth century, which turned

round and destroyed the power of commercial capitalism, slavery, and all its works' (Williams, 1944: 210). From contributions to the shipbuilding industry, the development of British port cities, and the uses of various manufactured products in the slave trade to the connections between specific bankers, industrialists, and merchants to the transatlantic slave trade, Williams created a research agenda that marked the entire historiography of slavery. His discussion of the broader transformations that led to abolition in turn included not only soil exhaustion in old British Caribbean colonies and the competition of French colonial rivals, but also the political and economic consequences of the American Revolution and the new phase of British imperial expansion into Asia, reconfigurations that helped understand the expansion of free trade ideology in the Atlantic. Williams opened his book emphasizing that it was 'not a study of the institution of slavery but of the contribution of slavery to the development of British capitalism', but James criticized him for ignoring the capitalistic elements of modern slavery. 'The great commerce built up on the slave trade and slavery', James argued, 'had its foundation in a very highly advanced and essentially capitalistic mode of production, although this was in the colonies' (James, 1996: 119).

In Latin America, a colonial past that produced brutal forms of coerced labour and land concentration was interpreted by a large number of scholars during the first half of the twentieth century as a feudal or feudal-like legacy that explained problems of their time. Very early on, however, dissenters such as Caio Prado Jr, Jan Bazant, and Sérgio Bagú, among others, emphasized in one way or another the modern nature of the colonial experience and its connection to a forming capitalist world market (Stern, 1988: 833). Despite differences in conceptualization and definition, all these US, Caribbean, and Latin American scholars sought to understand the history of their own former colonial societies within the broader context of modern capitalism, thus offering some crucial insights for understanding the history of slavery and coerced labour as part of the modern world.

TRENTE GLORIEUSES

The three decades after World War II were marked by the development of a much larger body of work on the history of slavery and its connections to capitalism, building on the insights of the earlier generations. In Cuba, starting in the late 1940s, Manuel Moreno Fraginals produced one of the largest and most authoritative body of studies of slavery in the New World, observing the radical social and spatial transformations produced by the expansion of sugar production in the Spanish colony in the context of an expanding capitalist world economy. According to Moreno Fraginals, the nature of slavery itself was transformed by this articulation, becoming less patriarchal and more exploitative over the nineteenth century, an argument that was also similarly made by Marx for the US South (Moreno Fraginals, 1988: 47–8). Unlike Marx, however, the Cuban

historian ultimately saw a contradiction between the modernization brought by industrial capitalism and the predominance of an enslaved labour force, producing tensions that ultimately led to the abolition of the institution. In a later article, Moreno Fraginals outlined an interpretation that was closer to Marx's take on US slavery, arguing that slaveholders could be described as bourgeois since two key factors of capitalism – production and circulation of commodities – could be found in Cuba, but on the whole he continued to conceive of slavery and capitalism as two radically different things (Tomich, 2003: 92; Piqueras, 2016: 213–4).

The treatment of capitalism and slavery as contradictory poles became a hallmark of many Marxist studies of slavery in the Americas over the 1960s and 1970s. Attributed not only to Marx, but also to Williams, such a view depends on a very partial and incomplete reading of both authors (Neptune, 2019; Foster et al., 2020). In the USA, the main Marxist works on slavery during this period came from Eugene Genovese, even though more than one author has pointed out that one should look elsewhere for proper Marxist studies of US slavery (Patterson, 1977: 426; Ransom and Sutch, 1988: 134; Clegg, 2020: 75). The opposition between slavery and capitalism was initially put in even more rigid terms by Genovese (1967), who later softened his views on the issue but never really abandoned some of the 'orthodoxies' that depended on very partial readings of Marx.

In Brazil, a powerful interdisciplinary tradition inspired by the work of Marx emerged within the University of São Paulo, with different groups and individuals pushing the discussion in multiple directions. Marx was the starting point, but the capitalism and slavery debate soon became one of the main themes explored within this tradition. This was an obvious choice if we remember that Brazil was the largest importer of enslaved Africans in history (approximately 5,800,000 individuals between the sixteenth and the nineteenth centuries) and the last country to abolish slavery in the Americas, in 1888. Florestan Fernandes (1976), Octávio Ianni (1962), Fernando Henrique Cardoso (2003), Paula Beiguelman (1967), Emília Viotti da Costa (1966), Roberto Schwarz (1992), Maria Sylvia de Carvalho Franco (1997), and Fernando Novais (1979), among others, all published seminal works exploring in different ways the relationship between capitalism and slavery. As Roberto Schwarz (2017) argues, observers in the capitalist periphery are more prone to conceptual invention when exploring European intellectual traditions, including Marxism, to understand their own reality. This element of innovation appears, for example, when Paula Beiguelman writes that 'while theoretically the capitalist system might be defined with regard to free labor, empirically or historically colonial slavery must be considered a constituent part of it'. She then continues: 'From this it follows that a process of progressive purification is not what happens, since slavery does not represent a noncapitalist component (as do, for example, feudal relations, which were eliminated with the advance of capitalism) but, on the contrary, constitutes a *capitalist creation*' (1978: 77).

The serious consideration of the history of slavery and capitalism depended, therefore, on a very open and rich reading of the work of Marx. Still, the idea that

capitalism and slavery were separate and contradictory units did inform some of these works, such as Fernando Henrique Cardoso's *Capitalismo e escravidão no Brasil meridional* (Capitalism and Slavery in Southern Brazil) and Octavio Ianni's *As metamorfoses do escravo* (The Metamorphoses of the Slave). Even though writing of a 'slave capitalism' in a later preface to his book, Cardoso (2003: 21) considered that slavery nonetheless imposed a structural limit to the full development of a proper capitalism (*capitalismo pleno*). While it helps to reveal some of the contradictions of 'slave capitalism', the idea of capitalism proper does insert a certain teleology into the discussion and reduces the scale of analysis to the regional or national scale, reproducing the same duality that can be found in the work of Moreno Fraginals, Genovese, and others.

A more radical and less ambiguous break within the whole capitalism and slavery debate came with the contributions of Maria Sylvia de Carvalho Franco. Recognizing the difficulties of thinking about capitalism as part of the 'colonial system', Franco used the concept of capitalism not only to explore the connections of the colonies to 'commercial capitalism', but especially to emphasize the novelty of the forms of production established by the Portuguese in colonial America (Franco, 1997: 15). Her discomfort with the concept of commercial capitalism came from the teleological nature of many uses of the concept, which at times reproduced the idea that merchant capital merely parasitized old forms of production. For others it was synonymous with primitive accumulation, a process that helped create capitalism but was not capitalism proper (in this case understood as industrialization). As she would later argue (Franco, 2011), the work of Eric Williams complicated the traditional opposition between capitalism as a modern, civilizing force and backward slave societies such as Brazil. In her view, a number of Brazilian scholars employed concepts such as 'commercial capitalism' or 'primitive accumulation' to safely maintain the idea that slavery – like many other 'backward' characteristics of the country – was not part of capitalism.

In the following years Franco continued to reject the methodological duality that increasingly marked the Marxist historiography of slavery, calling instead for an integrated analysis that incorporated it in modern capitalism. In a later article, she argued that

the resurgence of slavery, the development of free labour, the making of the bourgeoisie, the constitution of the colonial entrepreneur are categories unitarily determined: in modern times one does not exist without the other. In other words, the same essential determination appears in all of them: in each of them one can find the unification of the various and contradictory elements of the whole. (Franco, 1979: 34)

She conceived her objects of analysis as contradictory totalities whose parts conditioned each other in multiple ways.

Around that same time, Brazilian economist Antônio Barros de Castro also made a number of brilliant contributions to the capitalism and slavery debate. Castro explored in very creative ways the different Marxian analytical strategies

outlined at the outset of this chapter and, in the process, criticized many of the orthodoxies that continued to inform much of the debate. One of his first targets was the idea that free labour was more productive than its slave counterpart because of the use of incentives in the former. According to Castro, like slaves, modern proletarians have very little interest in their work, largely determined as they are by the rhythm and compulsion of machines (thus, like Marx, blurring the boundaries between the two forms of labour). The key difference between wage and slave labour was to be found in the fact that while modern proletarians to some extent endorse their own exploitation by selling the only commodity they own, slaves are introduced into and maintained within the system by force (Castro, 1980: 77–8). While this distinction has been explored by a number of Marxist scholars in terms of the simplistic opposition between capitalism and slavery as respectively based on economic and extra-economic forms of labour exploitation (for an overview, see Rioux, 2013), Castro goes in a different direction. In a comparison between ancient and modern slavery, he argues that one of the key features of the latter is that sugar mill owners were not exactly in control of their properties. In fact, once formed, the ‘mill anthropomorphizes itself and starts to determine the actions of the owner’ (Castro, 1980: 87). This happens not only as a result of the articulation of this production to a capitalist world market, but also because the mass production of sugar in the New World led to the establishment of a complex productive apparatus that needed to be reproduced over time, creating compulsions that were greater than the will of its owners. Labour in a sixteenth-century sugar plantation in turn bore more similarities to that performed in nineteenth-century British factories than to the European manufacturing units of the sixteenth and seventeenth centuries. ‘One does not need to show the “external” connections’, Castro argues, ‘to demonstrate the strong similarities between modern slavery and capitalism – a proximity that is reinforced by the fact that this organization [of slave plantations] appears associated to the birth of capitalism, growing and expanding in articulation to it’ (Castro, 1980: 92–3). The *differentia specifica* of modern slavery according to Castro is that, unlike their counterparts of the Ancient world, modern slaveholders were subject to a broader economic compulsion.

The impersonal compulsion described by Castro stopped at the masters themselves, leaving brute coercion to the enslaved labourers. In capitalism, the owner of the means of production and the proletarian are personifications of capital and wage labour, thus making the history of the working class part of the history of capital. The slave cannot be the personification of an economic category since direct coercion continues to be a central part of labour relations. There is still something of the dualistic approach criticized by Franco here, but Castro makes this distinction to actually argue that slave agency had important political implications for the system as a whole (a point that would later be developed by James Oakes in the US context) (Oakes, 1986). Unlike the free labourer who participates in the system as a seller of his own labour, direct coercion is a

key component of slavery (along with other strategies such as the concession of incentives, but ultimately with the threat of force behind them), thus leading to potential political tensions that are also larger than the plantations themselves. His conclusion turns upside-down many of the comparisons between slavery and capitalism: ‘the slaves, who continue to be described as “things” by a juridically inspired tradition, make the reification of social relations impossible’ (Castro, 1980: 94). In this way Castro also offered a powerful critique of the earlier Marxist historiography that spoke of a ‘thingification’ of slaves, usually relegating them to a passive role in history. He then proceeds to give a few examples of how the actions of slaves interfered in broader developments. The classic transition from a more patriarchal to a more brutal, industrial slavery, which as we have seen Marx and Moreno Friginals described with reference to the USA and Cuba in the second half of the nineteenth century, is usually explained by the expansion of the world economy. According to Castro, however, in addition to world economic developments, the actions of slaves themselves helped explain that transition: namely the fears produced by the combination of an expanding slave trade (with the tensions produced by the arrival of a growing number of Africans) and the Haitian Revolution. It was for this reason that stronger control mechanisms emerged and, in the case of Cuba, political independence was postponed (an argument that could be similarly made for the British Caribbean during the American Revolution) (Castro, 1980: 102–3). Unlike Franco, Castro offered more of a comparative than an integrated analysis. But following in the footsteps of Marx, he moved between those different strategies of analysis, at times blurring the differences between slavery and capitalism, at other moments emphasizing their differences, always without ignoring the clear connections between the two. Despite the differences between wage and slave labour, there is no hint of a contradiction between slavery and capitalism here.

FROM CAPITALISM AND SLAVERY TO SLAVERY AND FREEDOM

With the rise of dependency theory (to which many of the scholars above contributed), especially the work of Andre Gunder Frank in the 1960s, a new round of Marxist debates on the relationship between capitalism and slavery also appeared in the 1970s. According to Frank, Latin America had been capitalist since its early days in the sixteenth century as part of what he called the ‘development of underdevelopment’. Frank made for an easy target: his grasp of Marxism was poor and his depiction of colonial history extremely simplistic (Stephens, 2018). After an initial critique from Ernesto Laclau (1971: 37–8), who argued that Frank had confused ‘capitalist mode of production and participation in a world capitalist economic system’, a number of other scholars expanded the debate. Largely inspired by the work of French structuralist Marxism (Althusser, Balibar, Godelier), they explored the idea of an articulation

of modes of production within a larger social formation in which capitalism may be the dominant mode. Some took these suggestions too far, with extremely abstract models that completely annihilated history, leading to a decline of interest in the perspective almost as fast as its emergence (Corrigan and Sayer, 1978). Still, the goal of overcoming the linear, stagist interpretations of orthodox Marxism, as well as the simplification and homogenization put forward by Frank, was an important one, leading to some important work. In Brazil, historians Ciro Flamarion Cardoso and Jacob Gorender produced a significant body of work based on the concept of a colonial slave mode of production (unfortunately conflating relations of production and forms of exploitation, as many others did in this tradition) (Banaji, 1972; Cardoso, 1975; Gorender, 1978). The duality that separated slavery from capitalism was made more rigid by assigning them to different modes of production.

In the following years, three additional developments would completely reshape the historiography of slavery. First, the idea that colonization could have been significant to European development received a sustained attack from scholars of different theoretical persuasions in Anglo-American academia. A large number of British and US historians, many of them inspired by the methods of the New Economic History, attempted to show that gains from the slave trade and slavery in the Americas contributed very little if at all to European development. 'In the absence of West Indian slavery', Joel Mokyr (1999: 75) argues, 'Britain would have had to drink bitter tea, but it still would have had an Industrial Revolution, if perhaps at a marginally slower pace'.

Second, a widespread reduction in the scale of analysis accompanied the development of new methods in social and economic history that depended on intensive work in local and regional archives. A large number of works showed the differences of slavery over time and space. Such a move was reinforced by the critique of more systemic scholars such as Williams and Wallerstein. By the 1980s, Ciro Cardoso, for example, had incorporated many of the critiques of New Economic Historians on peripheral contributions to European development, considering *Capitalism and Slavery* a completely discredited book (Cardoso, 1987: 15–16). With the connection to European capitalism now appearing to have been irrelevant, Brazilian scholars of slavery could focus on the dynamics of the institution within the country. A large number of works explored the dynamics of internal markets in opposition to what Maria Yedda Linhares (1996) described as a 'plantationist model', by which she meant the excessive focus of an earlier historiography on the export sector of the Brazilian economy. Eventually some of the works produced in this trend simply opposed colonial Brazil to a capitalist Europe, showing how the logic of slaveholders was aristocratic and social relations were eminently non-capitalist (Fragoso, 1998). In the USA, a somewhat similar shift took place with the development of New Economic History, which simultaneously discarded the kind of systemic approach offered by Williams and affirmed the capitalist nature of New World slavery by outlining elements such

as the profitability of plantations and the rationality of slaveholders in the US South. As more than one observer has noted, this was very similar to the analysis of the political economy of slavery developed by Marx in his late work (Ransom and Sutch, 1988; Clegg, 2020). But it largely came without the more systemic considerations that transcended the nation state as the unit of analysis. Much of the debate on capitalism and slavery became a discussion on the logic of slaveholders, opposing paternalist practices to a capitalist rationality – with opposite conclusions in Brazil and the USA.

Finally, the reduction in the scale of analysis also led to a move towards the everyday lives of slaves and a number of other aspects of the institution such as gender that had been largely neglected by previous studies, with important Marxist contributions here as well (Rawick, 1972; Davis, 1983). This was part of a broader shift in labour studies as a whole, with a growing attention to the experience of workers in various settings, their subtle forms of resistance and multiple strategies of survival, and in this no other Marxist scholar played a larger role than E. P. Thompson. The main goal of a large number of historians of slavery then became to show how slaves pursued various strategies of survival, having freedom as their ultimate goal, and proving their humanity against a dehumanizing system in the process (Genovese, 1974; Johnson, 2003). This research strategy largely came from a simplified reception of Thompson, but part of the problem could already be found in his own formulations, such as in his excessive emphasis of ‘men and women as subjects of their own history’ (Thompson, 1978). In this regard, Perry Anderson was right to point to problems in the ways ‘agency’ was used by Thompson, who freely moved between (and ultimately conflated) various scales of analysis (Anderson, 1980: 21). Ultimately, *The Making of the Working Class* opened with the observation that this process ‘owes as much to agency as to conditioning’, but delivered mainly the first half of the equation. ‘The advent of industrial capitalism in England’, Anderson argues, ‘is a dreadful backcloth to the book rather than a direct object of analysis in its own right’ (Anderson, 1980: 33). A few years later William Sewell Jr made a somewhat similar point: ‘by suppressing but unconsciously retaining economic determinism, Thompson cleared a vast narrative space that could be filled almost exclusively by specific accounts of working-class experience, agency, and consciousness, untroubled by, yet globally shaped by, the underlying rhythm of a classical Marxist movement from class-in-itself to class-for-itself’. It was this ‘vast narrative space’ that was appropriated by scholars of labour across the world, including scholars of slavery (Sewell Jr, 1986: 10). While the richness of this research agenda is undeniable, it did not favour explorations of the various levels that can be found in a totality. A more radical approach to this focus on labourers appeared in a few works (Linebaugh and Rediker, 2000), but the general trend was towards ignoring the more systemic approach of earlier generations. Antônio Barros de Castro, as we have seen, and many others before him, explored the issue of slave agency within the wider structures of which it was part (Aptheker, 1943; Moura, 1959).

A few Marxist scholars nonetheless continued to produce studies of slavery in more systemic fashion, exploring comparisons and connections based on the modes of production approach or variations of it (Ashworth, 1995; Post, 2011). Perhaps the potential and limits of such an approach for the study of slavery is nowhere better seen than in the work of Robin Blackburn. Like Ashworth, Blackburn puts class struggle and slave agency at the centre of his interpretation of abolition in the Americas. He also places wage labour at the centre of his interpretation of capitalism. Unlike Brenner and a few others, however, Blackburn does have some room for discussing so-called primitive accumulation. In his view, capital has produced 'regimes of extended primitive accumulation' for its own reproduction, with New World slavery as 'the first and least-camouflaged expression of this capitalist logic' (Blackburn, 1997: 554). When looking at the plantations themselves, Blackburn emphasizes their modernity in Jamesian fashion. Slave plantations in the New World were 'not animated by a pure capitalist logic but closer to it than European serfdom and slavery would have been, or were'. At the same time, he remains attached to the idea that 'ultimately merchant capital, with its reliance on tied labour, was conservative and rigid, and the slave plantations it sponsored raise output mainly by multiplying units of production, not by raising labour productivity' (Blackburn, 1997: 24). Blackburn is using a subtle form of the articulation of modes of production, as becomes clear in his comparison of the Ancient world (where 'the slave mode of production may be regarded as dominant') with New World slavery (which paradoxically had more slaves 'even though it was now only a subordinate mode of production') (1997: 377). While he is sensitive to mutual influences, there is a certain tension in Blackburn's description of the modernity of slave plantations and his view that merchant capital is ultimately conservative.

This also reflects on how Blackburn conceives the origins and development of capitalism. The capitalist mode of production starts as an English phenomenon: it appears in the English countryside (he incorporates Brenner and Wood in his explanation) and later receives a contribution from the slave colonies, which 'acted as a "forced draught" fanning the flames of metropolitan accumulation' (Blackburn, 1997: 232–3). Brenner's account of this story (1977), which is embraced by Blackburn, if somewhat less rigidly, is based on a very selective reading of the chapter on the so-called primitive accumulation, which ignores Marx's own observation (Marx, 1990: 876) that his focus on England is because this is where the process has taken the 'classic form', followed by a footnote that singles out Italy as the place where 'capitalist production developed earliest'. England in this reading becomes not the classic, but the first form. It is based on this selective reading that many of the comparisons between England and Spain appear in a number of Marxist works, usually to take the latter as a non-capitalist counterpoint to the former (Fox-Genovese and Genovese, 1983; Wood, 2002). This formal comparison establishes these two units as autonomous and coherent entities. The consequence is that slavery in the Iberian empires completely

disappears from view once the North Atlantic becomes the key dynamic pole of the world economy. Marxist scholars who accept the disjunction between Britain and Spain tend to neglect the fundamental role played by coerced labour in the plantations, mines, and rivers of colonial Latin America not only for the establishment of structures that would later be explored by Northwestern European powers, but also in its persisting importance within the bundle of global relations that made possible the development of historical capitalism over the long eighteenth century. Precious metals, for example, continued to be fundamental for the system as a whole, with the main known deposits largely located in the Iberian Americas during that period and coerced labour playing a central role in their extraction. From the maintenance of European trade in Asia to the creation of a stable financial and commercial environment in Northwest Europe (fundamental elements for the construction of a fiscal-military state and investments in various enterprises on both sides of the Atlantic), coerced labour in colonial Latin America continued to be a critical component within the history of capitalism. Blackburn refers to the importance of Brazilian gold for the healthy financial environment of Britain and the continuance of Asian trade, but completely ignores it when exploring the process of primitive accumulation in the British empire (and in this reproducing a problem that can also be found in Williams' Anglocentrism) (Marques and Marquese, 2020).

The tradition that explored the connections between capitalism and slavery in less orthodox ways was kept alive after the 1970s mainly by the group of scholars within and around the Fernand Braudel Center, as a quick look at the many editions of the Center's journal *Review* shows. In its second volume, the journal already included a section on the issue of slavery and capitalism with two different articles: a translation of a section of Paula Beiguelman's (1978) article cited above and Sidney Mintz's 'Was the Plantation Slave a Proletarian?' (1978), a critical engagement with the work of Wallerstein. Mintz answered the problem announced in the title in ways that strongly resembled the arguments offered by Franco only a few years earlier. After discussing the formal comparisons between slavery and capitalism that pervaded the modes of production literature, Mintz concluded that 'it is not analytically most useful to define either "proletarian" or "slave" in isolation, since these two vast categories of toiler were actually linked intimately by the world economy that had, as it were, given birth to them both, in their modern form' (Mintz, 1978: 97) – an obvious variant of Marx's quote on the interdependence between veiled and unqualified slavery.

Mintz would further develop this perspective in *Sweetness and Power* (1986). Here we see the results of the formulation that had already appeared in the 1970s: wage and slave labour as mutually constitutive forms linked through the world economy. One of the key aspects of Mintz's work was showing, in the footsteps of James, the precocious modernity of the slave Caribbean, where enslaved populations were carried from Africa to work under industrial rhythms in sugar production, an approach that resembled the earlier one developed by

Barros de Castro for colonial Brazil. There wasn't anything remotely close to the New World slave plantations anywhere else in the early modern period. In Europe, as Braudel showed so extensively, the transformation of the structures of everyday life proceeded at a much slower and contradictory pace. In the New World, especially in the Greater Antilles, where the Indigenous populations were largely annihilated in a short period of time, capital investments allowed for the creation of enterprises from scratch, with the transference of a vast labour force from the outside. The modernity of the Caribbean plantation was intimately connected to the transformations of everyday life on the other side of the Atlantic, with the expansion of consumption in Europe and a redefinition of what Marx called a 'system of needs' (Fracchia, 2004). In his famous conclusion, Mintz argues that 'the first sweetened cup of hot tea to be drunk by an English worker was a significant historical event, because it prefigured the transformation of an entire society, a total remaking of its economic and social basis' (Mintz, 1986: 214). Mintz still suffers from a certain Anglocentrism, which leads him to understate earlier transformations. The taste for sugar, for example, increased in the North Atlantic as a result of the expansion of sugar production in Brazil, which was distributed from Antwerp to various parts of the continent in the sixteenth century (Ebert, 2008). His methodological approach, as that of others outlined here, however, allows us to explore the longer history of capitalism from its beginnings in the Mediterranean (Godinho, 1968: 271–2; Arrighi, 1998: 126–8; Moore, 2009).

Over the 1980s, other scholars engaging in these debates produced equally vital contributions within the journal and beyond. Michel-Rolph Trouillot (1982) brilliantly showed the role of former slaves and their descendants in the expansion of coffee production in Saint Domingue, with local and global implications during the years leading to the Haitian Revolution. The methodological spirit of earlier Brazilian Marxists such as Franco and Castro, however, appears nowhere as clearly as in the work of Dale Tomich. As he argues in the introduction to his *Slavery in the Circuit of Sugar*, neither production nor exchange should be treated in isolation, but must be conceived as parts of a contradictory whole. Similarly, 'instead of approaching world, national, and local dimensions as discrete empirical entities, it [this approach] treats them as mutually formative parts of a larger whole' (Tomich, 2016b: 7). By the late 1980s, based on his studies of nineteenth-century Cuba, Tomich (2003: 58) also put forward the idea of 'second slavery' as a way of approaching and understanding the history of the new slave systems that were created in the context of the Industrial Revolution, a clear sign of the 'unevenness of capitalist development'. The shifts in historical capitalism that left international trade in British hands (thus giving Britain access to cheap primary products), combined with the expansion of an internationalist anti-slavery movement, ensured that slavery would emerge in previously peripheral areas, namely the western lands of Cuba, the Paraíba Valley in Brazil, and the southern states of the USA. The recreation of slavery in this context carried

a series of new characteristics: new rhythms, new technologies, new forms of labour organization. At the other end of this world were the expanding working classes of the North Atlantic.

PRESENT AND FUTURE EXPLORATIONS

Despite the rich historiography on the relationship between capitalism and slavery outlined above, capitalism as a concept largely disappeared not only from the historiography of slavery, but from the discipline as a whole in the last decades of the twentieth century. Atlantic History in the USA, for example, a field that had figures such as Sidney Mintz as one of its founding fathers, has no room for Eric Williams or the whole capitalism and slavery debate in its latest incarnations (Bailyn, 2005; Greene and Morgan, 2009). Global History, especially the work of Kenneth Pomeranz (2000), has revived aspects of the Williams thesis, but is basically concerned with industrialization, not capitalism. In fact, many global historians over the last three decades seem to agree that capitalism as traditionally used by scholars is a Eurocentric construction that misrepresents the distribution of power in the early modern era, either projecting the concept back into the Ancient world to include all of the Old World or abandoning it altogether (Pomeranz, 2009). One consequence of this move has been the appearance of a growing number of global studies of slavery that pay very little attention to the issue of time (Marquese, 2019).

Nonetheless, a renewal of capitalism and slavery debates has appeared in the twenty-first century in different parts of the world. In this concluding section I want to briefly point to three different groups that have made important contributions to this renewal of the debate. The first and best known is the so-called New History of Capitalism, whose main works have generated an incredible amount of responses and critiques. In fact, we might have reached the point where there are more articles about the New History of Capitalism than from the New Historians of Capitalism themselves. Nonetheless, works such as Walter Johnson's *River of Dark Dreams* (2013), Edward Baptist's *The Half Has Never Been Told* (2014), and Sven Beckert's *Empire of Cotton* (2014), among others, have renewed debates on the relationship between slavery and capitalism, even if largely focused on the nineteenth-century USA (for a critical overview of this scholarship, see Burnard and Riello, 2020).

A second productive trend of the last two decades has been the so-called 'Global History of Labour', which has in Amsterdam's International Institute of Social History one of its main centres. In a number of individual and collective projects, scholars associated with this group have explored various aspects of the agenda originally put forward by world system scholars and Marxist feminist scholars of the 1970s and 1980s, for instance with regard to the combination of different forms of labour, the limits of proletarianization, and the importance of

household labour. The relationship to Marx is not always clear since, as van der Linden has put in a recent definition of the field, ‘different theories can be constructed and tested, whether inspired by Karl Marx, Max Weber, John Commons, or other thinkers’. For some scholars within the group, the concept of capitalism does not have much use (Lucassen, 2019). There has nonetheless been a great effort involving many of these scholars to discuss theoretical and methodological aspects of the capitalism and slavery debates. What are the strengths and weaknesses of the concept of capitalism? How were multiple forms of labour combined in specific settings? What were the parallels and connections between empire and labour in the Atlantic and Indian oceans (Kocka and van der Linden, 2016; van der Linden and Rodriguez Garcia, 2016; Brandon et al., 2019: 7)?

A third group of scholars has explored the possibilities of Dale Tomich’s concept of the second slavery. By taking forward the methodological aspects outlined earlier, that is, by looking at the three main slave societies of the nineteenth century as formed by and formative of the wider relations of historical capitalism, scholars have explored not only the connections of these societies to an industrializing North Atlantic, but also the mutual conditionings produced between Cuba, Brazil, and the USA themselves. From the circulation of technologies and knowledge to the political articulations and tensions produced by slavery and the transatlantic slave trade, the fruitfulness of such an approach has appeared in a number of books (Marques, 2016; Tomich, 2016a; Rood, 2017). The concept of the second slavery has been embraced by Brazilian historians more than any other group, perhaps because of the historiographical genealogy outlined earlier. These historians have explored not only the economic aspects of the expansion of slavery in the industrial era, but also its connections to politics, geopolitics, press, legal, urban, and cultural developments within this broader context of the second slavery (Marquese, 2004; Salles, 2008; Santos, 2012; Parron, 2015; Silva Jr, 2015; Ferraro, 2019; Youssef, 2019). The methodology behind the concept of the second slavery has also been employed to explore earlier periods (Tomich, 2004; Marquese et al., 2016; Marques, 2020). Directly related to the second slavery network has been the development of a specific research group on the Paraíba Valley, in Brazil, the largest coffee production region in the world in the first half of the nineteenth century. The region works as a kind of laboratory for extremely rich theoretical discussions and exhaustive archival work (Muaze and Salles, 2015, 2020).

Future scholarship on slavery and its relationship to capitalism will certainly be enriched by the ongoing dialogue between these different recent trends. While historians of the second slavery may help push the scholarship of slavery to incorporate in more effective ways the Iberian world in current debates, the ‘black radical tradition’ and the recent New History of Capitalism (Robinson, 1983; Johnson, 2017) can push scholars of colonial Latin America to better understand the role of race in the history of slavery in those societies. A better grasp of past Marxist traditions may also contribute to this since they dealt with

many of the same issues that have been reappearing in the contemporary debates on slavery and capitalism. Here one can take inspiration from the theoretical flexibility shown by Marx himself, who made fruitful comparisons between capitalism and slavery in various ways (approximating and differentiating them), noted the connections between the two, and offered integrated interpretations of slavery as part of a wider capitalist world. The most fruitful contributions outlined above largely followed in these footsteps.

Finally, developments in Marxist theories of value, reification, and abstraction over the last half century have barely been explored by historians in general, including those studying slavery. At the same time, many of these works, especially the more theoretically inclined, have very little to say about the role of slavery in the history of capitalism, usually only referring to its previous incarnations as a counterpoint to capitalist dynamics, thus reproducing only the first of Marx's strategies outlined at the beginning of this article. But the time of capital has historically been plural and contradictory. Bringing the history of slavery to the forefront can operate as a constant reminder of the unevenness of the capitalist past and present, pushing scholars to explore the multiple temporalities of the system in its historical trajectory (Tomba, 2013; Harootunian, 2015; Marquese and Silva Jr, 2018). This key aspect disappears when scholars conflate the theoretical description of the system offered by Marx in *Capital* – its ideal average – and its historical manifestations (Heinrich, 2012: 31–2). In this sense, neither a crude historical application of Marx's *Capital* (thus ultimately annihilating history) nor the total abandonment of his theoretical analysis of the system will do. One must make a constant movement between the two levels, in open and innovative ways, in order to fully grasp the place of slavery within the history of capitalism.

Gender

Sara R. Farris

INTRODUCTION

I find the task of writing an entry on gender for a *Handbook of Marxism* particularly daunting. In one of the rare entries on this concept, which had been originally planned for the *Historisch-Kritisches Wörterbuch des Marxismus (HKWM)*, Donna Haraway (2001) writes that what began as a five-pages long ‘keyword’ text ended up taking many more pages and six years of work. That was not encouraging.

For Haraway, one of the difficulties of writing about gender within a Marxist framework was due to its fundamental acceptance of the nature/culture binary which, she argues, prevented traditional Marxists from developing gender into a political category.

I slowly realised that what I found so baffling in the process of working on this chapter was not only due to some of the epistemic difficulties that Haraway identified, or to the paucity of examples on which I could draw, but also to the widespread conflation within much Marxist and socialist feminist writing of the concept of gender with that of women’s oppression. Of course, these concepts have in many ways the same history, at least to a point, but more recent developments in both feminist and Marxist theory, as well as in capitalist social relations, have increasingly shown the need to disentangle them, not least because of the pathbreaking analyses of queer and transgender Marxists who have pushed for a more consistent disambiguation of gender and (female) sex.

The modern meaning of gender, if not immediately the term, dates back to one of the foundational texts of second-wave feminism, *The Second Sex*, and particularly to Simone de Beauvoir's idea therein that one is not born, but rather becomes, a woman. After the publication of de Beauvoir's tome, the notion of gender as a social construct not dictated by biological/sex constraints was widely accepted and somehow uncritically employed by Marxist and socialist feminists. Gender was de-naturalised while sex remained in the realm of nature, whether implicitly or explicitly. The question became then not so much what gender (and sex) is, but in what ways the social construction of femininity is based on, and reproduces, relations of domination and oppression. It was not until the work of Monique Wittig in France in the 1960s and 1970s (Wittig, 1992) and of Judith Butler in the USA in the 1990s (Butler, 1990) that the category of sex itself, alongside that of gender, was subjected to full political scrutiny.

What follows is an attempt, inevitably selective, to reconstruct some of the main tenets of this complicated history and to find organising criteria to comprehend the different articulations in which the concept of gender has been discussed by western, and especially Anglophone, Marxist and socialist feminists in particular.

GENDER RELATIONS IN MARX AND EARLY MARXISTS

Donna Haraway is correct when she maintains that the modern feminist concept of gender is not found in the writings of Marx (Haraway, 2001: 52). Yet comments on women's role, relations between the sexes, and the nature of femininity are scattered throughout his work, albeit not in a systematic form and often in ambivalent ways. At times, Marx showed a progressive view for his times on women's role in society; at others, he disclosed rather traditional and male-centred ideas. In this section I will provide a brief reconstruction of the main tenets of Marx's view on women's role and relations between men and women (the closest approximation we can find to the modern concept of gender) by looking particularly at his early works (*The 1844 Manuscripts* and *The German Ideology*) and *Capital Volume I*.

Early Writings

One of Marx's most relevant statements on gender relations can be found in the text 'Private Property and Communism' in the *1844 Manuscripts*, in which he argues that the relationship between men and women is the benchmark to understand the level of development of a society. As he put it:

The immediate, natural and necessary relation of human being to human being is also the *relation of man* [Mann] to *woman* [Weib]. In this *natural* species relationship humans' [Mensch] relation to nature is directly their relation to man [Mensch], and his relation to the human [Mensch] is directly their relation to nature, to their own *natural*

function. Thus, in this relation is *sensuously revealed*, reduced to an observable *fact*, the extent to which human nature has become nature for him. From this relationship man's [Mensch] whole level of development can be assessed. It follows from the character of this relationship how far *human* [Mensch] has become, and has understood himself as, a *species-being*, a *human being*. The relation of man [Mann] to woman [Weib] is the *most natural* relation of human being to human being. It indicates, therefore, how far man's [Mensch] *natural* behavior has become *human*, and how far his *human* essence has become a *natural* essence for him, how far his *human nature* has become *nature for him*. It also shows how far humans' [Mensch] *needs* have become *human* needs, and consequently how far the other person [Mensch], as a person, has become one of his needs, and to what extent he is in his individual existence at the same time a social being. (Marx, 2004 [1844]: 103)

This passage has been interpreted differently by several feminists. Simone de Beauvoir and Judith Grant, for instance, understood it to show Marx's principled commitment to the equality between men and women. For de Beauvoir: 'To gain the supreme victory, it is necessary for one thing, that by and through their natural differentiation men and women unequivocally affirm their brotherhood' (de Beauvoir, 1989 [1949]: 732). For Grant, this passage testifies that Marx's perspective on gender relations was mediated by his idea of what it means to be human (Grant, 2006). Grant argues that Marx had a fundamentally dialectical understanding of the relationship between humanity and nature. Human beings are natural beings, but their world is in constant transformation in relation to the natural. Alienation, thus, refers to human beings' incapability to understand themselves as species-beings, that is, as beings who can achieve their true creative potential by means of their unique capacity at transforming nature for their own needs. It is precisely this dialectical feature of Marx's humanism that, according to Grant, makes his position relevant on gender relations as he maintains human nature to be 'self-transformational', thereby showing a nonessentialist understanding of nature.¹

Juliet Mitchell and Donna Haraway, on the other hand, understood this passage to be a testament to Marx's understanding of the female as the expression of the realm of nature. Mitchell takes Marx to argue that the index of civilisation lies fundamentally in 'the progress of the human over the animal, the cultural over the natural' (Mitchell, 1971: 77). For Mitchell, thus, as Marx seems to associate women with nature, he is replicating the nineteenth-century naturalisation of gender roles, with women being identified with the non-rational. Similarly, for Donna Haraway, 'the relation of feminist gender theories to Marxism is tied to the fate of the concepts of nature and labour in the Marxist canon' (Haraway, 2001: 53). Thus, Haraway maintains that traditional Marxist approaches did not lead to a political concept of gender because women 'existed unstably at the boundary of the natural and social (...) such that their efforts to account for the subordinate position of women were undercut by the category of the natural sexual division of labour, with its ground in an unexaminable natural heterosexuality' (2001: 53).

In *The German Ideology* and other essays published in the *Neue Rheinische Zeitung* in the 1840s, Marx and Engels present some reflections on the family as an institution, which has deleterious effects on women. For Marx and Engels, the ‘natural’ division of labour between men and women within the family – whereby ‘natural’ seems to refer to ‘biological’, or what is dictated by different anatomical configurations between the sexes – leads to an unequal distribution and thus to the subordination of women and children to men as the heads of the household. As they put it:

the division of labour, which was originally nothing but the division of labour in the sexual act, then the division of labour which develops spontaneously or ‘naturally’ by virtue of natural predisposition (e.g., physical strength), needs, accidents, etc., etc. Division of labour only becomes truly such from the moment when a division of material and mental labour appears. (Marx and Engels, 1998 [1846]: 50)

Maria Mies criticised Marx and Engels for arguing that the true division of labour appears only with the distinction between manual and mental labour. In particular, Mies claims that ‘by separating the production of new life from the production of the daily requirements through labour, by elevating the latter to the realm of history and humanity and by calling the first “natural”, the second “social” they have involuntarily contributed to the biological determinism which we still suffer today’ (Mies, 1998 [1986]: 52). Conversely, according to Heather Brown, while Mies’ point is well placed, Marx’s views on the division of labour did not amount to a glorification of the social over the natural (or sexual) division of labour. For Brown, Marx considered the division between manual and mental labour not as a superior one, but as an exploitative and alienating process (Brown, 2012: 41).

In his early writings, thus, Marx’s ideas on the relations between women and men are mainly informed by his reflections on the binary natural/social. Here Marx (and Engels) seem to maintain that women’s seeming ‘proximity’ to nature disadvantages them in the realm of the social, when the division of labour becomes more complex and rewards those who are able to take distance from, and ‘dominate’, nature. Haraway contends that Marx’s inability to historicise – rather than naturalise – women’s labour and the division of labour in the family was rooted in his failure to historicise sex itself, which Marx seemed to conceive as a ‘raw material’ (Haraway, 2001: 53).

Capital

Besides his discussion of ‘simple reproduction’, or reproductive labour (which are extensively discussed in this volume), in *Capital Volume I* in particular Marx’s references to ‘gender’ relate both to his assessment of the impact of factory work on women and the family, and on femininity. For Marx, the introduction of machinery in the labour process, and the subsequent inclusion of women and children in factory work, fundamentally changed gender relations within the family. As he put it,

the labour of women and children was (...) the first thing sought for by capitalists who used machinery. That mighty substitute for labour and labourers was forthwith changed into a means for increasing the number of wage-labourers by enrolling, under the direct sway of capital, every member of the workman's family, without distinction of age or sex. Compulsory work for the capitalist usurped the place, not only of the children's play, but also of free labour at home within moderate limits for the support of the family. (Marx, 1976 [1867–1875]: 517)

Women and young girls in particular, Marx noted, were employed for the dirtiest and worst-paid jobs. In the footnotes Marx quotes long excerpts from factory inspectors' reports arguing that factory work for women led to the 'deterioration of their character'. These inspectors' reports implied that the subtraction of women from their more 'natural' roles at home had negative implications on their morality. While Marx's own opinion on these reports is unclear – as he often failed to comment on them – there are passages in *Capital Volume I* in which he seems to suggest that, in challenging traditional female roles, factory work could have a deleterious effect on women's morality and gender relations more generally. For instance, Marx referred to gang workers as images of 'coarse freedom', 'noisy jollity' and 'obscene impertinence', with high rates of teen girls' pregnancy and a general atmosphere of 'Sodoms and Gomorrah' dominating the villages supplying gang workers.

As noted by Heather Brown, in these passages Marx appears to be struggling to reconcile 'his own overall theoretical views on the transitory nature of all kinds of "morality" with some remnants of Victorian ideology' (Brown, 2012: 88). But while Marx's position on female morality and factory work is quite ambiguous, what is clear is that for Marx capitalist social relations had profoundly transformed family and gender relations. On the one hand, 'in overturning the economic foundation of the old family system and the family labour corresponding to it, [large-scale industry] had also dissolved the old family relationships', as Marx writes in the chapter on the working day. On the other hand, he analysed how women were used as a cheap and docile labour force to threaten male labourers' bargaining power as well as their role as heads of the family. By employing all members of the family into labour units, machinery, for Marx, 'spreads the value of the man's labour-power over his whole family. It thus depreciates it' (Marx, 1976 [1867–1875]: 518). However, Marx regards it as a highly contradictory process with potentially positive effects on gender relations and women's role in particular. As he states:

however terrible and disgusting the dissolution of old family ties within the capitalist system may appear, large scale industry, by assigning an important part in socially organized processes of production, outside the sphere of the domestic economy, to women, young persons and children of both sexes, does nevertheless create a new economic foundation for a higher form of the family and of relations between the sexes. (Marx, 1976 [1867–1875]: 620)

Marx, thus, seems to suggest that in shaking patriarchal authority within the working-class family, capitalist social relations could have, at least potentially,

an emancipatory role on gender relations as old roles were challenged and new ones could take shape. Albeit not discussing these issues in detail and often not presenting his own position in clear or unambivalent terms, Marx's understanding of capitalist social relations and gender relations as dialectically tied one to the other indicate a method for analysing gender roles in more complex ways. As we shall see in the next section, Engels' work on gender relations attempted to apply the historical materialist method by linking the origin of the family and class society to changes occurring in the mode of production and gender roles. However, as several feminists pointed out, in doing so Engels ended up separating relations of production and gender relations (or social reproduction) as two separate spheres, thereby contributing to the many splits that will characterise subsequent analyses among Marxist thinkers in the twentieth century.

GENDER RELATIONS AND CLASS SOCIETY: ON FRIEDRICH ENGELS

Friedrich Engels' *The Origin of the Family, Private Property and the State* was seen for decades as the most systematic Marxist account on gender relations and women's oppression. As Michèle Barrett put it, 'scarcely a Marxist-feminist text is produced that does not refer somewhere to Engels's argument, and if one had to identify one major contribution to feminism from Marxism it would have to be this text' (1983: 214). *The Origin of the Family* was written after Karl Marx's death in 1883, but it was largely based on notes that both Engels and Marx had taken on the research of anthropologist Lewis Henry Morgan, who had published *Ancient Society* in 1877. Morgan was of great interest to Marx and Engels as he was one of the first ethnologists to apply a materialist analysis to the history of human social organisation.

By observing the Iroquois in New York State, Morgan thought he could reconstruct the ways in which primeval humans had organised. He took the Iroquois to exemplify primitive human life and organisation and inferred from those observations that kinship relationships and family life must have been totally different in the past when compared with family life in nineteenth-century Britain. Morgan was particularly struck by the level of gender equality and women's prominent roles within Iroquois society, which made him conclude that a subsequent process of civilisation had spoiled that primitive egalitarianism.

In *The Origin of the Family, Private Property and the State*, Engels used Morgan's ideas to argue that the family form as it was known in Britain (and Europe) in the nineteenth century was not a 'natural' institution, but had been the result of the rise of class society. According to Engels, in pre-class societies gender relations had been much more advanced than in Victorian Britain, women and men had more sexual freedom and the family was not conceived as the repository and guardian of private property. Engels thus concluded that the

monogamous family had been the result of a change in the social and economic formation. Famously, he argued that the transition from a prevalently hunter-gatherer society to an agricultural society led to a distinct gendered division of labour, which disadvantaged women. As agricultural societies led to the creation of a surplus and the rise of private property, for Engels men came to control the sphere of production, while women were relegated increasingly to the sphere of reproduction and the family became the means through which property could be passed down from generation to generation. The advent of class society, according to Engels, turned the household into the realm of the private sphere to which women were segregated as the head servants.

Since its publication, Engels' *The Origin* has become the reference point of Marxist discussions on gender for decades and, as such, it has been subjected to praise, but also severe criticisms. While anthropologist Eleanor Burke Leacock and other feminists generally praised Engels' reconstruction of gender relations in primitive societies and the method he used to analyse them (Dee, 2010; Delmar, 1977; Gimenez, 2005; Orr, 2015; Vogel, 1983), others analysed the Eurocentric underpinnings of his inferences (Anderson, 2010) and the many historical and logical shortfalls of his arguments (Barrett, 1983; Mitchell, 1974), not least his establishment of a dual analysis in which gender relations are subordinated to economic relations (Carver, 1985; Haug, 2005).

In this latter respect, according to Carver, Engels' fundamental flaw was to establish 'two autonomous lines of explanation for the social order: economic relations and family relations, the class war and the sex war' (Carver, 1985: 449). Similarly, according to Frigga Haug, Engels had 'strengthened a mode of reading that, to a certain extent, comprehended gender relations as an addition to, and outside of, the relations of production' (Haug, 2005: 287). By relegating the production of the means of subsistence to the realm of labour and economic production, and the production of life to the realm of kinship, Engels, according to Haug, failed to write 'the history of gender relations as a dimension of the relations of production' (Haug, 2005: 287). Haug's criticism of Engels is at the core of her entry on 'gender relations' (*Geschlechterverhältnisse*) that she wrote for the Historical-Critical Dictionary of Feminism (*Historisch-Kritisches Wörterbuch des Feminismus*). Given its importance in the context of this discussion and this entry, the next section is devoted to providing a succinct summary and commentary of Haug's arguments.

GENDER RELATIONS AS RELATIONS OF PRODUCTION

In the attempt to conceptualise what it would mean to understand gender from a Marxist viewpoint, German Marxist feminist Frigga Haug argued that the greatest obstacle to such an endeavour had been the tendency within Marx's

and Engels' work to think of gender relations 'as relationships between men and women' (Haug, 2005: 288). For Haug, different historical modes of production must be investigated 'as gender relations' because neither of them can be comprehended without answering the question of how 'the production of life in the totality of the relations of production is regulated and their relation to the production of the means of life, in short, how they determine the reproduction of the whole society' (Haug, 2005: 288). That includes, as Haug maintains, the differential 'shaping of genders themselves, the particular constructions of femininity and masculinity, just as much as the development of the productive forces, the division of labour, domination and forms of ideological legitimation' (2005: 288).

For Haug, the history of socialist and Marxist feminism shows that gender relations always emerged as the women's question with no attempt at linking them with the relations of production. One of the most promising paths to understand gender relations as relations of production, in her view, comes from feminist ethnology. By looking at the work of Eleanor Leacock (1981) and her historical reconstruction of different modes of production and especially domestic economies, of Ilse Lenz (1995) and her rethinking of the concept of power and domination in relation to production, and of Maxine Molyneux's (1977) centrality of the concept of gendered division of labour, Haug argues that these works were contesting precisely Engels' dualism of production and reproduction, which ended up essentialising the former. While most Marxists according to Haug continued making this mistake, thereby treating the study of gender relations as a field almost separate from the study of production and value creation, Antonio Gramsci in her view constituted an exception. His work on Fordism in particular, she maintains, provides an exemplary illustration of how a materialist analysis of gender relations should be carried out. By investigating the changes in the mode of production introduced by Fordism, not only at the level of productive forces and technologies, but also at the level of family norms and gendered subject formation, Gramsci allowed us to see 'the disposition of the genders and thus essential aspects of their construction, along with political regulations' (Haug, 2005: 288).

Ultimately for Haug, 'research into gender relations as relations of production requires a differential combination of historically comparative studies, attentive to moments of transition, with social-theoretical and subjective analysis' (Haug, 2005: 299). Commenting upon Haug's theoretical proposal to recombine the analysis of gender relations and production relations, Johanna Brenner endeavours to spell out how the latter must be understood. For Brenner, to comprehend women and men's positioning within specific modes of production, we must look at 'social reproduction' (see Ferguson et al., Chapter 3, this *Handbook*), which she defines as 'that part of the process of social labor which focuses on meeting individual needs for sustenance and on birthing and rearing the next generation'

(Brenner, n.d.: 6). By encapsulating what Haug calls gender relations within the concept of social reproduction vis-à-vis production, Brenner claims, we are not separating the two spheres, but rather attempting to capture a fundamental dynamic of the capitalist mode of production.

Similarly commenting on Haug's concept of gender relations as relations of production, Rosemary Hennessy points at Haug's promising, but equally unclear and contradictory, project. For Hennessy, while Haug identified 'a longstanding theoretical knot' within historical materialism's treatment of gender relations, and offered an important starting point for thinking the materiality of gender, that is, the standpoint of the reproduction of society, ultimately she offers 'no clear view of how the production of life and of the means of life are related nor of how gender relations feature in both under capitalism' (Hennessy, n.d.: 39).

Hennessy finds that several important debates and fruitful paths forward are missing from Haug's discussion. For instance, can gender be thought as an ideological formation? How are gender relations shaped by colonial histories and the ways in which they fashioned knowledge production itself? What is the relationship between gender and race? The emphasis upon feminist ethnology, for Hennessy, is also a problematic sign that Haug takes into account the history of capitalism in Europe as universal history, thereby naturalising kinship relations as trans-contextual. As we shall see in a later section, much of contemporary Marxist feminist discussions on gender have been attempts to answer these questions. But before I delve into these discussions, the next section provides a brief reconstruction of 'dual system analyses' developed by Marxist and socialist feminists particularly in the 1970s and early 1980s. Their richness, as well as shortfalls, as I will attempt to show, will mark subsequent attempts to theorise gender as ideology as well as to interrogate the 'whiteness' and 'westocentrism' of much Marxist feminist theorising up to the present.

DUAL SEX/GENDER SYSTEMS ANALYSIS

Haug's identification of the limits of Marx's and especially Engels' theorising on gender in their distinction of production as the realm of the economy and reproduction as the realm of sex and kinship clearly hit the target. Such a distinction was rooted in a fundamentally un-dialectical understanding of social relations, particularly in Engels, which had important reverberations on Marxists' theory and practice. The most evident one was the tendency many communist and socialist organisations had in the first half of the twentieth century (and beyond...) to consider gender (or the woman question to be more precise) as a *secondary* contradiction, and women's liberation as subordinated to the abolition of class society. Taking stock of the condescending attitude, if not open hostility that many 'comrades' expressed towards feminism, in the

1970s in particular, several Marxist and socialist feminists decided to officialise in theory the split they experienced in practice. The result of such a theoretical split goes under the name of ‘dual system theories, or analyses’. In spite of their variety and differences, all dual system approaches identify capitalism and patriarchy as two different ‘systems’, which need different theoretical tools to be analysed.

In France, in 1970, Christine Delphy was one of the first to theorise an influential version of the dual system analysis in her article ‘The Main Enemy’ (2001). Here Delphy identifies unpaid housework undertaken mostly by women as a form of servitude that marked their submission to men. She thus theorises the existence of a ‘patriarchal mode of production of domestic services’, which she conceives as a mode of production different but parallel to the capitalist one. Within the patriarchal mode of production, women are to men what the proletariat is to the bourgeoisie: the class of the oppressed. The main enemies of women, thus, are men and their inherent desire to subjugate female freedom. Delphy’s work, alongside that of Monique Wittig, Colette Guillamin and others, developed so-called ‘materialist feminism’, to signal the continuity with Marx’s method in their attempt at thinking the economic basis of women’s oppression within domestic work, but also their rupture with what they perceived as Marxists’ failure to recognise women as a class.

In the USA, Gayle Rubin in 1975 published one of the most important sources of inspirations for the dual system analyses within anglophone feminism. In her article ‘The Traffic in Women: Notes on the “Political Economy” of Sex’, Rubin used Marx’s concept of exchange and commodity to analyse what she called ‘the domestication of women’. For Rubin, females had historically been the raw material for the production of woman which occurred through the exchange system of kinship controlled by men. Appropriating Marx and Engels, alongside Freud, Lacan and Levi-Strauss, Rubin defined the sex/gender system as ‘the set of arrangements by which a society transforms biological sexuality into products of human activity, and in which these transformed sexual needs are satisfied’ (Rubin, 2011 [1975]: 29).

Rubin’s work was particularly influential on Heidi Hartmann, the author of the most representative text of dual system analyses, that is, ‘The Unhappy Marriage of Marxism and Feminism’. Published in 1979, Hartmann’s article represented a predictable shockwave for Marxist and socialist feminists and Marxist conceptualisations of gender. Besides being in dialogue with Rubin, in this text Hartmann meant also to respond to Shulamith Firestone’s book published almost a decade earlier, *The Dialectic of Sex*, which had attracted a great deal of attention and greatly influenced a whole generation of feminists.

In a nutshell, in *The Dialectic of Sex*, Firestone rejected Marx’s and Engels’ substantial argument that the roots of unequal gender relations had to be found in the division of labour and changes in the mode of production. For Firestone, Marx and Engels’ work was fundamentally a form of economic reductionism,

not allowing to see that ‘there is a level of reality that does not stem directly from economics’ (Firestone, 1970: 5). However, Firestone aimed to employ Marx’s and Engels’ method in order to develop ‘a materialist view of history based on sex itself’ (Firestone, 1970: 5). Such a view was based on the identification of women as the underclass that needs to take control of the means of reproduction and to seize control of human fertility (Firestone, 1970: 10–11). Firestone thus advocated for the abolition of sexual classes and sexual difference through the liberation of women from childbirth.

While treating women as the ‘oppressed class’ in Marxian terms, Firestone’s work, according to Hartmann, was ‘the most complete statement of the radical feminist position’ (Hartmann, 1979: 9), but her insistence that women’s oppression was the fundamental contradiction in society set her apart from Marxist feminism. Hartmann, on the contrary, wanted to provide a new ‘feminist Marxist’ conceptual framework by theorising patriarchy as a separate system with a material base. Contra Firestone, the task for Hartmann was not to overcome oppression by getting rid of sex difference, but to understand ‘how sex (a biological fact) becomes gender (a social phenomenon)’ (Hartmann, 1979: 9). It was Rubin’s sex/gender system that, for Hartmann, would allow feminist Marxists to understand patriarchy as that ‘set of social relations between men, which have a material base, and which, though hierarchical, establish or create interdependence and solidarity among men that enable them to dominate women’ (Hartmann, 1979: 14). Though Hartmann sees patriarchy as hierarchical, which entails that men of different classes, races, or ethnic groups have different places therein, men are still unified in their ‘shared relationship of dominance over their women; they are dependent on each other to maintain that domination’ (1979: 11).

The material base of women’s oppression for Hartmann thus lies in men’s control over women’s labour power, which operates by excluding them from certain economic sectors and jobs and by luring them into monogamous heterosexual relations and controlling their sexuality. One of the main problems with Hartmann’s argument was that, while claiming to provide a materialist analysis of women’s oppression as one rooted in men’s interest in controlling women’s labour, she did not explain where this ‘interest’ came from. If men are differentiated by class interests and racial oppression, what do they gain by uniting under the banner of women’s subordination? Is such an interest, or desire, rooted in anthropology, or psychology?

In the end, one of the fundamental pitfalls of dual system analyses, from Delphy to Hartmann, was their assumption that categories such as men, or women, could be thought of as leading to internally coherent ‘classes’ linked by common interests. Such an assumption in the end was premised (albeit unwittingly) upon whiteness, which disavowed the possibility for these feminists to understand the fundamental differences implied by race.

GENDER AND SEXUAL DIVISION OF LABOUR ANALYSIS

Dual system analyses were strongly criticised by a number of Marxist and socialist feminists from early on – from those advocating for a ‘unitary theory’ foregrounding social reproduction analysis, as in the case of Lise Vogel, to those suggesting an integrative approach that would explain the workings of gender oppression without invoking separate systems.² Iris Marion Young was the proponent of the latter approach. The challenge for Young was to develop ‘an analytical framework which regards the material social relations of a particular historical social formation as one system in which gender differentiation is a core attribute’ (Young, 1981: 50). The point, thus, was not to marry or divorce Marxism, but to take it over and transform it into a theory that foregrounds gender as a core element.

By locating patriarchal relationships within the family as opposed to the economy, Hartmann, according to Young, had only sanctioned the original split proposed by Engels and criticised by Frigga Haug. This ‘model of separate spheres’ (Young, 1981: 48) thus tended to hypostasise the division between family and economy specific to capitalism into a universal form, thereby accepting that traditional Marxist theory is gender-blind and simply adding a system of patriarchy to the list. The way forward, instead, for Young was to develop a theory of gender division of labour that supplements the concept of class within Marxism.

Young maintained that while the category of class at the core of traditional Marxism is gender-blind, the way to remain ‘within the materialist framework’ was to ‘elevate the category of *division of labour* to a position as, if not more fundamental than, that of class’ (1981: 50). The advantages of foregrounding the category division of labour for centring gender within Marxism were testified, first, by the fact that such a category was central to Marx’s work itself. Second, the category of division of labour was broader than that of class, but also more specific. ‘The specific place of individuals in the division of labour – she maintained – explains their consciousness and behavior, as well as the specific relations of cooperation and conflict in which different persons stand’ (1981: 51). Third, gender division of labour analysis brings gender relations to the centre of historical materialist analysis as it provides ‘a way of regarding gender relations as not merely a central aspect of relations of production, but as fundamental to their structure’ (1981: 53). Furthermore, gender division of labour analysis for Young could also explain the ‘origins and maintenance of women’s subordination in social structural terms. Neither a biological account nor a psychological account’ can (1981: 54).

All in all, gender division of labour analysis had the benefit of allowing feminists ‘to do material analysis of the social relations of labour in gender specific terms without assuming that all women in general or all women in a particular society have a common and unified situation’ (Young, 1981: 55). Young thus

challenged Hartmann's assumption – which she shared with many Marxists – that capitalism's inherent tendency was to homogenise the workforce, 'reducing the significance of ascribed statuses based on sex, race, ethnic origin and so on' (Young, 1981: 57).

A gender division of labour analysis of capitalism which asks how the system itself is structured along gender lines can give an account of the situation of women under capitalism as a function of the structure and dynamic of capitalism itself. '*My thesis is that the marginalization of women and thereby our functioning as a secondary labour force is an essential and fundamental characteristic of capitalism*' (Young, 1981: 58).

The fact that patriarchy existed before capitalism in Young's view did not prove that it is an independent system, just as the existence of class societies before capitalism did not mean that all class societies have some 'common structure independent of the system of capitalism' (1981: 58). Class societies, and so gender relations too, undergo historical transformations.

Departing from similar premises, Nancy Hartsock in those same years (Hartsock, 1983a, 1983b) focused on the division of labour between men and women as key to understanding women's oppression. Yet, unlike Young, Hartsock rejected the terminology of gender and talked instead of the sexual division of labour to highlight the bodily dimensions of women's work. For Hartsock, the differential bodily experience of men and women vis-à-vis nature, mediated as it was by their different activities, had given rise to entirely different life-worlds. This differential experience, for Hartsock, should become the basis for a 'feminist materialist standpoint'.

THE MATERIALITY OF GENDER SUBJECTIVITY

While many Marxist and socialist feminists up until the early 1980s tried to understand the ways in which gender, as a set of roles and social relations of oppression and domination, is directly, albeit complexly, tied up with capitalist relations of production, we also see attempts at understanding gender in terms of subjectivity and identity. How do people identify as female or male? Can processes of gender identification be explained through the Marxian method of historical materialism?

Three main approaches addressed these questions: the first includes authors like Juliet Mitchell and Michèle Barrett, who in different and sometimes even conflicting ways, understood gender in psychological and ideological terms. The second approach includes Marxist scholars such as Kevin Floyd, Rosemary Hennessy and Jordanna Matlon, who instead analysed gender identification as a form of reification (Floyd), and consumption (Hennessy, Matlon). The third approach can be found in the work of Beverley Skeggs, who analysed gender formation as moral class struggle.

Gender as Ideology

In 1974 Juliet Mitchell published *Psychoanalysis and Feminism*, which set to foreground the Freudian theoretical framework to understand gender formations in ways that were still compatible with Marxism. Even though Mitchell was focusing upon psychoanalysis, ideology appears in her account as the organising principle of the chief gender formation, that is, patriarchy. For Mitchell, 'ideology and a given mode of production are interdependent'; however, 'one cannot be reduced to the other nor can the same laws be found to govern one as govern the other [...] we are (as elsewhere) dealing with two autonomous areas: the economic mode of capitalism and the ideological mode of patriarchy' (Mitchell, 1974: 412). The particular expression of patriarchal ideology for Mitchell depends upon the way in which it interconnects with a specific mode of production. However, capitalism and patriarchy respond to different logics. While the former regulates the economy and class formation, the latter, which is expressed particularly in the nuclear family, is responsible for women's oppression and gender roles. In Mitchell's understanding, ideology is what mediates the unconscious, which enables the interiorisation of gender roles and thus the reproduction of the patriarchal law. 'The unconscious that Freud analysed' – writes Mitchell – 'could thus be described as the domain of the reproduction of culture or ideology' (1974: 413). Ultimately, Mitchell, just like Hartmann, supported a dual systems analysis which saw patriarchy and capitalism as separate systems governed by independent laws. For this reason, for Mitchell, the overthrow of the capitalist economy would not in itself mean the end of patriarchy, for 'the ideological sphere has a certain autonomy' (1974: 414). That is why, for Mitchell, we need a cultural revolution headed by women as the chief victims of patriarchal laws and thus the main subjects of transformation.

In her 1980 book *Women's Oppression Today*, Michèle Barrett criticised psychoanalytic approaches to the understanding of gender as fundamentally ahistorical. Building on Italian Marxist philosopher Sebastiano Timpanaro, Barrett argued that psychoanalysis eternalises situations that are historically specific and remains suspended in a limbo between the biological and the social without choosing either, thereby remaining elusive. A Marxist feminist approach instead, for Barrett, needs to understand sexuality and gender at any given period and not in isolation from the economic. Mitchell's fundamental mistake, for Barrett, lied in separating the ideological and the economic in such a way that not only fails to understand the ideological nature of developments such as the division of labour, but also leads to divisive and ineffective political strategies that separate class struggle from cultural struggles.

This notwithstanding, Barrett herself conceived of gender as an ideological construct too. Gender identity, she maintained, is created 'in an ideology of family life' and is 'continually recreated and endorsed, modified or even altered substantially, through a process of ideological representation' (Barrett, 1980: 206). By resorting to an Althusserian frame that conceived of ideology as interpellation,

Barrett proposed to analyse the category of gender as ideology. Contra Mitchell, however, who had also framed gender as the result of an ideological system (i.e., patriarchy) with relative autonomy, Barrett defined ideology as ‘a generic term for the processes by which meaning is produced, challenged, reproduced, transformed’ (1980: 97). For Barrett, such ideological processes have an integral connection with ‘the relations of production’, as becomes clear in the case of the capitalist division of labour and the reproduction of labour power. As she put it: ‘A sexual division of labour, and accompanying ideologies of the appropriate meaning of labour for men and women, have been embedded in the capitalist division of labour from its beginnings’ (1980: 98). For Barrett, however, the point is not to understand the ideology of gender and women’s oppression as simply a function of capitalist relations of production, but as a set of ideas and representations of femininity and masculinity that pre-dated capitalism, but that have been well embedded within capitalist social relations (1980: 165).

At the time of its publication, Barrett’s book represented one of the most sophisticated and systematic attempts to analyse gender relations without either treating them as simple reflections of economic relations, or as autonomous from them. However, as Johanna Brenner and Maria Ramas pointed out in a rather engaged critique of Barrett, the book ultimately gave ideology too much ground and tended to treat ‘the appropriation of gender ideology as the relatively passive internalization of an already defined set of ideas about men and women that exists at the level of “culture”’ (Brenner and Ramas, 1984: 35). By analysing the ways in which Barrett discusses familial ideology as at odds with the structure of the working-class household, which depends also on women’s income, while portraying women as unproductive and mainly carers, Brenner and Ramas conclude that Barrett ultimately conceived of ideology ‘as a mysterious, powerful, unchanging phenomenon – one that imposes itself upon individuals who accept it passively and for reasons that are really not very clear’ (Brenner and Ramas, 1984: 35).

Gender and Sexuality as Consumption

A new sustained Marxist feminist engagement with the concept of gender, and in particular with the idea of gender as ideology, was represented in the early 2000s by Rosemary Hennessy’s *Profit and Pleasure: Sexual Identities in Late Capitalism*. Here Hennessy attempted to understand gender as an ideology, or a set of ideologies, that ‘naturalize and reproduce the asymmetrical social divisions that help to sustain, manage, and maximize the appropriation of surplus labour through a variety of complex arrangements’ (Hennessy, 2000: 25). For Hennessy, patriarchy is an historical formation, thereby subject to change and continual reorganisation. Ideology, in Hennessy’s view, is what naturalises patriarchal gender hierarchies by maintaining that mainstream ideas of femininity and masculinity are the way things are and should be. Hennessy thus links

gender ideologies to the sexual formations that are compatible with capitalism at any given moment. As she put it:

Bourgeois patriarchy depends on a hetero-gendered social matrix that includes imaginary identifications with opposite and asymmetrical masculine or feminine positions (naturalized as expressive attributes of males and females) as well as hierarchical gendered and racialized divisions of labour. By presenting hetero-gendered differences as fixed and natural opposites, patriarchal ideology makes invisible the precariousness of these imaginary identifications and the social order they help guarantee as well as the multiplicity of possible other engenderings of desire. As supplementary 'other,' homosexual identity is a product of this discourse even as it threatens to belie the naturalness of the heterogender system. (Hennessy, 2000: 25)

While the dominance of hetero-gendered ideology for Hennessy characterised especially early capitalism and Fordism, she maintains that late capitalism has produced a shift in the realm of sexuality and gender identifications. While the latter were naturalised and taken for granted under the early capitalist hetero-normative order, under late capitalism we witness a move to 'free choice'. Sexuality, desire and the forms of gender identity that ensue from them are no longer a given, but rather are presented as a range of options from which the late-capitalist consumer can freely select.

The emergence of a new subject of sexual desire was conditioned by the gradual disruption of gender distinctions taking place through changes in the division of labor, property, and consent law. This was a subject that was not defined so much in terms of species needs for reproduction as in terms of individual consumer preferences or the objects he or she desires. (Hennessy, 2000: 101)

According to Hennessy, while the move has certainly been liberating for many, it has not meant the end of patriarchal hetero-normative ideologies. The shift to an understanding of gender as synonymous with sexual identity and the articulation of the concept of gender as object-oriented (i.e., towards an object of desire) for Hennessy did not really threaten patriarchy, but rather assimilated to it.

Hennessy's work in many ways initiated the Marxist reflection on gender as consumption that would be subsequently taken on and developed by Kevin Floyd. In *The Reification of Desire*, Floyd set to historicise Judith Butler's account of gender as performance. Like Hennessy, Floyd foregrounded the ways in which specific stages of capitalism and their predominant modes of production and consumption produce ideals of masculinity, femininity and gender roles more generally. For Floyd the changes in the division of labour and the deskilling of the workforce that have occurred under capitalism changed also how the gendered body and sexual desire have been understood.

Against this background, Butler's concept of gender as performativity becomes intelligible as the capitalist demand to develop new performances, or skills, including sexual skills. Floyd linked the development of gender and sexual skills with changes in the organisation of labour that occurred between the end of the nineteenth and the first half of the twentieth century. Like Hennessy, Floyd

analysed the shift in the conceptualisations of desire (see Proctor, Chapter 71, this *Handbook*) and male bodies (see Mau, Chapter 69, this *Handbook*) that occur particularly under Taylorism and Fordism. In such contexts, desire, Floyd argues, becomes 'an isolated, autonomous epistemological object; it is dissociated from, made independent of and irreducible to, any particular subject' (Floyd, 2009: 62). As desire becomes external to the desiring subject, it is 'reified'. But such 'reification of desire' can be understood only in connection with the reconceptualisation of male and female bodies that occurs towards the turn of the nineteenth century. Here Floyd analyses how the deskilling of male labour that characterised the advanced stage of capitalism in the early 1900s is accompanied by a crucial shift in gender roles – from manhood to masculinity. While 'the opposite of manhood' in the nineteenth century was childhood, the distinction pivotal to twentieth-century masculinity is the dissociation from femininity. Men are now required to abide by a hetero-normative gender regime of performance in different ways. These requirements for masculine men are strictly linked to the deskilling of labour. While manhood was the reflection of an economic period in which industrial manufacture still demanded skilled male labour, masculinity instead is the product of the deskilling of labour that occurs under Taylorism and Fordism. Deskilled labour at work is matched by the requirements of consumption at home. And consumption patterns are now entirely geared towards masculine males and feminine females – the drill for DIY enables suburban white men to perform the illusion of skilled labour at home, while their wives take pleasure in the kitchen mixer enabling them to perfect their caring tasks. The performative 'character of masculinity in the US within the Fordist regime of capitalist accumulation is the outcome of a series of prescribed behaviours and patterns of consumption within a leisure time rigidly regulated by the commodity form' (Arruzza, 2015: 48).

The historical materialist method applied by Hennessy and Floyd to foreground the concept of gender enables us to analyse how capitalism transforms gender and shapes and re-shapes gender hierarchies. While Floyd in particular specifically treats the sexual and gender identity formations he studied as rooted in white, American Taylorist and Fordist settings, the discussion of how changes in capitalist regimes differentially impact different populations did not receive sustained attention from Marxists. One partial exception is the work of Jordanna Matlon, who employs the racial capitalism framework and Gramscian concept of hegemony to understand the shifts that have invested Black masculinity in Africa under neoliberalism. Matlon analyses in particular the masculine gender roles available to African urban men in the context of neoliberal crisis and mass un- and under-employment. For Matlon, capitalism is that system that mediates gender relations. In the context of racial capitalism in Africa, this has meant, on the one hand, that ideals of male breadwinner-provider have been increasingly unavailable for most marginalised Black men. On the other hand, successful Black masculinity has become the new ideal which is performed by Black African men through over-consumption. The identification with a masculine,

capital-owner male ideal which is unattainable has led to what Matlon calls 'complicit masculinity'. As she put it:

Complicit masculinity underscores the reality of differential aspirational models in the context of severe un- and underemployment and the failure of the classic breadwinner model for black men globally (...) I return to the Gramscian origins of hegemony to suggest that complicit masculinity is a gendered analogue to *consent*, and consider masculine identities and practices in the context of 'the common sense about breadwinning and manhood'. (...) Complicit masculinity represents ideologies that foster consent, ideologies through which structurally dislocated men reinforce hegemonic norms. In short, complicit masculinity affirms that masculine agency is located within capitalism. (Matlon, 2016: 1017)

Gender Subjectivity as a Classed Moral Formation

In *Formations of Class and Gender* (1997), Beverley Skeggs partly builds on Marx's insight in *Capital Volume I* that working-class femininity and moral codes had been singularly produced and shaped by capitalist social relations. For Skeggs, gender subjectivity is an empty abstraction if detached from class. But to understand gender as a 'classed formation', we need to foreground the ways in which ideals of femininity (and masculinity) from the nineteenth century onwards were both circulated as moral codes for respectable behaviour, and built upon classed bodies. For Skeggs, gender-classed formations are sensuous constellations in which the body itself (its shape, smell, clothing, gesturing) functions as a proxy for class, thereby foregrounding class subjectivity as the result (and process) of internationalisation of class morality.

In the nineteenth century, gendered notions of sexual propriety (Nead, 1988; Pollock, 1989) were encapsulated in the ideal of the middle-class lady, the embodiment of middle-class femininity. As Skeggs put it: 'Femininity was seen to be the *property* of middle-class women who could *prove* themselves to be respectable through their appearance and conduct' (Skeggs, 1997: 99), a gendered version of the possessive individual. White middle-class femininity was coded as frail, soft, passive, while working-class women – both White and Black – were coded as hardy and robust. But while these codes have changed over time, it was the relation to sexuality that signalled the most important distinction between different classed genders. At the same time as being represented as strong and hardy in the realm of labour, 'working-class women – both Black and White – were coded as the sexual and deviant other against which femininity was defined' (Skeggs, 1997: 99).

Relations to work and the sexual have continued to define gender as a classed and raced formation, albeit in different ways and depending upon specific contexts. Skeggs offers a longitudinal ethnographic account of living gender through class with and against a moral symbolic economy. Focusing on white working-class bodies in the neoliberal UK, Skeggs highlights how working-class women's bodies are always represented as in excess and pathological. They are associated with the 'lower unruly order of bodily functions' which is then linked with

moral codes of vulgarity and lack of taste. The body signals class through moral euphemisms which are not named directly but work through ideological associations. This leads to everyday moral class battles between middle-class representatives of state institutions (welfare, education, law) who repeatedly pathologise working-class women. The working-class women produce a strong defence by developing their own standards of care by which they reverse the moral-classed judgement, naming middle-class women's care as of poor quality and claiming 'real' respectability. But only one group has the backing of symbolic and institutional power and the working-class women's investment in care locks them into a specific position in the division of labour, ripe for exploitation across work, family and community. It is a study of the inseparability of class and gender, where struggles lived through gender generate investment in exploitative relations (for a further discussion of the relationship between gender and class see Skeggs, Chapter 11, this *Handbook*).

GENDER AND RACE

Most Marxist and socialist feminist analyses on gender I have reconstructed so far did, wittingly or unwittingly, presuppose and focus on white women's life experiences, practices and institutions in western contexts. Yet, with a few exceptions, they tended to pose themselves as universal. Black Marxist and socialist feminists, particularly in the USA, strongly challenged this assumption of universality.

In 1981 Angela Davis published one of the most profound and detailed analyses of the intermingling of class, gender and race in the US context and one of the best examples of 'intersectional' analysis from a Marxist feminist viewpoint (see Bohrer, Chapter 57, this *Handbook*). Davis is of great relevance in the context of a discussion of Marxist approaches to gender and race because she devoted a great deal of attention to the formations of femininity and masculinity among Black people under slavery. In many ways, according to Davis, slavery had been characterised by the absence of distinct gender formations, to the extent that women and men were 'gender-less'. As she put it:

The slave system defined Black people as chattel. Since women, no less than men, were viewed as profitable labor-units, they might as well have been genderless as far as the slaveholders were concerned. In the words of one scholar, 'the slave woman was first a full-time worker for her owner, and only incidentally a wife, mother and homemaker.' Judged by the evolving nineteenth-century ideology of femininity, which emphasized women's roles as nurturing mothers and gentle companions and housekeepers for their husbands, Black women were practically anomalies. (Davis, 1981: 75)

The conceptualisations of gender relations and formations I discussed in previous sections were largely based upon analyses of gendered division of labour and ideals of femininity and masculinity rooted in their different roles as male

breadwinners and female carers. Such conceptualisations could not apply to Black women who had always worked outside their homes and had often been the sole breadwinners in their households. For Davis, the place occupied by work in Black women's lives followed a pattern established during slavery. For slaves, men and women alike, work overshadowed everything else; there was neither time nor room for considerations of sex. In such a context, 'the oppression of women was identical to the oppression of men' (Davis, 1981: 76). But Black women, Davis reminds us, also suffered in different ways as victims of sexual abuse and torturous punishments. Work exploitation made them genderless, while oppression and violence was inflicted on them in their 'exclusively female roles' (Davis, 1981: 76).

Ultimately, the ideology of bourgeois femininity that associated women with domesticity and caring, and that impacted women in working-class households as well, was completely alien to Black women. Such an ideology allocated women to the essential, but inferior, world of motherhood and housewifery, which holds true for working-class women too at certain stages of capitalist accumulation. However, the economic arrangements of slavery first, and work later, contradicted the hierarchical sexual roles incorporated in such a feminine ideology. 'Male-female relations within the slave community could not, therefore, conform to the dominant ideological pattern' (Davis, 1981: 16). For Davis, the only exception to the representation and reality of Black women primarily as workers occurred after the abolition of the international slave trade, when slaveholders found it harder to import slaves from Africa and began incentivising enslaved women to reproduce in order to sustain the demand for a labour force. Black women were increasingly appraised for their fertility, but that did not translate into an exaltation of motherhood. They were not to enjoy their condition of mothers, for they were treated as breeders, and their children sold as soon as they were old enough to work. Davis' careful analysis of Black female roles here offers a lucid and powerful reminder of another key difference between white and black gender formations related to the realm of reproduction. As Françoise Vergès discusses in *The Wombs of Women* (2020), reproductive injunctions for non-white women are not so much a matter of ideological persuasion and interpellation, but of sheer violence.

Davis' powerful analysis of the inapplicability of gender categories rooted in white life experiences to the lives of Black women had an enormous influence on subsequent Black Marxist and socialist feminists. These feminists knew they could not rely on Marxist frameworks to understand their condition; they had to analyse it on their own. Responding to Heidi Hartmann's provocative article on the unhappy marriage between Marxism and feminism, Gloria Joseph talked of an incomplete ménage à trois, where the third partner was race. For Joseph, while Hartmann had rightly acknowledged that Marxist categories were gender-blind, she had not highlighted how they were race-blind as well. But so were Marxist feminist categories too. Like Davis and others beforehand, Joseph foregrounds the

differences in work and life experiences and, thus, the different roots of inequality that impact Black women. Importantly, the main cause of Black women's oppression was not (Black) men, as Hartmann had posited, but rather white men and women and the racial capitalist system they had established. In this sense, Black women and men shared a history of brutalisation and de-humanisation that brought them together, rather than dividing them. As she put it: 'Capitalism and patriarchy simply do not offer to share with Black males the seat of power in their regal solidarity. [...] here is more solidarity between white males and females than between white males and Black males' (Joseph, 1981: 101).

If Black women did not share with white women the *gender* of their oppressor, for white women, just as much as men, could be Black women's enemies, they did not share the *place* of their oppression either. Whereas most Marxist and socialist feminist analysis, from Engels to Hartmann and Barrett, had identified the family as the quintessential receptacle and reproducer of an oppressive gender ideology that locked women into their inferior roles, Black women did not experience the same. Under slavery, the family for Black women and men was the place where they could 'exercise a modicum of autonomy' (Joseph, 1981: 95).

As Hazel Carby effectively put it, the three concepts which were 'central to feminist theory become problematic in their application to black women's lives: "the family", "patriarchy" and "reproduction". When used they are placed in a context of the herstory of white (frequently middle-class) women and become contradictory when applied to the lives and experiences of black women' (Carby, 1982: 213). Bhavnani and Coulson (2005) address another issue which has framed Marxist and socialist feminist analyses, even those that have been more attentive to the issue of race. As I will discuss in more detail in the next section, Marxists have often treated the categories of gender and race as fundamentally rooted in capitalist social relations at best, or as secondary contradictions at worst. But in both cases, they tended to overlap the two. Instead, Bhavnani and Coulson argue, while racism and sexism can look like similar processes, for they both rely on ideas of 'natural' and 'biological' differences, gender and race are fundamentally different experiences. As they continue, such experiences are organised through different institutions and need different forms of analysis to be understood. In the words of Carby:

The experience of black women does not enter the parameters of parallelism. The fact that black women are subject to the *simultaneous* oppression of patriarchy, class and 'race' is the prime reason for not employing parallels that render their position and experience not only marginal but also invisible. (Carby, 1982: 2012)

The question of how racism shapes gender identity, how gender is experienced through racism and how class is shaped by gender and 'race' remain the fundamental questions that interrogate Marxist feminists today (see Bhandar, Chapter 13, this *Handbook*).

GENDER AND CAPITALISM

As I mentioned above, several Marxists maintained for a long time that Marx's categories to describe the inner laws and functioning of capitalist exploitation are fundamentally gender- and race-blind (Eagleton, 1996; Harvey, 2014). For them, capitalism is a system that inherits and exploits gendered and racial oppression, but not one that gives rise to them specifically or that is in particular need of them at its core. This position is perhaps best expressed with the words of the late Ellen Meiksins Wood, who maintained that: 'If capital derives advantages from racism or sexism, it is not because of any structural tendency in capitalism toward racial inequality or gender oppression, but on the contrary because they disguise the structural realities of the capitalist system and because they divide the working class' (Meiksins Wood, 1988: 6).

Meiksins Wood, like others, did not intend to underestimate the importance of gendered and racial oppression for capitalism, for she well recognised that the history of capitalism is replete with racism and sexism. What she was trying to say, rather, is that what makes the capitalist mode of production absolutely novel and unprecedented in the history of modes of production is exploitation as a specific economic and juridical formula that allows certain individuals to own the means of production and to purchase the labour power of 'formally free' workers in order to use this legally purchased labour power to produce commodities and sell them on the market, with the aim of deriving a perfectly legal profit from this sale. In other words, Meiksins Wood, like Harvey and others, operates with an 'ideal type' of capitalism as an abstract 'marketplace' in which the race and gender of the people involved – whether buyers or sellers – do not really matter for the capitalist machine to work. According to them, then, we could think of capitalism as 'indifferent' to gender (and race), but we could not really imagine it without class exploitation.

The 'indifferent capitalism' thesis – as Arruzza (2014) called it – is entirely specular to the dual systems analysis proposed by Hartmann and others, for they both agree that Marx's categories are gender-blind and thus unable to address the specificities of gender under capitalism. The new wave of Marxist feminist theorising that has witnessed a renaissance in the last decade has begun to strongly contest these two positions. One such attempt is the publication by Cinzia Arruzza of 'Remarks on Gender' (2014). Here Arruzza's attempt is to contribute towards reopening a debate about how 'we should conceptualize the structural relationship between gender oppression and capitalism'. Departing from a critical reconstruction of dual system analyses and an engagement with what she names Meiksins Wood's 'indifferent capitalism' theory, Arruzza sets out to understand what the role of gender and women's oppression is within capitalism. For Arruzza, gender and racial oppression have become 'an integral part of capitalist society through a long historical process that has dissolved preceding

forms of social life'. Theoretically, she insists that we have to understand capitalism not merely as an economic system or a distinct mode of production, but as a complex and articulated social order that essentially consists of relations of exploitation, domination and alienation. Such an enlarged conception of capitalism allows us to recognise the irreplaceable role of social reproduction in it – the daily and intergenerational maintenance and reproduction of social life. From such a theoretical perspective, patriarchal gender relations appear intrinsic, rather than merely contingent or instrumental for the way that social reproduction is organised in capitalist societies.

Arruzza's remarks gave rise to an engaged dialogue which included Marxist feminists from different approaches including Johanna Oksala (2015), F. T. Manning (2015) and myself (Farris, 2015). Even though in all these interventions we were more concerned with attempting to theorise the place of gender within capitalism than with a systematic discussion or definition of the concept of gender itself (which we all took to stand for women's oppression), there are several aspects of this debate that are of particular interest in the context of this entry.

In spite of the important differences between them, all authors agree – contra Meiksins Wood – that gender oppression has been pivotal to capitalism and that its relegation to secondary contradiction has led to the downgrading of feminism by many Marxists. All authors, furthermore, agree that gender oppression is an historical configuration that assumes different forms according to the different phases and places of capital accumulation. Finally, all authors seem to refuse the dual systems analyses that characterised Marxist feminist debates in the 1970s and 1980s and aim at an integrated analysis of gender, class and race, even though they propose different ways of thinking through such an integration.

In a separate, but related attempt at thinking through the relationship between gender, class and race, Maya Gonzalez and Jeanne Neton propose to bridge the subjective and economic levels of analysis by advancing an analogy between gender and the fetishism of the commodity. For them, gender is the process of anchoring individuals to certain activities which results in the production and reproduction of two genders – masculine and feminine. While they follow Judith Butler in maintaining that both sex and gender are social constructions, and that the binary gender/sex de-naturalises gender while naturalising sex, they apply Marx's concept of commodity fetishism to unravel the relationship between the two terms of the binary. That is, they conceive of gender and sex as two sides of the same coin in which gender (exchange-value) attaches itself to sex (use-value), as if the value (i.e., meaning) of the former originated in the latter as some sort of inner substance. Gonzalez and Neton thus see gender as an external constraint imposed on naturalised sexed bodies that capitalism simultaneously de-naturalises – through a process of care commodification that appears to detach gender from biological concerns – and re-naturalises through the re-allocation of (certain) women to the abject role of reproducers, with the abject being 'what no one else is willing to do' (Gonzalez and Neton, 2013).

TRANSGENDER MARXISM

Marxist transgender theorists have produced some of the most compelling and challenging conceptualisations of gender, recently brought together in a collective volume (Gleeson and O'Rourke, 2021). For some of these authors, Judith Butler's theory of performativity and her de-naturalisation of sex is the necessary point of departure for an epistemic shift within Marxist understandings of gender. Rosa Lee, for instance, writes that

the categories Marx presents in *Capital* – commodity, capital, money – are performatives [...] What was thought to be an abiding substance, *value*, is in fact the result of contingent social practices. Rather than being natural or reliable, value is revealed to be processual and relational. And rather than appearing obviously, value's origins mean it will always remain unstable and subject to continual change and transformation. (Lee, 2021: 14)

For Lee, then, Marx's critique of political economy as one that unravels the contingent and historical variability of value and our mode of production is 'uniquely useful' for transgender theory, for it highlights gender's temporal dynamics.

For the authors of *Transgender Marxism*, 'the regulation of gender and sexuality must be understood as integral to capitalism as it survives across time' (p. 26). As the capitalist state constantly tries to domesticate gender roles and sexuality, transgender politics allows for an analysis of how the state and capital turn ascriptive distinctions into a material force.

According to their analysis, gender then is not merely 'a site of expressive potential – of self-realisation and self-fashioning – but also, and equally, a site bounded by property relations' (p. 26). Through patterns of ownership and entitlement, property seems to be naturalised even though it is in fact deeply gendered and racialised. That is how transgenderism represents a threat for capitalism, for it breaks with the ascribed roles and continuities on which capitalism relies. 'To transition', the authors argue, 'is to renege on agreements that were previously assumed, albeit never actually signed for' (p. 26).

In the same volume's afterward, Rosenberg outlines a materialist understanding of gender as the mediating link between the sexed body and nature, through the concept of metabolism. By stressing the troubled history of the term *Stoffwechsel* (metabolism) and its translation into English in *Capital Volume I*, Rosenberg aims to show how Marx's own rumination on this concept unwittingly 'overcodes the sexual division of labor, the abstraction of metabolics, and the question of social reproduction alike' (Rosenberg, 2021: 288). Transness, or transgenderism, in this light becomes the locus par excellence in which the metabolic process that mediates the social and the natural, the body and its significations, sex and gender, takes place most clearly.

CONCLUSION

The outright rejection of dual system analyses and the de-naturalisation of sex seem to me to represent some of the most prominent features of recent theorisations of gender within the Marxist field. On the one hand, dual system analyses do not appeal any longer to a generation of Marxist scholars who have grown under the aegis of neoliberal and globalised capitalism. In a way, the universalisation of the law of profit across the planet has been accompanied by the de-universalisation of gender, previously conceived as the analytic descriptor of white, middle-class femininity. In other words, the more the lives of the world population are brought together under the common denominator of capitalism, the more we see the multifarious ways in which gender is experienced and coopted, colonised and re-appropriated, but hardly ever reducible to an established binary pattern. On the other hand, queer and transgender scholars have pushed Marxists to question the often implicit assumption that gender operates as a kind of super-structure above somewhat stable sexed bases.

Several factors, in my view, have led to these developments in the contemporary Marxist theorisations of gender.

First, albeit running the risk of proposing a triple systems analysis in some versions of it, intersectionality theory has represented a fundamental challenge for Marxist feminists as it has forced them to look at economic exploitation and gender oppression as ‘interlocked’ and equally important expressions of capitalism (abandoning both the hierarchies of primary and secondary contradiction and the divisions of the dual systems analysis). Second, the changes undergone by the family form since the 1970s in many western countries and the increasing participation of women in paid labour have pushed feminists writing from a Marxist viewpoint to revisit an historical materialist understanding of gender oppression as one that manifests itself mainly through the relegation of women to domestic, unpaid labour. This shift has fundamentally undermined dual system attempts to theorise a domestic mode of production as opposed to a capitalist one. Third, and connected to the point above, the commodification of socially reproductive labour that has intensified in the last 30 years, and which has shown the importance of care chains and the racialisation of care labour (through the employment of migrant women from the Global South in particular), is showing the various articulations of gender not only in time – from Fordism to post-Fordism, for instance – but also in space. The penetration of capitalism in the Global South and the growth and feminisation of international migratory movements are all phenomena that have complexified our understanding of gender oppression in multiple directions. The simultaneous mass commodification and racialisation of social reproduction are processes deeply invested in the doing and un-doing of gender. While the employment of racialised women in socially reproductive activities continues *to do* gender, as it is women who are still required to undertake caring and traditionally feminine jobs, these same racialised women enable their

female employers (often middle-class, but also working-class women) to *un-do* gender by allowing them to undertake other non-feminised activities outside the household (Farris, 2017).

Finally, the growing scientific evidence that the instability and plasticity of sex is not an anomaly (as it used to be understood in the past by clinicians and scientists) is profoundly changing our understanding of gender too. According to Jordy Rosenberg (2021), the history of the medicalisation of transness could shed a different light on gender itself. For Rosenberg, who builds on Jules Gill Peterson, in the process of reassigning a sex to intersex infants, medical transition became a way ‘to align the plasticity of sex with the intractability of gender’ (p. 286). It is gender, thus, that comes to be understood as ‘a kind of characterological predisposition that – unlike the plasticity of sex – is immovable’ (p. 286). Gender, in other words, is the social construct that is fixed as binary in order to stabilise the instability of sex.

All in all, I believe these will be the main terrains on which Marxist theorisations of gender will develop in the future. As capitalist social relations continue to deepen social divides centred on sexuality and reproduction, the category of gender will inevitably be one of the central theoretical and practical battlefields on which we will be defining our political strategies.

Servants

Laura Schwartz

Karl Marx's interest in servants extended only so far as to explain what they were not. They were not part of the working class; they were not producers of surplus value; and they had no place within the logic of capitalist modernity except as its by-product parasitic luxury. The *Grundrisse* (1857–61) asserted an '[e]ssential difference between th[e] *servant* class and the *working* class'.¹ While a worker's labour produced exchange value (a commodity whose value could be circulated to generate profit within a wider marketplace), a servant's labour produced only use value (a personal service for their employer that would be consumed, and therefore its value entirely dissipated, in that single exchange) (Marx, 1993: 401, 465–6). Marx's understanding of labour power as an abstract entity, a potential capacity to labour that does not realise its value until it becomes congealed into a commodity, wed him to an understanding of 'productive' labour as only that which produced 'vendible objects' (Steedman, 2009: 42–3). Servants' labour therefore failed to produce surplus value even when the servant class exhibited superficial characteristics akin to those of the industrial proletariat, e.g. when it was made up of free labourers, rather than enslaved or indentured, and paid in money rather than in kind. Thus, according to Marx, even those servants living and working in the modern capitalist societies of nineteenth-century Western Europe continued to embody pre-capitalist social relations (Marx, 1993: 465–8). In chapter 15 of *Capital* volume 1 (1867) 'Machinery and Large-Scale Industry', he found humour in the paradox of the supposedly modernising forces of industrial capitalism in fact increasing the number of

working people employed in the manner of ‘ancient domestic slaves’. Mechanisation enabled an accelerated production of commodities embodying surplus value and thus an ever larger capitalist class:

Their growing wealth, and the relative diminished number of workers required to produce the means of subsistence, begets both new luxury requirements and the means of satisfying them... permits a larger and larger part of the working class to be employed *unproductively*. Hence it is possible to reproduce the ancient domestic slaves, on a constantly extending scale, under the name of the servant class, including men-servants, women-servants, lackeys etc. (Marx, 1990: 573–4)

This description of servants as ‘unproductive’ workers echoed similar sentiments already expressed in the *Grundrisse*, which noted how:

the creation of surplus labour on the one side corresponds to the creation of minus-labour, relative idleness (or *not-productive* labour at best), on the other. This goes without saying as regards capital itself; but holds then also for the classes with which it shares; hence of the paupers, flunkies, lickspittles etc living from the surplus product, in short, the whole train of retainers; the part of the servant class which lives not from capital but from revenue. (Marx, 1993: 401)

In both these works, Marx elided his discussion of a general ‘servant class’ (‘the entire class of so-called services from the boot black up to the king’, including many of the professions) with a critique of *domestic* servants in particular (Marx, 1993: 465). He understood domestic servants’ labour as the performance of their employers’ social status, which reduced them to baubles of luxury rather than contributors to a ‘social product’. This was in spite of the fact that the vast majority of nineteenth-century domestic servants were not flunkies or retainers in the homes of the wealthy, but general servants employed to do hard manual domestic labour in lower-middle-class households. Marx briefly noted this demographic fact in a footnote (Marx, 1990: 574), but did not bring it to bear upon his general point that not only were servants excluded from the working class, they were not really workers of any kind but luxury items in and of themselves. From this perspective, servants could not even be understood as (re)producing the capitalist class in their daily lives, but were rather the ‘dependents’ or by-products of the ‘surplus product’. Although from a purely theoretical perspective Marx’s distinction between productive and unproductive labour was an analytical category rather than a value judgement, a more historicised reading highlights the politically charged nature of this formulation. Marx’s rhetorical flourishes implied some kind of alliance or shared interest between the capitalist class and the servant class. Servants within modern capitalism were not located in opposition or antagonism to the bourgeoisie but were its parasites, its cringing ‘lickspittles’.

This had important political implications. Marx firmly declared that servants were of no interest to those seeking to mobilise the working class as a revolutionary force and agent of history. *Capital* volume 1 asserted that ‘types of work that are consumed as services and not products separable from the worker...

are of microscopic significance when compared with the mass of capitalist production' and may therefore 'be entirely neglected' (Marx, 1990: 1044–5). Yet, in the nineteenth and early twentieth century, to exclude servants from this political project was to exclude the most numerous of all waged workers. Marx acknowledged that the 1861 census of England and Wales recorded 1,208,648 domestic servants out of a potential workforce of about eight million, outnumbering all the various forms of industrial worker put together. To neglect servants was also to ignore the vast majority of the female workforce since, as Marx remarked in a footnote, more than 91% of this huge population of servants were women (Marx, 1990: 573–5). This remained the case in Britain into the 1930s, when servants made up between one-quarter and one-third of all women in paid employment (Horn, 1990: 171–2). Across Europe domestic servants remained one of the most numerous types of waged worker into the twentieth century, declining after the First World War but only definitively disappearing as a central component of the labour market after the Second World War (Fauve-Chamoux, 2004) – a development that, as I argue below, might now only be viewed as temporary. Servants also constituted an important element of the labour market across the territories colonised and settled by European imperial powers, and colonial families tended to employ far more domestic servants (both Indigenous and European, men and women) than their counterparts in the metropole (Haskins and Lowrie, 2015). Nevertheless, Marx's contemporaries and successors in male-dominated socialist and labour movements tended to neglect the domestic workforce. Some even made explicit what remained implicit in Marx's work, suggesting that servants were not merely outside of the working class but were in fact a counter-revolutionary force. It was argued that the conditions under which most servants laboured – working in private homes, often alongside their female employers in tiny workforces of ones or twos, with little free time to attend political meetings or socialise with other workers – presented insurmountable difficulties to successful union organising and even the development of class consciousness (Delap, 2011: 91–2; Schwartz, 2019: 164–5).

Some domestic servants defied such expectations and in the early decades of the twentieth century they formed unions in many countries, including Australia, Britain, Denmark, Finland, Germany, New Zealand, Sweden and the USA. The German Domestic Servants' Union (est. 1906) was one of the strongest, and was initiated by Marxists and Socialists in the Social Democratic Party such as Clara Zetkin and Helene Grunberg. The union demanded an end to the semi-feudal regulations which still determined servants' working conditions, a cause that was taken up once again in 1917 by the Central Union of Domestic Employees and continued into the Weimar Republic. Membership peaked in 1919 at 31,000 out of a total of 1,300,000 domestic servants. In 1921 and again in 1927 it spearheaded attempts to pass legislation regulating household service and limiting the working day, although these ultimately failed (Quataert, 1979; Bridenthal, 1983). The Domestic Workers' Union of Great Britain and Ireland (est. 1909–10) was

far smaller – a maximum of 2,000 members at any one time – but was led from the grass roots by domestic servants Kathlyn Oliver and Grace Neal, as well as Jessie Stephen of the Scottish Federation of Domestic Workers (est. 1911), which merged with the national union in 1913. They proudly declared their union to be an organisation ‘by servants for servants’ and refused to apologise to critics who complained that the union was ‘organised along class war lines’. They rejected sentimentalised views of the mistress–servant relationship as anything other than an employment contract, and insisted that domestic labour could be regulated and legislated for like any other job (Schwartz, 2014, 2015, 2019). Around the same time, but on the other side of the globe, class consciousness, pride in one’s work and claims to professional status were also asserted by migrant Chinese *amahs* (skilled domestic servants, household managers and governesses) in Southeast Asia, who formed networks, provided accommodation for fellow servants during periods of unemployment and assumed their own professional dress (Gin, 2013; Hoerder, 2015: 98). These unions were inspired by a general upsurge in working-class and feminist militancy in this period, yet rarely received large-scale or active support from either movement. As a result, they tended to be sporadic, short-lived and disrupted by the First World War. Domestic worker organising in the inter-war period was both galvanised and ultimately limited by the economic crisis of the 1930s and coercive state welfare systems that forced many former domestic servants (who had briefly enjoyed far higher wages as factory workers during the war) back into service (Bridenthal, 1983; Delap, 2011; May, 2011; Horn, 2014). Nevertheless, the real, if uneven, improvement in domestic servants’ pay and conditions that occurred in the twentieth century must in part be attributed to both formal and informal organising efforts by the workers themselves.

Most nineteenth- and early-twentieth-century Marxists and socialists, however, did not look to the organisation and/or revolutionary activity of domestic workers as the solution to their low pay and poor working conditions. Instead they argued that domestic service would wither away under socialism through the mechanisation and collectivisation of housework. The German Marxist August Bebel’s *Woman and Socialism* (1879), widely translated, reprinted and read by socialists across Europe, argued that housework must be modernised in line with other forms of industry:

The preparation of food must be conducted as scientifically as any other function... The private kitchen disappears... All the former troubles of keeping ranges, lamps etc. in working order removed by the central heating and electric apparatuses for lighting. Warm and cold water supplies places bathing within reach of all... The central laundries assume the washing, drying, etc. of clothes and the central cleaning establishment see to the dusting et cetera of clothing and carpets... Domestic life being thus radically transformed, the servant, this ‘slave of all the whims of the mistress,’ is no more... (Bebel, 1904: 338–41)

Jane Clapperton, Clementina Black and Sylvia Pankhurst in Britain and Charlotte Perkins Gilman in the USA also proposed blueprints for collective living and/or the collectivisation of cooking, cleaning and childcare (Clapperton, 1894, 1904;

Gilman, 1912; Black, 1918; Pankhurst, 1920). While all of them worked within a broadly socialist tradition, only Sylvia Pankhurst advocated a Marxist-influenced revolutionary politics. Ideas of ‘cooperative housekeeping’ gained a much wider audience within the varied political currents of the women’s movement, and also drew upon visions of cooperation put forward by the British Owenites and the French Fourierists in the early nineteenth century – those whom Marx and Engels had labelled ‘utopian socialists’ in the 1848 *Communist Manifesto* (Taylor, 1983; Thomson, 1988, Marx and Engels, 2012).

The early years of the 1917 Russian Revolution also generated a great deal of enthusiasm for the collectivisation of housework as part of an even more radical project for the eradication of the bourgeois nuclear family. The Bolsheviks argued that under socialism household labour would be transferred to the public sphere, and during the Civil War (1918–21) public dining halls, laundries, creches and free food for children were introduced. Vladimir Lenin described housework as ‘the most unproductive, the most savage, and the most arduous work a woman can do’, reiterating Marx’s belief that it was ‘barbarous’ and ‘unproductive’ (Lenin, 1934: 63, 69). Alexandra Kollontai maintained that sewing, cleaning and washing would become indistinguishable from mining and machine production, condemning the institution of the family for its inefficient use of labour, food and fuel. Housewives, rather than domestic servants, were the subject of this professed desire to emancipate women from housework, although in Russia too the vast majority (80%) of waged women workers at this time were either servants or landless agricultural labourers (Goldman, 1993: 3–5). In their desire to create a society without household servitude, early revolutionaries ignored paid domestic labour and thus excluded servants from their definitions of the proletariat. After 1921, however, when the New Economic Policy conceded that some form of domestic service would continue, servants were encouraged to develop proletarian consciousness and join the state-run trade union of Workers of Public Catering and Dormitory Workers. In 1926 ground-breaking labour legislation was introduced, intended to meet the particular needs of servants who were not adequately covered by the existing Labour Code designed with factory workers in mind. Recognising the flexibility of the domestic labour process, the new legislation did not specify a working day but rather a monthly limit of 192 hours and guaranteed paid holidays. Although it was difficult to ensure that this was implemented in private homes, it did give servants a formal legal basis upon which to assert their rights as workers. Steps towards including domestic servants within the Soviet proletariat were limited by the fact that service was viewed as exclusively women’s work, with men still expected to undertake higher status ‘productive’ work outside the home. Such value judgements also informed the push towards industrialisation from 1929, when women were called upon to leave service for ‘real’ work in the factories. By the end of the first five-year plan in 1933 the number of servants had fallen from 527,000 women to 241,000 (Goldman, 2002: 6, 9, 19, 90–1; Klots, 2018: 85–86, 90–92).

By the end of the Second World War, European domestic life ceased to be structured around the assumed existence of a permanent 'live-in' servant. In its Western social democratic nations, improvements in housing and the mass production of household appliances lightened the burden of housework; some of this work (notably elder care and care for the sick) was brought under the aegis of the welfare state rather than the private home. The growing political power of the working classes made domestic service appear even less appealing when compared to jobs in the expanding sectors of retail and light manufacturing. The post-war valorisation of domesticity propelled many middle- and working-class women into the role of unwaged housewife, or at least combining this full-time responsibility with part-time waged work. In 1973 the left-wing North American sociologist Lewis A. Coser declared uncontroversially that the forces of modernisation had made domestic service an almost entirely obsolete occupational role (Sarti, 2015: 39). Servants were apparently consigned to history, yet they did not feature in the Marxist and Marxist social histories that flourished during this high point of social democracy. E. P. Thompson's heterodox Marxism, which famously shunned the scientific socialism of Stalinism in favour of a more humanistic vision of class as a 'relationship' rather than a 'thing', stopped short at incorporating domestic servants into a history of *The Making of the English Working Class* (1963). Although Thompson acknowledged that, next to agricultural workers, servants were 'the largest single group of working people' during the whole period of the Industrial Revolution', he did not examine their place in class *struggle* (Thompson, 1966: 9–10, 211). The discipline of history was itself greatly influenced by the teleology of Marx's historical materialism, so that historians of class, work and social change followed a plot line that had no room for servants (Steedman, 2009; Clark, 2013; Todd, 2013).

In the 1970s and 1980s, with the rise of the Women's Liberation Movement, Marxist and socialist feminists began to critique and reconfigure Marx's and Marxists' conceptualisation of domestic labour as unproductive. All feminists asserted the value of the unwaged work they performed in the home and argued that men should take an equal share in it. Socialist feminists of many hues emphasised how 'capitalism also depends on domestic labour', arguing that the factory system relied upon a healthy and disciplined mainly male workforce, which was enabled by wives at home cooking, cleaning and caring for their husbands and raising the next generation of workers. A particular current associated with the Wages for Housework Movement in Britain, Italy and the USA engaged most closely with re-writing Marxist theory, arguing that the category of the proletariat needed to be expanded to include unwaged housewives and that the home was as much a site of struggle as the factory:

In the name of 'class struggle' and 'the unified interest of the working class' the Left has always selected certain sectors of the working class as revolutionary subjects and condemned others to a merely supportive role in the struggles these sectors were waging. The Left has thus reproduced in its organisational and strategic objectives the same divisions of the class that characterise the capitalist division of labour. (Federici and Cox, 2012: 28–9; see also Dalla Costa and Federici, 1975)

Far more controversial was the Wages for Housework argument that domestic labour produced surplus value as well as use value and thus directly contributed to profit – an idea that provoked a great deal of debate and was by no means accepted by all Marxist-feminists (Harrison, 1973; Seccombe, 1974, 1975; Coulson et al., 1975; Gardiner, 1975, 1976; Gardiner et al., 1975; Himmelweit and Mohun, 1977; Federici and Cox, 2012).

These debates initially focused upon the unwaged housewife, rather than the waged domestic worker. This in part reflected the nature of the labour market in the historical moment and geographical location in which these ‘second wave’ Western feminists were writing. In the global south the demand for domestic servants did not decline in the decades following the Second World War. Struggles for independence and ensuing decolonisation certainly saw the end of the old colonial servant-employing class, but new postcolonial elites continued to employ servants, while the sudden withdrawal of capital by former colonisers created havoc and unemployment, increasing the numbers of people resorting to domestic work (Van Nederveen Meerkerk et al., 2015). Critical feminist approaches to Marxist theory have also been used to illuminate these contexts in which large numbers of women continue to be employed in domestic work and where employing full-time servants remains the norm for middle-and upper-class families. Raka Ray and Seemin Qayum’s study of ‘servitude’ in India engaged ‘with precisely the “microscopic” relations that Marx dismissed... and posit[ed] that the macroscopic relations of exploitation that interested Marx are rooted in the dialectics of the day-to-day and the intimacies of power’ that characterise domestic service (2009: 5–6, 20, 188–9). These Marxist-feminist interventions must be understood alongside parallel and intersecting moves within critical race theory and anti-racist and postcolonial politics to critique and expand more orthodox Marxist understandings of the proletariat. Looking beyond the Western, white, male factory worker has shifted attention not just to domestic workers but also peasants, slum-dwellers and a range of ‘subaltern’ subjects. These developments owe as much to thinkers and activists who position themselves against the grain of Marxism, as to those working within a broadly Marxist remit to rethink some of its categories.

In the last few decades, analysis of domestic work has also been informed by Marxist theories of immaterial, emotional and affective labour. Such scholarly developments occurred as the number of domestic workers globally grew by almost 20 million between 1995 and 2010 (Van Nederveen Meerkerk et al., 2015: 12–15). Since the 1980s, paid domestic labour has rapidly expanded to become a central feature of neo-liberalism and globalisation. As welfare states have been attacked and the majority of women in the global north are now employed outside the home (over 70% in Britain), some reproductive labour such as convenience food and private childcare has been outsourced to the commercial sphere, and more and more middle-class families have once again begun to employ domestic workers in their own homes.² In the UK around 448,400 people worked as cleaners across the industry in 2010, employed by as many as one

in 10 British households, and 37% of those in England were migrant workers (Institute for Employment Research, 2010; McDowell, 2009: 38, 81; Todd, 2009: 181). Global inequality has thus been key to delivering cheap labour back into British homes, and many migrant domestic workers are enmeshed in a global chain of care that requires them to outsource the care of their own homes and families in their countries of origin (Anderson, 2000; Cox, 2006). The importance of migration to the twenty-first-century domestic service industry has also led to a rise in the number of male domestic workers in the West. In Italy, where this phenomenon is most pronounced, men have made up as much as 17% of declared domestic workers in 1996, fluctuating at around 10 to 11% in the first decade of the twenty-first century. The vast majority are migrants from East Asia and Latin America (Sarti and Scrinzi, 2010: 7; Scrinzi, 2010: 47). Immigration controls and fear of deportation among undocumented workers and those whose visa is sponsored by their employers, in addition to a more general hostile environment affecting all migrant workers, make it difficult to assert even the limited employment rights currently in place (Delap, 2012). Yet many migrants have become involved in, and indeed spearheaded, a resurgence in domestic workers' unions and pressure groups demanding governmental and international legislative intervention. These organising efforts began in the global south in the 1980s and were brought to the global north in the early twenty-first century, primarily by migrating Caribbean, Latin American and Asian domestic workers (Van Nederveen Meerkerk et al., 2015: 15–17). In Britain, some of the most significant gains made by cleaners in the last decade or so have been won by small grassroots migrant workers' unions such as the Cleaners and Allied Independent Workers Union, the Independent Workers of Great Britain and United Voices of the World, although these have tended to focus on workers in offices and public institutions rather than private homes (Rogers, 2017). On a global scale, trade unions have begun to give greater recognition to domestic workers and in 2011 the International Labour Organization passed Convention 189 Concerning Decent Work for Domestic Workers (Mather, 2013; Boris and Fish, 2015). At the time of writing, this Convention is now in force in 32 nations, but has not been ratified in Britain, where cleaners on average earn around £9.44 per hour, less than the national living wage (McDowell, 2009: 85; International Labour Organisation, 2021; PayScale, 2021).³

Over these last few decades the domestic servants of the past have begun to be written back into the history of capitalism, imperialism and class formation. Leonore Davidoff's pioneering work traced how the British Industrial Revolution, that laboratory of early industrial capitalism attended to so closely by Marx and Engels, generated both the material and ideological separation of home and work. This was accompanied by a gendered division of labour that relegated women's economic activity to the private sphere and rendered it non-work. In showing how domestic labour came to be devalued and defined as unproductive, Davidoff also revealed the historical conditions under which Marx's own thinking on servants

was shaped. Instead, Davidoff maintained that industrial capitalism was founded upon the unwaged and low paid labour of housewives and domestic servants in the family home. She also highlighted domestic servants' importance in defining and affirming middle-class identity, offering a different perspective on the lickspittles and flunkies so derided by Marx. In Davidoff's view such servants were not unproductive but, on the contrary, performed the crucial ideological and material labour of class formation (Davidoff, 1974, 1995; Davidoff and Hall, 1987; Davidoff et al., 1999). Whereas Davidoff's emphasis was on the metropole, Anne McClintock examined the central role of domesticity, domestic labour and domestic servants in the formation of the British Empire, drawing an affinity between the 'denial of the value of women's domestic work in the industrial metropolis and the devaluing of colonised labour in the cultures coming under violent imperial rule' (McClintock, 1995: 138).

More recently, historians have begun to bring domestic servants into labour history, to tell a different story about 'the making of the working class'. Carolyn Steedman has done this for eighteenth- and early-nineteenth-century England, disrupting the 'plot' of Thompsonian social history by placing servants at the centre of accounts of modern labour and property law. Writing about a period before the stigmatisation of domestic labour that Davidoff recounted, Steedman insisted upon treating eighteenth-century servants not as 'dirty disgusting... social others' but as workers who, 'with the means available to them in a profoundly inequitable society', were aware of and asserted their legal rights (Steedman, 2009: 17, 26–8; see also Steedman, 2007). Selina Todd's history of 'the rise and fall of the [British] working class' has argued that, far from being marginal to this story, servants should be understood as barometers of social change and the fortunes of the wider working class (Todd, 2014). Todd has also called for historians not just to attend to the personalised aspects of the mistress–maid relationship, but also to take a labour-history approach to understanding how wages and conditions shaped experiences of service (Todd, 2009). A 2015 special issue of the journal *International Labor and Working-Class History*, 'Historicizing Domestic Workers' Resistance and Organizing', edited by Eileen Boris and Premilla Nadasen, reveals the extent to which such a project is now being undertaken from a global perspective. Premilla Nadasen's history of African-American domestic workers, who organised collectively in the 1950s–70s, highlighted the persistence of domestic service in the USA even after the Second World War, whereby in 1960 one-third of all employed African-American women were household workers. This bucking of the Western European trend towards decline serves as a reminder of the importance of race and the legacies of slavery in structuring the domestic labour market and cutting across the gains made by a (white male) labour movement (Nadasen, 2015; see also May, 2011). Histories of domestic servants' efforts to transform the conditions under which they labour point towards possibilities and offer lessons for future workplace activism in economies that no longer conform to orthodox Marxist visions of the industrial proletariat.

The shift in terminology from ‘servants’ to ‘domestic workers’ is significant – an indication that it is no longer possible to refuse to recognise them as agents of their own history.

PART III

Political Perspectives

This page intentionally left blank

Politics

Panagiotis Sotiris

The question of a theory of politics in Marx has been an open one in the history of Marxism. Marx was a thinker immersed in politics even from his very first theoretical steps, as part of the ‘Left Hegelian’ circles in Germany, and later by his commitment to various organizational efforts of the German and then International labour movement, in particular through his involvement in the International Workingmen’s Association and the formative process of the German Social-Democratic party. His theoretical conceptualization of politics went through different phases and the open questions of this theoretical trajectory had a profound effect on the later history of Marxist Theory.

Marx’s work began as a *critique of politics*. Already in the *Critique of Hegel’s Philosophy of Right* we find Marx’s critique against the inversion of the relation between the State and civil society.

The idea is made the subject and the *actual* relation of family and civil society to the state is conceived as its *internal imaginary* activity. Family and civil society are the premises of the state; they are the genuinely active elements, but in speculative philosophy things are inverted. When the idea is made the subject, however, the real subjects, namely, civil society, family, circumstances, caprice, etc. become *unreal* objective elements of the idea with a changed significance. (Marx and Engels, 1975–2004, Vol. 3: 8)

This inverted relation between the State and actual social practice is combined with an idealization of the State which leads to the legitimization of actual State practices, presenting them as the realization of an idea:

The inevitable outcome of this is that an *empirical existent* is *uncritically* accepted as the actual truth of the idea; for it is not a question of bringing empirical existence to its truth, but of bringing truth to an empirical existent, and so what lies to hand is expounded as a *real* element of the idea. (Marx and Engels, 1975–2004, Vol. 3: 39)

For Marx the emergence of the autonomous political sphere of modernity, in its particular relation to the State, separates the citizen of the political state and the member of civil society. Marx rejects Hegel's answer to this separation, which was the return to the corporatist version of the Estates system, and suggested a radical democratic enlargement of political participation, in the form of 'the *extension* and greatest possible *generalisation of election*, both of the right to *vote* and the right to *be elected*' (Marx and Engels, 1975–2004, Vol. 3: 120):

Civil society is *actual* political society. In this case, it is nonsense to raise a demand which has arisen only from the notion of the political state as a phenomenon separated from civil society, which has arisen only from the *theological* notion of the political state. In this situation the significance of the *legislative* power as a *representative* power completely disappears. The legislative power is representation here in the sense in which every function is representative – in the sense in which, e.g., the shoemaker, insofar as he satisfies a social need, is my representative, in which every particular social activity as a species-activity merely represents the species, i.e., an attribute of my own nature, and in which every person is the representative of every other. He is here representative not because of something else which he represents but because of what he is and *does*. (Marx and Engels, 1975–2004, Vol. 3: 119)

The next step in Marx's critique of politics took the form of a critique of the separation between civil society and the State as a form of alienation. Alienation had been a crucial concept in the evolution of Hegel's philosophy. Separation was part of the dialectical process leading to *Aufhebung*. However, in Feuerbach's critique of religion alienation had taken a negative tone as the separation of human beings from their essence through its projection into deity. Marx in a similar conceptual strategy defined the development of an autonomous sphere of politics, based upon an abstract conception of law and rights, where citizenship is defined as abstraction from real social conditions, as a form of alienation. If religion is the alienated reified projection of human essence as human capacity towards wisdom, love and happiness, by means of the inversion and projection of these elements to deity (the core of the Feuerbachian critique), Marx instead opts to see the autonomous sphere of bourgeois politics as an alienated and inversed form of real human sociality with its forms of inequality, exploitation and oppression:

Where the political state has attained its true development, man – not only in thought, in consciousness, but in *reality*, in *life* – leads a twofold life, a heavenly and an earthly life: life in the *political community*, in which he considers himself a *communal being*, and life in *civil society*, in which he acts as a *private individual*, regards other men as a means, degrades himself into a means, and becomes the plaything of alien powers. The relation of the political state to civil society is just as spiritual as the relation of heaven to earth ... In his *most immediate* reality, in civil society, man is a secular being. Here, where he regards himself as

a real individual, and is so regarded by others, he is a *fictitious* phenomenon. In the state, on the other hand, where man is regarded as a species-being, he is the imaginary member of an illusory sovereignty, is deprived of his real individual life and endowed with an unreal universality. (Marx and Engels, 1975–2004, Vol. 3: 154)

Marx's early critique of politics is a call for the socialization of politics and the politicization of the social in order to reverse this process of alienation. It includes a radical critique of law and legal rights as inefficient forms that reflect this alienation: 'the right of man to liberty is based not on the association of man with man, but on the separation of man from man' (Marx and Engels, 1975–2004, Vol. 3: 162). Marx moves beyond the limits of the democratic political revolution as defined by the French Revolution, since such a political emancipation also led to the full liberation of the dynamics of capitalist economic forms:

The political revolution thereby *abolished* the *political character of civil society* ... It set free the political spirit, which had been, as it were, split up, partitioned and dispersed in the various blind alleys of feudal society ... Throwing off the political yoke meant at the same time throwing off the bonds which restrained the egoistic spirit of civil society. (Marx and Engels, 1975–2004, Vol. 3: 166)

Marx suggests a new conception of the revolution as a process that could revolutionize all aspects of social life. In contrast, '*political revolution* resolves civil life into its component parts, without *revolutionising* these components themselves or subjecting them to criticism' (Marx and Engels, 1975–2004, Vol. 3: 167). This is what motivated Marx's turn towards communism as the '*general human* emancipation' as opposed to the partial '*merely political* revolution' (Marx and Engels, 1975–2004, Vol. 3: 184) and towards the proletariat as the social class that can accomplish this task, a:

[c]lass with *radical chains*, a class of civil society which is not a class of civil society, an estate which is the dissolution of all estates, a sphere which has a universal character by its universal suffering and claims no *particular right* because no *particular wrong* but *wrong generally* is perpetrated against it; which can no longer invoke a *historical* but only a *human* title; which does not stand in any one-sided antithesis to the consequences but in an all-round antithesis to the premises of the German state; a sphere, finally, which cannot emancipate itself without emancipating itself from all other spheres of society and thereby emancipating all other spheres of society, which, in a word, is the *complete loss* of man and hence can win itself only through the *complete rewinning of man*. This dissolution of society as a particular estate is the *proletariat*. (Marx and Engels, 1975–2004, Vol. 3: 186)

In contrast to classical political philosophy, which in its entire trajectory up to German Idealism considered the State as the guarantor of rationality and emancipation, Marx sets the rupture with the State and the emancipation of civil society, as the condition of human emancipation. Marx's conception of alienation as the substance of exploitation and of emancipation as overcoming of self-estrangement finds its fullest expression in the *Economic and Philosophical Manuscripts of 1844*:

Communism as the positive transcendence of private property as human self-estrangement, and therefore as the real appropriation of the human essence by and for man; communism therefore as the complete return of man to himself as a social (i.e., human) being – a return accomplished consciously and embracing the entire wealth of previous development. This communism, as fully developed naturalism, equals humanism, and as fully developed humanism equals naturalism; it is the genuine resolution of the conflict between man and nature and between man and man – the true resolution of the strife between existence and essence, between objectification and self-confirmation, between freedom and necessity, between the individual and the species. Communism is the riddle of history solved, and it knows itself to be this solution. (Marx and Engels, 1975–2004, Vol. 3, 296–7)

However, the question of the particular political practice that could bring forward this form of radical emancipation remained unclear.

After 1844 we can see an important conceptual displacement in the way Marx (and Engels) theorize the State and political power, a displacement that has repercussions on the question of politics. However schematic and to a certain extent inexact Althusser's conceptualization of an epistemological break in the evolution of the thinking of Karl Marx (Althusser, 1969; Althusser et al., 2016), there is beyond any doubt an important conceptual and theoretical shift in the texts after 1845. From the conceptualization of the political sphere as alienated projection of real human sociality, we move to a theorization of the materiality of politics in relation to political power. Already in the *German Ideology* we find the basic elements of this conception: social power is grounded in the production process, the State is a material expression of this class domination and exploitation, and the projection of an 'illusory form of common interests' (Marx and Engels, 1975–2004, Vol. 5: 47) is a result of the ideological functioning of the State. Consequently:

Communism is for us not a *state of affairs* which is to be established, an *ideal* to which reality [will] have to adjust itself. We call communism the *real* movement which abolishes the present state of things. (Marx and Engels, 1975–2004, Vol. 5: 49)

In the *Theses on Feuerbach*, written in early 1845, Marx defined *revolutionäre praxis* as the combined activity of changing the circumstances and self-change: 'The coincidence of the changing of circumstances and of human activity or self-change can be conceived and rationally understood only as *revolutionary practice*' (Marx and Engels, 1975–2004, Vol. 5: 4). Yet the exact form of this practice was to be defined.

According to Marx's *historical materialist conception*, political power is the expression, in terms of command, authority and coercion, of the dominant position of a class in the ensemble of exploitative social relations, which is materialized in the State apparatuses through which it is exercised. The dominant class has the dominant position within the dominant exploitative mode of production, but its dominance requires political power and control of the State apparatuses. Politics becomes the antagonistic material terrain where social relations of force are condensed and played out and where the dominant class ensures the

reproduction of exploitative social relations of production. A revolution aiming at communism must begin by attempting to seize political power (and the power of State) in order to initiate a process of revolutionizing all aspects of social life:

The proletariat will use its political supremacy to wrest, by degrees, all capital from the bourgeoisie, to centralise all instruments of production in the hands of the State, i.e., of the proletariat organised as the ruling class; and to increase the total of productive forces as rapidly as possible.

Of course, in the beginning, this cannot be effected except by means of despotic inroads on the rights of property, and on the conditions of bourgeois production; by means of measures, therefore, which appear economically insufficient and untenable, but which, in the course of the movement, outstrip themselves, necessitate further inroads upon the old social order, and are unavoidable as a means of entirely revolutionising the mode of production. (Marx and Engels, 1975–2004, Vol. 6: 504)

The struggle of the proletariat is defined as a political struggle for emancipation that intervenes in democratic upheavals and insurrections in order to transform them into social revolutions. The defeat of the proletarian current in the 1848 revolutions led to a conception of socialism as the full explosion of the revolutionary dynamic that the bourgeoisie tried to impede was expressed in the formula of ‘revolution in permanence’. It is a politics of class autonomy, exemplified in the demand for an autonomous working-class organization, an ‘independent party’:

But they themselves must do the utmost for their final victory by making it clear to themselves what their class interests are, by taking up their position as an independent party as soon as possible and by not allowing themselves to be misled for a single moment by the hypocritical phrases of the democratic petty bourgeois into refraining from the independent organisation of the party of the proletariat. Their battle cry must be: The Revolution in Permanence. (Marx and Engels, 1975–2004, Vol. 10: 127)

To the call for an autonomous proletarian organization (‘the emancipation of the working classes must be conquered by the working classes themselves’ (Marx and Engels, 1975–2004, Vol. 20: 14)) is added the conceptualization of the dictatorship of the proletariat as not just a political option but as a necessary *theoretical* conclusion:

My own contribution was 1. to show that the *existence of classes* is merely bound up with *certain historical phases in the development of production*; 2. that the class struggle necessarily leads to the *dictatorship of the proletariat*; 3. that this dictatorship itself constitutes no more than a transition to the *abolition of all classes* and to a *classless society*. (Marx and Engels, 1975–2004, Vol. 39: 64–5)

However, this conception of politics had to confront itself with two opposing tendencies in the working-class movement of the Marx and Engels era, the anarchist conception of politics, associated with the figure of Bakunin and the statist socialism exemplified by Lassalle. Etienne Balibar presented this double limit in the following manner:

Let us mention only one example: the triangle formed by Marx, Lassalle, and Bakunin. In my opinion, one does not wonder enough about the fact that such indefatigable polemicists such as Marx and his faithful assistant Engels turned out to be incapable of writing an 'Anti-Lassalle' or an 'Anti-Bakunin' which would have been practically much more important than an *Anti-Dühring* or even than the reissue of an *Anti-Proudhon*. No personal and no tactical reason in the world will ever be able to explain such a lapse, a lapse which moreover was, as we know, heavy with political consequences. They did not write it because they could not write it. (Balibar, 1994: 134)

Only after the experience of the Commune did we begin to see a new thinking on the question of politics, by means of the 'rectification' of the *Communist Manifesto*, and in fact the call for a new practice of politics. For Balibar (1974) this 'rectification' is evident in the 1872 preface to the German edition of the *Communist Manifesto*:

However much the state of things may have altered during the last twenty-five years, the general principles laid down in this *Manifesto* are, on the whole, as correct today as ever. Here and there some detail might be improved. The practical application of the principles will depend, as the *Manifesto* itself states, everywhere and at all times, on the obtaining historical conditions, and, for that reason, no special stress is laid on the revolutionary measures proposed at the end of Section II. That passage would, in many respects, be very differently worded today. In view of the gigantic strides of Modern Industry in the last twenty-five years, and of the accompanying improved and extended party organisation of the working class, in view of the practical experience gained, first in the February Revolution, and then, still more, in the Paris Commune, where the proletariat for the first time held political power for two whole months, this programme has in some details become antiquated. One thing especially was proved by the Commune, viz., that 'the working class cannot simply lay hold of the ready-made State machinery, and wield it for its own purposes'. (See *The Civil War in France. Address of the General Council of the International Working Men's Association*, German edition, p. 19, where this point is further developed.) (Marx and Engels, 1975–2004, Vol. 23: 174–5)

Balibar insisted this conception implied that proletarian action leads not to another politics but to a '*new practice of politics*' (Balibar, 1974: 99), in an explicit analogy to Althusser's insistence in *Lenin and Philosophy* to a '*new practice of philosophy*' (Althusser, 1971), based upon the existence of autonomous mass organizations of workers and upon the '*penetration of political practice into the sphere of "work", of production*' (Balibar, 1974: 96).

However, there is also another parallel line in Marx, having to do with the entire theoretical operation of a *critique of political economy*. Although unfinished, the elaboration of the theory of value-form represented the emergence of a new theoretical paradigm and the possibility not just of a radicalization of classical political economy but of a highly original theory of the capitalist mode of production. *Capital* and in general Marx's writings on the *critique of political economy* are not 'economic' texts, there is no purely economic relation of exploitation:

[t]he direct relationship of the owners of the conditions of production to the direct producers – a relation always naturally corresponding to a definite stage in the development of the methods of labour and thereby its social productivity – which reveals the innermost secret,

the hidden basis of the entire social structure, and with it the political form of the relation of sovereignty and dependence, in short, the corresponding specific form of the state. (Marx and Engels, 1975–2004, Vol. 37: 778)

As Balibar has suggested this implies that ‘the labour relation (as a relation of exploitation) is immediately economic and political; the form of the “economic community” and that of the state “grow” simultaneously out of this “basis”’ (Balibar, 1994: 138). *Capital* offers a novel conception of a theory of exploitation that stresses not only the economic aspects but also the political and the ideological. From the reference to the violence of primitive accumulation to the entire discussion of the legislation regarding the duration of the working day and to the entire conceptual framework of fetishism (not only commodity fetishism but also fetishism of value and capital) politics and ideology are present in *Capital*. Consequently, we might follow Balibar in insisting that in *Capital* we are not dealing with an ‘economic theory’ but with:

[t]he short circuit established by Marx’s analyses between two ‘realities’ that the whole movement of bourgeois thought, ever since the beginnings of the ‘transitional phase’ in the sixteenth and seventeenth centuries, tended on the contrary to separate from one another as much as possible not only in theoretical discourses but above all by a multiplication of material institutions the labor process and the state. (Balibar, 1994: 136)

However, there is unevenness between the theorization of the capitalist mode of production and the theorization of politics and political practice. The critique of political economy is not combined with a critique of politics. Instead, as Balibar (1994) has observed, we have a tension between the notion of the proletariat, in the sense defined in the works preceding *Capital*, and the notion of labour in *Capital*, which can also be seen as the tension between mass and class. Consequently, although *Capital* points to the direction of an invasion of politics in the workplace, the question of the particular *new* practice of politics remains open.

To this we should add another theoretical problem originating in some of Marx and Engels’ formulations, namely the idea that communism is the end of politics. Engels’ ‘Saint-Simonian’ reference in *Socialism Utopian and Scientific* that in communism ‘the government of persons is replaced by the administration of things, and by the conduct of processes of production’ (Marx and Engels, 1975–2004, Vol. 24: 321) exemplifies this contradiction.

The period of the Second International will leave a legacy of a strongly economic and reductionist conception of the relation between base and superstructures leading to a certain quasi-metaphysical theorization of politics as the simple reflection of economics. Despite the invocation of a revolutionary overthrow of capitalism, the combination between the defeat of the Paris Commune and the organizational and electoral successes of the German Social-Democracy were perceived as a possibility to abandon the ‘insurrectionary’ practice of politics towards a more parliamentary approach. Even Engels, in his 1895 ‘Introduction

to Karl Marx's *Class Struggles in France*', suggested that the era of street fighting, barricades and revolution as insurrection is past and 'legal' methods enable bigger advances from the proletariat:

With its successful utilisation of universal suffrage, however, an entirely new method of proletarian struggle came into operation and this new method quickly took on a more tangible form. It was found that the state institutions in which the rule of the bourgeoisie is organised, offer the working class still further levers to fight these very state institutions. The workers took part in elections to particular diets, to municipal councils and to trades courts; they contested with the bourgeoisie every post in the occupation of which a sufficient part of the proletariat had a say. And so it happened that the bourgeoisie and the government came to be much more afraid of the legal than of the illegal action of the workers' party, of the results of elections than of those of rebellion. (Marx and Engels, 1975–2004, Vol. 27: 516)

In the evolution of the working-class movement one could see the tension between a gradualist conception of politics as simply gathering strength, in organizational and electoral forms, which was a belief shared in Social-Democracy by both 'orthodox' Marxists and 'revisionists' like Bernstein, especially since German Social-Democracy managed to create a party machine without precedent; and a more radical, even if sectarian in certain cases approach, especially from the part of anarchist and revolutionary syndicalist tendencies that proposed abstention from elections. There was also the recurring tension between a politics based on the State and the formation of counter-institutions from below such as workers' councils or strong revolutionary trade unions. The question was whether the main vector for a proletarian political practice was the party or the autonomous forms of proletarian self-organization, an opposition which also led to a negation of the need for parties.

Lenin was to a certain extent the exception to this discussion. Although it has been suggested that his ideas were mainly based upon a projection of the conception of the political party developed by the German Social-Democracy (Lih, 2008), in texts by Lenin such as *What is to Be Done?* a gnoseology of politics emerges, with revolutionary politics depending upon the formation of a revolutionary consciousness, therefore linking the question of political practice to that of political intellectuality:

The fundamental error committed by the 'new trend' in Russian Social-Democracy is its bowing to spontaneity and its failure to understand that the spontaneity of the masses demands a high degree of consciousness from us Social-Democrats. The greater the spontaneous upsurge of the masses and the more widespread the movement, the more rapid, incomparably so, the demand for greater consciousness in the theoretical, political and organisational work of Social-Democracy. (Lenin, 1977, Vol. 5: 396)

However, Lenin did not restrict his intervention to the question of political organization and to the centrality of political struggle as opposed to simple trade union activity. He also insisted that communist political practice proper is one that aims at revolution. To this end Lenin added two crucial aspects to the theorization of a potential revolutionary political practice. First, he attempted to

rethink revolutionary political intervention as decisive intervention at a moment of condensation of contradictions at all levels of social reality, what Althusser would later try to define as over-determination. Then, he conceived of dual power as an antagonism of contrasting practices of politics, on the basis of autonomous organizations such as the Soviets:

What is this dual power? Alongside the Provisional Government, the government of the bourgeoisie, another government has arisen, so far weak and incipient; but undoubtedly a government that actually exists and is growing – the Soviets of Workers' and Soldiers' Deputies.

What is the class composition of this other government? It consists of the proletariat and the peasants (in soldiers' uniforms). What is the political nature of this government? It is a revolutionary dictatorship, i.e., a power directly based on revolutionary seizure, on the direct initiative of the people from below, and not on a law enacted by a centralised state power. (Lenin, 1977, Vol. 24: 38)

Dual power was the basis for a new form of revolutionary power that could initiate a process of the withering away of the State. Although dual power was presented mainly as a description of a certain conjuncture where there is a catastrophic equilibrium between two opposing blocs, it also pointed to the duality of two antagonistic forms and practices of politics. The entire period of transition could be described as permanent dual power.

Lenin insisted that the revolutionary political practice should also be a process of learning and experimentation: 'As if one can set out to make a great revolution and know beforehand how it is to be completed! Such knowledge cannot be derived from books and our decision could spring only from the experience of the masses' (Lenin, 1977, Vol. 29: 155), a point similar to Marx's observation in the *Critique of the Gotha Program* that the question of the transition to communism 'can only be answered scientifically' (Marx and Engels, 1975–2004, Vol. 24: 95), therefore experimentally.

The defeat of the revolution in the West and the inadequacy of the conceptualization of revolutionary political practice as well prepared insurrectionary acts (the 'Teilaktionen' of the German Communist Party) along with the rise of Fascism led to a renewed thinking of revolutionary politics and strategy, by both Lenin and Trotsky, in the form of the United Front, which was combined with the question of the possibility of a 'workers' government' (Riddel, 2012). Lenin's 'last battle' (Lewin, 1968) centred upon the question of cultural revolution as a renewed emphasis on mass political intellectuality as a condition for the difficult conditions of the transition period. Lukács' work in the 1920s (Lukács, 1971) also represented an attempt to answer the open questions of a revolutionary political practice and of a revolutionary form of intellectuality, exemplified in his assertion that the 'the question of organization reveals itself to be an intellectual (*geistig*) question' (Lukács, 2014: 116).

Gramsci, writing in prison, attempted to rethink these questions. Based upon an enlarged conception of the integral state (Thomas, 2009) as 'the entire complex

of practical and theoretical activities with which the ruling class not only justifies and maintains its dominance, but manages to win the active consent of those over whom it rules' (Gramsci, 1971: 244), he attempted to answer both the question of the political form of the United Front (the 'modern Prince') and the question of mass political intellectuality. He combined all these in his conception of *hegemony* as the modality and stake of political practice that combines politics and ideology, coercion, direction and consent, aiming at the formation of a new *historical bloc*. Based upon his conception of the passive revolution as the political practice of the dominant classes in advanced capitalist formations, he suggested the war of position as the political practice of the subaltern classes, in the sense of a struggle for hegemony, a war of position which is 'a strategy of anti-passive revolution' (Buci-Glucksmann, 1979: 232)

The evolution of the Soviet Union, the identification of the State with the Party and the annulment of any form of initiative from below, led to a conception of politics as command from above, reinforced by the emergence of the 'popular democracies'. In the West this was combined with the transition towards a parliamentary conception of politics combined with a reformist conception of union activity (Claudin, 1975).

However, various forms of communist heterodoxy persisted in the 1940s and 1950s. Coming from different traditions, such as council communism, heterodox trotskyism, bordigism, libertarian communism, they shared the rejection of parliamentarism, of incorporation in national politics and of trade union bureaucracy. Despite their relatively small numbers they reproduced a conception of revolutionary politics as a combination of theory, a forming of international networks, a combination of politics and aesthetics, and attempts to get in contact with the new forms of working-class radicalism, preparing in a way the eruption of radical political practices after May 1968 (Mattik, 1978; Bourrinet, 2017).

The new wave of radicalism in the 1960s, what we tend to define as '1968', even though in fact it was a much longer and complex process than simply the events of 1968 (Viale, 1978; Harman, 1988), also opened up the question of a new practice of politics. Although, initially it was, especially in the USA but also Continental Europe, influenced by the renewed interest in the Frankfurt School (Marcuse, 1966, 1991), in the end it included an entire range of Marxist and communist political references. It led to a renewed emphasis on political praxis, a challenge against traditional reformist electoral politics and a transgression of the barriers between the political and the personal, the social and the political. 'Everything was political' led to a new insistence on the socialization of politics and the politicization of the social. From the new forms of factory radicalism and the refusal of the capitalist division of labour, to radical feminism and the politics of sex, gender and the body and the entire range of 'new social movements', one could witness this quest for a new transformative practice of politics that could affect all aspects of social life.

The Chinese Cultural Revolution also seemed to offer an alternative in the sense of mass mobilization, an unleashing of political potential from the part of

the masses and an attempt towards a revolution inside the revolution, suggesting a return to a conception of permanent dual power, with movements from below becoming the central point (Bettelheim, 1974; Jiang, 2014). Despite the open theoretical questions regarding the Cultural Revolution itself and the limits of Western Maoism, it offered a point of reference for a radicalization of political practices.

Partially abandoned as a terrain of social contestation in the 1950s as part especially of Western European communist parties' turn towards national politics, the factory again became the site of intense conflicts in the entire trajectory of the 1960s and 1970s, with struggles that did not limit themselves to questions of wages but also challenged the capitalist division of labour. This was especially evident in Italy where the tendency that came to be known as *operaismo* attempted to redefine communist politics based on the centrality of the figure of the worker, attempting both new forms of co-research, reviving Marx's initial suggestion of a workers' enquiry, and new forms of politics and contestation based on the factory as the epicentre of an insurrectionary sequence (the attempt to bring 'Lenin to England') and on the hypothesis that the motor force of the development of capitalism is the constant resistance of workers in the workplace in a reversal of traditional communist economism (*Quaderni Rossi*, 1968; Wright, 2002; Tronti, 2013). On the basis of such struggles and other similar experiences, such as the French practice of the *établissement*, namely the practice of militants going to work as factory workers (Linhart, 1978), a broader re-politicization of the workplace emerged along with a critique of the capitalist division of labour and of the neutrality of science and technology (Coriat, 1973; Gorz, 1973; Braverman, 1974).

Operaismo went through an initial 'neoLeninist' insurrectionary phase (Negri, 2005, 2014) insisting on the possibility of rebuilding the party of insurrection based on the new radicalized factory workers' strata. Later it turned into 'organized autonomy' before the bifurcation between the more 'creative' dynamics of the 1977 movement and the dead-ends of armed struggle (Lotringer and Marazzi, 1980; Balestrini and Moroni, 2003). The sequence was over-determined by the choice of the Italian Communist Party to answer the profound hegemonic crisis of Italian society not with a renewal of revolutionary strategy but with 'Historical Compromise'. Both the inability of the large organizations of the revolutionary Left (Lotta Continua, Manifesto, Avanguardia Operaia, Potere Operaio) to actually offer an alternative hegemonic strategy and the inability of armed struggle organizations to initiate an insurrectionary sequence, represented the limits of a certain conception of communist political practice that faced the very complexity of the mechanisms of bourgeois power and hegemony even at a moment of acute crisis.

Regarding Marxist theory, Louis Althusser's initial project referred not only to the possibility of a theoretical correction to the political problems of the communist movement but also to an attempt by means of the conceptual framework of over-determination to rethink political practice as intervention in the uneven dynamics and contradictions of singular conjunctures, rejecting the metaphysics of both economism and voluntarism (Althusser, 1969). The

Marxist debates on the State of the 1970s were also, in a certain sense, debates on the question of political practice, exemplified in the Poulantzas / Miliband debate (Poulantzas, 1969, 1976; Miliband, 1970, 1973). The question whether the class determination of State was more 'structural' or simply reflected the empirical presence of representatives of the bourgeoisie in the higher echelons of State apparatuses, also had significant consequences regarding the politics versus the State. It was the question whether the State was to be revolutionized and transformed (or even withered away) or if it was to be basically taken over by antagonistic social forces.

During the broad debate about the possibility of left governments in the 1970s in Western Europe, associated with what came to be defined as Eurocommunism, two distinct answers came forward regarding political practice. On the one hand, the conception of a democratic road to socialism as a parliamentary road to socialism, led to a more classical conception of institutional politics not only at the parliamentary level but also at the level of local government and trade unions. On the other, proponents of 'left-wing Eurocommunism', which was based upon a more complex non-instrumentalist conception of the State, suggested the need to combine the strategy for parliamentary majority with grass-roots movements and practices of self-management. Christine Buci-Glucksmann defined it as a strategy for a 'dual power of *longue durée*' (Buci-Glucksmann, 1977: 153). Poulantzas offered the most advanced version of this in his 1978 *State, Power, Socialism* (Poulantzas, 2000). Based upon a relational conception of the State as the material condensation of a class relation of forces, he rejected what he defined as the dual-power frontal attack on the State and suggested a 'democratic road to socialism' that would combine forms of representative democracy, with profound transformations of the State and 'the development of new forms of direct, rank-and-file democracy, and the flowering of self-management networks and centres' (Poulantzas, 2000: 261–2). However, the changing political conjuncture of the late 1970s and late 1980s made this debate gradually irrelevant, as a result of both the ascendance of neoliberalism and the new wave of Social-Democratic governments. After 1989, the collapse of 'actually existing socialism' coincided with the open crisis of communist politics in the West.

The conjuncture after May 1968 called for a philosophy of the event. Alain Badiou's trajectory exemplifies this, beginning with his rethinking of his radical Maoism in the second half of the 1970s (Badiou, 2009) and then to the non-ontology of the (im)possibility of the event in *Being and Event* (Badiou, 2006), which led to a post-Leninist conception of politics insisting that 'a real politics holds itself at a distance from the State and constructs this distance' (Badiou, 2005: 119). In various instances this suggested a hostility to electoral or trade union politics and an insistence on either topical struggles (such as solidarity with *sans-papiers*) along with continuous fidelity to what Badiou defined as the communist hypothesis (Badiou, 2010; Bosteels, 2011).

Louis Althusser attempted in the 1970s a critique of both the ‘instrumentalist’ conception of the State and the Poulantzian version of a relational approach to the State, suggesting instead a communist politics exterior to the State, insisting upon the potential for popular struggles from below and the ‘traces of communism’ (Althusser, 2014) as ‘virtual forms of communism’ in the ‘interstices of capitalist society’ (Althusser, 1998: 285). Having abandoned from the second half of the 1960s any conception of latent structures, Althusser gradually developed a highly original conception of an anti-historicist and anti-teleological historical materialism, based upon the notion of the encounter (Althusser, 2006). The elaboration of the conceptual apparatus of the materialism of the encounter was not made public during Althusser’s lifetime and became known gradually by means of the posthumous publication of various manuscripts written by Althusser. It coincided with the attempt on the part of Althusser to articulate a left-wing critique to the right-wing turn of the communist movement. Althusser saw the strategic crisis of the communist movement and the particular forms of Marxism associated with it, as a potentially liberating and emancipatory moment, especially since there was the possibility of mass movements to emerge in their autonomous dynamic, hence the need to restore the voice to the people (Althusser, 1977). However, in the end he did not manage to formulate a politics based on this new theoretical framework.

The wave of new radicalism after 1999 and the mobilization of Seattle opened up the space for a rethinking of politics. Antonio Negri and Michael Hardt attempted to offer a theorization of this new form of radical politics by means of a rethinking of the collective subject as a biopolitical multitude in confrontation with the Empire, the globalized ensemble of power relations, which in their turn represented the expropriated collective potential of the Multitude (Hardt and Negri, 2000). This theoretical conception, which resonated well with the post-Seattle anti-global radicalism, did not offer a specific conception of politics except for a celebration of the existing repertoire of activist practices and a conception of the programme as a list of basic democratic demands (Hardt and Negri, 2004). Even the invocation of the ‘becoming Prince of the Multitude’ in *Commonwealth* (Hardt and Negri, 2009) fell short of a more concrete proposal regarding the practice of politics.

The new movements that emerged in the 1990s, such as the Zapatistas in Mexico (but also the continuous importance of the MST in Brazil), seemed to offer an alternative egalitarian and participative model. John Holloway attempted to see in such movements the possibility of ‘changing the world without taking power’, in the sense of a politics that would bring together the demands for radical change from the part of living labour but not by means aimed at State power:

If the state paradigm was the vehicle of hope for much of the century, it became more and more the assassin of hope as the century progressed. The apparent impossibility of revolution at the beginning of the twenty-first century reflects in reality the historical failure of a particular concept of revolution, the concept that identified revolution with control of the state. (Holloway, 2005: 12)

In contrast, the evolution of the experiments of left-wing governance in Latin America opened up the debate again on the possibility of combining governmental power with strong popular movements from below, in what has been described as the emphasis on the ‘protagonism’ of the popular classes, their active participation in the process of political decision and social transformation (Harnecker, 2007). Despite, the limited transformation of social relations and the persistence of capitalist forms and even neoliberal practices (Sponk and Webber, 2015), these forms of popular power and participation have been treated as a contemporary form of dual power (Ciccariello-Maher, 2013, 2016).

Recent attempts to theorize emerging new political formations and the possibility of left-wing governance in Europe tend to see it more in terms of a politics centred upon a political electoral campaign that would give expression to the conflict of the people with the political system (Iglesias, 2015), a direction strongly influenced by Laclau’s redefinition of populism (Laclau, 2005). However, the capitulation of the leadership of SYRIZA in Greece and the acceptance of the politics of austerity, despite the impressive dynamics of protest and contestation that actually brought the Left into power, can be seen as a manifestation of the limits of any traditional conception of parliamentary left politics without a strategy and process of rupture (Sotiris, 2016).

The new wave of mass protests after the end of the 2000s (beginning with the December 2008 revolt by the Greek youth) and in particular after 2011, led to a renewed emphasis on the possibility of alternative politics and, at the same time, on new contradictions and apprehensions of limits to each approach. The new emphasis on direct democracy, equal voicing and reclaiming of public space (Graeber, 2013) indeed seemed to offer an alternative and antagonistic political practice, but which in the end fell short of creating the necessary political force that could indeed represent the dynamic of communism emerging in such struggles, making necessary a return to the question of organization (Dean, 2016). At the same time, we also saw an increased interest in the possibility of a renewed version of an insurrectionary and in a certain sense neo-Blanquist conception of politics as an attempt to block the technical networks of power (Invisible Committee, 2009, 2015).

CONCLUSION

The possibility of social transformation requires not just another politics but a *new practice of politics*, a profound redefinition of the very notion of politics. It points towards not just struggle and class confrontation but also the liberation of the potential inherent in the collective practices of the subaltern classes. In this sense it includes both destruction and creation. At the same time, the realization that communism is neither a destiny nor a pre-inscribed material tendency, but rather the contingent outcome of a series of encounters (with the possibility of

non-encounters), requires a politics that is not conceived as simply representing some form of historical teleology. In this sense, we can perhaps think of this new practice of politics as the art of ‘organizing good encounters’ (Deleuze, 1988: 119), in order to conceive political programmes, strategies and hegemonic projects not as ‘designs for the future’, but rather as processes of collective experimentation.

Consequently, the question of hegemony re-emerges as the stakes in such a conception of politics. Althusser, in his attempt to think over-determination and the singularity of the conjuncture as a way to actually conceptualize the possibility of revolutionary politics, insists ‘Who has *really* attempted to follow up the explorations of Marx and Engels? I can only think of Gramsci’, adding a footnote that also insists: ‘*hegemony*: a remarkable example of a theoretical solution in outline to the problems of the interpenetration of the economic and the political’ (Althusser, 1969: 114).

This politics of struggle, experimentation, transformation and hegemony requires a rethinking of organization as ‘laboratory’, as the terrain for the production of new forms of mass critical intellectuality and as the ‘crucibles where the unification of theory and practice, understood as a real historical process, takes place’ (Gramsci, 1971: 335).

The question of political practice has remained essentially open in the history of Marxism. The return of new forms of mass politics inspired by some variety of Marxism, the strength (but also the defeat) of important movements and the parallel new wave of theory inspired by Marxism in the twenty-first century offer the possibility of exactly that terrain of experimentation with such a new practice of politics.

Revolution

Neil Davidson

Editor's note: Neil Davidson (1957–2020), arguably the preeminent Marxist scholar of revolutions of his generation, was tragically unable to complete his entry. We are very fortunate that among his papers was a finished draft of the sections of his chapter concerned with pre-Marxist conceptions of revolution and with the development of Marx and Engels' own understanding of revolution, with particular emphasis on the questions of bourgeois revolution and permanent revolution; we publish it here, with minimal editing. Though Neil had made significant headway with the part of his entry dealing with developments in the Marxist theory of revolution after 1917, lacunae still remained and we did not think it appropriate to present this work in its unfinished form. In his abstract, he described that part as follows: 'The chapter will then look at how three subsequent Marxists have extended these positions – in Gramsci's concept of "passive revolution", Lenin's identification of workers' councils as an alternative to bourgeois state power, and Trotsky's version of permanent revolution – but also contributed their own innovations to revolutionary theory and practice, in Trotsky's law of uneven and combined development and Lenin's interventionist model of the revolutionary party'. Though fragmentary, we have decided to include by way of conclusion some of Neil's suggestive remarks on the impasses of proletarian revolution in the present. Readers wanting to explore further Neil's path-breaking work on revolutions should turn to his classic *How Revolutionary Were the Bourgeois Revolutions?* (Chicago: Haymarket, 2015; abridged edition, 2017) as well as *We Cannot Escape History: States and Revolutions* (Chicago: Haymarket, 2015) and forthcoming volumes from Haymarket Books.

INTRODUCTION

György Lukács opened his 1924 book on Lenin with the words: 'Historical materialism is the theory of the proletarian revolution' (Lukács, 1970a: 9). Lukács later regretted the 'single-dimensionality' of this definition (Lukács,

1970b: 90), but his focus on proletarian revolution does nevertheless capture the way in which, unlike most other intellectual traditions, Marxism involves both a social interpretation of the historical past and a political practice intended to produce a particular outcome in the future. The former is a *theory* which holds that the expansion of the productive forces under capitalism produces both the material resources to make the transcendence of class society a possibility and a working class with the potential, through revolution, of turning that possibility into a reality; the latter is a *strategy* for intervening in the revolutionary process which can make the victory of socialism more likely.

Given the centrality of revolution as theory and strategy to Marxist thought, it is obviously impossible to survey every aspect of what Marxists have written or done in relation to the subject in a single chapter. In what follows, I briefly survey the conceptions of revolution which prevailed before Marx and Engels, before reviewing their innovations with respect to both the bourgeois and socialist revolutions. I then assess the extent to which the Russian Revolution both confirmed and qualified the Marxist theory of socialist revolution, and ask whether Classical Marxism contains an explanation for their non-occurrence since October 1917, other than as brief episodes, which does not involve concluding that its own central thesis about the revolutionary capacity of the working class is false.

PRE-MARXIST CONCEPTIONS OF REVOLUTION

The Marxist conception of revolution is distinct in several ways from those which preceded it. The actual term ‘revolution’ had been used since the Middle Ages to indicate the cyclical movement of celestial bodies around the Earth and, from the work of Copernicus and Galileo onward, that of the Earth’s orbit around the sun. It was in this sense of returning to a starting point that the term began to incorporate the notion of a ‘cycle of constitutions’ inherited from the ancient world, which held that society remained essentially immobile beneath surface political changes. Possible regimes or constitutions, which either followed each other in cyclical succession or were simply available as alternatives, were few in number – in most versions only three, each of which had two aspects reflecting whether they were operated justly or unjustly: monarchy and tyranny, aristocracy and oligarchy, democracy and anarchy (Aristotle, 1988; Polybius, 1979). But whether these types of regime were seen as either endlessly recurring or as a set of options, at no point did the ancients see the possibility of one emerging on the basis of reconstituting their societies: changes were purely political and always revocable. The later Christian tradition opposed the cyclical theory of the classical world, but in other respects was equally incapable of comprehending the possibility of fundamental social change.

For a modern concept of revolution to emerge there had to be the possibility of irreversible transition to a new type of society. A proto-theory of social revolution

had sporadically emerged and re-emerged between the English and French revolutions, all variants of which argued that there was a link between revolution and prior changes in socio-economic relations, specifically the emergence of a class based on new forms of property and new ways of organizing production. The connection was first identified after the English Civil War by James Harrington, only to be consciously or unconsciously repressed during the Restoration by the theoreticians of the newly triumphant bourgeoisie, above all John Locke, in favour of the traditional conception of political revolution restoring a pre-existing constitution (compare Harrington, 1977 and Locke, 1988). Perhaps the most developed version, however, was formulated by the French revolutionary intellectual Antoine Barnave in the early 1790s, although he retreated in practice from what was politically necessary for the safety and security of the revolution he had helped initiate. He feared the forces it was unleashing from below – entirely justifiably, since his attempts to contain the Revolution ultimately cost him his life (Barnave, 1971). Indeed, an earlier conception of social revolution, in the 1760s, by the Scottish political economist (and former Jacobite counter-revolutionary), Sir James Steuart, envisaged revolution from above precisely as a means of forestalling a more destructive revolution from below (Steuart, 1966).

By the post-Restoration period, after 1815, one can speak of the consolidation of a bourgeois view of the social revolution, which saw it stretching from the Dutch Revolt through the English Civil War before climaxing in the French Revolution (see, for example, Guizot, 1846; Saint-Simon and Thierry, 1952; and Staël, 1818). But this was relatively short-lived as a dominant strand within ruling class thought. The ideological problem was that any assertion of the idea that class-based revolutions had been required for social transformation in the past was increasingly seen as giving dangerous encouragement to the idea that they were also necessary in the present. As this suggests, the bourgeoisie was becoming expert in covering its tracks, diverting attention on to false trails – at least where capitalism was already dominant – and rewriting the history of their own revolutionary rise to power so that each individual moment appeared to be a *political* rather than *social* revolution, a position which tended to be accompanied by the claim that capitalism had essentially always existed. Bourgeois thought therefore began to reinterpret the great revolutions in terms that gave greater emphasis to ‘liberty’, or the achievement of constitutional government, than to ‘property’, or the unshackling of a new economic order (for British examples from the latter half of the nineteenth century, see Acton, 1906 and Spencer, 1969).

Perhaps because of these bourgeois associations, socialists and other radicals in the emergent working-class movement were resistant to the notion that social revolutions had ever taken place. They no longer accepted that revolution could only involve a cyclical process, but nevertheless still regarded all previous revolutions as having been primarily political in nature. In the 1790s, Thomas Paine had hailed the French Revolution as an entirely new type of event in human history,

fundamentally different from all earlier revolutions – including those which most resembled it, like the Dutch Revolt and the English Civil War – by virtue of not merely replacing one set of rulers with another, but establishing a new type of democratic politics (Paine, 1969: part 1). Yet Paine was exceptional in holding this view and from the 1830s at least, working-class radicals tended to follow instead the position of Gracchus Babeuf and were consequently inclined to argue that even the French Revolution did not represent a qualitatively different type of event from earlier revolutions. ‘The French Revolution is but the precursor of another revolution, far greater, far more solemn, which will be the last’, Babeuf had written in 1796: ‘We aim at something more sublime and more just, the COMMON good or the COMMUNITY OF GOODS!’ (Babeuf, 1920: 54, 55). The Irish Chartist leader Bronterre O’Brien certainly agreed with this view, but so too did such different figures as the Italian nationalist leader Giuseppe Mazzini and the Russian socialist Alexander Herzen: for them, whatever the level of popular involvement, previous revolutions were merely political, because they involved the replacement of one ruling class by another rather than instituting rule by the people. Only a revolution that resulted in the latter could be described as genuinely social in character: the only genuinely social revolution would be socialist (Herzen, 1956; Mazzini, 1912; O’Brien, 1948).

MARX AND ENGELS REDISCOVER THE SOCIAL REVOLUTION

Marx and Engels do not seem to have been aware of the pre-history of bourgeois theory of social revolution. Although they frequently referred to English materialists such as Hobbes, they never referred to Harrington – indeed, Bernstein seems to have been the first Marxist to take him seriously, as late as the 1890s (Bernstein, 1980). Similarly, although they were obviously aware of Barnave as a historical actor in the drama of the French Revolution, his ‘Introduction to the French Revolution’ was only published in 1843 and there is no evidence that either man read it. They certainly read and admired Steuart, but for his insights into what they would later call ‘primitive accumulation’, not his views on revolution (Marx, 1963; Marx, 1987). Nor did they derive their views from the French historians of the Restoration, of whom – Guizot above all – they were deeply suspicious for entirely justified political reasons. References to Tocqueville are few and exclusively concerned with his political role in 1848, by which time they had developed their own theory (see, for example, Marx, 1973d: 219–20). In fact, during the earliest part of their literary and political careers, Marx and Engels shared the widespread radical view that social revolution still lay in the future.

Engels, for example, recognized the opposed interests of the bourgeoisie and the proletariat: but did the bourgeoisie not also have ‘interests’ in the English Civil War of the 1640s? Was it consequently not also a social revolution? Apparently

not: so long as political life was dominated by the state and economic life was characterized by private property – which was certainly the case after both 1660 and 1815 – no social revolution could be said to have occurred. What Engels did not allow for at this time was the existence of different types of state and different forms of private property. He did not regard the revolutions of 1640 and 1789 as being irrelevant, of course, but they were significant only to the extent that they made the forthcoming social revolution possible (Engels, 1975: 419).

Marx started from a similar position to Engels in relation to political and social revolutions. However, in his initial critique of Hegel, which was still largely conducted using the language and concepts of German idealist philosophy, he attempted to distinguish between different types of political revolution, which he terms ‘legislative’ (the French) and ‘executive’ (all the others) (Marx, 1975a). At this point in his development, ‘revolution’ does not have a particularly positive connotation for Marx, since – in its executive aspect at least – it can include *coups d’état* or even *counter-revolutions*. This was soon to change.

In ‘On the Jewish Question’, Marx highlighted the inadequacy of merely political revolutions, but now also attempted to define them in relation to how far they contributed to what he called ‘political emancipation’. This, he argued, ‘may not be the last form of general human emancipation, but it is the last form of general human emancipation *within* the prevailing scheme of things’ (Marx, 1975b: 221). In other words, the achievement of ‘political emancipation’ *does* involve progress, not merely superficial political changes. Furthermore, his discussion shows a far greater sensitivity to the changing nature of the state than can be found in the work of Engels during this period, where it tends to remain an unchanging, undifferentiated source of oppression. For Marx, the key achievement of political revolution, the basis for ‘political emancipation’, involved breaking the former unity of state (‘politics’) and civil society that had characterized feudalism: ‘Political emancipation was at the same time the emancipation of civil society from politics, from even the *appearance* of a universal content’ (Marx, 1975b: 232). Even in the still very abstract formulations typical of Marx’s writings at this time, it is clear that he recognized feudalism as a distinct form of society. Like Engels, however, he did not regard its supersession as a social revolution, since private property survived and consequently human liberation remained unachieved, even where this had been the intention of revolutionaries.

Germany had not yet attained the level of France and, in 1843 and 1844 at least, Marx was sceptical about the capacity of the local bourgeoisie to achieve even this much, leading him to pronounce, in one of his earliest dialectical paradoxes: ‘It is not the *radical* revolution or *universal human* emancipation which is a utopian for Germany; it is the partial, *merely* political revolution, the revolution which leaves the pillars of the building standing’. This led him to argue in more detail what the role of the French bourgeoisie had been in their revolution – a revolution that Marx still describes as political:

If the *revolution of a people* and the *emancipation of a particular class* of civil society are to coincide, if one class is to stand for the whole of society, then all the deficiencies of society must be concentrated in another class, one particular class must be the class which gives universal offence, the embodiment of a general limitation; one particular sphere of society must appear as the *notorious crime* of the whole society, so that the liberation of this sphere appears as universal self-liberation. (Marx, 1975c: 253–4)

But the embodiment of the general interest was illusionary in the case of the bourgeoisie, or at least real only to the extent that the pseudo-universal class was able to achieve formal equality before the law (although not yet democracy), leaving economic inequality untouched. Some other social force was therefore necessary in order to move beyond the mere bourgeois right established in France, but still to be established throughout most of Europe, a genuinely universal class. For Marx and Engels, this was the working class: ‘A class with radical chains’ (Marx, 1975c: 256).

What lay beyond bourgeois right was communism, a desirable and potentially achievable state of affairs familiar to young radicals like Marx and Engels through the projections of Utopian Socialists like Etienne Cabet or through the philosophical positions of Left Hegelians like Moses Hess. But for Marx at any rate, the proletariat still appears as a solution to the philosophical problem of agency: the proletariat is a universal class on the basis of its poverty and suffering, its lack of private property, but the proletarian ‘heart’ remains on equal footing with the philosophical ‘head’: ‘Philosophy cannot realize itself without the transcendence [*Aufhebung*] of the proletariat, and the proletariat cannot transcend itself without the realization [*Verwirklichung*] of philosophy’ (Marx, 1975c: 256). Marx is, so to speak, still looking down the wrong end of the telescope and would only change his perspective as the result of his increasing knowledge of the working-class movement (the activities of the Chartists in Britain and, closer to home, the revolt of the Silesian weavers in June 1844) and cumulative encounters with actual workers (the secret societies and the League of the Just while in Paris during 1843–4). But this is illustrative of the relationship between social developments and their theorization which lies at the core of historical materialism: ‘The existence of revolutionary ideas in a particular period presupposes the existence of a revolutionary class’, as he and Engels were shortly to write (Marx and Engels, 1975: 63).

The new conception of the working class that emerged was stated fully for the first time by both Marx and Engels in their first jointly written work, *The Holy Family* (1844), and developed in the collection of unfinished notes eventually published under the title of *The German Ideology* (1845–6), both of which emphasize its structural situation, as in this passage from the former:

It is not a question of what this or that proletarian, or even the whole proletariat, at the moment *regards* as his aim. It is a question of *what the proletariat is*, and what, in accordance with this *being*, it will historically be compelled to do. Its aim and historical action is visibly and irrevocably foreshadowed in its own life situation as well as the whole organisation of bourgeois society today. There is no need to explain here that a large part of the English and French proletariat is already conscious of its historic task and is constantly working to develop that consciousness into complete clarity. (Marx and Engels, 1975: 36–7)

However, in order to appreciate the claims which Marx and Engels were making about the revolutionary capabilities of the working class we need to compare them with those of its bourgeois adversary.

THE BOURGEOISIE AND THE PROLETARIAT AS REVOLUTIONARY CLASSES

One might have expected the discovery of the proletariat as a revolutionary class, and the identification of the various ways in which it was distinct from the bourgeoisie, to merely strengthen Marx and Engels in their existing conviction that only the forthcoming proletarian revolution could be regarded as genuinely social. In fact, it is precisely at this moment that they extend the concept backwards in history to identify the bourgeois revolution. Discovering the capacities of the working class as a revolutionary agent in relation to capitalism led Marx and Engels to perform the same investigation for the bourgeoisie and feudalism, but they did so at the very moment when the bourgeoisie was retreating into what Marx would later refer to as ‘the bad conscience and the evil intent of apologetic’ (Marx, 1976c: 97). Essentially, Marx and Engels exchanged positions with their bourgeois contemporaries: where the latter increasingly denied that the revolutions against feudalism were social revolutions and, like Locke before them, now defined them in political terms, Marx and Engels affirmed the opposite, but without accepting that these were the only such revolutions that had ever happened or would ever happen. Revolutions had occurred earlier in history and would happen again in the form of the socialist revolution, which, by ending the existence of antagonistic social classes, would genuinely be the last social revolution. As Lukács later pointed out:

One of Marx’s greatest theoretical achievements was to distinguish clearly between bourgeois and proletarian revolution. This distinction was of the utmost practical and tactical importance in view of the immature self-delusions of his contemporaries, for it offered the only methodological instrument for recognizing the genuinely proletarian revolutionary elements within the general revolutionary movements of the time. (Lukács, 1970a: 47–8)

If Marx and Engels were aware *in practice* of the difference between the two types of social revolution, their main theoretical discussion – by Marx in ‘The Class Struggles in France’ – was brief, highly impressionistic, and concerned more with style than substance – not least because they had no examples of proletarian revolution on which to draw, other than the defeated French uprising of June 1848 (Marx, 1973d). It is possible, however, to draw out the main distinctions from elsewhere in their work. For the purposes of this discussion, I will focus on the different forms of class agency involved.

The earliest successful examples of bourgeois revolution, in the United Provinces and England, involved leadership by mercantile, agrarian, and – in the case of the latter country – even industrial capitalists, although these tended to

be based in the countryside and the colonies rather than the metropolitan centres. There was a difference between the French Revolution and these earlier examples of bourgeois revolution from below: as a consequence of the relative success of the absolutist regime in retarding the development of capitalism, France was internally less developed in 1789 than England had been in 1640. But even those capitalists who had emerged in France were more inclined to reform than their predecessors, not least because of the risk that revolution posed to their property, which tended to be more industrial than agrarian or mercantile. From 1789 on, therefore, the nature of leadership in the bourgeois revolutions became increasingly removed from capitalists in the class structure: Robespierre was a lawyer, Danton a journalist, Roux a priest; only a very few of the leading French revolutionaries, of whom Pierre Louis Roederer was the most important, could seriously be described as capitalists. Nevertheless, figures of this sort were integral to the bourgeoisie as a whole, as is well conveyed by Gramsci's later discussion of 'organic intellectuals' (Gramsci, 1971: 5–6, Q12§3).

The connection between the non-capitalist and capitalist sections of the bourgeoisie is that both derive their income, directly or indirectly, from the extraction of surplus value from the proletariat, but the former were central to forming revolutionary leaderships for three reasons. First, precisely because they were not subject to competitive economic divisions within their class, these groups were often more able to express the common interests of the bourgeoisie as a whole than capitalists. Second, and conversely, they were prepared to *temporarily* violate capitalist property rights in order to better permanently enshrine them. The leadership of the French Revolution was forced to suppress bourgeois private property (Marx, 1975b). Third, because these revolutionaries still belonged to a minority exploiting class, albeit one broader than their feudal predecessor, they needed to involve other social forces, particularly the petty bourgeoisie, which, until 1848 at least, invariably provided the foot soldiers for the struggle with feudal absolutism.

The capacity of the non-capitalist bourgeoisie to represent a collective bourgeois interest, to abandon when necessary the immediate economic manifestations of that interest, and to unite classes outside the bourgeoisie was only possible because they tended to act from motives that were not strictly economic in nature. These motives varied over time but tended to be more concerned with religious or constitutional liberties than with removing absolutist impediments to the exploitation of wage labour. In no bourgeois revolution did the revolutionaries ever seek to rally popular forces by proclaiming their intention to establish a new form of exploitative society – a goal that peasants, small commodity producers, and workers might have been understandably reluctant to support – but did so instead by variously raising demands for religious freedom, representative democracy, national independence, and, ultimately, socialist reconstruction, although, as we shall see, with the last of these the dissociation between being and consciousness, between reality and representation, had become almost total. This should not surprise us, for as Marx noted:

A distinction is made in private life between what a man thinks and says of himself and what he really is and does. In historical struggles one must make a still sharper distinction between the phrases and fantasies of the parties and their real organization and real interests, between their conception of themselves and what they really are. (Marx, 1973d: 173–4; see also Marx, 1975d: 426)

In fact, of all the successive, if overlapping, ideologies under which the bourgeois revolutions were waged, only that of the Enlightenment can be genuinely described as originating within the bourgeoisie, rather than being adopted and adapted for bourgeois purposes. And of all the victorious bourgeois revolutions, only the French can be said to have been inspired by Enlightenment thought, which is only one of several reasons why this greatest of all examples is also the most exceptional.

Until 1848, however, revolutionary leadership did at least come from an actual section of the bourgeoisie, albeit one distant from the immediate process of production. Perhaps the most startling difference between bourgeois and proletarian revolutions is that the former could be carried out by classes quite distinct from *any* section of the bourgeoisie – including by fractions of the feudal nobility, such as those led by Bismarck in Prussia and Cavour in Piedmont. Until the early 1850s, the possibility of ‘bourgeois revolution from above’ was still a subordinate aspect of Marx and Engels’ thinking compared to their overwhelming stress on French-style ‘revolution from below’, a position that expressed the historical experience up to 1848. In so far as they did consider ‘revolution from above’, they saw the process as largely being one conducted ‘from outside’ by Napoleon’s armies across Europe. Post-1848, it appeared that such revolutions might also be possible ‘from within’.

In the decades that followed, the non-capitalist sections of the bourgeoisie, which had previously provided revolutionary leadership, who had been less paralysed by fear of plebeian radicalism and more prepared to face down peasant reaction, were increasingly integrated into a society in which their former frustrations and humiliations were rapidly becoming things of the past. While all bourgeois revolutions involve a ‘passive’ element in the sense that they involve larger or smaller minorities taking power in the state, after 1849 the top-down aspect became more dominant as the result of two related factors, both products of the growth and dynamism of the capitalist system. The first was the emergence of the working class as a social force, compelling a formerly revolutionary bourgeoisie to seek accommodation with the existing regimes rather than risk igniting a conflagration that might engulf them. The second factor was the availability of agencies that could provide capitalist leadership in the place of this increasingly cautious bourgeoisie.

Among later Marxists, Gramsci had perhaps the greatest insight into the process of bourgeois revolution from above, or what he called (in this context) ‘passive revolution’ (Gramsci, 1971: 115, Q10II§61 and 182, Q13§17). Gramsci identifies three main characteristics of passive revolution in Italian history, although these

are more generally applicable. The first was a favourable geopolitical context: the very conflicts and rivalries which the emergent capitalist system engendered provided a space and opportunity for new participants to emerge (Gramsci, 1978). The second was the key role of a dynamic territorial area as the active core within the process of state formation – Piedmont in the case of Italy – operating over the head of the local bourgeoisie (Gramsci, 1971: 105). The third was the establishment of a new leading group involving elements of the old, and the consequent ‘formation of an ever more extensive ruling class’ (Gramsci, 1971).

Finally, once the bourgeois revolution had established a state capable of acting as a territorial centre of capital accumulation, what relationship did it have to the actual bourgeoisie, particularly the economic core of that class? Here, too, there was no need for them to be directly involved. Marx and Engels famously wrote in the ‘Manifesto of the Communist Party’: ‘The executive of the modern state is but a committee for managing the common affairs of the whole bourgeoisie’ (Marx and Engels, 1973: 69); but this did not mean that the ‘executive’ *consisted* of members of the bourgeoisie. As Engels noted 20 years later:

It is a peculiarity of the bourgeoisie, in contrast to all former ruling classes, that there is a turning point in its development after which every further expansion of its agencies of power, hence primarily of its capital, only tends to make more and more unfit for political rule. (Engels, 1987: 97)

Under all pre-capitalist modes of production, exploitation took place visibly through the extraction of a literal surplus from the direct producers by the threat or reality of violence: economics and politics were ‘fused’ in the power of the feudal lord or the tributary state. Under the capitalist mode of production, exploitation takes place invisibly in the process of production itself through the creation of surplus value over and above that required in reproducing the labour force. This is the basis of the famous ‘separation of the political and the economic’ which makes capitalism unique among class societies.

Marx and Engels therefore acknowledged that bourgeois revolutions could be the work of a number of different social forces; in their view, socialist revolutions, however, could not, since they would be *constituted* by the process of working-class self-liberation. This emphasis on the working class as agency should not obscure the fact that Marx and Engels saw it as being the core of a much *wider* revolutionary agency. The socialist revolution would require ‘the social movement’, a term widespread throughout socialist and communist circles at the time (Marx and Engels, 1976: 486). By the mid 1840s, Marx and Engels had identified the proletariat as the only force capable of achieving the social revolution, but they did not regard it as acting entirely alone – the minority position of the working class on a global scale, even at the time of Engels’ death, in 1895, precluded that. Their position seems rather to have been that workers would act as both the political leadership and the organizational core of the social movement as a whole. Indeed, towards the end of his life Marx claimed that in some situations,

above all that of British rule in Ireland, it might be the colonial peoples who would initiate the process of social revolution; this was why, he wrote in a letter to Engels at the end of 1869, 'the Irish question is so important for the social movement in general' (Marx, 1988: 396).

Nevertheless, the working class plays a unique historical role, in three respects. The first, which is really a concretization of Marx's description of the working class as possessing 'radical chains', is that it alone has the potential to become a universal class. One reason for this is that it has no property. Marx and Engels wrote of capital: 'In order to become an "unendurable" power, i.e., a power against which men make a revolution, it must necessarily have rendered the great mass of humanity "propertyless", and moreover in contradiction to an existing world of wealth and culture' (Marx and Engels, 1976: 48). The process that characterized the origins of the system was the reduction of peasant farmers and urban artisans from people who had previously owned or controlled their means of production, and hence were able to provide for their own subsistence, to people who had nothing but their ability to labour and were therefore compelled to sell it in order to survive. Being propertyless does not, of course, mean that workers have no personal possessions, but these are simply commodities, not the means of accumulating capital.

The second respect is that the working class is forced to behave collectively. Factories, mines, and offices cannot be divided between their workers in the way that, for example, a landed estate can be divided up by peasants. As this suggests, it is not the case that the simple existence of the working class as an economic formation gives it the structural capacity for revolution. Wage labour is more than necessary to capital: along with competitive accumulation, it is constitutive of the system, but wage labourers have not necessarily been capable of challenging for power at every stage in the development of capitalism. Rural labourers and domestic servants comprised the majority of workers in the eighteenth and nineteenth centuries respectively, but neither was in a position to overthrow the system. It is therefore not only the creation of a working class that we owe to capitalism, but the particular way in which capitalism concentrates workers together into collective situations. The very fact of gathering workers together has a perverse if unavoidable outcome for employers: it creates the possibility of the exercise of their collective strength in addition to the actuality of their collective exploitation.

The third respect is that it is the first exploited (as opposed to oppressed) class in history which is capable of making a revolution on its own behalf. Unlike the peasantry, it is structured collectively and is therefore the basis of a new form of social organization in a way that the former can never be. Unlike the bourgeoisie, it has the numeric size and structural capacity to rebuild society without using another class as an instrument to destroy the existing system: the working class is not an alternative exploiting class to the bourgeoisie and it will not be transformed into one by victory. Consequently, the 'everyday' class struggles between exploiters and exploited and the 'transformative' struggles for social revolution are linked by the

fact that the same classes are involved: the former always contains the possibility of the latter. Nevertheless, it is only through the transformative process of taking power that workers can throw off the legacy of years of enforced servility or misdirected anger that capitalism inculcates:

Both for the production on a mass scale of this consciousness, and for the success of the cause itself, the alteration of men on a mass scale is necessary, an alteration that can only take place in a practical movement, a *revolution*; the revolution is necessary, therefore, not only because the *ruling* class cannot be overthrown in any other way, but also because the class *overthrowing* it can only in a revolution succeed in ridding itself anew of all the muck of ages and become fitted to found society anew. (Marx and Engels, 1976: 52–3)

Yet the form taken by that revolution underwent several changes in Marx and Engels' writings, not least because – as noted earlier – they had no successful examples on which to draw. The key problem was the attitude of the working class towards the state.

The bourgeois revolutions involved the establishment of capitalist nation-state forms capable of acting as territorial centres of accumulation; but as accumulation grew and with it the working class, the question of the latter's democratic rights became ever more sharply posed. The ruling classes assumed that if the working classes had the vote, they would surely use it to deprive them, their masters, of their property. Marx and Engels initially thought so too – that is the meaning of the 'battle for democracy' referred to in the 'Manifesto of the Communist Party'. Here, Marx and Engels argue for the proletariat to take control of the existing state and 'wrest, by degrees, all capital from the bourgeoisie ... centralize all production in the hands of the state, i.e. of the proletariat organised as a ruling class' and only in the future ('in the course of development') after a period in which, having 'swept away the conditions for the existence of class antagonisms and of classes generally', will we have 'an association, in which the free development of each is the condition of the free development of all' (Marx and Engels, 1973: 86–7).

Marx's writings of the early 1850s, particularly in relation to France, show a shift from this position, no doubt as a result of the experience of the revolutions of 1848–9. In particular, the process of taking over the state is no longer a gradual process, but a violent act of seizure leading to what he now called 'the dictatorship of the proletariat' (Marx, 1973c: 123). But while this conception, like its predecessor, certainly envisages the abolition of social classes, it still involves utilizing the existing state apparatus, until there is no longer any need for it. As both men wrote in a relatively obscure book review from 1850: 'The abolition of the state has meaning for Communists, only as the necessary consequence of the abolition of classes, with which the need for the organised might of one class to keep the others down automatically disappears' (Marx and Engels, 1978: 333). There is no suggestion at this point that the working class will have to *destroy* the existing state and *replace* it with another, and that it is this latter form which will dissolve with the transition to full communism.

In 1852, Marx noted of the French state under Louis Bonaparte: ‘All political upheavals perfected this machine instead of smashing it’ (Marx, 1973d: 238); yet he does not then go on to argue that this state should be smashed rather than taken over. It took nearly 20 years for Marx and Engels to arrive at the former conclusion, and, as was typical of their approach, it was only after absorbing the theoretical implications of a new development in the class struggle: the Paris Commune of 1871. The change in attitude to the state, from conquest to destruction, is decisive here. In ‘The Civil War in France’, Marx expressed his new-found discovery that ‘the working class cannot simply lay hold of the ready-made state machinery, and wield it for its own purposes’ (Marx, 1974: 206):

The multiplicity of interpretations to which the Commune has been subjected, and the multiplicity of interests which construed it in their favour, show that it was a thoroughly expansive political form, while all the previous forms of government had been emphatically repressive. Its true secret was this. It was essentially a working-class government, the product of the struggle of the producing against the appropriating class, *the political form at last discovered* under which to work out the economical emancipation of labour. (Marx, 1974: 210, 212; emphasis added).

The process of transition therefore *begins* with the destruction of capitalist states and the substitution of transitional forms of highly democratic public authority (‘states that are not states’), but only as the prelude to their ultimate self-dissolution, as capitalist (and in some cases residual pre-capitalist) productive relations are replaced by socialist ones. In that sense, the transition to socialism involves the withering away of both the market *and* the state.

PERMANENT REVOLUTION: THE WORKING CLASS IN THE BOURGEOIS REVOLUTION

What level of capitalist development was necessary for socialism? At one point in *The German Ideology*, Marx and Engels seem to suggest that the forces of production would need to exist at a globally even level of development before socialism was possible (Marx and Engels, 1976: 49, 51). During the later 1840s, their attention became focused on Europe and its colonial-settler extensions in North America, which they saw as decisive and where the situation was relatively straightforward. Capitalism was the dominant mode of production only in parts of Western Europe and the eastern seaboard of the USA, and industrialization was still more narrowly focused. Elsewhere the bourgeoisie were still politically and socially subordinate to the Old Regime. The task for communists was therefore to encourage the bourgeois revolutions which would overthrow the feudal-absolutist states, remove the structural obstacles to capitalist development, and thus create the material basis for the international working class that would make socialism a possibility. The working class had an interest in overthrowing absolutism, and their methods were required to do so, methods from which the bourgeoisie themselves shrank:

Therefore, where they stood in opposition to the bourgeoisie, as for example in 1793 and 1794 in France, [the plebeians] were fighting for the implementation of the interests of the bourgeoisie, although not *in the manner* of the bourgeoisie. The *whole of the French terror* was nothing other than a *plebeian manner* of dealing with the *enemies of the bourgeoisie*, with absolutism, feudalism and parochialism. (Marx, 1973a: 192)

This raises two questions. The first concerns the revolutionary capacity of the bourgeoisie even at its most radical. The issue here was not simply the lack of social weight possessed by the bourgeoisie and its consequent need for allies; it was that the majority of its members would not *in any case* have demanded the necessary action without being pushed from below (Marx, 1976b: 319). Marx's contrast between economic readiness and political vacillation suggest that the self-restraint of the bourgeoisie as a revolutionary class and the consequent need for representatives of another social class to substitute for it in the realm of political action did not begin in Germany in 1848, but had a longer lineage dating even further back in time than the French Revolution. From the Dutch Revolt onwards, popular forces had been necessary to ensure victory over the absolutist regime but had also threatened to take the revolutions in a more radical direction than the bourgeoisie themselves were prepared to contemplate, above all in relation to democracy. The French Revolution showed this process in the most developed form; its most committed opponents, like Burke, and members of its extreme left, like Babeuf, understood the logic of escalation as a threat, in the case of the former, or as a promise, in the case of the latter (Burke, 1968; Babeuf, 1920). In reality, however, both men misunderstood what the outcome could have been. For even in France between 1789 and 1794, the social forces involved were incapable of sustaining the new society of equality, with the result that it fell back into what was historically possible at the time – in other words, a bourgeois regime.

The second question facing Marx and Engels as 1848 drew near was therefore whether this was *still* the only viable result that could be expected from the incipient German Revolution. Marx warned in 1847 that central though the plebeians would be to victory over the Old Regime, they would not hold on to power (Marx, 1976a). In 1847, Marx believed that the material conditions did not exist for the proletariat to overthrow bourgeois rule; by 1850, he argued that if not already existent, they could be established in a very short time: this change of position was the basis of the new strategy of 'permanent revolution'.

Marx and Engels may have been among the first people to refer to 'permanent revolution' in print, in 1843 and 1844 (Marx, 1975b: 222; Marx and Engels, 1975: 123). It was not, however, a concept exclusive to them but one common to members of 'the Democracy', the alliance of the petty bourgeoisie, peasantry, and working class to the left of the bourgeois liberals. Their goal was the Social Republic – not socialism, but a regime modelled on the Jacobin state at its most radical; in other words, one that went beyond the limits of bourgeois acceptability. During the course of the German Revolution of 1848, Marx and Engels held three versions of permanent revolution, each successively more radical as the unwillingness of

the bourgeoisie to confront the absolutist regime grew more apparent. In the first, the bourgeoisie would ally with the Democracy to overthrow the existing regime, after which the Democracy would remove the bourgeoisie to establish the Social Republic. The second, formulated when it became apparent that the bourgeoisie were more concerned with a potential threat to their property than with absolutism, involved the Democracy striking out on its own for the Social Republic – still remaining within the boundaries of capitalism, but intent on opening up the way for rapid capitalist development while a new revolution was being prepared. The third, formulated when it also became apparent that the leaderships of the non-working-class elements of the Democracy were no more willing to take the revolution forward than the bourgeoisie proper, involved the proletarian revolution as the only alternative to counter-revolution, but on the basis of an international movement led by the more advanced working classes, most importantly in France and Britain. Here, finally, is the idea that the escalation characteristic of the French Revolution would, in the new conditions of more advanced capitalist development, lead to the victory of the proletariat (Draper, 1978).

It is the third and final version of permanent revolution that is incorporated in the most radical text written by Marx or Engels during this period: the ‘Address to the Central Committee of the Communist League’ of March 1850. Two themes emerge from the main body of this work: first, that the liberal bourgeoisie and the social-reformist Democracy would be the most dangerous enemies of the working class when in power; second, and consequently, the working class needed to retain absolute organizational and political independence (Marx, 1973b). The reference to ‘make the revolution permanent’ in the address and the concluding sentence (‘their battle-cry must be: The Permanent Revolution’) might lead to the conclusion that Marx anachronistically saw socialism as being immediately realizable. In fact, apart from this climactic rhetorical flourish, Marx argues for a more realistic agenda throughout (Marx, 1973b). German workers must maintain their organizational and political independence from the petty bourgeoisie to push the latter class beyond the satisfaction of its own demands and to continue pressing their own class interests even after the feudal-absolutist state has been decisively overthrown. Marx confirmed this position later in the same year in *The Class Struggles in France*:

Given this general prosperity, wherein the productive forces of bourgeois society are developing as luxuriantly as it is possible for them to do within bourgeois relationships, a real revolution is out of the question. Such a revolution is possible only in periods when *both* of these factors – the *modern forces* of production and the *bourgeois forms of production* – come into opposition with each other. ... A new revolution is only a consequence of a new crisis. The one, however, is as sure to come as the other. (Marx, 1973c: 131)

For Marx and Engels, workers not only *could* not retain power, they *should* not seek to do so. ‘We are devoted to a party which, most fortunately for it, cannot yet come to power’, said Marx at a meeting of the Central Authority of the Communist League late in 1850: ‘If the proletariat were to come to power the

measures it would introduce would be petty-bourgeois and not directly proletarian. Our party can only come to power when the conditions allow it to put *its own* views into practice' (Marx, 1978: 628). Marx's contrast between economic readiness and political vacillation suggest that the self-restraint of the bourgeoisie as a revolutionary class and the consequent need for representatives of another social class to substitute for it in the realm of political action did not begin in Germany in 1848 but had a longer lineage dating even further back in time than the French Revolution. The corollary is that the actors who do carry through the revolution on behalf of the bourgeoisie are likely to find their own goals impossible to attain, as was pointed out in a classic passage by Engels from 1850, on the role of Thomas Münzer in the German Peasant War of 1525. While Münzer represented the communist aspirations of the peasantry, these were unrealizable at the time since the only social force actually capable of achieving them, the working class, did not yet exist in sufficient numbers to act as an agency; as a result, all that Münzer could have hoped to achieve were the goals of the bourgeoisie, 'the class for whom conditions are ripe for domination', even though they had signally failed to enter the field on their own behalf (Engels, 1978: 469–70).

Part of the case Engels wanted to convey is that the German bourgeoisie has always been vacillating and untrustworthy, in 1525 as in 1848. In fact, it is questionable whether the German lands were even ready for domination by capitalism at this period. The essential point had been made by Marx in relation to contemporary Germany during 1847:

If therefore the proletariat overthrows the political rule of the bourgeoisie, its victory will only be temporary, only an element in the service of the *bourgeois revolution* itself, as in the year 1794, as long as in the course of history, in its 'movement', the material conditions have not yet been created which make necessary the abolition of the bourgeois mode of production and therefore also the definitive overthrow of the political rule of the bourgeoisie. (Marx, 1976b: 319)

Towards the end of his life, Engels concluded that he and Marx had been over-optimistic: 'History had proved us, and all who thought like us, wrong. It has made clear that the state of economic development on the Continent at that time was not, by a long way, ripe for the elimination of capitalist production' (Engels, 1990: 513). In fact, the appearance of a working class large and militant enough to overthrow capitalism occurred some decades after 1848, following the consolidation of bourgeois states in Central and Southern Europe, North America, and Japan during the 1860s – at some point between the Paris Commune of 1871 and the Russian Revolution of 1905. If a symbolic date is required, then we might settle on 1889, the year during which the Second International was launched. Confirmation might also be found in the literature of the time. William Morris' *News from Nowhere*, first published in 1890, a year after the International was reborn, is perhaps the first novel to imagine a socialist future not as a miraculous or unexplained event, but as the result of a revolutionary process which became possible at the time the book was written (Morris, 1920).

CONCLUSION

Revolutionary change is more desperately urgent than ever but we do not know any more what revolution means. (Holloway, 2002: 215)

In a lecture of 1887 entitled ‘The Policy of Abstention’, William Morris identified the two ‘courses’ which could be followed by the bourgeois as ‘fraud and force, and doubtless in a commercial country like this the resources of fraud would be exhausted before the ruling class betook itself to open force’ (Morris, quoted in Thompson, 1976: 457). Exploiting classes have always displayed a far greater awareness of their position than the majority of those whom they exploit – indeed, this is a precondition of their continuing to exploit them. Exploited classes, on the other hand, have shown far less awareness, but it would be wrong to say that any worker who is not committed to the revolutionary overthrow of capitalism is not class-conscious. On the contrary, the levels of consciousness between failing to even recognize oneself as a member of the working class and recognition of the revolutionary role of the working class are occupied by the particular form of class consciousness produced by the tension between accepting the system as an unchanging feature of human society and rejecting the way in which specific aspects of it negatively impact on the lives of working-class people. For most workers, most of the time, it is the norm, not the exception. In this sense, Lenin was absolutely right to argue that:

there could not have been Social-Democratic consciousness among the workers. It would have to be brought to them from without. The history of all countries shows that the working class, exclusively by its own effort, is able to develop only trade union consciousness, i.e., the conviction that it is necessary to combine in unions, fight the employers, and strive to compel the government to pass necessary labour legislation, etc. (Lenin, 1961: 375)

The notion of ‘trade union consciousness’ is not, however, a particularly helpful one, since the type of reformist consciousness Lenin describes can and does exist outside of trade unions, whose members have always tended to be a minority of the world working class.

It is not true that socialism will arise automatically from the daily struggle of the working class. Socialism will be the consequence of (1) the growing contradictions of capitalist economy and (2) the comprehension by the working class of the unavoidability of the suppression of these contradictions through a social transformation. (Luxemburg, 1970: 59)

The ascent to revolutionary class consciousness occurs when workers see that the negative aspects of their lives are neither accidental nor incidental, but direct effects of how the system operates, *and* that it is possible to replace that system in its totality. If the working class has not successfully acted as a revolutionary class in the way Marxist theory holds that it should, this is not because of a structural incapacity, but rather the continued operation of bourgeois hegemony, which can be successfully challenged, but only if contemporary revolutionaries can combine appropriate organizational forms with an effective strategic orientation.

State

Heide Gerstenberger

Marx had planned to complement his analysis of capital with an analysis of the state in order to develop a comprehensive critical understanding of bourgeois society. Since he was not able to put this into practice and never completed the intended volume on the state, we have to rely on the bits and pieces which are to be found in his other writings. As far as the state is concerned, the most well-known of these is the 'Preface' (1971 [1859]) to 'A Contribution to the Critique of Political Economy'. Here Marx introduced the concept of a 'superstructure' arising on the foundation of the 'economic structure of society' or the 'mode of production of the material life'. Identifying the state and political and legal relations more generally as part of the superstructure serves Marx as a means to counter concepts of history which assume it is the so-called general development of the human mind that determines history. Unfortunately, this Preface, time and again, has not been understood as a preliminary outline of a concept intended for further analysis but as the summary of already achieved results. It was thereby wrongly turned into one of the cornerstones of orthodox Marxism.¹

There are many explanations in Marx's writings which should have prohibited this orthodox reading. But his conception of the history of mankind as an inevitable sequence of progressive stages didn't just inspire political activists, it also invited the dogmatization of his concepts. This philosophy of history was already spelt out in the political 'Manifesto' which Marx and Engels prepared for the Congress of the Communist League in 1848. The way they explained that the transition from capitalism to communism would inevitably occur was to

argue that in the history of mankind the development of the productive forces was accompanied by certain social and political relations such as property relations, which would ‘burst asunder’ whenever they became fetters to the further development of the productive forces. This philosophy of history is also present in the chapter on the ‘so called primitive accumulation’ in Volume I of *Capital*. While most of the analysis in *Capital* is focused on the basic structures of capitalism, this chapter outlines the prehistory of capitalism and its future. Marx explains that at a certain stage of development capitalism will bring forth ‘the material agencies for its own dissolution’. The old social organism ‘must be annihilated. It is annihilated’ (1974 [1887]: 714). Since history has not confirmed the philosophy of progress, which is present in these explanations, it cannot be considered a promising starting point for a Marxist theory of ‘the state’.

ON THE HISTORICAL SPECIFICITY OF CAPITALIST STATES

Against the Hegelian conception of the state as ‘the reality of the ethical idea’, Friedrich Engels insisted that the state is the product of society itself. His explanation focuses first on the institution of certain functions for society as a whole and second on the image of the state as a third power which becomes necessary once society is characterized by an ‘irreconcilable [class] antagonism’ (1962 [1884]:135).² Since society is ‘powerless to dispel’ this antagonism, policies and regulations are necessary to stabilize the existing society. As part of these explanations Engels transfers concepts which Marx developed for the analysis of the bourgeois capitalist state to historical epochs that preceded bourgeois society. Against this method we have to insist that pre-capitalist forms of domination were instruments for the appropriation practices of those in power. And if anything like the image of a power which stood aloof from social and political conflict did indeed exist, it consisted in the symbolic practices employed as part of the responsibility of kings to safeguard the benevolence of the Almighty vis-à-vis their subjects. The ideological mediation of pre-capitalist forms of domination (Konings, 2005: 98) has never gone so far as to disguise their instrumentality for the appropriation practices of those in power.

Referring to Engels’ explanations as expressions of the fundamental concepts of Marxism, W. I. Lenin also advances the idea of a double function of states. For him they are organizations which further the development of the productive forces and ‘organs’ of class domination. While Engels had assumed a whole range of possible state functions, for Lenin states were above all a ‘specific power of repression’. Even though this is historically more adequate than Engels’ concept of a ‘third power’, Lenin uses this conception for the integration of state theory into the Bolshevik theory of revolution: once revolution will have been set in motion, the state (i.e. the institution of repression) will not wither away,

but will become the instrument of the proletariat for the final victory over the expropriators (1993 [1918]).

Apart from these versions of the supra-historical characteristics of states, supra-historicity as such has long been present in Marxist writings. This already started with Marx himself who – in the context of Vol. I of *Capital* – did not differentiate between the practices of the owners of personal power in pre-capitalist societies (who furthered the exploitation of faraway people and aided practices of dispossession against people nearer to home), and the bourgeois capitalist state (which decreed the English factory acts, thereby helping to safeguard preconditions for the continuing exploitation of wage laborers but also furthering their possibility to stay alive).

Another example of this sort of reasoning is contained in Immanuel Wallerstein's hypothesis that from the sixteenth century onwards world trade constituted the beginning of capitalism and thereby furthered the development of strong states in the core areas of the European world (1974: 134). In this context he evidently had to conceive of the states in question as early versions of their later forms. These supra-historical concepts of state are very close to the mainstream explanation of the history of the state as an expansion and refinement of its institutional elements.³

THE CONUNDRUM OF SEPARATION AND ALIENATION

It was against the focus on trade as the determining precondition for capitalism that Robert Brenner explained and insisted that, in England, capitalism began with the violently pursued transformation of agrarian production into market production. By focusing on the very specific English development, Robert Brenner and those Marxists who rallied under the label of 'Political Marxism' declared complete market dependency of laborers to be the defining characteristic of capitalism. This not only placed the separation of the economy from the state center stage but it also led to the assumption that the English road to capitalism could be taken as a general pattern. The theoretical exclusion of extra-economic forms of exploitation favored analytical deviations from concrete historical analysis.⁴ That it also narrowed down the theoretical conception of capitalist states is evident in Ellen Meiksins Wood's (2002a [1999]: 169) theory of the capitalist state. It is based on the structural separation of two distinct processes with their own logics. Her analysis of the French state at the beginning of the nineteenth century is telling. In Wood's opinion (2003: 120–121), it should not yet be considered a capitalist state because state offices continued to be a dominant form of property, and the holders of these offices lived on the taxes which had to be paid by peasants. But when the French Revolution dispossessed the owners of legal rights of domination, it thereby also transformed state offices into occupational positions. Even if they offered the possibility to become rich,

competences of state were no longer forms of private property. The explanation of the separation of the state from society as the origin of the capitalist state, which is dominant among scholars who have accepted to be called ‘Political Marxists’, is not in accordance with Marx’s conception of the separation of the state from civil society.⁵

This was first spelled out in Marx’s (1843: 277, trans. 1970: 22) discussion of Hegel’s *Philosophy of Right*. He started out by confirming Hegel’s statement, that the specificity of the modern state, as distinguished from organizations of power in pre-capitalist societies, is its separation from the ‘materialism of civil society’. In his discussion of Bruno Bauer’s *Zur Judenfrage* (1844: 343–377, trans. 2008/09: 9) Marx then explained that the state abolishes distinctions of birth, social rank, education and occupation when ‘it proclaims, without regard to these distinctions, that every member of the nation is an equal participant in national sovereignty’ (1844: 354, trans. 2008/9: 8).⁶ But outside of the state all of these distinctions continue to exist, because the state allows private property to determine transactions in civil society. Citizens, therefore, lead a twofold life: as communal beings in the political community and as private individuals in civil society. When Marx declared the relation of the political state to civil society as being ‘just as spiritual as the relation of heaven to earth’ (1844: 355), he designated the modern state as the expression of the communion of citizens, albeit in an alienated form.⁷

‘Political Marxism’ is just one of the many examples of Marxist approaches to the analysis of the capitalist state which are void of any concept of alienation. But it is this theoretical concept which more than anything else differentiates Marxist state analysis from mainstream conceptions of the state (see also Reitter, 2011: chapter 13). That its outline is to be found in writings of Marx which preceded his analysis of capitalist production, but is not referred to in *Capital*, can be taken as an example of the difficulties one has to deal with when endeavoring to make use of this concept of separation and alienation for concrete analyses. The first and foremost precondition for any such analysis is the acceptance of the historical specificity of bourgeois capitalist states.

Historically, the constitution of the state as a public realm was arrived at through struggles against privileges, i.e. the lawful usage of means of power for private appropriation (Gerstenberger, 2009 [2007] [1990]: part III). Together with the advent of the concept of corruption as the illegal usage of state power for private ends (which, indeed, marked the goal of separating the spheres of politics and economy), the legal definitions of citizenship proclaimed that the state is separated from the inequalities which reign in society, thereby constituting national states as the (alienated) expression of the communality of citizens. Even if, in the historical process of its constitution, this separation has, sometimes more, sometimes less, also taken on the form of a separation between the political and the economical, this separation of functional spheres is not the essence of bourgeois/liberal capitalist states.⁸ Therefore, if states intervene in the economy or

transform private property into the property of the state, they thereby change the relation of the sphere of politics into the sphere of the economy without changing the essential character of the bourgeois/liberal state as the alienated expression of communality. The same holds true for the creation of private–public partnerships, and private bodies which enact government functions. It could be discussed, however, that the use of private military forces as well as of private prisons infringes on the state monopoly of legal uses of violence and thereby on the state as representing the unity of society.

Contrary to the historical explanation of the constitution of states as alienated forms of the communality of citizens, the so-called derivation school of Marxist state theory derived separation and alienation by way of logical reasoning from the basic structures of the political economy of capitalism as explained in *Capital*. Adherents to this theoretical approach upheld that just like highly developed capitalism needed the legal form of the labor contract, it also needed the representation of communality which is the state. Since these necessities follow logically from the basic structures of capitalism, the empirical reality of capitalist states must necessarily result in their adjustment to this principle. Proponents of this concept took their theoretical starting point from a question which Eugen Paschukanis asked (1970 [1929]: 119) when he inquired why, under capitalism, the apparatus of coercion was no longer directly organized as a private apparatus of the dominant class, but had, instead, taken on the form of an impersonal public power which was separated from society. His answer focused on the fact that in capitalist societies, laborers as well as capitalists are owners of commodities. Their communality, therefore, exists in the interest of having their property safeguarded by law, i.e. by an institution which is formally separated from class conflict. Notwithstanding the objections which can be formulated against Paschukanis' theory,⁹ the so-called 'Paschukanis Question' should be retained as an attempt to explain the structural limits of reforms. By sanctioning private property regardless of the fundamental differences between the property of one's labor power, the small private property of consumers, and the property in means of production, the state sanctions the social preconditions of capitalism. Therefore, the transformation to socialism would necessitate the violation of law, hence the destruction of the state. In other words, the class character of the bourgeois/liberal state is not defined by politics, but is already inherent in its basic form. It is the state's capacity to safeguard private property.

The derivation debate achieved a theoretical conception of the limits to any reformist strategy and thereby also of the theoretical limitation of any state analysis, which is focused on state functions and political strategies. It developed in the 1970s, hence at a time when political conditions in European capitalist societies seemed to confirm the assumption that developed capitalist societies need to institute equality of law in the face of their inherent social inequalities. The derivation debate, however, was no exception to the rule that whenever concepts of historical necessity come to reign Marxist analysis, the relevance of history

is reduced to the illustration of preconceived knowledge. To rely on logical derivation and thereby dispense with the necessity to analyze specific historical conditions which lead to the constitution of bourgeois/capitalist states not only prevented the proponents of this approach from being able to analyze the later developments of these states. It also stopped them from theoretically grasping the specificities of capitalist states which differ from the bourgeois capitalist form. If the political forms which resulted from bourgeois revolutions have become functional for the stabilization of social relations in highly developed capitalist societies, this has been brought about by political struggles and should, therefore, not be mistaken as the logical consequence of the basic structures of capitalism which have been spelled out in *Capital*.¹⁰

While I, for one, insist on the fundamental insight that is to be gained from the theoretical focus on the form of the state, its applicability to the analysis of concrete historical developments is limited. This became evident when the specific social and political situations which had developed after World War II came to an end. The focus on structural limits of reform all but disappeared. Instead, Marxists, once again, rather endeavored to explain politics.

HOW TO EXPLAIN STATE FUNCTIONS AND POLITICS

Since the early attempts to grasp the specificities of imperialism, the endeavor to explain politics has been an ongoing preoccupation of Marxist scholars. Notwithstanding their continuous membership in communist parties (until they were expelled), more and more of them left the theoretical confines of 'Marxism-Leninism'. While scholars in the Soviet Union and the German Democratic Republic modernized the concept of 'base and superstructure' into the concept of states as instruments for the interests of monopoly capital, Marxist state theoreticians in the West attempted to grasp the complexity of the causes of politics. While some took Louis Althusser's suggestion of many different state apparatuses as a starting point, it was the turn to Antonio Gramsci's concept of the integral state which decidedly marked the growing theoretical distance between these scholars and the Marxist orthodoxy.

The 'integral state' is explained as comprising all ideological and practical activities of the state, among them the organization of the consent of subaltern social groups (Becker et al., 2013: 70). Peter D. Thomas (2009: 68-9) convincingly argues that Gramsci neither conceived of the political and the social as two separate terrains nor conceptualized them as fused.¹¹ Instead, Gramsci understood civil society as well as political society as ideological forms which form part of the superstructure. This concept went beyond the traditional definition of the state as consisting of its bureaucratic and repressive apparatuses plus parliament. According to Gramsci, ideology is an objective reality which should neither be conceived of as a simple reflection of social reality nor as an illusion. Instead, it is an important

terrain for the acting out of social struggles, i.e. of struggles to determine hegemony.¹² The term ‘historical block’ was used in this context to describe historically specific political alliances. But as much as these concepts helped to further historical analysis of political strategies because they no longer simply assumed that states were the instruments of dominant classes, they nevertheless limited the theory of the capitalist state to the condensed expression of private interests.

Gramsci’s prison notebooks set off the trend to dissociate theoretical conceptions of the capitalist state from its legal form. The most radical version of this tendency has been advanced by Ernesto Laclau and Chantal Mouffe. In their conception of a discursive theory of the political, the state apparatus is no longer accorded any relevance. Its separation from society is theoretically abolished. The state is dissolved into ‘the political’, the latter to be understood as the field of struggles for hegemony *qua* articulatory or ‘discursive’ practices. A social formation is thought to be shaped by constantly changing ‘nodal points’ (Laclau and Mouffe, 1991 [1985]: 241).

According to Nicos Poulantzas, it was the theoretical shortcomings of the Second and the Third International that determined the absence of a theory of the state. This led to the Comintern’s disastrous analysis of fascism. Poulantzas sharpened his own conception of the state by criticizing Ralph Miliband’s assumption that the class character of the state is based on personal relations between the ruling class and the personnel of the state (2009 [1969]). Against Miliband, Poulantzas insisted that the state personnel actualizes the class character of the state through its objective function in the state apparatus (1969, reprinted in Martin, 2008).¹³ Following the example of Gramsci, Poulantzas suggested that the conception of the state should no longer be restricted to the ‘classical Marxist sense of the term’, i.e. the apparatus of repression, but include the economic and ideological apparatuses (2013 [1978]: 97). If the repressive apparatus always remains in place, it is the greater autonomy of the ideological apparatuses which enhances their possibility to maintain the cohesion of a social formation (1969, reprinted in Martin, 2008: 183–4). In other words, the relation of politics to the economy is not determined but dependent on the results of class struggle. Different from Gramsci (and especially from Laclau and Mouffe) Poulantzas distinguishes between state power and state apparatus, i.e. the material existence of the state. Though it is clear that this implies the state is neither to be conceived of as the instrument of the ruling class(es) nor as the direct reflection of the changes in the power relation between classes, Poulantzas’ formulation that the state is ‘the condensation of power relations’ (‘condensation d’un rapport des forces’) (2013 [1978]: 183–232) remains vague.

Poulantzas’ theoretical concepts evolved over time and some of his concepts, especially his explanation of the relative autonomy of the state, have provoked widespread criticism.¹⁴ That they continue to be present in debates about Marxist approaches to state theory is proof of the fact that Poulantzas struggled with theoretical problems which, as of yet, have not been convincingly resolved.

STAGES OF CAPITALISM AND STAGES OF CAPITALIST STATE FORMS

Not only Lenin's concept of imperialism, but also its modernized version 'Monopoly Capitalism' focused on the forms of market competition as decisive preconditions for state actions and hence also for the development of revolutionary movements. While 'Monopoly Capitalism' more or less disappeared from international debates after the end of the Soviet Union, the concept of stages of capitalism and hence of stages of capitalist states remains on the agenda of Marxist debates.¹⁵ In 1980, Nicos Poulantzas remarked that, until that point, he had assumed one cannot speak of a third stage after industrial capitalism and monopoly capitalism and that, therefore, he had thought 'authoritarian statism' should not be considered a distinct stage. But now he realized that the problems were 'much more complicated' and that 'authoritarian statism' should in fact be considered the political expression of the structural crisis of the capitalist state (1979 reprinted in Martin, 2008: 399). If his theoretical conclusions remained tentative, his remarks on the growing economic functions of the state 'which are plainly to be seen in the vastly increased state interventions in all spheres of social life' were soon to become general knowledge (1980, reprinted in Martin, 2008: 409).

In the 1970s French scholars proposed to conceive of historically specific stages of capitalism as being determined by the correlation between technological and social forms of production, on the one hand, and strategies of regulation, on the other. Taken together these factors are said to shape historically specific regimes of accumulation which are constituted as a result of crises. This analytical approach has come to be known as 'théorie de la régulation'. Early versions of the concept of regulation had been restricted to practices of setting wages and prices. But then Joachim Hirsch as well as Robert Jessop, while adopting its basic assumptions, criticized the absence of an analysis of the state. Jessop broadened the theoretical concept of regulation to incorporate an analysis of those institutional elements of states in advanced capitalist societies, which developed after World War II. Because, according to him, this development necessitates analyses which focus on economic and social policy, it is acceptable to analytically ignore the repressive functions of states (2005 [2002]: 1–3). He has since come to explain that states are constituted by historically specific strategic relations between state and society (Jessop, 2016). If this allows for historical contingencies and hence many variations of states in capitalist societies, he still retains a strong focus on institutional structures and even advances the notion of 'normal' and 'exceptional' versions of statehood in capitalist societies. By explaining that liberal bourgeois democracy is the 'adequate' form of state in societies where market-mediated accumulation is dominant (Jessop, 2016: 211),¹⁶ he, once again, gives structural conception preference over historical analysis.

Joachim Hirsch's introduction of regulation theory into Marxist state theory resulted in him suggesting the term 'Fordism'. According to Hirsch the Fordist stage

of capitalism was marked by new technological and social forms of production (of which the assembly line in the Ford factories was taken to be the symbol), and these forms of production not only correlated with new forms of (mass) consumption but also with the development of the interventionist state. Dominant political strategies were oriented towards social policy, thereby furthering class compromise. Endeavoring to integrate form analysis into the analysis of historical specificities, Hirsch stated that while processes of globalization provoked the advent of national competitive states, the national state remained the fetishized expression of society (1995: 118–119). But during the era of ‘Fordist statehood’, policies of the ‘national competitive state’ are no longer oriented towards domestic structures. Instead, governments now endeavor to unite wage-earners and capital owners in the goal to successfully compete on the world market (Hirsch, 1998: 75). Since these policies discriminate against interests which are different from those of globally competing capital owners, they endanger social stability (1998: 120). Strengthening national security capacities has, therefore, become one of the characteristics of national policies in the era of globalization. Hirsch’s terminological suggestions have been widely accepted. In the meantime, discussions about ‘post-Fordism’ or ‘neo-liberalism’ have even been followed up by discussions about post-neo-liberalism.¹⁷ Alex Demirović argues that notwithstanding the many changes in political strategies which have been provoked by the crisis of neo-liberalism, ‘the substance of politics has not changed’ (2009: 55). We should be very clear: the focus of these discussions is on politics. That this, more often than not, excludes the question of the historical specificity of capitalist statehood as such, is evident in the discussion about the nature of international institutions.

ON THE DIFFERENCE BETWEEN STATES AND STATE-LIKE INSTITUTIONS

Governments of capitalist states have long endeavored to establish internationally valid rules for economic activities as well as for decisions over war and peace. In the course of the twentieth century, and especially after World War II, the heretofore dominant practice of using international conferences for this goal was superseded by the establishment of a plethora of international organizations. The range of their areas of deliberation and decision-making, as well as the set-up of administrative structures, provoked discussions about the new possibility to make use of different political ‘scales’,¹⁸ but also about the ‘nature’ of these international organizations. Those, who, like David Harvey, suggest that they should be considered state-like institutions, argue that they decide international regulations and usually assume that these regulations are actually adhered to. According to William I. Robinson, state apparatuses are the instruments through which dominant classes enforce and reproduce class relations. And these apparatuses do not have to be national states (2002: 214f.). Those who object to

this interpretation usually focus on the fact that supra-state institutions are not able 'to perform the administrative and coercive functions that sustain the system of property and provide the kind of day-to-day regularity, predictability, and legal order that capitalism needs more than any other form' (Wood, 2003: 141).¹⁹ If international institutions are set up to reduce the range of policies that fall into the remit of national governments, their actual relevance is, nevertheless, limited by the sovereignty of nation states, hence dependent on changes in relative economic power and national policies. In any case, even if governments would decide to transfer many more competences to such institutions, these would not become the alienated expression of the communality of citizens, but remain international organizations.

ON BOURGEOIS AND NON-BOURGEOIS CAPITALIST STATES

For a very long time Marxists used the term 'bourgeois state' as a synonym for 'capitalist state'. But the term 'bourgeois state' came into use in Europe in order to differentiate the new political apparatus from its aristocratic predecessor. This mainstream historical use of the term is more precise than the traditional Marxist one, because – contrary to the assumptions in long-time dominant Marxist explanations – the legal constitution of the bourgeois state form did not necessarily coincide with capitalist forms of production becoming dominant in the respective states. Therefore, the term 'bourgeois state' should only be applied to those states which resulted from bourgeois revolutions and only for those periods in which laws expressly privileged the political influence of members of the bourgeoisie (Gerstenberger, 2009 [2007] [1990]: 679–80).

Post-colonial states are capitalist states, they are not bourgeois states. Their historical predecessors tried to prevent the development of a public in which individuals could strive to voice and pursue their interests. Colonial states were agencies for the exploitation of the dominated people and the natural resources of the lands they inhabited. When these apparatuses were transformed into post-colonial states, their history was not, at the same time, eradicated. Notwithstanding the fact that the constitutional forms which characterized the bourgeois state form have been adopted by many post-colonial states as well as by many post-socialist states, these have not thereby become bourgeois capitalist states. And if political oppositions in these states strive to make use of their constitutional rights in order to further their interests, they are not only confronted with opposing interests in the national context but also with the economic and political forces of present-day imperialism.

The sovereign competences of the first capitalist states were based on their acceptance by other states, but this, in turn, was based on the effectiveness of their power. If diplomacy has sometimes²⁰ led to the creation of sovereign states which did not fulfill this requirement, this phenomenon only became widespread

after the United Nations decided to 'grant' independence to colonial countries and people in 1960. Because coercion can now be cloaked over with contracts between formally equal sovereign states (Chemillier-Gendreau, 1995: 281–93, 321), international law has become a means for strategies of appropriation. The range of such strategies has been further enlarged by recent developments in the sphere of international law (Picciotto, 2011a). While international political debate focuses on the practices of corruption in many a post-colonial state, the most important basis for these practices is their integration into the world market, hence the relation to transnational capital.

Many of these relations are either illegal or dependent on those informal juries which decide conflicts between states and transnational capital. Their most important form, however, is the partial commodification of sovereignty through the constitution of fictitious states. More and more often the competence of governments to enact laws which are to be observed in the political space of the respective nation is being used to create 'offshore' spheres of law. The term alludes to the fact that legal conditions for foreign investors are constituted 'outside' of the (legal) mainland. Offshore spheres of law exist in the form of offshore financial markets (Picciotto, 2011), 'flags of convenience' (Alderton and Winchester, 2011 [2002]) and 'export processing zones' (Gerstenberger, 2018 [2017]: 485–503). Their creation of especially advantageous conditions for investment transforms sovereign rights into a commodity that is offered on the world market. In all of these legal spaces capitalism reigns more or less unrestricted by national governments.

THE PLURALITY OF CAPITALIST STATES

Within Marxism there is hardly a tradition of theoretically taking into account the plurality of states (Teschke, 2005). This became evident when the breakdown of the world monetary system in the 1970s did not just set off an accelerated development of financial markets, but also provoked governments to concentrate on competing for capital by establishing legal and economic conditions which would prevent capital owners from investing outside of the national realm while drawing foreign investors into the respective national economy.²¹ Discussions about the changing relation between 'the state' and the international market abounded at the time. At the beginning of these processes, some Marxists, just like mainstream state theoreticians, tended to interpret the political focus on conditions of international economic competition as marking a fundamental reduction in, if not even the end of, national sovereignty.²² Robinson (2002) suggested that the new world order was brought about by a global ruling class. Michael Hardt and Toni Negri concluded that the 'new capitalist project' brings together economic power and political power. In their opinion it 'tends to project a single supra-national figure of political power' (2000: 9).

Yet, over time, the enduring relevance of the nation state was asserted. Sol Picciotto (2011b) showed how capitalist states changed in order to assist transnational capital. John Holloway remarked that capitalist states reshaped themselves by differentiating between citizens and non-citizens. Making use of national anthems and other symbols of national unity, they reproduced the fetish of the state as the representation of a nation (Holloway, 2002: 115–118). While Hirsch and Kannankulam (2011) also noted the potential to mobilize nationalism, they stressed the fact that the particularization of statehood makes it possible to achieve class compromises in order to enhance the competitive strength of national capital on the world market. Ellen Meiksins Wood (2002b: 30) concluded that it is ‘the very nature of capitalism to intensify the contradiction between its expansionist imperatives and the territorial divisions of its original political (and economic) form’. It was only Claudia von Braunmühl (1978 [1974]) who pointed out that Marxist theoreticians had always interpreted imperialism as a sort of ‘spill-over’ from basically national economies, which is why they failed to recognize that the world market has a consistency of its own. While Colin Barker’s (1978: 118–126) insistence that the capitalist state only exists in the plural is, of course, present in Marxist analyses of international relations and in endeavors to analyze the extraterritoriality of law;²³ it has not yet sufficiently been integrated into dominant Marxist debates.

This failure may go back to the virtual absence of this topic in the work of Marx and Engels. Both of them followed international conflicts and commented on them in numerous articles. Friedrich Engels was a thoroughly knowledgeable specialist of the social, technological and political elements of military organizations. He wrote about different national organizations of the military, analyzed ongoing military conflicts and – at the end of his life – debated possibilities of international disarmament. That his ‘theory of force’ (which is developed in ‘Anti-Dühring’) did not amount to a materialist theory of war²⁴ is explained by the fact that this would have required a theory of the international which amounted to more than a conception of the world market. The assumption that the development of capitalism would not only develop the world market but also lead to an increasing uniformity in the mode of production and in the conditions of life, had already been put forward by Marx and Engels in the ‘Manifesto’. They assumed that this development would provoke the globalization of class conflict. Benno Teschke (2019: 6) concludes that the mediating impact of the inter-state system on the expansion and reproduction of capitalism had to remain a non-problem for Marx because he arrived at his conception of globalization by extrapolating ‘directly from the national to the universal, eliding inter-state relations as the decisive instance’.

This notwithstanding, there have been attempts at a Marxist theory of the international. If Immanuel Wallerstein only conceived of ‘the international’ as being constituted by markets, his approach did further discussions about long lasting structural inequalities in the international sphere. Justin Rosenberg (1994)

insisted on the 'corollary' between capitalism and the international political system, but he did not explain how this had come about. It was Benno Teschke who was able to illuminate their link when he showed that basic structures of the modern international system preceded the development of capitalism. Analyzing the results of the peace deliberations which were held in Münster in the year 1648, he argued that the princes who were represented at these deliberations ended the war by deciding to henceforth recognize the sovereignty of each other. In other words, the political system which was founded in 1648 was not a system of sovereign nation states but a system of 'proprietary dynasticism' (Teschke, 2003: 238). The capitalist successor of this overwhelmingly dynastic system only came into being with the rise of capitalism in post-revolutionary England. Thus, capitalism emerged in a territorially pre-figured states system (Teschke, 2003: 265),²⁵ and the political organization of the modern world system is not a function of capitalism.

When David Harvey explained that 'the geographical patterning of capital accumulation' is not only brought about by the logic of capital but also by a territorial logic of power (2003: 103f.), he accepted the requirement for a Marxist theory of geopolitics. Unfortunately, his suggestion comes with the assumption of a perennial nature of the state and without any concept of the specificity of capitalist statehood.

A starting point for the development of a Marxist concept of inter-state analysis may be the recognition that in spite of the fact that many individuals profited from geopolitical strategies, colonialism and classical imperialism were economic failures as far as national economies were concerned. Instead, long-term political strategies played a decisive role in the development of international capitalism. A new situation was reached, when former colonies became sovereign states and capitalists could enter into contracts with their governments, thereby insinuating the equality of partners. China Miéville (2005: 319) concludes that since international law has become the political form of imperialism, it cannot be successfully made use of for struggles against imperialism.

THE STATE?

No capitalist state is the institution of a separation from the sphere of the capitalist economy. Instead, there is a separation of coercion. While all capitalist states claim the monopoly of 'legitimate use of force', coercion in the private sphere is based on 'the rights of property'.²⁶

International law defines states as the representatives of nations in the international realm. The extent to which this definition can conceal the class conflicts inherent in capitalist societies depends on political constitutions and ongoing political struggles. There undoubtedly exists more than one form of capitalist statehood.

Notes

- 1 In 1890 Friedrich Engels stated (in a letter to Joseph Bloch) that neither Marx nor he himself had ever conceived of the economy as being the only determinant for all the components of the superstructure because this would transform their proposition of the economy being 'the *ultimately* determining element in history' into 'a meaningless, abstract, senseless phrase'. See: Marxists.org 1999
- 2 The citation is taken from 'The Origin of the Family, Private Property and the State' which was published in 1884. In 'Anti-Dühring' (Engels, 2020 [1878]) Engels had not yet understood the state as being necessary for stabilizing class societies but thought it started as an organization for the tasks necessary for all of society to then be transformed (by functions becoming hereditary) into an organization which dominated society.
- 3 See e.g. Michael Mann's history of 'The Sources of Social Powers' (1986 and 1993). Though Mann agrees that 'modern states' require specific theoretical evaluation, he proposes a concept of powers the elements of which can be traced throughout much of the history of mankind (see especially Vol. I: chapter 2 and 37). This, notwithstanding his critique of Marxist state theory, though reducing much of it to economic reductionism, is worth taking into consideration (see especially Vol. II: chapter 3).
- 4 Samuel Knafo and Benno Teschke (2017: *passim*) propose to better historicize Political Marxism by separating it from the idea of a structural logic of capitalism which neglects the historical relevance of concrete social struggles.
- 5 This critique – spelled out in Gerstenberger (2017) – also refers to the assumption that there is no extra-economic violence present in capitalist forms of accumulation.
- 6 See also Ollman (1971: chapter 30).
- 7 When Marx stated that in capitalist economies commodities appear as 'natural' facts which exist independently of the social labor from which they resulted, he referred himself to the belief in 'fetishes' which are present in natural religions (1974 [1887]: 86–7). The use of the term implies that the belief produces a fact, which is then considered to exist independently from the conditions of its constitution. The term 'state-fetishism' refers to the belief that the state not only has an existence which is independent of social forces, but is also decisive for the development of society. Eugen Paschukanis has coined the term *Rechtsfetischismus* [fetishism of law], thereby indicating that law in bourgeois societies is supposed to create an image of equality (1970 [1929]: 96). While in the 1970s, Marxists not only discussed the meaning of the fetishized form of commodities, money and capital but also of the state, the concept of 'state-fetishism' or the fetishization of the state more and more disappeared from theoretical debates in the following decades. However, John Holloway and Joachim Hirsch persevere in its usage. The concept of alienation is related but not identical to the concept of 'fetishization', because the latter not only stresses the conversion of a product of society into its subject but also points to the fact that this process is more or less determined by dominant social theories.
- 8 In terming the society–state distinction 'a fetishized social construct' Bob Jessop criticizes the assumption of separate spheres (2016: 79) but does not thereby make use of the Marxist concept of state-fetish.
- 9 For example, that owners of different commodities concur in their interest to have law safeguard their property, does not satisfactorily explain the state. Not only in pre-capitalist time but also in the era of globalization, private actors have produced non-state law regulating commodity exchange. *Lex mercatoria* (the 'law' of merchants which in early modern times consisted of customs of dealing among merchants that were not sanctioned by political powers) is still present in decisions of the International Chamber of Commerce and in the fact that the creation of private arbitration courts is being included in Free Trade Agreements.
- 10 On the different approaches which have been followed in this debate as well as on their respective shortcomings, see Holloway and Picciotto (1978) as well as Clarke (1991: chapter 1).
- 11 Thomas argues decidedly against the reading of Gramsci's state theory by Perry Anderson, which, at a certain time, had become widely adopted (see especially Anderson, 1976). Drawing on his

- experience of translating the 'prison notebooks', Joseph A. Buttigieg stated that given the conditions of Gramsci's production of theory, there will never be anything like a 'correct' or 'true' interpretation of the 'prison notebooks' (2011: 302). W. F. Haug remarked that Gramsci's critique of objectivism was not coupled with the critique of political economy (2011: 213–214).
- 12 The 'Amsterdam School' or 'Amsterdam Project', which focused on transnational capital and class fractions (albeit not empirically), can be seen as one of the offshoots of this concept of hegemony (Jessop and Overbeek, 2019).
 - 13 In his clear-sighted overview of 'the State Debate' Simon Clarke pointed out that the early discussions in the 'Conference of Socialist Economists' reproduced this debate (1991: 23).
 - 14 See for example, Jessop (1985: passim); Hirsch (2005: 21–30); Demirović (2007: passim, esp. part II); Reitter (2011: chapter 14).
 - 15 Richard Westra has produced what should probably be considered the most sophisticated example of this method of periodizing capitalism (2019).
 - 16 This makes it unavoidable to conceive of capitalist states in the global South as being formally inadequate to capitalism (Jessop, 2009: 79), a conclusion with which I disagree (Gerstenberger, 2009: 103–136).
 - 17 Discussion of 'Post-neo-liberalism' started in the context of left-wing governments which came to power in Latin America in the 2000s. This debate of political strategies provoked discussions about the theoretical value of the concept (Brand and Sekler, 2009).
 - 18 The respective political strategy is called *scaling*. It was made possible by the processes of spacial-temporal reorganization of capitalist societies which have come to be termed globalization (Wissen et al., 2008: 8).
 - 19 See also Hirsch and Kannankulam (2011).
 - 20 For example, in the course of the peace deliberations after World War I.
 - 21 Johanna Stark provided a thorough discussion of the relevance of this development of law markets (2019: especially 152–155).
 - 22 Tobias ten Brink insightfully outlines the various theoretical approaches (2008: 98–102).
 - 23 These endeavors are documented in the reader 'Extraterritoriality of Law' by Margolies et al. (2019) as well as in Pal (2021).
 - 24 This also holds true for Lenin. Since he considered Engels' theory of the state as the *non plus ultra* of materialist theory, he could only conceive of war as being conducted in the interests of capitalists.
 - 25 This analysis withstands criticism, in spite of the fact that Teschke overemphasized the impact of international markets on the development of social forms of production in the states where capitalism was first to become dominant.
 - 26 This is explained in Barker (1997: 38).

Nationalism and the National Question

Gavin Walker

The Irish question is therefore not simply a question of nationality, but a question of *land* and *existence*.

Marx – On the Irish Question (1867; in Marx and Engels, 1985: 317)

‘If you see us as comrades, we can find common interests. If you see us as competitors, the suffering will continue.’

‘But this is what I was saying,’ Okoi intervened. ‘That a nationalistic emphasis prevents this.’

Akande smiled.

‘Nationalism’, he said, precisely, ‘is in this sense like class. To have it, and to feel it, is the only way to end it. If you fail to claim it, or give it up too soon, you will be merely cheated, by other classes and other nations.’

Raymond Williams – *Second Generation* (1964)

Nationalism is the pathology of modern developmental history, as inescapable as ‘neurosis’ in the individual, with much the same essential ambiguity attaching to it, a similar built-in capacity for descent into dementia, rooted in the dilemmas of helplessness thrust upon most of the world (the equivalent of infantilism for societies) and largely incurable.

Tom Nairn – *The Break-up of Britain* (1977: 359)

For Marxist theory and historiography – and for socialist political practice – the nation has always constituted a key problem. In theoretical terms, posing ‘the

national question' has meant considering where to place the nation within the schema of the critique of capitalist production: is it an entity that serves ideologically to ground the labour market? Is it merely an apparatus to regulate and segment the 'bearers' and 'guardians' of labour power, and guide them to the sphere of exchange? Is it a real reflection of division among peoples? Is it an ancient entity, on par with the state, which persists into the modern era? And what should be the clarification of *how* the nation functions within the cycle of reproduction, in which capitalism must interact with elements exterior to its own cyclical movement in order to guarantee its social basis and persistence?

On the other hand, in historical terms, Marxist thought has always had to contend with elements of the nation whose clarification is essential to formulating 'lines of march' and plans of action in concrete socialist political practice. The colonial question, the globally divergent functions of race, ethnicity, and language, the fractures of federated states containing multiple national entities, the imperialist subordination of some nations to others, the relation of class and nation, questions of culture, and above all, the complexity of the distinction between oppressor and oppressed nations, have all constituted key points of contestation in the history of socialist movements. Separate from debates over the relation to the state, the electoral sphere, state institutions, and so on, the question of how to relate a socialist political practice to the terrain of the national – the regime of culture, national sentiment, linguistic and territorial imagination, and so on – has remained fundamentally unresolved, despite exhaustive attempts to settle it as a problem. How should socialists act as citizens of imperialist or oppressed nations? How should they relate to their counterparts? How can resistant nationalisms vis-à-vis the imperialist exterior relate to national minorities within the nation-state? How to combat 'great nation chauvinism' in the larger federated states of the world? How to orient Marxist theory around the possibilities or limitations of the project of the national independence of small nation-states? Can national independence serve as a lever for a socialist political transformation, or is the terrain of the national itself something permanently warped by the ethno-territorial cultural project of rightist reaction?

Although these two aspects – one theoretical and the other historical or political – have often been treated in isolation from one another, an overall grasp of nationalism and the national question within the history of Marxist thought must place them into dialogue, both because of their interconnected historical development and also in order to exploit the gap that opens between them. The national question has often been a catch-all term for Marxism, as a conceptual umbrella under which a vast array of analyses of 'backwardness', 'late development', 'specificity', or 'particularity' has taken place.

Politically speaking, debates over the national question in the history of the socialist movement often resolved into a debate over the theory of the 'two-stage' revolution: the notion that an anti-colonial or anti-feudal 'national democratic' revolution must necessarily precede socialist demands. This logic of the 'double

revolution' was first articulated by the early Comintern in the 1920s in relation to the national question in East Asia. It subsequently became developed in a variety of situations: in the Indian subcontinent (persisting in the theory of 'semi-feudal, semi-colonialism'), in the South African theory of 'colonialism of a special type', in the USA in relation to the African American national-colonial question (both on the left in the form of the Black Belt nation thesis, and on the right in the form of Browderism and its inheritances), in the UK by means of the 'British road to socialism', in diverse Latin American situations, and many others. All of these examples express a common revolutionary imaginary of the relation between global capital and local circumstances that itself informed this 'double structure', founded also on the theory of 'dual economy' (an ostensibly partially feudal, partially capitalist structure) in the world periphery.

Tom Nairn's famous text on the nation as 'The Modern Janus', one visage facing 'backwards towards the past' while the other squarely faces 'modernity' (Nairn, 1975), provides one frame for understanding the double function of the nation, but we might also look here to Georges Dumézil's famous conception of the duality of sovereignty in the split gods Mitra-Varuna, combining a mythic, narrative aspect (the magician/sovereign) and a law-forming, institutionally defensive aspect (the jurist or priest) (Dumézil, 1988). After all, the nation is not only a mythic, ideological construct that will simply collapse when exposed to its historicity; it is also a remarkably central, forceful, and persistent institutional figure of the *materiality* of the juridical-political order of our world. In other words, the nation cannot be thought through only one of these two aspects. Neither can we develop any kind of serious critical grasp of the function of nationalism within the Marxist camp unless we recognize both the ideational and material character of the nation – not material in the sense of something possessing physical properties, but in the sense of something that, while imaginary in a strict sense, nevertheless crystallizes within itself and subsequently organizes *real social relations*.

In taking in not only the long history of theorizations of the national question in the general orbit of Marxist thought, but also the *political* history of debates on the nation within socialist practice, this chapter will attempt to present not an exhaustive history of specific debates on the nation (far too numerous to encompass in this short space), but rather a holistic *theoretical* assessment of the limits and possibilities for the analysis of the national question in contemporary Marxist thought.

THE NATIONAL QUESTION: ORIGINS AND DEBATES

Marx and Engels began their theoretical work at a time of remarkable change for the status of the nation in central Europe – the middle of the nineteenth century, a period when their 'own' national formation was in tremendous flux. The Holy

Roman Empire had been dissolved in favour of the German Confederation, whose existence paralleled the Kingdom of Prussia in encompassing German-speaking central Europe (with the notable exceptions of Alsace and German-speaking Switzerland). Virtually all of Western Europe, with the sole exception of Britain, perhaps, had only a tenuous relation to the notion of stable – to say nothing of ‘eternal’ – borders. The status of national minorities, based on linguistic groupings, remained complex and unresolved, while the very notion of territorially bounded and inherently ‘appropriate’ national states, even for long-standing regions of settled cultural character, constantly changed.

From the outset, what distinguished the perspective that Marx and Engels took vis-à-vis the nation was not their focus on single national units, but their emphasis on the primacy of relation, seeing national entities always in a parallax with the network of relations in which they emerged and existed.¹ In other words, they did not begin from the presupposition of the nation’s legitimacy or retrojection into the distant past, but from the actuality of its relational position in the present. Encapsulated in Engels’s statement in the pivotal year of 1848 that ‘Germany will liberate herself to the extent to which she sets free neighboring nations’ (Engels, 1848), Marx and Engels fundamentally treated – implicitly, at the start, and later explicitly – nations as either oppressed or oppressors. When it came to oppressor nations, Marx and Engels never made any concession to ‘great nation chauvinism’, even if their earlier works inherited certain formulas from the Hegelian philosophy of history’s less fruitful moments (‘historical’ and ‘non-historical’ nations, nations with the capacity for development, and others consigned to the ‘dustbin of history’, and so forth). By the 1880s, as the second wave of great Marxist thinkers (such as Kautsky) emerged, Engels could write, summing up the experience of the mid nineteenth century, ‘It is historically impossible for a great people even to discuss internal problems of any kind seriously, as long as it lacks national independence’² – establishing the national question as an essential lever of socialism itself, in some sense its *precondition*. This implied temporality – first, the national question and, second, socialism – would later become an object of momentous Marxist polemics. Marx and Engels’s conception of the national question, which would furnish the basis for the developments of early twentieth-century Marxism stemmed in particular from their engagement with two specific national situations. Both situations involved the evaluation of the colonial question, or more broadly, of the project of national independence: Poland and Ireland.

Throughout the nineteenth century, rule over Poland was divided between Austria, Prussia, and Russia, and the long history of Polish non-rule over lands inhabited by Poles constituted one of the principal national contradictions in Central-Eastern Europe. Reflecting on this period, and specifically on the Polish situation, Engels emphasized to Kautsky that, contrary to certain tendencies in the international landscape of socialist movements, ‘an international movement of the proletariat is possible only among independent nations’. He continues:

Only historical events could teach them – and several others also – and still must teach them daily that international cooperation is possible only among *equals*, and even a *primus inter pares* can exist at best for immediate action.

Every Polish peasant or worker who wakes up from the general gloom and participates in the common interest, encounters *first* the fact of national subjugation. This fact is in his way everywhere as the *first barrier*. To remove it is the basic condition of every healthy and free development. Polish socialists who do not place the liberation of their country at the head of their programme, appear to me as would German socialists who do not demand first and foremost repeal of the socialist law, freedom of the press, association and assembly. *In order to be able to fight one needs first a soil to stand on, air, light and space. Otherwise all is idle chatter.*³

Engels here synthesizes the perspectives on the national question that he and Marx had developed over their long working relationship by making two crucial theoretical moves. First, Engels notes, there is no possibility of simply bypassing the national question, either by considering it as already sorted out or by simply placing the point of emphasis on *the social question*, and treating the national element as something that will be automatically resolved through the pathway of revolution. Rather, there is an order of priority here: if you do not deal with the national question *as such* (the ‘first barrier’), it will disable the very possibility of social revolution by placing it from the outset on an ‘unfree’ and ‘unhealthy’ basis. Second, while emphasizing the dialectical unity of national freedom and social struggle, Engels notes that the goal of national liberation is not to enjoy one’s own nationalism and eternalize it, but rather to create the proper conditions for *international* socialist revolution, a process which itself would entail a dramatic transformation of relations of force around the world, and which would break the structure of national dominations (empire and colony, oppressor and oppressed nations). Engels thus sums up a position he certainly held – as did Marx – by the time of their mature work:

Thus I hold the view that there are *two* nations in Europe which do not only have the *right* but the *duty* to be nationalistic before they become internationalists: the Irish and the Poles. They are internationalists of the best kind if they are very nationalistic. The Poles have understood this in all crises and have proved it on the battlefields of all revolutions. Take away their expectation to re-establish Poland; or persuade them that the new Poland will soon fall into their laps by itself, and they are finished with their interest in the European Revolution.⁴

If Marx and Engels posed the question of the nation in starkly materialist and especially *political* terms, this was not always the case in the years following their active engagement.

The current of thought known generally as ‘Austro-Marxism’, and associated principally with Otto Bauer (along with others such as Karl Renner, Victor Adler, Rudolph Hilferding, and more), emerged at the turn of the twentieth century, developing a specific socialist culture of political thought in Austro-Hungary and later the Austrian Republic. But the crucial question that Bauer in particular dealt with was a revision or innovation in the Marxist theory of the national question.

Not content with Marx and Engels' scattered remarks on nationalism, nationality, and the form of the nation, Bauer's 1907 *The Question of Nationalities and Social Democracy* attempted to theorize the nation in a form that would take account of the status of 'national minorities' in the larger imperial or federal states of Europe, proposing that rather than a territorial-political unit, the *principal* element of the nation was 'the totality of human beings bound together through a common destiny into a community of character' (Bauer, 1907; see also Czerwińska-Schupp, 2016; Munck, 1985). A definition meant to consider how multiple *nationalities* could exist in a single nation-state while nevertheless being granted a certain principle of 'personal autonomy', this conception of the nation would become the target of intense and vitriolic polemics. Bauer's formulation is a definition of the nation that risks everything on the category of 'national character', a concept that, needless to say, cannot be grounded in anything material, but is rather a collection of prejudices, situational observations, customs, and other discrete pieces of information bound together by an attribution of these observations to an apparently eternal or supra-historical form. In its furthest extension, this concept of the nation can easily give rise to an essentialist theory of race, ethnicity, and cultural belonging, rendering the nation into something self-evident rather than a *modern* political production. The Bolsheviks were, *en bloc*, essentially hostile to the Austro-Marxist theory of the nation, not only because of its ahistorical and immaterial character but especially because in the guise of 'self-determination' it could even be the catalyst for a form of ethnic separatism, imagining the socialist political project as one of the separation of human beings on the basis of cultural-racial character.

Stalin's (1942 [1913]) *Marxism and the National Question* more or less remains the central text around which has developed the modern conception of the nation within Marxist thought and socialist practice. It is a text devoted principally to the critique of Austro-Marxism and Bauer's reintroduction of the discourse of 'spirit', 'character', in other words, some concept of the national essence. In contrast, Stalin's definition, formed through his famous list of attributes of nations, emphasized that nationality is formed through the *historical* constitution of a territorial, linguistic, psychological, and economic commonality whose bonds are *cultural* (Stalin, 1942 [1913]). In refusing, however, the theory of 'national autonomy' so beloved of Bauer and his co-thinkers, Stalin re-emphasized the categories of history and politics that are so crucial to the development of the nation, which followed on from Lenin's work, in which the nation is principally posed as the form taken by community to constitute a labour market.

When attempting to define Leninism as a specific current, Stalin produced the influential formulation that 'Leninism is Marxism, in the era of imperialism and the proletarian revolution' (Stalin, 1965), forever linking Marxism to a specific anti-imperialist orientation and a concomitant stance on the national question, focused on the liberation of the colonial and oppressed peoples, along with the sanctified status of 'the right of the self-determination of nations'. But there is

a further specification. Stalin's famous formulation continues as follows: 'To be more exact, Leninism is the theory and tactics of the proletarian revolution in general, the theory and tactics of the dictatorship of the proletariat in particular'. Without sidestepping into the concept of the 'dictatorship of the proletariat' (Balibar, 1977), this point nevertheless marks an important transformation in the nature of the national question for the history of Marxism. If the work of Marx and Engels constituted a theoretical archive of concepts, clues, and formulations, some incomplete, for *thinking* the national question in relation to the critique of political economy, Leninism as a doctrine of twentieth-century revolutions provided something different. In contrast to its bourgeois equation with totalitarianism, 'dictatorship of the proletariat' is a modulation of the term *democracy*: the *kratos* (rule) of the *demos* (the people, the masses, the citizenry). In this sense, Leninism is a doctrine of 'victorious subjectivity', in Badiou's terms (1985), a Marxism of the victory of struggle and the new post-revolutionary project to conceive of a mode of *ruling*. Once we enter into the question of rule rather than resting content with preliminary theoretical considerations, we are dealing not with how to conceive the national question but how to implement *policy* related to the form and contradictions of the nation. In this sense, beginning with Lenin, the national question would cease to be a theoretical projection, in a speculative mode, about communist society and become part of a body of concepts in power, influenced thereafter by the concrete policy choices of the construction of socialism. This latter development through the twentieth century, and into the present, has had major consequences for the theory of the national question, not least because we have a concrete history of national policy within socialist political practice to examine.

The early twentieth century was a time of extraordinary upheavals concerning the form of the nation. From new nations carved out of existing ones to national-revival projects, the assertion of new linguistic sovereignties and newly discovered national borders, it appears at first glance a historical moment at extraordinary odds with the post-1991 conjuncture, in which we were all told of a new 'post-national' world characterized by free movement, an end to national sovereignty, and the promise of a globalization that would have done with the limits of national consciousness.

THE NATION-FORM: CAPITAL AND THE NATION

'The history of nations, beginning with our own, is always already presented to us in the form of a narrative which attributes to these entities the continuity of a subject' (Balibar and Wallerstein, 1991: 86).⁵ So begins Étienne Balibar's now-famous inquiry into the 'nation-form', the term he gives to the aggregate of 'apparatuses' and 'practices' that institute the individual as '*homo nationalis* from cradle to grave' (1991: 93). Balibar's remark on the history of nations

introduces us to an entire network of concepts and issues that orbit around a theoretical question that is not only historical but profoundly *actual*: the relation between the inner logic of capital, the fundamental expression of modern social relations, and the form of the nation-state, the quintessential ‘entity’ within which the modern form of *belonging* is cartographically, politically, and conceptually organized. In turn, this excavation of *homo nationalis* is inseparable from a set of questions posed in another famous text, where Balibar introduces us to a very specific problematic characterizing our modern world order: the volatile articulation or process of referral between the *citizen* and the *subject*. Here, he emphasizes something that is central for the present inquiry when he states: ‘The citizen *is* the subject, the citizen is always a *supposed* subject (legal subject, psychological subject, transcendental subject). I will call this new development the citizen’s becoming-a-subject (*devenir-sujet*)’ (Balibar, 1991: 46). As we attempt to think the relation between the nation-form and the citizen-subject, we will need to examine the problem of *supposition* and *presupposition*. This conceptual sequence of Hegelian derivation – the entire discursive economy of *Setzung* and *Voraussetzung* in Marx – will allow us productively to complicate the ways in which *homo nationalis* remains not merely a corollary or peripheral question to the broad concerns of capitalist development, but rather a profoundly historical field of force located at the very core of the *logic* of capital, in which the abstract individual who is the *presumed* subject of exchange is always *presupposed* not merely as a subject, but as a *national* subject.

When we imagine ‘the national question’, we generally think of a field of problems that presumes or presupposes the givenness of the nation-form. That is, we often presuppose that the national question involves simply the excavation and categorization of the putatively ‘national’ factors of development, the relative stage of a given national capital in relation to various other national capitals, the dynamics internal to a particular national formation’s reproduction, and so forth. In other words, the national question is typically posed as if the *national itself* is not a question, but rather an answer: the notion of *specificity* or *particularity* is frequently treated here as if it were something that explains, rather than something to be explained.

It is common to conceive of the nation as a form in which *belonging* is organized and to which the state responds. In this view, the nation must precede the state, because it legitimates and justifies the state, providing the latter with a solidity that would otherwise be lacking. But this sequence cannot be logically sustained for a number of reasons. First and foremost, if the nation were to precede the state, it would imply that a concept of *boundary* or *border* (Mezzadra and Nielson, Chapter 87, this *Handbook*) could be rigorously drawn between one nation and another prior to the advent of the modern *political* community. It would imply, for instance, that national language or custom could be strictly delimited or demarcated within boundaries that corresponded to concrete differences at the level of the *concept*. This in turn would imply that prior to such

nations, there would exist a *natural stratum of difference*, in which difference could be understood as *already* organized. In this sense, it would imply that each national community was simply a historical concretization of a set of differences that existed not only in antiquity, but eternally, in an infinite regress, but always corresponding to some natural hierarchy that would be inscribed in the earth itself.

Needless to say, we know, and have known for centuries, that such a conception of an inherent systematic ordering of difference never existed. Nations rise and fall, they are constituted and dispersed, the borders of languages fluctuate and mutate in historically complex waves, groupings emerge, accidentally aggregated groups become 'peoples', migrate, resettle, colonize, are colonized, are eradicated, or flourish. None of the communities that emerges from or submerges into the historical body of the earth has ever corresponded to a prior systematic *ordering of difference*, in which their divergences and continuities could be simply 'proven' by reference to a given 'natural' stratum. This leads us, therefore, to assert the precise opposite of the commonly held wisdom. In other words, it is that the state – a social form always associated with an *intensive* concentration of systems and institutions that in turn are made to correspond to an *extensive* territoriality and formation of borders – must always precede the nation. This would lead us quickly to another means of understanding why the nation-form is so critical to modernity in general, but also to two of its fundamental characteristics: its determination by the irreversible historical fact of imperialism and colonialism, and the fundamental basis of modern social relations in that form we call 'capital'.

If we provisionally accept the view of the nation-state as a building-block or unit of analysis through which the modern international state system was formed and maintained, it remains to be clarified why this form of the nation should be *necessarily* produced. In thinking this problematic, we may be reminded of the famous line from Alfred Jarry's *Ubu roi*, later borrowed by Lacan: 'Long live Poland, for without Poland there would be no Poles!' (Copjec, 2002). At first glance, there is something uncanny about how this declaration upends our expectations about the relation between the nation-form and the national subject. It strikes us as humorous precisely because it apparently implies its inverse – 'There must be Poles first, so that they can constitute a Poland' – as a matter of course. But in fact, we should read quite faithfully: the national people, as an extension of the *presupposed* national subject, is a production of the nation-form, itself a technology of belonging that is subsequent to the form of the state, not the reverse. The supposedly 'concrete', 'obvious', and 'real' national subject is always a derivation from the most abstract schema of modern life.⁶

But behind this problem of the temporality or ordering of the genesis of the nation-form lies a more basic problem regarding the national question. Because the national question is essentially concerned with the specificity or particularity of a 'given' national scenario, it is always linked to a specific field of historical

concerns. That is, it is always linked to the question of the *transition*. The various debates on the transition to capitalism on a world-scale have long been at the centre of the problem of the nation-form. Why and for what concrete material reasons should a certain national situation develop a particular trajectory of capital accumulation, particular expressions of social relations, particular 'cultural' features, customs, linguistic specificities, and so on?

This type of question was typically answered with reference to the specific mixture of local social factors that preceded a given transition to capitalism. Was there a strong feudal social stratum, as in Western Europe, with its broadly developed seignorial system and burgeoning urban centres? Was there a type of 'absolutist' social system with an inverted form of overpopulation in the rural village rather than the city, as in the Russian or Japanese countryside? Was there a strong legal character to the transition, as in the English Enclosures Act and 'Poor Laws', both throwing the peasantry off the land and simultaneously criminalizing movement through the category of 'vagabondage', or as in the eastern German *Bauernlegen*, stripping land tenancy protections from small farmers and subordinating them to a vast estate system? And what about the profoundly colonial character of the transition to a world capitalist system throughout Africa, South and East Asia, and Latin America, wherein the growing global character of markets was from the very outset tied to the experience of slavery and imperial plunder of natural resources?

What we see in all these cases is that the transition to capitalism has always been tightly linked to the history of the formation and global ordering of putatively *national* communities. In this sense, the historical background of the transition to world capitalism, situated just behind the formation of the global and systematic arrangement of the world on the basis of the form of the nation-state, is always linked to the *production of national subjectivity*. That is, the nature and character of the national question, when investigated historically and theoretically, always reveals itself to be first and foremost a question of *how* this peculiar and generalized arrangement, in which territory, human beings, and social systems are articulated together into national units, came into existence in the first place.

The question of why *this* particular arrangement should obtain is indissociable from that of the production of individuals who would furnish, in their forms of citizenship and of subjectivity, the 'raw materials' through which the nation-form could emerge, in the guise of that *homo nationalis* which the social apparatuses of our modern world system essentially *presuppose*. Marx makes the decisive point in his devastating polemics against Bakunin, when he emphasizes that 'economic conditions ... create conditions and differences among peoples independent of the "State"' (Marx, 1989: 507). The capacity to segment or hierarchize the population is not the exclusive purview of the state: typically, we are familiar with the state as the principal actor of this kind under capitalism, subjecting the undifferentiated mass of the population to its regime of calculation and measure –

via censuses, tax surveys, and the wide array of ‘statistical’ work. But what is the nation in this sense? Or more specifically, what is the *economic functioning* of the nation as an apparatus?

In his unpublished writings of the 1970s, Althusser reflected at length on this question, pointing out that fundamentally, ‘behind the dialectic of labour exalted by Hegel, Marx points to a silent, invisible process that controls the former: *the reproduction of the conditions of production*’ (Althusser, 2018: 272). The latter is a relayed process linking the relations of production to the specific character of a social formation that enables such a general reproduction to take place. Althusser seizes upon the status of the national in the context of the broad reproduction of society in general, linking the *nation-form* to a general investigation of the specific forms of different social formations, and emphasizing that it is the form of the nation that is specific to capitalist society and to it alone, leading him to the remarkable conclusion that under a communist mode of production, the specific form of society would absolutely not be the nation as such. He asks:

Why do capitalist social formations ‘exist’ under the nation-form? Because, in the final instance ... the nation-form is imposed by the existence of the *market*, the geographic *area* of existence and of development of capitalist commodity production: not just the market for manufactured goods (commodities), but also the market for means of production and also the market for labour power. This is the obligatory starting point, and not only the starting point, but also the obligatory material basis, inscribed in geographic space, of every capitalist social formation. (Althusser, 2018: 235)

In essence, this is not significantly different than the perspective of the early Lenin, for whom the nation constituted first and foremost the social form of the labour market. But Althusser adds an important twist when he emphasizes that the *internationalization* of trade and the imperialist expansion of markets does not constitute an abolition of the nation-form, but rather requires its presence. This latter point of Althusser’s resonates with Poulantzas’ important work from the late 1970s, which stressed that:

Capital is a relationship between capital and labour; and it is because it moves in the *international* spatial matrix of the labour and exploitation process that capital can reproduce itself only through *transnationalization* – however deterritorialized and a-national its various forms appear to be. (Poulantzas, 1978: 106)

In other words, capital, by its very drive for the exploitation and utilization of all sorts of *differentials*, maintains and nurtures the nation as a form. This is not to suggest that the nation is *simply* a product of capital; it is not. It is a product of an entire series of forms and relations key to the modern state – the invention of tradition to ground the state as an apparatus in the local situation, the need to distinguish on a ‘cultural’ basis an exterior and interior of belonging, and so forth. But capital and the nation are co-extensive as forms of relation. Deleuze and Guattari once argued as follows:

The constituents of the nation are a land and a people: the 'natal', which is not necessarily innate and the 'popular' which is not necessarily pregiven. The natal or the land, as we have seen elsewhere, implies a certain deterritorialization of the territories (community land, imperial provinces, seigneurial domains, etc) and the people, a decoding of the population. The nation is constituted on the basis of these flows and is inseparable from the modern State that gives consistency to the corresponding land and people. (Deleuze and Guattari, 1987: 504)

Nationality, or the *sentiment* of nationality, covers over this paradox by means of the putative unity of the citizen: the citizen must testify to the inheritance or continuity of the presumed national subject. And yet, since the advent of this modern concept of the citizen, those who cannot be located in this continuity and are placed in a separate position of *difference* in one way or another must also be encompassed within the concept of the citizen. But strictly speaking, those placed in this position cannot be assumed to have inherited the *nation* in the expected manner (Balibar, 1991). The position of difference or *minority* (understood in a very broad manner, referring to any socially expressed divisions) is the *quintessential* position of the modern system of nation-states, because it expresses the irresolvable tension that difference or minority must exist *within* the regime of citizenship, and yet simultaneously be excluded from its most basic presupposition.

There are two historical arguments regarding the tendency for the nation to incarnate itself in the nation-state: (1) a conservative or traditionalist one that simply argues that the nation-state is the 'realized' form of the nation, that nations without corresponding states remain frozen in a form of infancy; (2) the typically Marxist argument that the tendency towards the articulation between the nation and the state is an effect of the development of capitalism, in which individual labour markets tend towards centralization and concentration, alongside a political trend towards a hierarchical arrangement of unevenly distributed modes of development (the specific economic stage of imperialism). This latter argument was developed by Lenin, Gramsci, and others to emphasize the necessity in political strategy for independent nation-states. In this view, only independent nation-states, corresponding to their respective labour markets, would allow for relations of solidarity between working-class movements from different national formations. Without this national anchoring, the working-class movement would merely mirror in its internal organization the global hierarchies installed by capital as an abstract and overarching figure of social relations. If there is a strategic space for 'nationalism' here it is not in terms of the inevitability of the nation-state. Rather, it emphasizes that the nation-state, while utilized by capital to form the field of the supply of labour, also serves as a device or arena for moving beyond the nation-form.

THE NATION AFTER GLOBALIZATION

Once we emphasize the nation's pivotal place within the cycle of capitalist reproduction, we are faced with a crucial task – to deal not just with the *logical* place of the nation within the functioning of capitalism, but with the *historical* and

actually existing nation as a form of social organization, whose dynamics do not completely correspond to those of capital.

Chantal Mouffe, for instance, argues as follows:

A left populist strategy cannot ignore the strong libidinal investment at work in national – or regional – forms of identification and it would be very risky to abandon this terrain to right-wing populism. This does not mean following its example in promoting closed and defensive forms of nationalism, but instead offering another outlet for those affects, mobilizing them around a patriotic identification with the best and most egalitarian aspects of the national tradition. (Mouffe, 2018)

For Mouffe, a left-populist investment in the nation must occur through the construction of a people formed by the drawing and enforcement of new boundaries and borders. But this confuses two aspects of the national question: the tactical stance vis-à-vis the nation as an existing entity, and a strategic vision that must grapple with the nation's futurity, as well as with its tendency to conjure up forms of the archaic. This tendency towards archaism is perhaps the most foundational dimension of the nation-state. Archaism is the nation's mode of self-legitimation, of 'proving', so to speak, that the national-political community was a necessary development from what was there before, that everything that pre-existed the nation was itself merely 'pre-national'.

Today, archaism is everywhere. It is the driving force behind the resurgence of 'white nationalism', a cheap rebranding of early twentieth-century revanchist, racist ethnocentrism. But it is not just the driving force of the nationalisms of the right. Archaism – the displacement of questions of the present into the infinite regression of a putative originary past – is perhaps *the* political tactic par excellence. Today, we are always 'restoring' rather than newly creating. We are making something 'great again', attempting to live up to an image of the past whose primary function is to exert an effect on the present, to eliminate contemporary contestations by conjuring up political forms of sentiment in order to enact forms of hegemony over 'common sense'. Common sense – that fundamental category that Gramsci reintroduced to a Marxist political vocabulary – is the most crucial medium here, not least because its inner dynamics tend to privilege precisely the ancient, the inherited, that which can be posed as the cultural ground. What is the next step for the political analysis of archaism and its 'return'?

Marx, in his late 'Russian texts' (the multiple drafts of the letter to Vera Zasulich, the letter to the editorial board of *Otechesvenniye zapiski*, the introduction to the Russian edition of the *Manifesto*), gives us only a very brief and impressionistic sense of this problem, when he argues that the rural commune could be a point of departure for the new rather than simply the burdensome spectre of the old (Shanin, 1983; Walker, 2016). But what are we to do within Marxism with the residues that politically surround us and buttress our present? If we attack them as signs of the 'backwardness' of the supposedly 'progressive' order, we run the risk also of abandoning the category of the mythic, the legendary, the 'grand narratives', to the right.

Stalin's presentation of the national question has remained foundational, if disavowed, for Marxism since its publication over 100 years ago: so much so, in fact, that even entirely oppositional trends, for instance Trotskyism broadly conceived, the left-communist tradition, and even Maoism, have more or less upheld its arguments. Stalin was surely correct in emphasizing the materiality of nationality in contrast to the Austro-Marxist deviation towards 'spirit', 'national character', and other such mystifications, but Stalin's text equally installed certain key prejudices into the core of Marxist 'common sense': the iron-clad belief in the superiority of large, multinational federated states (a belief that tended to become a form of 'great nation chauvinism'); the formal presentation of the national question, producing a 'model' that could be applied anywhere and anytime; a tendency to distrust any expression of 'national culture' as a slippery slope towards 'bourgeois nationalism'. As Blaut, for instance, has argued:

First, Stalin in 1913, and most Marxists at that time, believed that nations emerge only in the period of early, rising capitalism, and die or dissolve with the socialist revolution. But nations have been born since 1913 under all manners of circumstances, socialist as well as capitalist, and more crucially, nations can also be destroyed under capitalism itself. (Blaut, 1987: 71)

But Lenin also innovated significantly after the emergence of Stalin's famous essay. Between 1914 and his death in 1924, Lenin began to rethink the national question in relation to imperialism. That is, he began to argue that imperialism did not connote an epoch in which the national question would wither away, but rather that imperialism would pose the national question in an even more intense form. In his last years (1921–24), Lenin moved further to the left in his position on the national question, and began to seriously criticize Stalin's formulations and their implication, despite the fact that Lenin himself (and virtually the entire leadership of the CPSU(b)) had been in a firm agreement with the (1942 [1913]) text on the national question. Why did Lenin change his mind? First and foremost, Lenin began to see the policy effects of a formal theory of the national question that did not take its historical, contextual, and contingent variation into account. He also began to sense the problem behind the dyadic structure of the nationalism of the large, federated state vis-à-vis the nationalism of small, oppressed nations. We must emphasize once again that this late position of Lenin has not been the dominant position in the history of the world communist movement – quite the contrary. As mentioned earlier, no matter what the position taken on 'the Russian questions' (i.e., the inner-party struggle for the leadership and hegemony within the CPSU(b)), virtually every Marxist tendency (and their successors) wittingly or unwittingly adopted the positions first elaborated in Stalin's *Marxism and the National Question*. Among other effects of this was an intense suspicion, throughout the history of Marxism, that struggles for national independence, or the self-determination of nations, was merely a thin veneer behind which lurked the spectre of a particularistic, closed, integralist *retreat* into the ethnos or national essence. In many ways, this prejudice continues to play an outsized role within Marxism – suspicions of 'racial separatism',

‘bourgeois nationalism’, ‘communitarianism’, etc. persist in our current moment. What makes the late Lenin so interesting in this respect was his intensely dialectical, even paradoxical, mode of argumentation on the question, in effect emphasizing that what appears as the *closure* of national or even racial struggles for self-assertion can also be read as openings to the world, the condition of possibility for another point of departure for a truly global socialism:

Nothing holds up the development and strengthening of proletarian class solidarity so much as national injustice; ‘offended’ nationals are not sensitive to anything so much as to the feeling of inequality and the violation of this equality, if only through negligence or jest – to the violation of that equality by their proletarian comrades... That is why the fundamental interest of proletarian solidarity, and consequently of the proletarian class struggle, requires that we never adopt a *formal* attitude to the national question. (Lenin, 2002: 190)

In other words, Lenin points out quite correctly that a truly ‘formal’ (or ‘normative’) presentation of the national question will only result in an evacuation of the *political* evaluations required seriously to deal with the degree of sentiment or imagination that subtends the nation-form. It is impossible *universally* to uphold an independentist orientation, for instance, in a world where nations rise and fall with the passage of history, where the forms of one nation’s oppression by another constitute *historically* formed relations, which in turn work on the capacity to determine political strategy. For example, while we can point to the historically, politically, and socially progressive character of national independence in many situations (Ireland, Québec, Kashmir, Okinawa, and many more), this determination can never be carried out ‘formally’. For instance, today, the Israeli state has transformed the very character of its own legal conception of nationality with the passage of the 2018 ‘Nation-State Law’, in which the right of ‘self-determination’ solely accrues to ‘the Jewish people’, Hebrew is established as the dominant ‘official language’ of the territory, and the expansion of the national state’s territorial scope is justified so long as it is ‘Jewish settlement’, something given a recognized ‘national value’. In such a situation, the self-assertion and self-determination of the Palestinian nation is only possible on the basis of a pluri-national federated state of Palestine, where Jewish nationality would be recognized as a foundational component. That is, it is not just independence that can lead to a resolution of the national question in all circumstances; the determination of the political tasks related to the nation-form must always be based on the historical, social, and political investigation of the specific situation.

Samir Amin, concisely expressing the innovations of world-systems theory in general historiographical terms, argues that:

The national question, which in the nineteenth century was primarily that of oppressed European nations, was transferred in the twentieth century to Asia and Africa, where it became the colonial question. This was not only a geographical transfer. As a correlate of the formation of the imperialist system, it implied a change in the very nature of the national question. The old national question, that of European nationalities oppressed by the absolutist feudal regimes, was part of the incomplete bourgeois revolution ... The principal axis of the new national question is defined by its anti-imperialist character. (Amin, 1980: 173)

Amin's understanding is essential for a grasp of how the national question in Marxist theory transformed from the situation of the Second International to the world-situation of the mid twentieth century. Today, another development of the national question is essential, and it involves the problem of *how* to account for the persistence of the nation-form under conditions of capitalist integration on a world-scale. This new stage of the national question, then, is also concerned with rethinking its content – in conditions of global capitalist integration that intensify year by year, we do not see the 'falling away' of national conditions of oppression or exploitation. Instead, we see a new strengthening of the nation-form as a mode of global organization. The post-1945 international world is gradually disappearing and a new configuration is taking shape. China's role is becoming a profoundly complex issue. The Atlantic order will likely never return to the imperial and colonial hegemony it enjoyed for 450 years. The current crisis is rapidly becoming a generalized crisis of large, federated states, and it is possible that the era of federalism as such, as a mode of post-empire political organization, may be over. In such a context, the future of the nation-state will become an important site of interrogation.

CONCLUSION

In concluding this chapter, which can only serve as a brief overview of an extraordinarily complex, historically dense, and politically volatile question, I want to return to my three epigraphs. In three divergent circumstances and moments, from very different political and theoretical angles, they all disrupt in productive directions, the 'common sense' that we hold with regard to the nation-form, something ubiquitous and foundational for our modern life.

In 1867, in a short speech to the International Workingmen's Association on the Irish question, Marx emphasized, after a detailed discussion of the political-economic background to the circumstances of Ireland under British colonial rule, the following striking formulation: 'The Irish question', he states, 'is therefore not simply a question of nationality, but a question of *land* and *existence*' (Marx and Engels, 1985: 317).

In other words, what is at stake in the national question is not merely the self-assertion of the nation, or its recovery from the yoke of colonial rule. The national question concerns two truly fundamental categories of the social: *land*, the dimension of property, governance, and hegemony, in other words everything that belongs to *the state*; and *existence*, in other words, the cultural, social, linguistic, and political forms proper to peoples and the inscription of community onto the earth. The national question is not merely the self-assertion of the nation-form, something that is essentially impossible in and of itself. The nation is not an institution, neither is it a practice. It cannot be grasped solely in its materiality, despite its material effects and material consequences. This is why Marx's point, that the national question concerns everything related to land and

existence, is so important. The national question in such an optic is not merely related to a political nationalism, that is, to one political choice among others; it is related to the totality of human territorial, institutional, and cultural life in a given location and situation.

Almost 100 years after this address to the International Workingmen's Association, Raymond Williams, in his 1964 novel *Second Generation*, provides us with a crucial vignette, written against the backdrop of the wave of decolonization and national liberation struggles across the former colonial world. In response to the rather general dismissal of nationalism by a student, Akande, foreign minister of an unnamed African state in the grips of the revolutionary process replies: 'Nationalism is in this sense like class. To have it, and to feel it, is the only way to end it. If you fail to claim it, or give it up too soon, you will merely be cheated by other classes and other nations'. Already, we have a difference with Marx – the object of Williams' point is not nationality or the national question, but *nationalism*, and his point concerns not the broader import of the nation-form, as does Marx's point, but rather the stratum of sentiment, of passion. What is it to feel part of a nation? What is it in turn to feel your nationality denied? What is it to inherit, in the colonial context, an empty nationality, subsumed under another? And is it possible to alter such relations without an affirmation of nationality that would take the modern form of nationalism? What about those who belong to the oppressor nation? What should be their comportment vis-à-vis their 'own' nation? In a sense, Williams' argument is a precursor to the current debates around left populism, but with an important corrective: here, Williams speaks of claiming nationalism as one's own, not in order simply to achieve governmental hegemony, or successfully rule for a time, but rather paradoxically, as a necessary step in order to *end* nationalism, or even to end the nation-form as a constraint. Yet, the point acknowledges that the national constraint between peoples cannot be simply wished away or hastily abandoned – doing so simply eternalizes the nationalism of the oppressor nations. In this sense, Williams is faithful to the Leninist orientation, for which the right of self-determination of nations is not an end in itself, but a form of creating comradely relations among peoples. To give up on the nation too quickly, to say that it is merely an enclosure, risks delivering it over, lock, stock and barrel, to the side of reaction. Mouffe's recent work begins at this point, but also ends there. The late Lenin instead taught us that to fight for national independence, the self-assertion of nations under the yoke of others is itself a worthy cause, but in the final analysis it is one whose tactical value is linked to the overall strategic orientation of a new political point of departure for the entire earth.

The third of these overarching statements is from Tom Nairn, in his now-classic *The Break-up of Britain* (Nairn, 1977). Nairn here famously diagnoses the character of nationalism in psychoanalytic terms, giving a more or less 'normative' definition that has perhaps served, in the ensuing 50 years, as a kind of unspoken 'common sense' on the left:

Nationalism is the pathology of modern developmental history, as inescapable as 'neurosis' in the individual, with much the same essential ambiguity attaching to it, a similar built-in capacity for descent into dementia, rooted in the dilemmas of helplessness thrust upon most of the world (the equivalent of infantilism for societies) and largely incurable. (Nairn, 1977: 359)

Just as the neurotic can no more 'know' his or her own condition, in the sense of comprehending it from an external standpoint, Nairn argues that in our modern capitalist world, formed from an order of nation-states, we can never be outside the bounds of nationalism. In this sense, he is right. But this point has a twofold implication. On the one hand, it alerts us to the fact that nationalism and its tendencies exist within societies as pathological formations, structures within which political and social forms arise but that can be no more dispensed with than the psychological structures within which we think. On the other, it emphasizes that there is no fundamental way out of the bind of nationalism without another mode of human social and political organization that is not simply our capitalist 'modern developmental history'. In that sense, Nairn signals the volatile fusion of capital and nation, a combination that can never be disaggregated.

For us today, on the national question, as for so much else, we would do well to remember, as Althusser once wrote, that:

[t]he basic task of Marxist theory, its strategic task, has Marxist theory itself for its object. I mean, to be quite precise, that Marxist theory has to know *exactly* what it is as a theory, and to know exactly what point it has reached in its development, in order to know what kind of theoretical work it must and can accomplish. (Althusser, 2003: 10)

In any case, in contrast to a frequent tendency to relegate this problem to the past, we must accept that the national question is a real and actual question, not only in the long-standing sites of independence struggles but on a global scale. There can be no resolution or settlement of the national question without a valorization of this question *as* a question: the nation is not an answer to anything, but a volatile, powerful form of human relations, and one that can be developed in a reactionary or emancipatory direction. The nation in this sense is a grammar of common sense, a repository of commonalities and divergences, one that exerts a decisive force over the social field, and into which, therefore, we have no choice but to intervene.⁷ The nation as a form of common sense must be fought for, it must be a terrain of combat for hegemony over the forces it organizes. In Marx's own terms:

Collisions proceeding from the very conditions of bourgeois society must be overcome by fighting, they cannot be reasoned out of existence. The best form of polity is that in which the social contradictions are not blurred, not arbitrarily – that is, merely artificially, and therefore only seemingly – kept down. The best form of polity is that in which these contradictions reach a stage of open struggle in the course of which they are resolved. (Marx, 1848)

Is there a pathway through these divergent modes of analysis towards a future – a new and unanticipated future – for the national question in Marxist theory? If there is, it must reckon with the haste and superficiality with which the nation

as a form has often been treated, as if it were a mere prehistorical vestige bound to wither away with the passage of time and the development of the productive forces. If anything, this argument today appears almost incoherent, as we fully enter into a ‘post-globalization’ era in which the prospects of global governance, global markets, and global culture recede into mere nostalgia for the 1990s ‘Third Way’ and its passing reign in the advanced industrial countries. Today, the nation has fully returned to the stage of history, both for the right and for the left, as much in the global North as in the global South. If there is to be another thinking of the nation for Marxism – and there must be – we must put into question all the inherited prejudices of the history of socialist movements and produce a new point of departure for the analysis of this remarkably persistent form of human social organization.

In particular, I would single out the near-total twentieth-century consensus within Marxist thought in support of the form of the large pluri-national federated state-form, and in some ways, the hostility to the project of small, independent national states (here, it should again be stated that nearly every socialist political tendency adhered to this position, largely indistinguishable from Stalin’s 1913 text). There is no theoretically coherent position that can demonstrate the superiority of ‘great nation’ nationalism over ‘small nation’ nationalism; we would do well to take a set of clues from the late Lenin instead, who taught us that:

[I]nternationalism on the part of oppressors or ‘great’ nations, as they are called (though they are great only in their violence, only great as bullies), must consist not only in the observance of the formal equality of nations but even in an inequality of the oppressor nation, the great nation, that must make up for the inequality which obtains in actual practice. Anybody who does not understand this has not grasped the real proletarian attitude to the national question, he is still essentially petty bourgeois in his point of view and is, therefore, sure to descend to the bourgeois point of view. (Lenin, 2002)

In re-emphasizing today the burning need for this self-reflexive and rigorous internationalism of the late Lenin, the theorization of the national question in the history of Marxist theory teaches us that perhaps it is a world constituted from the independence of the small nation that will be the closest transitional form to a global superseding of the nation-form itself, and in turn the capitalist system that sustains the current geopolitical order.

Notes

All translations from languages other than English are mine unless otherwise indicated.

- 1 It is impossible in this short space to even cite adequately a general cross-section of texts dealing with the national question, because the literature within Marxism is vast. For a general overview, see among many other texts, Blaut (1987); Chopra (1984); Davidson (2016); Haupt et al. (1997); Löwy (1976); and Petrus (1971); see also the debate between Neil Davidson and John Foster (Davidson, 2002; Foster, 2004).
- 2 ‘Nationalism, Internationalism and the Polish Question’, Letter of Engels to Kautsky, 7 February 1882, originally published in Marx and Engels (1933), and with a short introductory statement by Karl Kautsky (Kautsky, 1935: 66–72).

- 3 Ibid. My emphasis.
- 4 Ibid.
- 5 I expand on this in Walker (2013).
- 6 Although I cannot take it up here for reasons of space, this question should also be developed in relation to the work of Nicos Poulantzas, in particular his final work (Poulantzas, 1978). See the exceptionally important set of reflections in Balibar (2010), in particular his discussion of the specific form of the nation-state (2010: 185–188).
- 7 See the passionate and powerful essay by Eric Martin (2017), an exceptional text that should be widely read not only on the specificity of Québec, but on the national question in general.

Crisis

Ken C. Kawashima

THEORY, BELIEF, AND DIALECTICS

Why... have science at all?... Once interconnection is grasped, all theoretical belief in the permanent necessity of existing conditions collapses before their collapse in practice. Here, therefore, it is absolutely in the interest of the ruling classes to perpetuate a senseless confusion. (Marx and Engels, 1955: 197)

The eclectic is ... too timid to dare to revolt. (Lenin, 1899b)

The crisis is the spectacle: Where is the Real? (Badiou, 2010)

The Marxist theory of crisis gives us a logic and a revolutionary common sense to construct strategies and programmes to advance working-class struggles from the analysis of capitalist crisis to the analysis of the necessity of revolution and the planning of a transitional epoch from capitalism to socialism and communism (Althusser and Balibar, 2015: 350–5, 441–80; Bettleheim, 1975; Mandel, 1952; Marx, 1978; Uno, 1974). The *theory* of crisis is revolutionary, however, because of its fidelity to Marx's 'power of abstraction' (Marx, 1990a: 90), his immense *theoretical revolution* in *Capital* (Althusser and Balibar, 2015: 337). This revolution in theory is inseparable from Marx's theoretical exposition (or 'narrative') of the inner-interconnections of the 'capitalist mode of production, its relations of production and forms of intercourse [exchange] that correspond to it' (Marx, 1990a: 90).

What is the effect of this exposition? Marx writes, ‘Once interconnection is grasped, all theoretical belief in the permanent necessity of existing conditions collapses before their collapse in practice’ (Marx and Engels, 1955: 250–3). This *double sense of collapse* is fundamental to Marx’s method in *Capital*, and it provides us with a basic reason to renew the theory of crisis today, as a critique of capitalist and neo-reformist forms of consciousness that are ‘too timid to dare to revolt’, too enthralled by capitalist crisis itself, beholding it as a spectacle of horror or fascination, and perpetuating *eclectic* explanations over the cause of capitalist crisis, *interminable* analyses of their sudden appearance, and *speculative* prognostications over their future recurrence. The Marxist theory of crisis cuts through this nonsense and explains how capitalist crises are inevitable and signs of the *impermanence* of existing conditions of capitalism. Thus, it shows how irrational it is to believe in the *permanent necessity* of these conditions.

In the place of irrational belief, the theory of crisis gives us a *logic* based on dialectical materialism, which guides us to the Real. In his notebooks on Hegel’s *Logic*, Lenin summed up the essence of dialectics: ‘The splitting of a single whole and the cognition of its contradictory parts ... is the *essence* ... of dialectics’. He then lists examples of dialectics at work in the natural and social sciences:

In mathematics: + and – Differential and integral

In mechanics: action and reaction

In physics: positive and negative electricity

In chemistry: the combination and dissociation of atoms

In social science: class struggle. (Lenin, 1972: 359)

To this list, we add the Marxist theory of crisis, which dialectically grasps the phenomenon of capitalist crisis as something that is split into two contradictory parts, what Marx called ‘excess capital alongside surplus populations’ (Marx, 1991: 359–68)

Crisis Theory as a Theory of ‘Excess Capital Alongside Surplus Populations’

As Badiou says, ‘It is safer and more important to say that the existing world is not necessary than it is to say ... that a different world is possible’ (2010: 64). From the perspective of the theory of crisis, what is most *unnecessary* about the capitalist mode of production is its own, periodic and inevitable crisis (‘the necessity of crisis’), expressed most egregiously in ‘excess (or surplus) capital alongside surplus populations’. Similar to the late nineteenth century, we face again the necessity to bring about an end to the *artificial scarcity* capitalism produces through sheer waste, hoarding, and privatization (Ross, 2016: 127).

On one side, we are dominated not only by capital, but by capital in the form of an *excess*: a ‘plethora of capital’ that exists as an ‘immense collection of commodities’ *that cannot be sold*. So long as capital remains in this state it is doomed to periodically repeat a process of forcible devaluations, degradation, and decomposition, much like the value of a putrefying mass of harvested vegetables in an unplugged refrigerator. One thinks: *unbelievable, what an immense waste, how stupid and unnecessary!*

This plethora of capital, however, is born of the same causes that produce surplus populations: ‘The so-called plethora of capital ... arises from the same causes that produce a relative surplus population that complements the latter, even though the two things stand at opposite poles – unoccupied capital on the one hand and an unemployed working population on the other’ (Grossman, 1929; Marx, 1991:359).

Surplus populations represent the great human masses whose everyday lives are defined and interrupted by the world of capital – and the state – and held or detained indefinitely in the *precarious* position of never knowing whether they will live to realize the value of their potential to create and work, their *labour power*. As Marx writes, ‘The uncertainty and irregularity of employment ... are all symptoms of a relative surplus population’ (Marx, 1990: 866). Under the domination of capitalism – especially in its imperialist stage – if we cannot sell our labour power as a commodity and realize its value, we cannot labour as an activity and obtain money in the form of wages; if we cannot obtain wages, we cannot purchase our daily necessities (i.e. other commodities), with money; if we cannot consume our daily necessities, we get *sick unto death*. With every passing day of unsold and unemployed labour power, the bodies and minds of surplus populations cannot avoid becoming devalued and degraded on a mass, decomposing scale. Again, one thinks: *unbelievable, what an immense waste, how stupid and unnecessary!*

Blind-Spots in Crisis Theories: Labour Power and the ‘Law of Populations Peculiar to Capitalist Society’

In analysing the phenomenon of capitalist crisis as one that is split between excess capital and surplus populations, one of our theoretical intentions is to delineate our approach *alongside* two, especially dominant theories of crisis in Marxist discourse: first, theories of the falling rate of profit, and second, theories of over-production and under-consumption.

Where do these theories locate the epicentre of crisis, and how do these theories grasp the ‘cause’ of crisis? Broadly speaking, in theories of the falling rate of profit, the epicentre of crisis is found in the sphere of production, and revolves around the exploitation of surplus labour time, the changing values of the organic composition of capital, and the question of wages. Specifically, the cause of crisis is found in the tendency of the profit rate to fall in the face of rising wages

(Shaikh, 1978; Weeks, 1977). On the other hand, theories of over-production and under-consumption locate the epicentre of crisis in the sphere of circulation and the process of accumulation, where the cause of crisis is seen in the disproportion between Department I and II (the production of means of production and the production of articles of consumption), and ultimately in an inability to realize surplus value and sell products of labour to workers (Grossman, 1929; Lenin, 1899a; Luxemburg, 1951; Mattick, 1974).

The former approach emphasizes the immediate conditions of exploitation, while the latter emphasizes the conditions for the realization of that exploitation. As Marx says, these conditions are not identical. 'Not only are they separate in time and space, they are also separate in theory' (Marx, 1991: 352). Theories of crisis that fall onto one side or the other, however, only 'see' the cause of crisis in an 'immediate' sense within their respective spheres, and cannot *simultaneously* see a deeper, more hidden, cause of these causes themselves, one that mediates their very appearance. Like a Luden's Vase, they see the contours of two, opposing faces, *or* the contours of a vase, but never both at the same time. This is the problem of a 'parallax view' (Karatani, 2005; Zizek, 2006).

The parallax view has specific theoretical effects, akin to a blind-spot. For example, theories of the falling profit rate, which have led to important tactics and strategies for organizing workers who are currently employed and exploited, often *lose sight of* how the very possibility of employment (and capitalist exploitation itself) is necessarily interconnected with – and dependent on – the formation of a vast ocean of the unemployed, struggling to survive in various forms of the surplus populations (Jameson, 2014; Shaikh, 1978). This leads us to consider a cause of crisis that is not reducible to falling profit rates only, but also to the contradictory movement from employment to unemployment, and 'vice versa'. As Marx says:

The condemnation of one part of the working class to enforced idleness by the over-work of the other part, and *vice versa*, becomes a means of enriching the individual capitalists, and accelerates at the same time the production of the industrial reserve army on a scale corresponding with the progress of social accumulation. (Marx, 1990: 790)

The secret of this condemnation is found in the notion of *vice versa*, and in Marx's analysis of the law of populations peculiar to the capitalist mode of production: 'The working population ... produces both the accumulation of capital and the means by which it is itself made relatively superfluous ... This is a law of population peculiar to the capitalist mode of production' (Marx, 1990: 784).

For workers, this law represents 'the secret of why it happens that the more they work, the more alien wealth they produce, and that the more the productivity of their labour increases, the more does their very function as a means for the valorization of capital become precarious' (Marx, 1990: 793). This precariousness throws the notion of 'the progress of social accumulation' into question, and places the commodification and social reproduction of labour power at the centre of analysis (Althusser, 2014: 49; Fortunati, 1995; Tronti, 2019: 152; Uno, 1974).

In theories of over-production and under-consumption, on the other hand, a blind-spot is found in the theoretical reliance on Marx's reproduction schemes of *Capital*, Volume 2, which even offer algebraic equations to demonstrate the inevitable and cyclical instability between capitalism's two departments (Marx, 1992: 468–74). But what is the proper *object* of analysis of the reproduction schemes? In addition to the turnover time of capital, which remains a crucial problem for understanding capitalism's (and imperialism's) cyclical temporality, they examine the totality of the *products of labour*, i.e. 'an immense collection of commodities' that have been produced and that now must be bought and sold, in a market, to realize surplus value. In short, the reproduction schemes only see commodities in the form of products of labour and never ask the all-important question: how is *labour power* 'itself' transformed into a *given* commodity, without which no other product of labour could even come into existence, as a commodity, to be bought and sold on a market in the first place? For a theory of crisis, this is carried out by the 'law of populations peculiar to the capitalist mode of production', which mediates the laws of value and profit in a theoretically interconnected totality.

Grasping the law of populations is crucial because it reveals one of the most oppressive conditions of the working class overall, which is that *the process of the commodification of labour power can never be assumed to be one that is always already complete, a fait accompli*. It is never *merely* an accomplished fact, only a fact to be accomplished – or not (Althusser, 2006: 198). What *is*, empirically, an accomplished fact is that of excess capital co-existing alongside surplus populations.

NARRATING THE POSSIBILITY OF CRISIS: THE EXCHANGE PROCESS AND THE LAW OF VALUE

The leap taken by value from the body of the commodity into the body of the gold is the commodity's *salto mortale*. (Marx, 1990: 200)

With the narration of the *possibility of crisis*, we rely on Marx's theoretical exposition of the law of value and the process of exchange in the opening chapters of *Capital*, i.e. the abstract analysis of the commodity-form, commodity fetishism, and the metamorphosis of the *forms of value* that the commodity undergoes in the process of exchange. As Marx writes, 'The commodity appears at first sight an extremely obvious, trivial thing. But its analysis brings out that it is a very strange thing, abounding in metaphysical subtleties and theological niceties' (Marx, 1990: 163).

The abstract and formal possibility of crisis is found in 'simple circulation', and in the division of the commodity-form into two contradictory parts, use-value and exchange-value. Crisis is formally a possibility because a commodity's use-value will always remain latent, virtual, and unrealized unless the qualitative,

sensuous use-value of a given commodity is quantitatively abstracted in the body of another, equivalent commodity.

In the most abstract and formal sense, the commodity-form discloses two, formally asymmetrical social positions representing two forms of value: the 'relative form of value' (20 yards of linen), which can be called the position of selling; and the 'equivalent form of value' (1 coat), or the position of buying (Marx, 1990: 163). Crisis is always possible because the very form of the commodity implies two asymmetrical and contradictory social positions, separated in time and space from each other, the positions of selling and buying (Karatani, 1995: 164).

For this reason, when Marx writes of simple circulation and the 'first metamorphosis' of the commodity into money, or C-M, he begins his analysis from the perspective of the position of selling, and not from the position of buying (M-C). C-M represents a position that cannot avoid what Marx calls a risky leap of faith, a *salto mortale*. This risk is never experienced by the position of buying. He writes, '*C-M. First metamorphosis of the commodity, or sale. The leap taken by value from the body of the commodity into the body of the gold is the commodity's salto mortale ... If the leap falls short, it is not the commodity which is defrauded but rather its owner*' (Marx, 1990: 200; see also Karatani, 1995: 117).

The centre of possibility of crisis is thus found in the *salto mortale*, which expresses the risk of selling that inheres in the very form of the commodity. The *salto mortale* is always a gamble, a speculation, an uncertain relation to the Other. As Marx says, if the commodity is not sold, 'their use value and their exchange value go to the devil' (Marx, 1968: 496). In the capitalist epoch, the act of selling is equivalent to an act of praying. The position of selling is driven by faith and speculation, an irrational belief.

Marx theoretically overcomes the *salto mortale* in simple circulation to show how the commodity-form transforms into the form of money (the 'general equivalent'). While the form of money is derived from the contradiction of the use-value and exchange-value of the commodity-form, money now appears in circulation *as if* it were independent of the commodity-form. With the 'general formula of capital', now expressed as M-C-M' (or merchant's capital), capital's 'monotheistic' structure is revealed:

Value suddenly presents itself as a self-moving substance which passes through a process of its own ... It differentiates itself as original value from itself as surplus, just as God the Father differentiates himself from himself as God the Son, although both are of the same age and form, in fact one single person; for only by the surplus-value of £10 does the £100 originally advanced become capital, and as soon as this has happened, as soon as the son has been created and, through the son, the father, their difference vanishes again, and both become one, £110. (Marx, 1990: 256)

With M-C-M', sellers of commodities cannot avoid always having to sell *particular* commodities to owners of the *universal* equivalent of money. In selling, the *salto mortale* of the position of selling is endemic to the process of exchange;

it is structural and therefore cannot be eliminated, only deferred by credit. As Karatani writes, ‘The essence of credit lies in its avoidance of the crisis inherent in the selling position – the postponement of the present crisis to some future date’ (Karatani, 1995: 179; see also DeBrunhoff, 1976).

The possibility of crisis, whose overcoming from C-M to M-C discloses capital’s fundamentally speculative structure, only offers a formal framework for thinking of the *necessity and inevitability of crisis*. As Marx writes, ‘the factors which turn this possibility of crisis into (an actual) crisis are not contained in this form itself, it only implies that the framework for a crisis exists’ (Marx, 1968: 509).

The ‘Deepest, Most Hidden Cause of Crisis’: Political Economy’s Unconscious

The fact that bourgeois production is compelled by its own immanent laws, on the one hand, to develop the productive forces as if production did not take place on a narrow restricted social foundation, while, on the other hand, it can develop these forces only within these narrow limits, is the deepest and most hidden cause of crisis, of the crying contradictions within which bourgeois production is carried on and which, even at a cursory glance, reveal it as only a transitional, historical form. (Marx, 1968: 88)

In *Capital*, the notion of the cause of crisis is *split* into two interrelated levels of causation. One level perceives a range of immediate or direct causes of crisis, which are all too visible, even spectacular. On another level, it perceives a deeper cause of the outwardly visible causes, but it is hidden, disavowed, or repressed by the very perception of the outwardly visible causes themselves. As Althusser writes, ‘The invisible is not therefore simply what is outside the visible ... but ... inside the visible itself’ (Althusser, 1990: 26). In exposing the limits of what political economy *sees* as the cause of crisis, Marx makes visible, for the first time, the deepest cause of crisis, hidden beneath the superficial circuits of money-capital, and co-extensive with the narrow, restricted social foundation of capitalist production.

Why is this *social* foundation of capitalist production necessarily *narrow* and *restricted*? First, it points to how the *social passage* to the world of ‘employment’ (i.e. the commodification of labour power) is necessarily narrow and restricted. As Marx says, above the door to capitalist production hangs the sign: ‘No admittance except on business’ (Marx, 1990: 280). In other words, the ‘narrow and restricted social foundation of capitalist production’ is inseparable from the sale and purchase of labour power (Marx, 1990: 270), which tells us that, in thinking of the inevitability of crisis in the capitalist epoch, it is never about a *generic* (i.e. mercantile) commodity economy in which mere products of labour are exchanged (M-C-M’). Rather, it is about a specifically *capitalist* commodity economy of wage-labour, one that is based on the transformation of labour power into the form of a commodity. As Marx writes:

Capital ... announces from the outset a new epoch in the process of social production ... The capitalist epoch is therefore characterized by the fact that labour-power, in the eyes of the worker himself (sic), takes on the form of a commodity which is his property; his labour consequently takes on the form of wage-labour. (Marx, 1990: 274; see also Kawashima, 2005; Walker, 2016)

Second, the narrow and restricted social foundation refers to the *social reproduction* of labour power itself, which is closely tied to what Marx called the ‘power of consumption’ and the:

[a]ntagonistic conditions of distribution, which reduce the consumption of the vast majority of society to a *minimum* level, only capable of varying within more or less *narrow limits* ... The more productivity develops, the more it comes into conflict with the *narrow basis* on which the relations of consumption rest. (Marx, 1991: 352–3, italics added)

The ‘antagonistic conditions of distribution’ – which are themselves determined by the antagonistic conditions of exploitation in production – are ultimately based on the sale and purchase of labour power, and to what Marx called, ‘The ultimate reason for all real crises’, which ‘always remains the poverty and restricted consumption of the masses, in the face of the drive of capitalist production to develop the productive forces *as if* only the absolute consumption capacity of society set a limit to them’ (Marx, 1991: 615, italics added).

Finally, by foregrounding the ‘deepest and most hidden cause of crisis’ and the ‘narrow restricted social foundation of capitalist production’, Marx’s analysis critically exposes the *unconscious* of ‘political economy’, which is sustained by nervous and anxious forms of *disavowal* and *apologetics* over capitalism’s excesses, encapsulated in the innocuous phrase, ‘*as if* (*als ob*)’. Disavowal allows the ruling classes and the state to think and act *as if* capitalist production is not based on a narrow and restricted social foundation; *as if* there is no hidden or deep cause of crisis, only superficial and visible ones to manipulate; *as if* the consumption of the masses was not restricted by capitalist productivity itself; and *as if* everyone was absolutely free to consume. These are symptoms of a generalized disavowal which recognizes *and* denies, simultaneously, the difference between commodity and money; labour power and labour; value and surplus value; employment and unemployment; and wealth and poverty. Various expressions of disavowal go on and on, interminably. What does Marx especially hear in the capitalist choir of disavowal? Of course, David Ricardo’s ‘Absurd denial of the over-production of commodities accompanied by a recognition of the over-abundance of capital’ (Marx, 1968: 496).

Disavowal quickly leads to the ever-recurring tendency of *apologetics*. As Marx says, ‘The theory of the impossibility of general over-production is essentially apologetic in tendency’ (Marx, 1968: 527). In the face of capitalist crisis, disavowal and apologetics expose the *nervous breakdown* of the capitalist class and its sycophant, ‘political economy’.

Narrating the Inevitability of Crisis: The Vicious Cycle of Accumulation

The theoretical exposition of the inevitability of crisis begins by grasping the social foundations of the capitalist mode of production and the specific circuit of industrial capital. The form of industrial capital is: $M-C \dots P \{lp/mp\} \dots C'-M'$, which forms a 'loop' or cycle from M to M' , and from M' *back to* M . Industrial capital differs from merchant's capital, $M-C-M'$, insofar as it differentiates the commodity 'inputs' of labour power (lp) and means of production (mp) into the process of production (P).

In *Capital*, however, capitalist production is inseparable from its *reproduction*, for without the reproduction of the relations and means of production, capital would be unable to accumulate and expand production. Capitalist *accumulation*, however, abides by a *cyclical* movement, one that alternates between phases of prosperity and phases of depression. Mediating this cycle is the phase of crisis itself (Itoh, 1988: 290; Uno, 1974). Let us look at this vicious cycle more closely.

The accumulation phase of prosperity

In the accumulation *phase of prosperity*, the production process 'absorbs' surplus populations (formed in the previous phase of depression) through the sale and purchase of labour power, and on this basis, production expands and widens. Expansion is based on the presence of unemployed workers, but also on generous extensions of credit from banks, the use of available idle funds and hoards, which sets low interest rates for industrialists and commercial capitalists (DeBrunhoff, 1973: 86; Marx, 1991: 435). These conditions allow industrial capitalists to reinvest a portion of their profits back into the production process, and to focus on exploiting as much surplus labour time within the production process as possible, without having to worry about final sales to consumers. *Commercial capital* – the 'modern' form of merchant's capital – assumes this function of sales to final consumers, which allows the industrialist to focus on 'production for production's sake' (Marx, 1991: 379).

In the phase of prosperity, this drive for production increases the *organic composition of capital* by investing proportionally more into *constant capital* than *variable capital*. With widened production, prices of *raw materials* become inflated while larger and larger masses of surplus populations are absorbed into production as a class of wage-labour. This absorption, based on the commodification of labour power, raises wage-levels and pulls down profit rates over time. The resulting *tendency of the profit rate to fall*, however, is itself phenomenally concealed by exuberant *speculations* by creditors, who gamble on the prices of increasingly overstocked commodities, which continue to be produced without any care for sales to final consumers (Marx, 1990a: chapter 25; 1991: parts 3–5).

With credit and loan capital mediating finance, industry, and commerce, the conditions for the transformation of the possibility of crisis into an inevitable necessity are actualized at the zenith of prosperity, when the forecasted and speculated prices of commodities cannot be actualized in a sale, cannot *realize* surplus value in the sphere of circulation, which leads to the appearance of *excess capital* in the form of unsold means of production and means of subsistence (Marx, 1991: chapter 15, section 3). Phenomenally speaking, it now appears *as if* the root of crisis is found in the fact that, while commodities have been produced, they cannot be sold (Uno, 1974).

Since credit always implies a *time limit* for the borrower, when the latter cannot pay back the interest on these loans (let alone the principal), a chain of defaulted payments spreads between industry, commerce, and finance, paralyzing the circulation of capital. Spatially, everything goes from '*meuble*' to '*immeuble*' (Marx, 1990: 227). Industrial and commercial capitalists now scramble desperately for money as a means of payment (DeBrunhoff, 1973: 44–5; Marx, 1990: 232). Bankers react by cutting back on lines of credit while increasing interest rates, a last-ditch attempt to compensate for rampant defaulting. Rising interest rates then collide with falling profit rates, now fully exposed, resulting in the inability of the capitalist to reinvest a portion of their profits back into production and maintain production. Simply put, M' cannot return to M, cannot complete the cycle of its circuit (Marx, 1990a: chapters 23–24; 1991: parts 5 and 7).

The accumulation phase of crisis

In the accumulation *phase of crisis*, the chain of payments is 'broken in a hundred places', interrupted indefinitely, bringing production to a halt, and bringing about 'sudden forcible devaluations' and 'an actual decline in reproduction' (Marx, 1991: 363).

In 'crisis itself ... capital already invested is in fact massively unemployed, since the reproduction process is stagnant. Factories stand idle, raw materials pile up, finished products flood the market as commodities' (Marx, 1991: 614). Moreover, workers, once indispensable for production in the prosperity phase, now begin to turn into the opposite, becoming disposable and falling into unemployment and precarity. Here, a 'surplus of productive capital' (Marx, 1991: 614) comes into being alongside 'a growing surplus population' (Marx, 1991: 353).

The formation of the surplus populations is the result of capital's devaluation of the existing organic composition of capital in the phrase of depression, and discloses the *law of populations peculiar to capitalist society*. The formation of the relative surplus population – a capitalist *prosthesis* of the originally absent labour power commodity – allows the capitalist to now think that labour power is a *pre-given* commodity, indistinguishable, in form, from any other (Kawashima and Walker, 2018).

The accumulation phase of depression

Finally, in the *phase of depression*, the phenomenon of excess capital, in the form of unsold means of production and means of consumption, exists alongside a growing mass of the surplus population. These two parts are held in suspense as capital *devalues* itself ('the destruction of capital'), as well as the value of labour power, until the *historical* point can be reached when labour power can be commodified (again) so that surplus value can be produced (again). This is done by reforming the organic composition of capital (especially through the replacement of fixed capital) and reorganizing the relations of production, thereby establishing the necessary social conditions for a new phase of prosperity, and theoretically completing the narration of capital's vicious cycle of accumulation (Marx, 1991: chapter 6, section 2).

In sum, narrating the inevitability and necessity of crisis follows the circuit of industrial capital in the process of accumulation from: (a) the sphere of circulation (the sale and purchase of labour power and means of production); into (b) the sphere of production (where surplus value is produced); (c) *back out* into the sphere of circulation (where commodities must be sold to realize surplus value); and (d) *back again to production* (to replace and replenish the component parts of production, now on an expanded scale). Theoretically, it is in the movement from (c) to (d) that we see the outbreak of crisis, expressed and visible in the phenomenon of 'excess capital co-existing alongside surplus populations'. The *sense* of this cycle is that it constantly gives the *presentiment* of inevitable crisis, even during the most prosperous of times.

THE SUSPENSION OF THE CAPITAL-RELATION: WEALTH AND POVERTY

From day to day it thus becomes clearer that the relations of production in which the bourgeoisie moves do not have a simple, uniform character but rather a dual one: that in the same relations in which wealth is produced, poverty is produced also; that in the same relations in which there is a development of the forces of production, there is also the development of a repressive force. (Marx, 1995: 134)

Some people are so poor, all they have is money! (Bob Marley)

The contradictory splitting into two parts of excess (capital) and surplus (populations) viciously repeats a dead-zone – a void, a place 'up for grabs' – between the spheres of production and circulation. Here, reproduction is fundamentally interrupted. This signals the capitalist *interregnum* (Gramsci, 1989: 276), an indefinite suspension and interruption of the capital-relation and class contradiction between capitalists and workers. Now, capitalist contradictions appear within *the masses*; class contradictions from the factory have extended into mass contradictions of society, as well as into contradictions of the 'planner state'

(Negri, 1988). In this suspension of the capital-relation, the ‘old is dying and the new cannot be born; in this interregnum a great variety of morbid symptoms appear’ (Gramsci, 1989: 275–6). A prevailing symptom of the interregnum is a loss of the sense and sensibility of class contradictions, for in crisis, the capital-relation itself is suspended and interrupted. However, where this contradiction collapses, a new one emerges, ideologically and discursively, to replace it: wealth and poverty.

In Marx’s *Capital*, wealth is inseparable from the possession of use-values and money, from a power to purchase labour power and to command wage-labour, and thus from a right to exploit surplus labour time and alienate workers from their own work (Oki, 2019). Moreover, wealth is inseparable from a passion to accumulate capital, a passion that is in Faustian conflict with the desire for private enjoyment (Marx, 1990: 741). From the specific perspective of a theory of crisis, however, wealth is inseparable from *excess capital in a process of devaluation*, which unleashes ‘anxious calculation’ and the ‘passion of avarice’ in the present (Marx, 1990: 741). Most importantly, because wealth is inseparable from excess capital, it is fundamentally impermanent and thus something that is periodically and inevitably lost.

Wealth never exists in isolation but is always born alongside poverty. For Marx, poverty is not an accidental condition that one falls into. Rather, it is an unavoidable effect of how ‘the higher the productivity of labour ... the more precarious therefore becomes the condition for their existence, namely the sale of their own labour-power’ (Marx, 1990: 798). Poverty is an omnipresent and formal possibility, endemic to the position of selling labour power, which ‘constantly affect[s] precarious and transitory forms of existence’ (Ranciere, 1989: 31). In this sense, Marx speaks of the ‘virtual pauper’ (Marx, 1973: 604).

Here, however, we emphasize the question of poverty in relation to ‘a given framework of antagonistic conditions of distribution’ and the ‘power of consumption’ (Marx, 1991: 352–3). For Marx, this is connected to the ‘absolute general law of accumulation’, the ‘Lazarus-layers of the working class’, ‘the industrial reserve army’, and ‘official pauperism’. As Marx writes:

The more extensive, finally, the Lazarus layers of the working class, and the industrial reserve army, the greater is official pauperism. *This is the absolute general law of capitalist accumulation*. Like all other laws it is modified in its working by many circumstances, the analysis of which does not concern us. (Marx, 1990: 798)

For a theory of crisis today, however, the analysis of this ‘modification’ is of utmost concern.

Lazarus, the Industrial Reserve Army, and Repressive Force

If the analysis of the possibility of crisis revealed a theological and monotheistic fetishism of money in circulation, then Marx’s analysis of the inevitability or

necessity of crisis leads to an opposite pole, represented in *Capital* by the biblical figure of Lazarus, the poor beggar denied food by the king, and the entombed, dead brother of Mary, resurrected by Jesus four days after his death, another example of the theological niceties of the world of capital.

By introducing the figure of Lazarus into Marx's analysis, the stratifications, segmentarity, and forms of existence of the industrial reserve army (the floating, latent, and stagnant forms of the surplus populations) all become extremely important for Marx's notion of the absolute general law of accumulation. The Lazarus-layers are entombed beneath these strata, far below the employed strata of the proletariat, and condemned to the lumpenproletariat (Marx, 1990: 794–8).

Crisis marks the impossibility of Lazarus's *resurrection*, shattering any illusions of being saved by money-capital. Instead, crisis raises from the grave the spectre of *insurrection*. For this reason, however, when Marx discusses the problem of official pauperism and poverty (not to mention capitalist productivity), he raises the problem of a repressive force. This is closely tied to the suspension of the capital-relation, the interregnum, in which class contradictions are in disarray and where the ruling class has lost its consensus. As Gramsci writes:

If the ruling class has lost its consensus, i.e. is no longer 'leading' but only 'dominant', exercising coercive force alone, this means precisely that the great masses have become detached from their traditional ideologies, and no longer believe what they used to believe previously. (Gramsci, 1989: 276)

On the one hand, this returns us to the problem of belief and its collapse. On the other, the analysis of this *force* needs to be developed in relation to the narrow and restricted social foundation of capitalist production, the absolute general law of accumulation, the antagonistic conditions of distribution, the power of consumption, and the social reproduction and commodification of labour power. These are problems of *the limits* of the capitalist mode of production, its relations of production, and the forms of exchange corresponding to it. These limits mark the place where the analysis of crisis necessarily opens onto problems of state power, state apparatuses, and state policy (Althusser, 2014; DeBrunhoff, 1978; Poulantzas, 1978).

Crisis and State Apparatuses: The Production of Difference

In the suspension of the capital-relation in crisis, state power appears in a crisis of its own, precisely in managing, policing, and repressing capitalism's excesses and its suspended class contradiction. Here we ask two key questions: by what institutional mediations and concrete apparatuses is a *class* of owners of labour power necessarily transformed into a *mass* of surplus populations – *and vice versa*? Second, how is this *mass* of surplus populations *distributed* into an 'industrial reserve army' and its many forms of existence, and into a 'part that has no part' (Ranciere, 1999).

These are questions pertaining to what Marx called the capitalist ‘mode of distribution’ (Marx, 1990: 192), which is also a vast ‘distribution of the sensible’ that is endemic to ‘policing the crisis’ (Hall et al., 2013; Ranciere, 1999). Not only is this a distribution of income, which is often senseless (‘the 1%’); it is also a distribution of the *sense* and meaning (*sens*) of labour power itself, precisely as a *surplus population*.

Ideological and repressive apparatuses of the state *differentiate* and *individuate* surplus populations, thereby bestowing upon them a particular sense and meaning, a statistical legibility and legality. It does so by ‘liberally’ representing and distributing populations on an individual, case by case and biopolitical basis, typically according to particularizing discourses of nationality, race, gender, and sexuality, but never of class (Foucault, 2004). In *this* sense, state apparatuses modify and represent the ‘absolute general law of accumulation’ as a problem of the ‘antagonistic conditions of distribution’. The apparatuses (re)produce dominant sensibilities of distribution as antagonistic effects, and maintains a most impoverished strata of the surplus population, entombed like Lazarus.

Ideological state apparatuses practise interpellation, or the process of calling and identifying individuals as Subjects, which represents an ‘imaginary relationship of individuals to their real conditions of existence’ (Althusser, 1971: 262). This imaginary relationship is central to the commodification of labour power and the reproduction of relations of production (Althusser, 1971: 262), but also to the ‘imagined community’ of the Nation (Anderson, 1991), which the state conjures up through state-led education, universities, the mass media, and the orchestration of public opinion, i.e. the training and cultivation of the mind, the colonization of language, the imperial guidance of the ‘voice in one’s head’, and the normalization of monolingualism (Balibar and Wallerstein, 1991; Derrida, 1996; Dolar, 2006). Through citizenship, the state is invested in maintaining a ‘part that has no part’ within a nationally ‘purified’ surplus population, and in modifying representations of (post)colonial populations, immigrants, ‘illegals’, ‘refugees’, and ‘the undeserving’ (Balibar, 1972, 2015; Fraser, 1989; Kawashima, 2009). Ideological state apparatuses seek to control *the mind* of labour power and surplus populations through the power of language and the voice, and constantly modify the division between intellectual and manual labour (Sohn-Rethal, 1978) through a massive production of difference.

By contrast, the *repressive* state apparatuses – the military and the police – control, colonize, incriminate, incarcerate, and capture the *body* of labour power and *bodies* of surplus populations. This is done through vicious cycles of *race-racialization-racism*, which only see the skin colour of faces and bodies. As a vicious cycle of its own, this triplet represents three discursive processes and diverse institutional ‘apparatuses of capture’, such as the prison, the state’s archetypical, repressive enclosure (Davis, 2003; Deleuze and Guattari, 1987; Foucault, 1979, 2003: 255; Hall et al., 2013; West, 1993). Race-racialization-racism disavows *capital’s* vicious cycle and its suspended capital-relation, fetishizing instead – or

condemning one to – particular forms of racial belonging. Moreover, it enforces a division between *the proletariat* and *the lumpenproletariat* by unleashing brute force against a particular race, condemning it to the Lazarus-layers of the industrial reserve army (Allen, 1997; Cleaver, 1972; Thoburn, 2002).

State racism is a mode of organizing surplus populations in the face of the suspended class contradiction, most visible in prolonged periods of depression. It modifies the antagonistic conditions of distribution as an ‘absolute’ ground of capitalist accumulation, and directly impacts the power of consumption of the masses in extremely unequal ways, while constantly maintaining a *racialized* ‘part that has no part’, a ‘Lazarus’. Moreover, state racism unleashes populist and nationalist discourses of essentialism, nativism and archaism (Harootunian, 2000), and a fascist ‘jargon of authenticity’ (Adorno, 2002), such as ‘being-toward-death’, ‘whiteness’, ‘male-supremacy’, ‘Blood and Soil’, ‘Yamato-race’, ‘Chinese characteristics’, ‘Homeland Security’, etc., which are accompanied by a general disavowal of *inequality*. Disavowal and official apologetics rear their ugly heads again, sustaining inequality, sexism, segregation, discrimination, racism, homophobia, and senseless violence, especially at the groping hands of the police and thugs. This is necessarily challenged by popular movements for *equality* and social justice, but also for revenge.

The struggles for equality against the disavowal of inequality often produce a vicious and vengeful cycle of their own, one in which a sense and sensibility of *class* contradictions does not exist (Haider, 2018). In *this* cycle, it is *as if* the capitalist *interregnum*, which suspends the capital-relation, is a *permanent* condition and not, in fact, a *transitional* one. The transitional nature of capitalist crisis is further clarified in the theory of imperialism.

CRISIS-AS-TRANSITION AND THE THEORY OF IMPERIALISM

In *Imperialism, the Highest Stage of Capitalism*, written in 1916 in the midst of the First World War, Lenin brackets out Marx’s abstract-logical analysis of crisis and approaches crisis as a fundamentally *historical* factor in the *transition* from capitalism in its liberal stage to the highest and most contemporary stage of imperialism (Lenin, 1975: 213). In terms of the *form of capital*, crisis marks the relative decline of *industrial capital* and the ascent of *finance capital* and *monopoly capital* after the 1870s (Baran and Sweezy, 1966; Braverman, 1974; Hilferding, 1985; Lenin, 1975). At the same time, in imperialism, *the form of capitalist crisis* itself changes (Uno, 1974: 24–35).

For a theory of crisis, what is the significance of finance capital? Fundamentally, it is related to joint stock companies, bank monopolies, the credit system, and the specific forms of loan capital, interest-bearing capital, and money-lending capital, or M ... M’. Finance capital funds operations of industrial and commercial capital through loan capital (based on idle funds organized by banks), subsuming

them within the mobile circuits of interest-bearing capital. Interest-bearing capital, of course, has mercantile origins in medieval and baroque times, and goes back to the old form of money-lending capital and usury-capital (LeGoff, 1990; Marx, 1991: chapter 36). But with capitalism in the stage of imperialism after 1870, *finance capital* preserved interest-bearing and money-lending capital, only now it is used to subsume *industrial capital*. In the stage of imperialism, the formula of industrial capital is hidden, as it were, in the ellipsis between M ... M'.

The significance of this hidden relation is that, with the dominance of finance capital, *monopolistic* investments in increasingly larger and larger forms of *fixed capital* raise the *organic composition of capital* to an unprecedented scale. This is because the dominant commodities of this era (i.e. after 1870) are iron and commodities in the extractive, heavy, and chemical industries (Uno, 2016: 173). In the wake of crisis, however, the upswing towards the phase of prosperity is dragged out, and phases of depression become extended over longer and longer periods of time. This is due to the difficulties in selling off such large quantities of fixed capital, the capitalists' *salto mortale*. The spatial fix of excess capital alongside surplus populations becomes a *chronic* phenomenon over time. As Kozo Uno writes:

After the 1870s ... the periodicity of crisis not only changed from what it was before; gradually, the mode of the cyclical process itself – of boom, crisis, and depression – changed ... More and more, the tendency to move steadily towards so-called chronic depression became common. (Uno, 1974: 30–1)

With *chronic unemployment* in the imperialist home country, the state's justification for foreign conquest, colonial domination, and war becomes a discursive norm. Lenin quotes Cecil Rhodes, 'millionaire, a king of finance, the man who was mainly responsible for the Anglo-Boer War':

I was in the East End of London yesterday and attended a meeting of the unemployed ... I pondered over the scene and I became more than ever convinced of the importance of imperialism ... My cherished idea is a solution for the social problem, i.e., in order to save the 40,000,000 inhabitants of the United Kingdom from a bloody civil war, we colonial statesmen must acquire new lands to settle the surplus population in the factories and mines ... If you want to avoid civil war, you must become imperialists. (Lenin, 1975: 236)

In the stage of imperialism, the *cyclical form of capitalist crisis* morphs into chronic depression and chronic unemployment, which creates justifications and apologies for war and imperialist expansion in the global South. As Marx says, 'The internal contradiction seeks resolution by extending the external field of production' (Marx, 1991: 353). Crucially, *excess capital* is now at the centre of the *export of capital*. As Lenin writes:

[s]urplus capital will be utilized not for the purpose of raising the standard of living of the masses in a given country ... but for the purpose of increasing profits by exporting capital abroad to the backward countries. In these backward countries profits are usually high, for capital is scarce, the price of land is relatively low, wages are low, raw materials are cheap. (Lenin, 1975: 226)

The export of excess capital to the global South is accompanied by a repetition and reinvention of so-called primitive accumulation, led by the state, which creates a surplus population out of whole cloth (Federici, 2004; Kawashima, 2009; Marx, 1990: 873; Walker, 2016). This lays the foundations for thinking – now in relation to imperialism – of Marx’s analysis of ground rent, the formal subsumption of labour, and a *third form* of extracting surplus value, one that is not reducible to the production of absolute or relative surplus value, and that extracts ‘super-profits’ by raising productivity through new inventions and by pressing wage-levels, through social forms of domination, below the value of labour power, i.e. through ‘super-exploitation’. This is visible, for example, in the gold mines of South Africa during the Anglo-Boer War (Higginbottom, 2011, 2012, 2014; Marx, 1991: 780; Smith, 2016). The necessity and inevitability of crisis is now transplanted to the global South, extending and reproducing conditions for capitalist crisis around the world, enforcing a world-wide division between intellectual and manual labour, and creating stratifications and boundaries of the industrial reserve army on a world-wide scale, a ‘global’ Lazarus.

Imperialism, State Power, and Crisis: Borders and War

In imperialism, the relation of state power – and its violence – to capitalist crisis is altered fundamentally, for the state governs not only national or domestic crises but also foreign, colonial crises, themselves the effects of capitalist contradictions in the home country. On the one hand, state power mediates so-called native workers as active workers and the most pauperized sections of the surplus populations within the national economy, often coded as immigrants; on the other, it mediates a labour aristocracy of workers and colonized workers in the peripheries and domestic households of the capitalist world-system (Dalla Costa and James, 1972; Lenin, 1975; Meillassoux, 1981).

The state can only manage this precarious balancing act through an immense production of difference and borders, led by the work of the ideological and repressive state apparatuses (Balibar, 2002; Messadra and Neilson, 2013). Bordering processes, combined with an immense, discursive production of difference, work to ensure that the unique, proletarian risk of the commodification of labour power is never eliminated, only deferred here and there for some, but never for all.

Finally, chronic depression in the stage of imperialism becomes the crucible in which the inevitability of crisis morphs into inevitable war. As Kozo Uno writes in the case of Japanese imperialism prior to the Second World War, ‘Excess facilities of fixed capital were now seen alongside a chronic surplus of labour power, and it is here that the unproductive military industry discloses its peculiar meaning’ (Uno, 1974: 33). War becomes a doctrine of state policy to extricate national economies from chronic depression. In war, however, the industrial reserve army is now absorbed into the state’s standing army. Unemployed workers,

who formerly toiled as ‘appendages’ to machines in capitalist production, now become appendages to unproductively circulating military machines and weapons, as in drone warfare. When wars end, the state throws discharged soldiers back into various reserves, but especially into the industrial reserve army and lumpenproletariat (Marx, 1990b: 75).

Interest-Bearing Capital: Time is Out of Joint!

The abiding lesson of Marx’s analysis of crisis in *Capital*, first published in 1867, is that it is based on the specific form of industrial capital. Today, well after the collapse of the Soviet Union and amid the periodic (even decennial-like) crises of capitalism since 1973 to the present – in short, with the emergence and decline of neoliberalism – the world-historical relevance of Marx’s analysis of industrial capital continues to endure alongside Lenin’s analysis of finance capital and imperialism.

As we mentioned earlier, finance capital is based on the modern credit system, interest-bearing capital, and money-lending capital, or $M \dots M'$, which subsume industrial capital. At the same time, interest-bearing capital has origins in a much earlier, medieval or pre-modern form of capital, namely money-lending and usury-capital. How are we to grasp this duplicity?

Money-lending capital, in fact, reveals a peculiar relation to industrial capital and to capitalist crisis, specifically. If the basic formula of industrial capital, upon which Marx’s demonstration of the inevitability and cyclicity of crisis is based, is: $M-C \dots P \{l/mop\} \dots C'-M'$, then the inevitability of crisis points to the circular movement in which the final term, M' , cannot automatically return back to the first term, M , in order to reproduce the capital-relation. The inevitability of crisis can therefore be grasped as $M' \dots M$. This is the inverted form of $M \dots M'$, the formula of money-lending capital. As Kozo Uno writes:

M \dots M' \dots takes the form of money-lender’s capital. Money lenders, who intercept part of merchants’ profits as interest on loans, do not even directly deal with commodities in order to reap a surplus. Their method rather is to dispossess others, sometimes with the ruthlessness characteristic of so-called usurer capital, which seizes the property of the insolvent. (Uno, 1980: 15)

In this sense, capitalist crisis creates a ‘time out of joint’, an inversion or a short-circuit, between present-day capitalism and its distant, medieval past, resurrecting the ethos and sensibilities of the pre-modern creditor and producer of debt, *the usurer*, ‘that old-fashioned but ever-renewed specimen of the capitalist’ (Marx, 1990: 740). The usurer shows, ‘how the love of power is an element in the desire to get richer’ (Marx, 1990: 740). His method of enrichment dispossesses others, seizes the property of the insolvent, and does not alter the mode of production. Rather, it ‘clings on to it like a parasite and impoverishes it ... sucks it dry, emasculates it and forces reproduction to proceed under ever more pitiable conditions’ (Marx, 1990: 731).

Today, in our trumped-up, disoriented, and digitally distracted era, when we often don't even realize how deeply we are caught in vicious cycles; when usurious and dispossessive practices are ever renewed by various parasitic specimens of the capitalist (e.g. real estate brokers and financial agents of the sub-prime mortgage crisis of 2007–8); and when capitalism in its highest and most contemporary form can (still) only repeat the backward, *historical dawn* of usurious money-lending capital and its medieval and authoritarian passions of avarice – the Marxist theory of crisis gives us a logic and a revolutionary common sense to construct new strategies and programmes to break capitalism's vicious cycle, once and for all. It enables us to critique eclecticism and overcome the timidity to dare to revolt, and to plan for the transitional epoch from capitalism to socialism, and ultimately to a communist society based on the *eternal decommodification of labour power*, the abolition of wage-labour and unemployment, and the collective ownership of the means of production by freely associating, direct and singular producers. '*All theoretical belief in the permanent necessity of existing conditions collapses, even before the collapse takes place in practice*' (Marx and Engels, 1955).

ACKNOWLEDGEMENTS

The author would like to thank Kanishka Goonewardena, Gavin Walker, Alberto Toscano, Harry Harootunian, Svenja Bromberg and the editors of the *Handbook*, and an anonymous reader for their thoughts and comments on previous drafts of this chapter.

Communism

Alberto Toscano

INTRODUCTION: THE MANY VOICES OF COMMUNISM

Stripped of a reference to communism, of a communist standpoint or perspective, Marxism loses its singular (and for many chimerical) status as a *revolutionary science*, to take its disciplinary place as another sociology, political economy or methodology. This subtraction of communism from Marxism is the premise for the periodic mainstream plaudits to Marx as an analyst of capitalism and crisis, now finally freed of the burdensome legacy of ‘historical communism’. Contrariwise, the first two decades of the twenty-first century have also witnessed a wide-ranging theoretical effort to reassert the vitality of communism as the idea of a thoroughgoing alternative to capitalism, what Marx once called our ‘religion of everyday life’ (Douzinas and Žižek, 2010; Badiou and Žižek, 2013; Žižek, 2013; Bosteels and Dean, 2014).

In what may appear a curious inversion of the 11th thesis on Feuerbach, this assertion of the necessity of a communist perspective in the wake of the collapse, defeat, suicide or capitalist transfiguration of historical communisms, has emphasised the need for a *philosophical* affirmation of communism as a prelude to a recovery or reinvention of a communist *politics*. Among its most prominent advocates, the return of communism as an idea or ‘hypothesis’ has been justified in terms of a historical context that bears far more analogies to the 1840s (as a time of revolutionary setbacks and unbridled capitalism) than it does to the titanic

struggles against capitalism and imperialism that marked the ‘short twentieth century’ (Badiou, 2010: 66–7). Sympathetic critics of this philosophical return of communism have stressed the strategic deficit that marks this debate, the loss of the perspective of *transition*, of the determinate and politically oriented negation of the capitalist social order that distinguished Marx’s proposal from the other communisms of his age (Garo, 2019). Others have underscored the need to supplement and displace Marxian and philosophical conceptions of communism by foregrounding the *common*, not as an objective production of capital to be expropriated and appropriated by the proletariat, but as the outcome of anti-capitalist practices of associationism – in a qualified return to Proudhon, as well as to a whole history of workers’ self-management and self-organisation (Dardot and Laval, 2019).

These efforts partially overlap with an attention to practices and discourses of the *commons* that glimpse a living post-capitalist potential in a wide variety of collective practices that oppose the framework of possessive individualism and private property – whether in terms of the continued vitality of Indigenous and subaltern lifeways or in view of the production of the commons at the cooperative cutting-edge of cognitive capitalism (Hardt and Negri, 2011; Linebaugh, 2014). Some of this literature has found succour in the increasing recognition of the late Marx’s concern with communal forms, namely the Russian peasant community (*obshchina*), but also the political institutions of the Iroquois (Haudenosaunee), viewed as potential vehicles for an abolition of capitalist relations that could circumvent the need to replicate the ideal-typical stages of Western bourgeois development (Shanin, 1983; Rosemont, 1989; Basso, 2015).

The more classically political counterpart to this emphasis on practices of *communings*, understood as instances of a communist praxis alternative to the historical horizon of state communism, has been a renewed interest in the *commune* as a political form (Bosteels, 2017), as well as in the possibility of experiences of *dual power* (Jameson, 2016), which would see islands of communism coexist, temporarily, with capitalist social and political relations. Efforts to draw on practices and ideas of the *common(s)* and the *commune* – with their attendant need to confront Marx and Marxism’s complex relations to the very idea of *community* as both a brake upon and a horizon of revolution – aim, among other things, at shaking off the fetters on political praxis and imagination imposed by the historical record of state (and party) communisms. They also endeavour to draw precious sustenance for contemporary communisms from subterranean or heretical traditions.

An analogous remark can be made regarding the contemporary prominence of the notion of *communisation*. Updating a whole arsenal of insurrectionary Marxisms and ultra-left theories historically marginalised by Stalinist and Eurocommunist perspectives (from Amedeo Bordiga to strands of 1970s autonomism, passing through groups like *Socialisme ou Barbarie* or the Situationist International), theorists of *communisation* generally display a steadfast fidelity

to Marxian value-theory in their drive to jettison the very notion of *transition* as defining the strategic horizon of communism. This repudiation of transition, and especially of any notion of a transitional *programme* (and of programmes *tout court*), is often based in the passage from an industrial antagonism grounded in the collective identification of workers waging *strikes* to the contemporary struggles of increasingly wageless populations in the realm of circulation that coalesce in *riots* (Clover, Chapter 65, this *Handbook*). As outlined by the group most responsible for honing the notion of communisation:

In the course of revolutionary struggle, the abolition of the state, of exchange, of the division of labour, of all forms of property, the extension of the situation where everything is freely available as the unification of human activity – in a word, the abolition of classes – are ‘measures’ that abolish capital, imposed by the very necessities of struggle against the capitalist class. The revolution is communization; it does not have communism as a project and result, but as its very content. (Théorie Communiste, 2012: 41; Toscano, 2012)

This chapter will strive to articulate an understanding of communism that maintains an emphasis on the strategic and political problem of transition, which, as the concluding section will propose, requires reflection on the very meaning of *abolition* in Marx and Marxism, as well as on the latter’s relation to broader traditions of *abolitionism* (including but not exhausted by the abolition of feudal and patriarchal privileges, of racial slavery, of the death penalty and prisons). To delineate communism in terms of the contemporary question of the transition from and abolition of capitalism, I will begin by providing a brief sketch of communism’s pre-Marxian history. I will then explore some of the different articulations of communism in Marx’s own work, move to a reflection on the transvaluation of transition that took place in the ‘long ‘68’, and finally address the thorny issue of abolition itself.

Before undertaking this investigation, however, it might be both pertinent and useful to acknowledge the polyvalence and equivocality of communism (Balibar, 2015: 12), the fact that it is rarely if ever spoken of with ‘one voice’. It is not simply a matter of differences in political practice or orientation; what is at stake is the very location of communism in the conceptual networks of Marxism and affine discourses. Communism may define a *form of government* (the Commune, the dictatorship of the proletariat, the post-revolutionary state); a *mode of production* (in the radically different meanings of *primitive communism* (Davidson, Chapter 63, this *Handbook*) and that of a *post-capitalist communism*); a *social formation*; a distinct form of *social relations* (Balibar, 2015: 14); ‘the end of the *economy* as a separate and privileged domain on which everything else depends’ (Dauvé and Martin, 2015: 52); or even ‘a life plan for the species’ (Basso in Bordiga, 2020: 88), as well as the *party* or *movement* oriented towards the achievement of the foregoing principles or visions.

Movement can in turn take the more restricted, if potentially planetary, characteristics of the *workers’ movement* or, in a more abstract dialectical vein, as in Marx’s arguably most celebrated (but also profoundly under-determined)

definition of communism, ‘the real movement which abolishes the present state of things’. The scope of communism has also been considerably extended beyond the various levels at which Marx (and Marxists) articulated the abolition of capitalism. Communism has been defined from a radical anthropological standpoint as a ‘principle immanent in everyday life’ (Graeber, 2014: 68); it has been delineated as an ontological and ‘technical’ condition in excess of politics, ‘the imbrication of everything and everyone’ (Nancy, 2011: 44–5); it has been articulated as a ‘communism of thought’, a movement intrinsic to thinking and human needs over and above any determinate social or political formation (Mascolo, 2018 [1953]; May, 2018: 60–93); it has even been captured as a ‘community of the possible’ in which human individuals can fully actualise an opening to sociality and collectivity grounded in their very biological makeup, and especially their linguistic capacities (Cimatti, 2011: 139–169).

Moreover, there are a welter of communisms whose relation to the Marxian variant is historically, geographically and conceptually remote, from the aristocratic anti-property utopia of ‘Platonic communism’ (Garnsey, 2007: 6–58) – itself an echo of ‘Spartan communism’ (Della Volpe, 2018 [1946]: 11) – to the recovery of a *sui generis* ‘Incan communism’ as an Indigenous resource for revolutionary politics by the Peruvian thinker José Carlos Mariátegui (Löwy, 1998); from the adoption by insurgent Mediaeval peasants of the biblical dictum *omnia sunt communia* (everything in common) to the 1970s slogan of uprisings in the Italian ‘social factory’, *Vogliamo Tutto* (we want everything). The language of communism has also consistently posed a scandal in the face of the supposed sophistications of elite political discourse. As the Guyanese Marxist historian and revolutionary Walter Rodney observed in his lectures on the Russian Revolution in Dar es Salaam: ‘Marxist writers have inevitably had to find new terms to describe society in the way it is seen by the members of oppressed classes. The language lacks the urbanity and refinement that the bourgeoisie developed as an expression of its own disassociation from sweat and cow dung’ (Rodney, 2018: 14).

COMMUNISM BEFORE MARX

Though a powerful claim can be made for the existence of ‘communist invariants’ (Badiou and Balmès, 1976) that long predated the consolidation of a world market, the modern acceptance of communism emerged around the time of the French Revolution. Jacques Grandjonc’s lexicographic inquiries attest to an extended if lacunary history in Europe, beginning around the twelfth century, for a number of terms contiguous with communism, rooted in the realities of mediaeval communal life and punctuating the written record in the wake of the revolts of peasants and commoners. In the history of French usage, as detailed by eighteenth-century dictionaries, *communiste* would appear to emerge in the Middle Ages as an equivalent for *communalis* or *comunarius* – an officer of the

commune. Alternatively, it could designate the members of a community of goods, more specifically a *communauté de main morte* – the kind of tacit community (*communauté taisible*) that villagers subjected to the rights of feudal lords over their property would establish in order to retain possession of their lands and goods across generations (Grandjonec, 1983: 144).

This understanding of ‘communists’ as members or partisans of a community of goods is registered in Latin, Polish and Dutch in the sixteenth and seventeenth centuries, in terms like *communelli* and *communicantes* and with reference to the communal doctrines of radical Protestant sects like the Anabaptists, Hutterites and Waldesians, as well as to the peasant and communal insurgencies against feudal mastery that punctuate this phase of European history. It is in this context that the term *communista* appears in a Polish manuscript from 1569, alongside the neologism *oconomista* (Grandjonec, 1983: 145). In the eighteenth century, the term is used to refer to the inhabitants of rural communes or those with rights of communal usufruct over shared goods – a testament to the affinity between the *commons*, *community* and *communism* that many contemporary authors continue to mine.

It is to the end of the eighteenth century that we must turn to see the tentative emergence of *communism* and *communist* as terms referring to political movements or ideologies oriented towards the abolition of private property and the establishment of communal ownership. The libertine novelist, thinker and pornographer Restif de la Bretonne (1734–1806) first uses the French term *communiste* in 1785, and in his book *Monsieur Nicolas* (1797) coins the modern term *communisme*, under the influence of Gracchus (François-Noël) Babeuf’s Conspiracy of Equals (*Conjuration des Égaux*) of 1796 against the Thermidorian Directory (Grandjonec, 1983). Especially after Philippe Buonarrotti’s 1828 retelling, in his *Histoire de la Conspiration pour l’Égalité dite de Babeuf*, of its defeated efforts to uphold the radical promise of the French Revolution against the Thermidorean revenge of the propertied classes, Babeuf’s ‘conspiracy’ became a touchstone for the mid-nineteenth-century crystallisation of a *communist workers’ movement* (Mazauric, 2006). The political and intellectual revolutions of the late eighteenth century appropriated the deep-seated languages of the *common*, the *commune* and the *community*, refashioning them into wholesale challenges to class rule, state power, clerical authority and multiple forms of domination. A (disputed) fragment from the German poet Friedrich Hölderlin, penned in 1790, at the time of his close friendship with Hegel, is entitled the ‘communism of spirits’ (*Communismus der Geister*) (D’Hondt, 1989; Lacoue-Labarthe, 2004: 15). In 1794, the first attested use in German of *Kommunismus* is inscribed in the interrogation transcripts of an Austrian Jacobin (Grandjonec, 1989: 19).

The repression of the radical, egalitarian wings of the French Revolution and its European avatars meant that the ruptural meaning of communism (as well as of some of its less successful French cognates: *communautiste*, *communismal*, *communisme*, *communaliste* (Grandjonec, 1989: 21)) inaugurated in the 1780s and 1790s was forced underground, only to re-emerge decades later as neo-Babouvist

activists and intellectuals mixed with a surging workers' movement. Before the 'spectre' (or 'hobgoblin', in Helen Macfarlane's translation of the *Manifesto*) would rear its head in the late 1830s and 1840s, the utopian and egalitarian challenge to the status quo would be channelled by different discourses and terminologies, ones that Marx and Engels would later term 'critical-utopian socialisms'. In the writings of Fourier, Saint-Simon, Owen and others, neologisms like 'societal', 'industrialism', 'mutual', 'mutualism', 'cooperation' were coined. 'Socialism' itself is first recorded in the 1830s, and shortly thereafter comes to be juxtaposed to communism – in a terminological division within the 'anti-capitalist' camp that would repeat itself in the wake of the Russian Revolution (Williams, 1985: 73–5). Then, as Grandjonc recounts, we witness the appearance of

[c]ommunist, refound or recreated by the anonymous neo-Babouvists of the secret association of Egalitarian Workers in Paris or in Lyon at the end of 1830, and *communism*, which starts to circulate after the public debates of July 1840 on the theory of these communists, and which will only really gain momentum, and in an immediately international fashion, during the same year. (Grandjonc, 1983: 143)

Both politically and discursively, 1840 is thus a watershed. On 1 July, in the Parisian neighbourhood of Belleville, a 'communist banquet' was held in the context of mass strikes supported by the expatriate workers and intellectuals of the *Bund der Gerechten*, the League of the Just, inheritor of the League of Outlaws (*Bund der Geächteten*) and later to morph into the Communist League for which Marx and Engels would draft their *Manifesto*. Labour migration thus played a critical role in this communist fermentation; in particular, the 'small collectivity' of German emigré workers and artisans 'radically redefined the concept of private property' (Herres, 2015: 18). The year 1840 was 'the key year for the distribution of the word *communisme* in the modern sense of common ownership of the means of production and the socialization of production; 1840 saw the foundation of the "communist party"; and 1840 saw the flourishing of the press of the various communist currents' (Meyer, 1993: 89). In 1842, the neo-Babouvist activist Théodore Dézamy (1808–1850) would publish his *Code de la Communauté*, viewed by some as the most advanced theoretical document of the French communism of this period (Mazauric, 2006).

By 1842, *communisme* was a common term in French for 'all programs that espoused egalitarianism through the abolition of private property' (Herres, 2015: 17). In this same moment, the German labour leader Karl Schapper provided a limpid summary of this vision of communism, with its emphasis on the material presupposition for a radical democratic republicanism: 'Collective property is the first and most essential requirement of a free democratic republic, and, without it, this is neither thinkable nor possible. With an unequal division of property we remain completely and absolutely dependent on the wealthy' (Herres, 2015: 18). By June 1843, responding to the polemics of conservative Christian journalists against the 'artisan communism' of Wilhelm Weitling (whose authoritarian dimensions he nevertheless rejected), the young Mikhail Bakunin could write that 'communism has now

become a global question and it is no longer possible for a statesman to *ignore* it, and even less can he *repress it through force alone*' (Bakunin, 2007: 151). We are, he continued, 'on the eve of a great world-historical transmutation' (2007: 158).

MARX'S COMMUNISM

Critique and Overcoming of Other Communisms

In 1843, Marx – who that year had launched into a critical survey of literature on the theme, including Lorenz von Stein's *Socialism and Communism in France Today* (1842) – still considered the communism advanced by the likes of Weitling or Étienne Cabet a 'dogmatic abstraction'. As he remarked to Arnold Ruge, in correspondence published in the *Deutsche-Französische Jahrbücher*:

[t]he advantage of the new movement [is] that we do not anticipate the world with our dogmas but instead attempt to discover the new world through the critique of the old. Hitherto philosophers have left the keys to all riddles lying in their desks, and the stupid, uninitiated world had only to wait around for the roasted pigeons of absolute science to fly into its open mouth. (Marx, 1992: 207)

Some years later, Blanqui would echo in his own pungent rhetoric this opposition to a static, apolitical image of communism as a confected utopian edifice, when he wrote that communism was ultimately 'a general result [*résultante*], and not an egg that can be laid and then hatched in a corner of the world by a two-legged bird without feathers or wings' (Blanqui, 2018: 257).

Marx's adoption (and transformation) of the language of communism was largely mediated by his friend, comrade and intellectual accomplice Friedrich Engels, whose conversion to communism came from conversations with Moses Hess, himself deeply impressed by the 'communist manifesto' of Baron de Colins – which spoke of a 'rational people's community (a commune as understood by committed communists)' (Herres, 2015: 20). Marx's communism, like the bulk of his concepts and arguments, was forged through *critique*. From 1844 to the end of his life, Marx, along with Engels, would repeatedly subject the communisms and socialisms of his day to exacting and often coruscating polemical evaluations. While his principal demarcation was from the wide gamut of socialisms – in the *Manifesto* subdivided into reactionary socialisms (feudal, petty-bourgeois and 'true' or 'German' socialisms), conservative/bourgeois and critical-utopian (Leopold, 2015) – self-described communisms (those of the 'Icarian' utopian Étienne Cabet, or of the artisan-philosopher Weitling) would be repeatedly castigated by Marx for their penchant for asceticism and crude egalitarianism or for a mere generalisation of private property that failed to make the transition to *social* property, to a communism of productive abundance and the liberation of needs rather than to a 'barracks' communism based on economic levelling and political regimentation.

Marx's 'insight' into the ways that capitalism bodied forth its own negation and overcoming in communism – critical to breaking with communism as an abstract dogma – would have to wait for his mature critique of political economy (especially the *Grundrisse*), but his philosophical 'vision' of communism, articulating a critique of political liberalism together with an anthropology of labour, would already find consummate expression in the *Economic-Philosophical Manuscripts* (or *Paris Manuscripts*) of 1844 (Berki, 1983). The widely accepted understanding of communism, hinged on the passage from private to collective property, was articulated with unprecedented depth by Marx in notes that drew on his critical readings of Hegel and Feuerbach, as well as, more distantly, his exposure to historical regimes of property in his earlier legal studies. The 'vision' of communism elaborated in 1844 was capacious indeed, its overcoming of private property heralding a transmutation in consciousness, politics and the very relationship of humanity to nature:

Communism is the positive supersession of private property as human self-estrangement, and hence the true appropriation of the human essence through and for man; it is the complete restoration of man to himself as a social, i.e. human, being, a restoration which has become conscious and which takes place within the entire wealth of previous periods of development. This communism, as fully developed naturalism, equals humanism, and as fully developed humanism equals naturalism; it is the genuine resolution of the conflict between man and nature, and between man and man, the true resolution of the conflict between existence and being, between objectification and self-affirmation, between freedom and necessity, between individual and species. It is the solution of the riddle of history and knows itself to be the solution. (Marx, 1992: 348)

At this juncture, Marx had not yet thoroughly rethought the juridical and economic category of private property as *capital*, with all of its profound repercussions on the very concept of communism (but also on the conception of man's relation to nature, which he would later address with the notion of *metabolism*). But the notion that the 'resolution' of humanity's contradictory, alienated condition is to traverse history rather than dogmatically to negate it, already defines Marx's demarcation from those competing communisms which he found guilty of peddling 'pocket editions of the new Jerusalem' or drafting recipe-books for the cookshops of the future:

The entire movement of history is therefore both the *actual* act of creation of communism – the birth of its empirical existence – and, for its thinking consciousness, the *comprehended* and *known* movement of its *becoming*; whereas the other communism, which is not yet fully developed, seeks in isolated historical forms opposed to private property a historical proof for itself, a proof drawn from what already exists, by wrenching isolated moments from their proper places in the process of development (a hobby horse Cabot, Villegardelle, etc., particularly like to ride) and advancing them as proofs of its historical pedigree. (Marx, 1992: 348)

Here we can also see how the communist (workers') movement, but also the tendencies to communism inhering in capitalism, are first crystallised in the early Marx in terms of a movement in historical ontology itself. After the recovery and publication of the *Manuscripts* in the 1930s, their historical-philosophical and anthropological vision of communism became a crucial source for the renewal of

Marxist thought. From Henri Lefebvre to Georg Lukács, Amedeo Bordiga to Raya Dunayevskaya, twentieth-century revisionings of communism drew amply on Marx's economic and philosophical notebooks. As with so many aspects of the Marxist corpus, philology and militancy were never far apart – the first partial translation in English of the *Manuscripts*, for instance, was produced by the Johnson–Forest Tendency (led by Dunayevskaya and C. L. R. James) in a translation by Grace Lee Boggs (under the *nom de plume* Ria Stone) (Marx, 1947).

Communist Individualism, Communist Freedom

I want to pause briefly on two interpretations of the legacy of the *Manuscripts*, by Herbert Marcuse and Galvano Della Volpe, respectively. Commenting on the passage that delineates the *positive* overcoming of private property, quoted above, Marcuse – writing in the early 1940s from his US exile – saw this as a warrant to draw from Marx's text the idea of a *communist individualism*. As he argued:

It is, then, the free individuals, and not a new system of production, that exemplify the fact that the particular and the common interest have been merged. The individual is the goal. This 'individualistic' trend is fundamental as an interest of the Marxian theory ... Communism, with its 'positive abolition of private property', is thus of its very nature a new form of individualism, and not only a new and different economic system, but a different system of life. (Marcuse, 2000 [1970/1941]: 283–6)

This argument relied in turn on Marcuse's earlier investigations (partially inflected by Heidegger's teaching) into the Marxian anthropology of labour (Toscano, 2009).

Marx's conception of labour in the *Manuscripts* allowed one to overcome liberal individualism as well as one-sided materialism, by grasping the *social* and *sensuous* character of individuality. In keeping with the Marx of the 1844 *Manuscripts*, Marcuse depicts labour as self-creation and man (*sic*) as an objectifying animal. Production is appropriation, transformation, revelation and, indeed, objectification. The question for Marcuse is not to have done with objectification, but with reification (Wendling, Chapter 28, this *Handbook*), the obstacle in the way of the sensuous assumption of man's capacity for free and social production. Note that the link between sensuousness, production and objectification in the early Marx, as identified by Marcuse, also involves an element of *passivity* – such that it is not merely a matter of possessing objects but also of *being an object* (this too is part of the definition of man as a social individual), of seeing man as an 'affixed, passive and suffering being' – even a being that finds a certain enjoyment in such suffering. As Marx wrote:

To be sensuous, i.e. to be real, is to be an object of sense, a sensuous object, and thus to have sensuous objects outside oneself, objects of one's sense-perception. To be sensuous is to suffer (to be subjected to the actions of another). Man as an object of sensuous being is therefore a suffering being, and because he feels his suffering [*Leiden*], he is a passionate [*leidenschaftliches*] being. Passion is man's essential power vigorously striving to attain its object. (Marx, 1992: 390)

The effort to find in the early Marx a resource to critique and surpass liberal (or social-liberal) individualism would be given a political steer in Galvano Della Volpe's contemporaneous work. In 1946, Della Volpe drew from Marx's early writings a 'critique of the person' that would provide the prelude and groundwork for a conception of 'communist freedom'. The Italian philosopher also stressed how the idea of a *positive* suppression of private property required moving beyond the mere negation of the bourgeois order and towards a *socialisation of nature* (Della Volpe, 2018 [1946]: 54), grounded in a conception of labour as inherently collective and mediated by technics. For Della Volpe, the 'total man, in the communist sense, is at the same time extremely *individual*, differentiated'. But he (*sic*) cannot be *substantialised*. 'The person-substance, the *hypostatic individual* ... which is the self-conscious man, this metaphysical receptacle of all moral inertia, privileges and abstract egoisms, is the dogma that hinders the understanding of how the individuality of man springs from that *spiritual concentration* that is *technicity*, the synonym of sociality, *free* or *communist* technics' (Della Volpe, 2018 [1946]: 111–112).

Drawing on the *German Ideology*, Della Volpe argues that hitherto personal freedom has been a mere 'enjoyment of contingency' (*Genuss der Zufälligkeit*). *Classist* freedom, or traditional bourgeois freedom, is the freedom of contingency (*libertà del caso*) – by contrast with communist freedom, which is the individual ethical moment in the context of a normative community grounded in socialised labour. Notwithstanding its suggestiveness, this juxtaposition of a communist *libertas maior* with a liberal *libertas minor* – this 'direct contact and contrast between the problem of freedom and the perspective of communism' (Tronti, 2000: 53) polemically oriented against post-war social-liberalism and social-democracies – also bears the stamp of its time, not least in Della Volpe's use of the Soviet hero of labour Stakhanov as an emblem of this new freedom.

Here, by way of correction, we could turn to an impressive recent effort to recover the centrality of *associational freedom* (rather than *communal equality*) in a reading of *Capital* from which Marx emerges as 'a radical republican and an (admittedly heterodox) Owenite communist' (Roberts, 2017: 231). Rather than seeking communist freedom in a socio-technical anthropology of labour, we have here 'republicanism in the realm of production', the anticipation of 'a communist economy managed by deliberation and debate' (2017: 251), in 'a global system of interdependent cooperatives managing all production by nested communal deliberation' (2017: 255).

Beyond Equality and Value

After the *Manuscripts*, the more speculative or philosophical dimensions of communism would lose some salience in Marx's work, first as urgent political struggles took precedence, then as the critique of political economy both absorbed and transformed the earlier formulation of the 'riddle of history'. The discursive setting in which Marx and Engels wrote the *Manifesto* was one where communism

had ‘already come to indicate not only a scheme of social reform more ambitious than socialism ... in that its institutional aims included some public control of productive resources (and consequently the transformation of private, or “bourgeois” property) – but also a political orientation towards the working class’ (Leopold, 2015: 35). The articulation of this proletarian standpoint was already evident in the December 1847 programme of the Communist League: ‘the overthrow of the bourgeoisie, the rule of the proletariat, the abolition of the old bourgeois society based on class distinction and the establishment of a new society without class and without private property’ (quoted in Herres, 2015: 22), as well as in Engels’s 1847 pre-*Manifesto* sketches, the ‘Draft of a Communist Confession of Faith’ and ‘Principles of Communism’ (Marx and Engels, 1976: 96–103 and 341–7).

Marx’s political re-articulations of communism cleaved closely to the struggles of his time – no more so than in the moment of the Paris Commune, as recorded in his *The Civil War in France* (Marx, 1969), where the reality of workers’ self-emancipation and self-government, and the challenge of breaking the bourgeois state machine, made themselves intensely and tragically present (Lefebvre, 1972; Toscano, 2021). Yet it was perhaps in the more prosaic ideological struggles within the social-democratic political wing of the German workers’ movement that Marx made what was arguably his most enduring contribution to posing the problem of communism. For it was in the 1870s that Marx most clearly defined the problem of communism not just as a critique of the person, but as a *critique of equality*, one closely linked to the economic, juridical and political problematic of the *transition* from capitalism.

The parliamentary-capitalist or liberal saturation of the concept of equality is so powerful as to pose an enormous danger of capture and neutralisation to any emancipatory politics. This risk is perhaps the central theme in Marx’s critique of the social-democratic followers of Ferdinand Lassalle. It is also a critical concern for Engels who, in the same year as the ‘Critique of the Gotha Programme’ (1875) (Marx and Engels, 1989), and after having himself proposed the substitution of the false idea of a ‘free people’s state’ with *Gemeinwesen* or *commune*, tells his correspondent August Bebel:

The concept of a socialist society as a realm of *equality* is a one-sided French concept deriving from the old ‘liberty, equality, fraternity’, a concept which was justified in that, in its own time and place, it signified a *phase of development*, but which, like all the one-sided ideas of earlier socialist schools, ought now to be superseded, since they produce nothing but mental confusion, and more accurate ways of presenting the matter have been discovered. (Marx and Engels, 1991: 64)

The fundamental thesis that can be gleaned from the ‘Critique of the Gotha Programme’ is that the equality waved like a banner by the social-democrats subsumes the image of communism to a conception of work which is in the final analysis immanent not just to the ideology of bourgeois society, but to the functioning and material reproduction of capital, a reproduction itself sustained

by a juridical ideology. In this perspective, every ‘equality’ – including the one imagined in the social-democrats’ programme as the equitable distribution of the product of labour – remains prisoner *both* to a neglect of the difference between labour and labour-power *and* to an image of justice that ignores that profound solidarity between the inegalitarian laws of capitalist exploitation and the egalitarian ideology of right. The equality of ‘equal rights’ to which social-democracy refers is an equality in *measurement*, in quantifiable standards and norms. As Marx notes in the 1875 ‘Critique’, ‘the equality consists in the fact that measurement is made with an *equal standard*, labour’ (Marx and Engels, 1989: 86). Consequently, ‘this *equal* right is an unequal right for unequal labour’. ‘*It is, therefore, a right of inequality, in its content, like every right*’, since right ‘by its nature can exist only as the application of an equal standard’ (Marx and Engels, 1989: 86). And so:

[i]f the concept of equality is based on the same principle as the exchange of commodities, and if the commodity is the fundamental cell-form of capitalism, then the abolition of capitalism necessarily entails an end to the ideal of equality, as a right that is always at odds with reality. But if that is the case, then the concept of a socialist society that emerges in Marx’s critique of the law (which is embedded in his critical theory of capitalism) is a paradoxical one; it is that of a classless society without equal rights, a classless society in which the law of equality is not realized, but, rather, is no longer applied. Like [Walter] Benjamin, therefore, Marx identifies the end of class society not with the establishment of a more just legal order, but rather with a liberation from law, together with its insuperable legal antinomies. (Nguyen, 2015: 114; see also Knox, Chapter 48, this *Handbook*)

The knot that binds together right, equality, measurement and labour means that every hope that one could ground a non-capitalist measurement directly in right, equality *or* labour stands revealed in its falsity, fatally haunted by its immanence to the capitalist mode of production. This is why Marx, and Lenin after him in his 1917 *State and Revolution* (Lenin, 2014), were compelled to mark their difference from the social-democratic mainstream and to think of communism not as the liberation of a fundamental equality but as the invention of a non-dominating way of experiencing and composing inequalities. Beyond measurement, outside of the homogeneous standard of an ‘equal right’, these inequalities will perhaps turn out to be no more, and no less, than *differences* – thereby giving a political inflection to the idea of a ‘differentiated’ individual already glimpsed by Della Volpe in the *Manuscripts*.

If every equality is an equality of measurement – a measurement originating in labour, money, the juridical status of the person or right and law in general – perhaps we will need to cease imagining communism as a politics of equality. This was the view of Althusser, for instance, who, in his posthumously published self-interview, *The Black Cows (Les vaches noires)*, warns that the ‘demand for egalitarianism is historically an impasse and a trap’, and who suggests, with reference both to Marx’s marginal notes (*Randglossen*) on the Gotha programme and Lenin’s gloss on the same, that ‘for unequal rights to cease, right itself must cease, and the real inequality of individuals among themselves must emerge’

(Althusser, 2016: 306, 308) – a real inequality, or difference, we might add, that we struggle to think or practise enmeshed as we are in the ideological and material apparatuses that secure capital's reproduction, and which will only surface in that singular process that Althusser himself calls *the formal subsumption of capitalism by communism*.

TRANSITION AFTER '68

To gauge the vitality of the problem of communism for contemporary Marxist theory it is worth thinking of the resurgent interest in the communist idea as itself inheriting the political and theoretical transformations crystallised by what shorthand dictates we call '1968', but which could go under the Italian monikers of *decennio rosso* (red decade) or *Maggio strisciante* (creeping May), the French *les années rouges* (the red years), or the 'world sixties'. This tumultuous context made possible the widespread recovery of that strand of Marx that identified 'the anti-capitalist revolutionary process both with a democratization (where necessary, a democratization of democracy itself, in the restricted forms it has hitherto assumed) and with a destruction of the class structure and its juridical, political and economic conditions of existence' (Balibar, 2017a: 159).

Contributing in 1970 to the programme *Per il comunismo* (For Communism) of the independent group *Il manifesto*, Lucio Magri declared the *maturity* of communism, as signalled by the social development of *needs* that could be realised immediately if only capitalist social relations were swept aside. '1968' had revealed the new forms of the classical Marxian logic of contradiction, making communism in its radical sense – a communism of the multi-dimensional development of social individuals through the collective appropriation of wealth in a transmuted relation to nature – a possible political programme 'for the first time in history' (Magri, 2012: 172). Prolonging the Marxian 'insight' into the immanence of communism in capitalism first truly crystallised in the *Grundrisse* (Berki, 1983), Magri and his comrades in *Il manifesto* argued that capitalism had rendered possible a reversal or upturning of history. Accordingly, communism:

[i]s not a new political economy but the end of political economy, not a just State but the end of the state; not a hierarchy reflecting different natural worths, but the end of hierarchy and the full development of all; it is not the reduction of work but the end of work as an activity which is extrinsic to man, a pure instrument. (Magri, 2012: 176)

This did not mean that attaining the realm of freedom was in any sense a foregone necessity: 'The maturity of communism is only one face, the positive one, of a gigantic historical contradiction, whose other face is catastrophe' (Magri, 2012: 176).

Seven years later, after a series of ebbs and defeats, Magri would dissent from 'autonomist' claims about the presence of communism in contemporary social relations, and suggest that the very changes in class composition that from the 1960s onwards had made the growth in wealth and needs possible had also undermined

the very idea of capital spawning its own negation in the guise of a united, combative proletariat (Magri, 2012: 224); capital, Magri declared, has broken ‘the relation between the maturity of the revolution and the maturity of the subject supposed to carry it out. It produces its own putrefaction and that of the social body, but not its own gravedigger or the equipment required for the burial’ (Magri, 2012: 236).

By contrast with Magri’s realist reckoning with the paradoxical nature of this communist ‘maturity’, objectively rich but subjectively disoriented, Negri would instead stress the autonomy and ‘self-valorisation’ of the motley proletariat of the metropolis and social factory (Negri, 1980), developing the tendency to communism in its own midst against an increasingly despotic and parasitic capitalist state. Retrieving Marx’s own vision of communism embodied in the forms-of-life and association of workers themselves, rather than in any abstract political programme (Birnbaum, 2011) – and, perhaps inadvertently, Georges Sorel’s conception of the autonomy of proletarian morality – Negri would declare that ‘Communism is normativity; it is the normalisation of a creative subjectivity’ (Negri, 1982: 125). This kind of normativity must be defined from below as ‘command over what one is’ (1982: 135). Accordingly:

One may speak of a revolutionary communist norm only when the latter is grounded in the immediacy of use value and involves a reorganisation of social cooperation, over the arc of the social working day, tending – with a strong degree of acceleration – towards the abolition of the relation between surplus value and necessary labour. (Negri, 1982: 144)

The sense of maturity or imminence felt in the wake of ‘68 among ample sectors of Marxist and communist theory and practice often meant emphasising communism as an immanent tendency within capitalism. It also involved challenging a Third-Internationalist (or Stalinist) orthodoxy wedded to a mechanical stageism, and reviving the polemics against ‘socialism’ (or social-democracy) of the 1840s, 1870s or 1920s. This was most forthright perhaps in Althusser’s contention that *there is no such thing as a socialist mode of production* (Althusser, 2020: 84). In keeping with Althusser’s asseverations against ‘expressive totalities’, his thinking about the virtuality of communism in capitalism is not grounded in a global tendency (of the kind limned by Negri), as much as in attention to the *traces* of communism in the present, and to their contingent recombination into a full-blown challenge or alternative to capitalist domination (Sotiris, 2020). As Althusser remarked:

The forms in which communist elements appear in capitalist society itself are countless. Marx himself names a whole series of them, from forms of children’s education combining work and schooling to the new relations reigning in proletarian organizations, the proletarian family, the proletarian community of life and struggle, joint-stock companies, workers’ co-operatives and so on, to say nothing of the ‘socialization of production’, which poses all sorts of problems, yet should also be noted. (Althusser, 2020: 64)

Althusser also mentioned ‘proletarian inventions in the class struggle’ (2020: 64), including the 1973 occupation at the LIP watch factory, concluding that ‘they are not all communist elements. They are elements for communism.

Communism will adopt them, combine them, perfect them and develop their potentiality, integrating them into the revolution in the relations of production which commands everything and is still absent from our world' (2020: 65). But this tendency is not 'in things themselves', it requires both the Leninist capture of the *Kairos*, the 'right moment', and the long march of transition to reassemble these 'elements of communism'. This is a communism not of totality, as much as of 'assemblage' (Berki, 1983: 5).

Althusser suggestively analogises the contemporary detection and political coordination of traces, interstices or islands of communism to Marx's Epicurean metaphor, whereby capitalism was not born at the core of the feudal world, but in its *intermundia*. Building on his rejection of the idea of a socialist mode of production and the chimeric idea of socialised (state) property, Althusser suggests that what matters for the prospect of communism is not relations of property as much as relations of production, where what is at stake is 'possession' (*Besitz, détention*) (of the means of production) not property (*Eigentum, propriété*). A communist mode of production will be defined by relations of production (and social forms) characterised by the *possession* of productive forces by workers themselves and 'this communal [*communautaire*] possession [*détention*] will have to do without any commodity relations at all' (2020: 84).

Distinguishing between a mode of production and a multiplicity of social formations, Althusser does acknowledge that this communism-to-come will not necessarily be homogeneous; there will be 'different forms of organization of the *communal* or *communist relation* of production in classless social formations' (2020: 83). Attention to the conditions of existence *and* inexistence of a communist mode of production requires Althusser to reflect on the possibility that certain *forms* taken by particular social formations hinder the existence of a mode of production, leading to the theoretical and political question:

in which forms (not just the nation-form) a socialist social formation has to exist so that the communist mode of production, which exists in it (Lenin) in an antagonistic relation to the capitalist mode of production (Lenin), may have real chances of existing, that is, of prevailing over the subsisting elements of the capitalist mode of production, while also preparing the forms of existence of this communist mode of production. No? (Althusser, 2020: 131–132)

If Marxism is not to morph into a philosophy of history and disavow political contingency – if it is to be what Althusser called a 'finite' theory, open to the aleatory rather than closed into a system – little can be theoretically anticipated about the forms of transition and the nature of a non-bourgeois practice of politics (and even less about the social forms and relations of communism 'itself'). More reason why a critique of our images of communism, *including Marx's own*, remains vital, since, as Althusser noted:

[e]xperience shows that even the vague representation of communism that men [*sic*] make for themselves, communists especially, is not extrinsic to their way of conceiving contemporary society and their immediate and imminent struggles. The image of communism is not

innocent: it can nurture messianic illusions that guarantee the forms and future of present action, deviate them from the practical materialism of the 'concrete analysis of concrete situations', nourish the empty idea of 'universality' which we find in some ambiguous ersatz variants. (Althusser, 1978: 18)

CONCLUSION: COMMUNISM AND THE MATTER OF ABOLITION

How is capitalism to be undone? And what is the character of this undoing? Following a *leitmotif* in Marx's writings, itself echoing a broader communist discourse he did not create *ex nihilo*, the major name for this undoing is arguably *abolition* (this could also be thought of as the *content* of that form, or forms, we call *transition*). Trying to define what he would elsewhere call the 'immutable tables' of the communism forged by Marx and Engels, Amedeo Bordiga, for instance, would assert – by contrast with the communist individualism mentioned above – that 'the original content of the Communist programme is the abolition of the individual as economic subject, holder of rights and actor of human history' (Bordiga in Camatte, 1974: 73–114). He did this while also warning that abolition could not be conceived as an act of will, something that would of course fly in the face of his demand for a 'reduction to zero of the individual factor in history' (Bordiga in Camatte, 1974: 98). Against any 'Carlylean spectre' of historical heroism, for Bordiga what is called for is a finally impersonal party for an anonymous revolution.

This trenchant fidelity to Marxian abolition is of course predicated on demarcating it from any Hegelian 'sublation' or 'overcoming' – terms that translate into English one of Marx's words for abolition, *Aufhebung*. It is in the latter that some, like Lucien Sève (2018), have seen fit to identify a communist dynamic that carries a large quotient of conservation, and is never reducible to wholesale destruction. Building on his rejection of Sève's arguments – which he deems insupportably reformist and philologically ungrounded – Patrick Theuret (2016, 2019) has provided an imposing audit of the Marxian language of abolition, helpfully itemising the targets of abolition. Among those which are the object of *Aufhebung* we find, in the *Manifesto* alone: class antagonism; the spatial scattering of means of production; bourgeois individuality, independence and freedom; the family and the exploitation of children by parents; the role of women as mere instruments of production; prostitution, exploitation (of man by man, of one nation by another); the town–country distinction, etc. Objects of *Abschaffung* (the term used for the abolition of slavery in German) are, *inter alia*: feudal property, personal property, nationality, eternal truths, religion, inheritance and bourgeois relations of production. These negations are summed up and crystallised, of course, by the abolition of private property – or, in Marx's mature lexicon, of the capital-relation.

Against Sève's insistence that *Aufhebung* is far more of a supersession, a conserving negation or even extension, a *dépassement*, than a destructive movement, Theuret (2016, 2019) points out that in French translations approved by Marx,

Aufhebung was rendered most frequently as *suppression*, *abrogation* or *abolition*, while in the English ones checked by Engels it is rendered by *abolish*, *do away*, *destroy*. And there is of course an ampler galaxy of terms that Marx (and Marxists) drew upon, including *dissolution*, *Auflösung* – with its prosaic resonances with *Lösung*, solution, and its ‘messianic’ ones with *Erlösung*, redemption (Balibar, 2017b).

But the language of abolition was of course deeply entangled with that of slavery. Though the use of the slave analogy in Marxism has been the object of Black radical critique (Johnson, 2004; Shilliam, 2015), it is also worth noting not just Marx’s passionate investment in US abolitionist politics, but also how an unorthodox Marxist politics was interwoven, already in the nineteenth century, with the ‘slave’s cause’:

After the [US Civil] war, an abolitionist–labor alliance found organizational expression briefly under Marxist auspices. Former abolitionists, Chartists, Owenites, utopian socialists, followers of Proudhon, labor, and ‘free love’ advocates like Andrews and Victoria Woodhull joined the First International, begun with Marx’s formation of the IWA in 1864 in London. Despite Marx’s criticism of utopian socialism in contrast to his own brand of allegedly scientific socialism, many of these reformers were the first converts to Marxism. Abolitionists such as Richard Hinton, a follower of John Brown who led a black regiment during the Civil War, and William West, who had brought up the plight of wage slaves in the pages of the *Liberator* before the war, were prominent in the First International, which earned the support of Sumner and Phillips. Andrews translated and Woodhull published Marx’s *Communist Manifesto* (1848) in the United States for the first time in her newspaper, Woodhull and Claflin’s Weekly ... After the suppression of the [Paris] commune, the IWA, now headquartered in New York, held a huge demonstration in sympathy that included an all-black Skidmore guard named after Thomas Skidmore. (Sinha, 2016: 370)

The nexus of anti-slavery abolitionism and the international workers’ movement, of the abolition of racial domination and the abolition of capital, has made itself felt at various junctures, often involving a creative appropriation of ‘mainstream’ communist discourse and dogma for Black peoples’ liberation projects (Du Bois, 1951; Baldwin, 2002; Boyce Davies, 2007; Olsavsky, 2018). In 1930s Alabama, African American sharecroppers could mobilise the Communist Party as a vehicle for self-organisation. This even included a militant translation of its otherwise worst moment, that of Third Period sectarianism, appropriating the Stalinist rhetoric of a ‘new world’ through Black traditions that ‘emphasized both a struggle for survival and the transcendent hope of deliverance’ (Roediger, 1994: 57; reviewing Kelley, 1990). In the domain of culture, the spiritual ‘Give Me That Old Time Religion’, was adapted, ending ‘It was good enough for Lenin, and it’s good enough for me’ (Roediger, 1994: 58). As Aimé Césaire wrote in his 1956 letter to Maurice Thorez, bidding farewell to the French Communist Party: ‘what I want is that Marxism and communism be placed in the service of black peoples, and not black peoples in the service of Marxism and communism’ (Césaire, 2010 [1956]: 150) – a sentiment that could well be echoed by other subjects, in other domains.

As anti-racist protests against police murders and mass incarceration take root in our own day, abolitionist imaginaries have come to the fore, articulated especially

around the horizon of prison abolition, and more recently the abolition of the very institution of the police. There is no straight line or mutual reduction between these contiguous but distinct senses of abolition – a certain abolition of capital may see the persistence of the prison and punishment, a certain kind of decarceration could be compatible with the reproduction of the capital-relation. And yet there is much to be gained from creating, or better recovering, lines of communication between contemporary theories of abolitionism and the ‘many-headed’ communist lineage I’ve sought to track here – not least in terms of thinking the relation between the negation of the contemporary forms of domination and the conjunction of the ‘traces’ or ‘elements’ of liberated collective life. As Ruth Wilson Gilmore enjoined in an interview in the wake of the mass insurgencies in response to the murders of George Floyd, Breonna Taylor and many many others:

abolition has to be ‘green’. It has to take seriously the problem of environmental harm, environmental racism, and environmental degradation. To be ‘green’ it has to be ‘red’. It has to figure out ways to generalize the resources needed for well-being for the most vulnerable people in our community, which then will extend to all people. And to do that, to be ‘green’ and ‘red’, it has to be international. It has to stretch across borders so that we can consolidate our strength, our experience, and our vision for a better world. (Gilmore, 2020)

Such a red and green abolitionism, which is also to say a communism for an age of disaster capitalism, will perforce also confront the vexed issue of what is to be done with the vast socio-technical and energetic ensembles that have long made capital into a climactic, ecological and geological agent. If communism may also be understood, in Jacques Camatte’s evocative formulation, as ‘the resurrection of dead labour’ (Camatte, 1988: 126; Camatte, 1976), how much of that dead labour will need to be ‘left in the ground’ or disactivated, along with all the supervisory and political functions that permit its reproduction and amortisation? How can we prise apart the communist use-values of ‘machinery’ integral to and form-determined by capital (see Saenz de Sicilia, Chapter 33, this *Handbook* and Smith, Chapter 8, this *Handbook*) – machinery now encompassing algorithms, logistical and communication systems, and the whole material framework of our social relations – from the place of that machinery in the valorisation process? Whether we are evaluating the potentials for reconfiguring or refunctioning capitalist infrastructures in a communist horizon (Bernes, 2013; Toscano, 2014; Dyer-Witheford et al., 2019), or delineating the urgency of an ‘ecological war communism’ in a warming, pandemic world (Malm, 2020), these are practical and theoretical questions that any real move to abolish the present state of things cannot avoid.

Imperialism

Salar Mohandesi

‘Our every action is a battle cry against imperialism’, thundered Che Guevara in his final political statement (Guevara, 2003: 362). Later that year, he lay dead, murdered by Bolivian soldiers advised by the CIA. But his political project did not die with him. Quite the contrary. The global struggle against imperialism was about to reach entirely new heights. In the 1960s and 1970s, ‘imperialism’ became the most central term in the radical vocabulary, even more so than ‘capitalism’. Hundreds of radical movements on every habitable continent identified imperialism as their enemy. Anti-imperialism mobilized millions, united diverse struggles, and theorized not only the possibility, but the necessity, of revolution on a world scale. It was the guiding idea of the most serious global revolutionary upsurge in human history.

But in many places today the very notion of imperialism has entered into crisis. Some deny imperialism exists at all. Others say the term is politically suspect, arguing that the struggle against imperialism has justified some of the most monstrous regimes in history, like that of the Khmer Rouge in Cambodia. For many others, especially the newly radicalized, the term has no specific meaning at all, except to signify something bad that must be opposed. While there are many reasons for this stunning reversal, notably the defeat of anti-imperialist movements since the 1970s, a central reason is that Marxist theories of imperialism have run into major limits. Faced with this impasse, quite a few theorists have recently expressed scepticism about the concept, claiming that reality has become far too complicated for inherited models of imperialism. David Harvey, author of

The New Imperialism, has gone so far as to assert that imperialism has become a kind of ‘straitjacket’ preventing us from understanding new historical developments (Harvey, 2017).

These limits are not new. From the start, most Marxist theories of imperialism struggled to offer an accurate account of history. For a time, these limitations were overlooked, not only because the theories did seem to explain some important features of the late nineteenth and twentieth centuries, but because ‘imperialism’ doubled as a rallying cry that could galvanize millions. But developments in the late 1970s and 1980s forced many thorny questions – some old, others new – onto the table. Why was it that in many cases colonialism preceded capitalism? How do we explain the fact that colonial expansion in the late nineteenth century was not always motivated by the search for greater profits? How come many empires fought to retain their colonies even though the extreme violence they imposed on subjugated peoples did not really generate anticipated profits for the metropole? How was it that some peripheral countries supposedly doomed to perpetual ‘backwardness’ came to develop highly advanced capitalist sectors? Why did newly independent countries themselves start to exhibit imperialist behaviours?

As dire as these challenges may be, the solution is not to jettison the concept of imperialism, but to rethink it. That means breaking with some of the core assumptions of older Marxist theories, the most fundamental of which is the tendency to reduce imperialism to capitalism. The primary weakness of most Marxist theories, this reductionism has generally taken three forms: imperialism is a policy directly caused by capitalism; imperialism is a stage of capitalism; or imperialism simply is capital export, capitalism, or the capitalist world system as such. In recent years, some theorists have tried to move beyond this problem by foregrounding the state, arguably the most under-theorized aspect of classical theories of imperialism (Miliotis and Sotiropoulos, 2009). Incorporating insights from a more robust theory of the state promises to recover the specificity of imperialism, explain why imperialist policy is so often over-determined, and better theorize the relationship between imperialism as a policy and imperialism as a larger system that organizes such policy. This entry will therefore survey some key Marxist theories of imperialism, reflect on their limits, and suggest avenues for further research. Since theories of imperialism are some of the most over-politicized aspects of Marxism, with the theory sometimes simply justifying already-decided-upon political positions, I will conclude with a brief discussion of anti-imperialism.

MARX

Karl Marx rarely used the term ‘imperialism’. When he did, it described the regime Louis Bonaparte forged during the Second Empire. Born of crisis, Marx argued in *The Civil War in France*, the Second Empire was ‘the only form of

government possible at a time when the bourgeoisie had already lost, and the working class had not yet acquired, the faculty of ruling the nation' (Marx, 1986). This 'imperialism', then, was a form of government that united competing social forces by promising something to everyone, including the restoration of national glory, often through foreign conquest. While this has little to do with contemporary definitions, Marx did write extensively about a range of topics that one would now associate with the concept of imperialism, such as the world market, international relations, and above all colonialism.

Marx tended to take an ambivalent view of colonialism. On the one hand, he roundly denounced its destructiveness; but on the other, he noted its historically progressive effects, both in Europe and in the colonies. At home, in Europe, colonialism served as a crucial precondition for the development of the capitalist mode of production, destroying the old world while making possible the new. Abroad, in the colonies, it had a similar 'double mission' – annihilating 'old Asiatic society', while building the positive foundations for 'Western society', the basis for future emancipation (Marx, 2007). Some critics have argued that this view was couched in Eurocentric stagism, pointing to Marx's claim that 'the country that is more developed industrially only shows, to the less developed, the image of its own future' (Marx, 1990). Colonialism, however calamitous it may be for the colonized, could push this process along.

But as others have pointed out, Marx was more nuanced, and later distanced himself from these assumptions (Ahmad, 1992). Whereas his earlier writings on India saw destruction and development as unfolding in tandem, his subsequent work on Ireland suggested that colonialism actually hinders, and even prevents, the development of the capitalist mode of production in the colonies (Anderson, 2016). At the same time, Marx reconceptualized the role of anticolonial struggle. In contrast to his earlier writings, which suggested that India could be liberated only when the English proletariat overthrew its ruling class at home, Marx now claimed the opposite, arguing for example that the 'decisive blow against the English ruling classes (and it will be decisive for the workers' movement all over the world) cannot be delivered in England, but only in Ireland' (Marx, 1975). In this way, although he never developed a concept of imperialism, Marx did implicitly raise some of the questions that would dominate debates in the twentieth century: why do states pursue imperialism? How does imperialism relate to capitalism? What is anti-imperialism?

HOBSON

Marx died just a year before the famous 1884 Berlin Conference, which heralded a new era of colonialism. Between 1870 and 1900, the largest colonial powers came close to doubling the size of their territories. By the turn of the twentieth century, a handful of great powers controlled nearly 90% of the entire globe.

Hoping to make sense of this development, commentators from across the political spectrum revived the word ‘imperialism’, which took on a range of new meanings. But the term’s popularity often led to frustrating vagueness. What, exactly, was this imperialism that everyone kept talking about?

In this context, a liberal British journalist named John A. Hobson published one of the first detailed studies of imperialism in 1902. According to Hobson, the rapid growth of monopolies in the major capitalist countries had led to a contraction of workers’ disposable income. This in turn had triggered a fall in consumption, which foreshadowed economic catastrophe. In response to this crisis of underconsumption, he claimed, capitalists searched for other investment opportunities, ultimately deciding to export their surplus capital to the rest of the world, with European states acting as the pliable instruments of these ravenous monopolies. It was precisely this insatiable search for profits that drove European powers to carve up the globe (Hobson, 2011). For Hobson, then, ‘imperialism’ referred to a specific policy – aggressive actions by one state against another. But it was, he thought, a bad policy because it would heighten rivalries between imperial powers in a way that could lead to world war. He hoped his book could convince British statesmen to pursue a different path (Arrighi, 1983).

Although not the first to do so, Hobson made a strong case for linking imperialism to capitalism. In this way, he set forth an important line of inquiry that Marxists embraced enthusiastically.¹ In 1910, for example, Rudolf Hilferding theorized that bank capital and industrial capital had begun to fuse into ‘finance capital’, which he claimed would lead national monopolies to close off large territories to foreign competition (Hilferding, 1981). In 1913, Rosa Luxemburg argued that chronically insufficient effective demand in the capitalist countries meant that capitalism had to seek out markets in the non-capitalist world. Without these new consumers, excess surplus value would not be realized, and capitalism would collapse (Luxemburg, 2015).

Although most Marxists thought imperialism was fundamentally based in capitalism, they disagreed about their precise relationship. Since all Marxists believed that theorizing imperialism was a precondition for action, how they defined imperialism informed what they thought should be done about it. Nowhere was this clearer than in the controversy surrounding Karl Kautsky. One of the most respected thinkers in the international socialist movement, Kautsky suggested that while capitalism led states to take aggressive actions, world war was avoidable. Since a non-imperialist capitalism was possible, and would in fact be better for capitalists, social democratic parties should work with progressive elements of the bourgeoisie to organize peace campaigns. Capitalists could reform their ways, curb their belligerent foreign policies, and create a kind of ‘ultra-imperialism’ without war. In the longer term, he wrote in a 1914 article, competing ruling blocs might even come together in a ‘holy alliance’ to peacefully rule the globe (Kautsky, 2012).

LENIN

Furious, radicals like V. I. Lenin accused Kautsky of promoting class collaboration. In fact, just a few weeks after his article appeared, war erupted between the empires, and the Second International effectively collapsed as its leading parties supported their governments instead of uniting against war. Lenin argued that proposing the possibility of 'ultra-imperialism' made this betrayal possible: instead of fighting for world revolution to overthrow imperialism, socialists were encouraged to participate in government to reform capitalism in a more peaceful direction. As Lenin fumed, Kautsky's theory

is a most reactionary method of consoling the masses with hopes of permanent peace being possible under capitalism, by distracting their attention from the sharp antagonisms and acute problems of the present times, and directing it towards illusory prospects of an imaginary 'ultra-imperialism' of the future. Deception of the masses – that is all there is in Kautsky's 'Marxist' theory. (Lenin, 1974b: 294)

To refute Kautsky's reformism, Lenin attempted to demonstrate that imperialism was not just one policy among many, but rather the inevitable consequence of capitalist development as such. In his pamphlet *Imperialism: The Highest Stage of Capitalism*, he drew on both Hobson and Hilferding to argue that capitalism had entered a distinctly new stage since the 1870s, defined by the following features:

(1) the concentration of production and capital has developed to such a high stage that it has created monopolies which play a decisive role in economic life; (2) the merging of bank capital with industrial capital, and the creation, on the basis of this 'finance capital,' of a financial oligarchy; (3) the export of capital as distinguished from the export of commodities acquires exceptional importance; (4) the formation of international monopolist capitalist associations which share the world among themselves; and (5) the territorial division of the whole world among the biggest capitalist powers is completed. (Lenin, 1974b: 266)

The concentration of capital, the compulsion to export capital, and the pressures that monopolies now exerted on the state, Lenin argued, compelled individual countries to pursue a reckless imperialist policy that would inevitably lead to world war. Imperialism, then, was the necessary product of this stage of capitalism, and therefore one that could only be overcome by destroying capitalism as such. The only way out was revolution.

Although Lenin's theory did play an important polemical function, it was not free from errors. Lenin overestimated the importance of monopolies, exaggerated the role of capital export as the main driver of imperialism, and, by his own admission, downplayed other crucial non-economic aspects of imperialism. Moreover, while it is true that the phrase 'highest stage' was a translation error, the theory was also thoroughly stagist, treating capitalist history as a sequence of bounded periods. Lastly, although Lenin placed much greater emphasis on the state than other classical theorists, he treated it as the instrument of capitalist monopolies. In explaining the actions of states, and therefore imperialist policy,

by looking to the purported needs of capitalism, Lenin ended up in a kind of functionalist economic reductionism (Brewer, 1990: 116–23).

Significantly, Lenin's pamphlet shifted the meaning of the term 'imperialism' from a specific policy to a capitalist stage that made such policy necessary. 'Imperialism', he declared, 'is the monopoly stage of capitalism' (Lenin, 1974b: 266). Although this move was designed to enrich the theory, defining imperialism in this way caused more confusion: what about other factors? Why did imperialist policies differ from country to country? When would this stage of capitalism end? Would countries enter this stage at different times, independently of one another?

Lenin's little pamphlet was hastily written, primarily designed to intervene in a political debate, and rooted in a very specific historical conjuncture. It was meant, as its subtitle made clear, to serve as a mere 'popular outline', rather than an exhaustive theory of imperialism. But Lenin's enormous stature after the Bolshevik Revolution, coupled with the fact that his prediction about growing inter-imperialist rivalry seemed to be coming true, ensured that this text would be codified as not only a general theory of imperialism, necessarily applicable in all contexts, but *the* orthodox theory of imperialism for the international communist movement for decades to come. The consequences were enormous: not only were the weaknesses of his model amplified on a grand scale, but subsequent theorists felt constrained to work within its terms, even if historical changes seemed to point beyond them.

DEPENDENCY

The Second World War generated a new conjuncture marked by decolonization, the Cold War, and the relative decline of inter-imperialist conflict. This in turn sparked a new round of theorizing in the 1950s and 1960s that tried to update some of the classical theories in light of such sweeping changes. One of the assumptions that came in for re-examination was the belief that 'backwards' countries subjected to imperialism were at earlier stages of development, and that they would progressively move through all the intermediate stages to capitalism. As Marx had once predicted, they could come to resemble the dominant social formations of North America and Western Europe.

By the 1950s and 1960s, such a view was untenable. Most countries in the Global South had clearly taken a different path from those in North America and Western Europe. Even formal political independence, which most Latin American countries had won in the nineteenth century, had not ushered in the kind of economic development most had expected. A new cohort, beginning with figures like Raúl Prebisch and Celso Furtado, and followed by theorists such as Andre Gunder Frank, Immanuel Wallerstein, Terence Hopkins, and Samir Amin, sought to not only explain why this had happened, but to find solutions to the problem of development.

Their efforts would culminate in what came to be known as 'dependency theory', whose most famous early representative was Frank. The development

of the wealthy capitalist countries, Frank explained, was not unrelated to the poverty of the poorer countries. The latter, in fact, was a *consequence* of the former. Backward countries were not ‘undeveloped’, that is, languishing in a kind of retarded state, their normal path to capitalist development blocked. Rather, they were actively ‘underdeveloped’ by the developed capitalist countries. The development of the ‘core’ and the underdevelopment of the ‘periphery’ were part of the same global capitalist process (Frank, 1966). Frank saw a single capitalist world system characterized by an international division of labour between the core and the periphery. In this system, the former forcibly extracted surpluses from the latter, driving the periphery into a state of dependency. Since this was a zero-sum game, in which the ‘metropolises tend to develop’ and the ‘satellites to underdevelop’, the only way forward was for states to ‘delink’ from the capitalist world system.

Dependency theory inaugurated a fundamental shift in perspective. Although earlier theorists always adopted a global view, they were primarily concerned with rivalries between the European powers. By contrast, dependency theorists argued that the primary axis of international conflict now ran between the capitalist powers and the rest of the globe. In the context of decolonization, anti-imperialist internationalism, and postcolonial development, this approach became immensely popular. It allowed many theorists to update Lenin’s classical theory for changed conditions. It played an enormous role in anti-imperialist social movements in the Global South. And it shaped the thinking of many postcolonial governments, even informing major international projects such as the New International Economic Order of the mid 1970s.

But dependency theory soon came under fire (Leys, 1977). Some argued that it was based on an idiosyncratic definition of capitalism that had little to do with Marx’s critique of political economy. In a scathing assessment, Robert Brenner argued that Frank and Wallerstein effectively reduced capitalism to ‘a trade-based division of labour’ that took for granted capitalism’s in-built tendency towards endless accumulation instead of explaining its historical emergence (Brenner, 1977: 38). Others observed a lack of clarity about the relationship between imperialism and capitalism, exacerbated by Frank’s generally vague terminology (Noonan, 2017). In some of his work, for example, Frank combined the two terms as ‘capitalism/imperialism’, which he defined as the economic exploitation of the ‘underdeveloped periphery to the benefit of the developed metropole’ (Frank, 1982: 72). Not only did this definition do little to distinguish it from Frank’s concept of capitalism, it failed to distinguish between different kinds of imperialism. US imperialism became another instantiation of the same centuries-old relationship: ‘This imperialism is an expression of the entire capitalist system today. Though differing in technical detail from its forerunners, it remains, especially for the underdeveloped world, essentially the same as all previous forms of capitalism-colonialism-imperialism: the source and systemization of exploitation and underdevelopment’ (Frank, 1982: 56).

Beyond its theoretical limits, one of the many reasons for the decline of dependency theory in the late 1970s and 1980s had to do with changing historical circumstances. Given centuries of dependency, many theorists argued that it would be extremely difficult for capitalist development of the kind seen in the metropolises to take hold in the Global South, with Frank himself initially claiming it was simply impossible in the current world system. But already in the 1970s, several countries in the Global South, such as Taiwan, Singapore, South Korea, or Brazil, were developing quite spectacularly. In the twenty-first century, they would be joined by a whole host of capitalist countries outside the conventional metropolitan core, such as India, China, Turkey, or Thailand, to name only a few. Changed conditions increasingly suggested the need for a changed theory.²

NEW THEORIES OF IMPERIALISM

The defeat of the anti-imperialist revolutions of the 1960s and 1970s gave way to an era defined by revived American power, debt crises in the Global South, the collapse of communism, and the triumph of neoliberalism. In addition, the 1990s and 2000s saw a host of wars, including devastating US invasions of Afghanistan and Iraq. All this prompted renewed interest in the idea of imperialism, as writers took the opportunity to not only explain the ‘new imperialism’, but to rethink some of the earlier theories (Harvey, 2007: 58–9).

This third wave saw a number of influential books by Antonio Negri and Michael Hardt, Ellen Meiksins Wood, and Alex Callinicos, among others (Hardt and Negri, 2001; Wood, 2005; Callinicos, 2009). One of the most prominent accounts was David Harvey’s *The New Imperialism*, published in 2003, just as the Iraq war was breaking out. Drawing on his earlier work, he argued that capitalism necessarily suffers from crises of over-accumulation (Harvey, 1982). One solution is to find areas ‘outside’ of capitalism to make available to surplus capital. This includes distant geographical regions, but it can also mean re-opening areas that have been closed off. The ‘outside’, in other words, can be created in the heart of capitalism. Harvey calls this process ‘accumulation by dispossession’, which refers just as much to privatizing industries in the Global North as to prying open new markets in the Global South. This, for him, is the meaning of contemporary imperialism: a solution to the crisis of the 1970s in which states use massive violence to force open areas for surplus capital (Harvey, 2005).

Although ‘accumulation by dispossession’ sheds light on what is commonly called ‘neoliberalism’, critics like Robert Brenner argue that Harvey tends to overburden the concept (Brenner, 2006). For Harvey, it includes everything from dispossessing peasants in Nigeria to foreclosing on the homes of Americans who could not meet their mortgage payments. What, one might ask, is not ‘accumulation by dispossession?’ The problem is not only that it is so expansive, but that it includes processes that are in fact quite normal to capitalism. While Harvey is

correct to argue that capital is limited in its ability to create the necessary conditions for its reproduction, and so must at times rely on state power, it is also true that in many cases capitalists can create those conditions on their own. Including these processes within the same concept of ‘accumulation by dispossession’ undermines its usefulness. As Brenner argues in his review of *The New Imperialism*:

The beating out by agribusinesses of family farms ... is an all-too-familiar aspect of capitalist competition. It is hard to fathom why Harvey would want to assimilate this to accumulation by dispossession any more than he would the destruction of family businesses (small or large) by giant corporations; likewise for the loss by Enron workers of their pensions along with their jobs when the firm went out of business. It deprives accumulation by dispossession of its substance to treat as the same sort of thing as workers’ loss of employment through their firm’s bankruptcy, which is a standard result of a well-established process of capital accumulation, and the expropriation of peasants from their land – in the English enclosures of the eighteenth century or through the destruction of the *ejidos* in contemporary Mexico – which is about creating the conditions for capital accumulation. (Brenner, 2006: 101)

In so doing, Harvey ends up making imperialism virtually indistinguishable from capitalism.

Like many before him, Harvey’s account risks reducing imperialism to crisis theory, which is striking since Harvey begins his book by attempting to escape economic reductionism. Drawing on Giovanni Arrighi, he argues at the outset that there exist two logics of power: the ‘territorial’ logic of state expansion and the ‘capitalist’ logic of accumulation. Leaving aside the problem of ascribing to the state a single logic, as if it were a monolithic entity with one invariable interest, Harvey never explains the relationship between the two logics, and in the end, the capitalist logic largely instrumentalizes the state logic: in response to a crisis of over-accumulation at home, capitalism, now in the form of accumulation as dispossession, needs state force to pry open new space of accumulation. As in the classical accounts, the state becomes a kind of tool wielded by capitalists to further their singular interest of capital accumulation.

LIMITS OF EXISTING THEORIES

Despite their diversity, most Marxist theories of imperialism share the same general weakness: a tendency towards economic reductionism. This generally takes three forms.

First, imperialism is sometimes simply equated with capitalism. For some, imperialism is nothing other than foreign investment. For others, any expansion of capital beyond national borders is automatically classified as imperialism. For still others, imperialism is basically the same as the capitalist world system. But if this were true, why even use the word imperialism? After all, the concept of capital already implies its global expansion in search of self-valorization. Capital, in other words, always tries to move wherever it can to find a higher rate of profit. Businesses might move to other countries for the same reason that

a firm might move some of its operations from one town to another in the same country. Calling normal processes of capitalism 'imperialist' is not only redundant, it effaces the specificity of imperialism.

Second, imperialism is reduced to a 'stage' of capitalism. Setting aside the general problem with all stagism, that is, the tendency to homogenize entire periods into expressive totalities, effectively foreclosing any real analysis of unevenness, the major drawback of this approach is that it cannot explain the history of imperialism. Since the Second World War, the old empires have collapsed, formal colonial rule has largely come to an end, the nation-state has become hegemonic, the Cold War came and went, major capitalist powers continue to cooperate with one another, transnational corporations stretch across the globe, new financial institutions exercise great power, and capitalism itself has been restructured. Although imperialism as a stage beginning in the late nineteenth century is over, imperialism as a policy continues to exist, albeit in very different forms. The fateful coupling of the two has therefore made it very difficult to explain how and why imperialism has changed over the last century and a half.

Third, while some theorists distinguish imperialism from capitalism, they see the former as immediately caused by the latter. State intervention abroad, for example, is said to happen at the behest of capital. While some states certainly pursued imperialist actions out of economic imperatives, they also did so for other reasons, such as winning national glory, securing military outposts, diverting internal social discontent, spreading a civilizing mission, or preventing colonies from falling into the hands of rivals. For example, in the late nineteenth century Otto von Bismarck intended to use colonies as bargaining chips in future negotiations over European affairs. At the same time, the renewed emphasis on empire in France was driven not simply by economic motivations, but also by France's humiliating defeat in the Franco-Prussian War. And while the British terrorized the globe for resources, markets, and investment opportunities, they also sought to control certain territories not for their intrinsic economic value, but because they helped to strategically secure the route to India, their prize colony. The problem with reductionist theories that claim imperialism exists to realize capitalist interests is that they not only fail to take into account the many other factors propelling imperialist policy, they cannot explain why these competing factors sometimes undermine the interests of capital. Historical examples of the non-correspondence between imperialism and capitalism have been far too common to be explained away as mere anomalies but need to be directly addressed.

A WAY FORWARD

A number of contemporary theorists, such as Leo Panitch and Sam Gindin, John Milios and Dimitris P. Sotiropoulos, and Spyros Sakellariopoulos and Panagiotis Sotiris, suggest that one way to move beyond this impasse is to re-theorize the

least-developed aspect of theories of imperialism: the state (Milios and Sotiropoulos, 2009; Gindin and Panitch, 2012; Sakellariopoulos and Sotiris, 2015). State theory can nuance theories of imperialism in at least three ways.

First, centring the state restores the specificity of imperialism. Instead of conflating it with capitalism, imperialism should be seen as an extension of state power. For something to be called imperialism, the state has to be involved. When a European firm invests in a West African country, that is not imperialism, but simply capitalism. But if that country tries to block this foreign investment, prompting the foreign state to intervene, that is imperialism. Imperialism, then, is an act of aggression by one state against another, which can include sanctions, adjusting monetary policy, orchestrating coups, military invasion, and outright annexation.

This approach can also help account for the diversity of imperialisms. Most people generally define imperialism as existing between North American and Western European countries and the Global South, an association so pronounced that imperialism is often rendered synonymous with ‘Western’ imperialism, or even just US imperialism. Although there are obvious reasons to foreground these relations, limiting imperialism exclusively to ‘Western’ domination has the unintended effect of obscuring other kinds of asymmetrical relations. The unpalatable truth is that history is rife with imperialist conflicts between countries that were themselves subjected to imperialist domination. The most famous case is Japan, a country once forced open by US gunboats, which then went on to deal a devastating blow to French, British, Dutch, and American imperialisms during the Second World War, but then imposed its own set of imperialist relations on conquered Asian territories under the guise of anti-imperialism. But Japan is far from alone; with the proliferation of nation-states since 1945, imperialist relationships within the Global South have become widespread. Contrary to most assumptions, imperialism, as a policy, is not only an attribute of powerful ‘Western’ states, but of all states.

Second, a more robust theory of the state can better explain the varied, and often contradictory, reasons driving imperialist policy. Most classical Marxist theorists of imperialism tended to treat the state as either a thing to be used by classes that stand outside of it or as an independent subject with its own logic perched above the struggles raging below. By contrast, some state theorists have argued that the state is a relationship. Nicos Poulantzas, for example, famously defined the state as the ‘material condensation of a relationship of forces’ (Poulantzas, 1978: 128). That is to say, the state is not only an ensemble of apparatuses, but that ensemble is traversed by struggles between different social forces. Antagonistic classes pursue their own interests, different state institutions compete with one another, and different branches within the same apparatus work at cross-purposes, all of which leads states to behave in erratic ways. As Poulantzas summarized, ‘The establishment of the State’s policy must be seen as the result of the class contradictions inscribed in the very structure of the State (the State as a relationship)’ (Poulantzas, 1978: 132).

Since the state is traversed by struggles, different social forces operating within different state institutions will fight over different ideas about imperialism. This is the key to explaining why imperialist policy is so over-determined, why imperialism often takes such contradictory forms, and why states sometimes act in ways that undermine the interests of capital. Certainly, some figures may be interested in using state power to aid those corporations with which they are affiliated to make profits. But others may wish to reshape the globe according to their worldview, which may cut profits for some industries. Still others may simply take actions to appease their constituents, or shore up allies, even if they know that doing so will harm specific capitalist interests. Even when representatives of the dominant classes seem to be in complete control, and share the same general objective of expanding capitalism, they often represent competing industries, promote different strategies, and operate in different state apparatuses with distinct capacities. The result can be inconsistent, incoherent, even unpredictable imperialist policy.

Lastly, state theory can help us think about imperialism as something beyond just a collection of actions. Defining imperialism as an antagonistic policy illuminates how powerful states continue to dominate others even if they do not make recourse to overtly violent operations. While this certainly highlights the subtle ways that imperialism works today, the problem with such a definition is that it is too expansive. If any form of aggression between one state and another is imperialism, then what isn't imperialism?

For that reason, it is important to build a definition that connects these individual acts of aggression to some larger system. Here again, state theory, especially the work of those who see the state as a relationship, offers insights. In a recent interview, Bob Jessop clarified the importance of seeing the state not simply as a relationship of social forces, but as the institutional condensation of those relationships:

It is not just a changing balance of forces that is at stake because this is conditioned by the prevailing institutional matrix or ensemble. That is why social forces struggle over institutions, why there are struggles for state power. If institutions did not matter, there would just be struggles for power tout court. In sum, institutions are important because they influence the balance of forces, and changes in the latter can rearrange the institutions in a sort of never-ending cycle. (Jessop, 2016: 309)

The same can be said about imperialism; there is a kind of institutional materiality that needs to be taken into account. Following the lead of state theorists, we can say that *if the state is the material condensation of a relationship between social forces, then imperialism is the material condensation of the international relations of force between states*. Imperialism, then, is not simply definable in terms of individual actions by one state against another, but rather constitutes the terrain on which such acts are made possible. In other words, imperialism must be understood as comprising both acts of aggression, or 'imperialist policy' and the material condensation of international relations, or what we can call the 'imperialist chain', following the efforts of some thinkers to breathe new life

into Lenin's old metaphor (Miliotis and Sotiropoulos, 2014; Sakellariopoulos and Sotiris, 2015).

The concept of the 'imperialist chain' refers to a hierarchically ordered network of individual states – the 'links' – that are bound together not only through direct relations with one another, but through numerous regional, international, and global bodies. The totality of these overlapping, competing, and contradictory connections is precisely what comprises the 'institutional materiality' of the chain. Spreading out in all directions, uneven and tangled, this chain is a constantly shifting field of competition. Strong links emerge as hegemonic leaders, poles of attraction that draw together other states, creating dense knots in the chain. 'Rogue states' contest this leadership, sometimes developing rival clusters in other corners of the chain. But at the end of the day, all states, even those with different modes of production, belong to this same chain, which is why it is not possible to characterize the chain as *a priori* capitalist. In fact, the imperialist chain is often the ground on which the struggle between different developmental models has played out.

Consider the history of the Cold War, which was not a simple rivalry between superpowers, but a bloody competition between different visions of the future for the chain as a whole (Westad, 2007). After the Second World War temporarily ruptured the imperialist chain, the USA not only assumed responsibility for the reproduction of capitalism on a global scale, but sought to reshape the chain in its own image. The Soviet Union, a highly contradictory formation claiming to make the transition to communism, proposed a different model of development for the chain. As the old empires gave way to independent states, both sides competed for the allegiance of the new links in this dramatically enlarged chain.

With the Cold War now over, a certain kind of capitalism has come to dominate the entire chain, which is now more tightly bound than ever before. And yet, since the 2000s, this same chain has paradoxically grown more politically fractured. The USA's ability to exert its vision is faltering, regional rivalries continue to heighten, and new competitors challenge the USA. With the Russian annexation of Crimea, regional conflicts in the Middle East, trade war between China and the USA, and crisis in the EU, we may be witnessing the return of inter-imperialist rivalry. These new imperialist policies are restructuring the chain.

In this way, both terms, imperialist policy and the imperialist chain, are needed. Without a concept of the imperialist chain, we will be lost in a sea of endless aggressive state actions, with no real theory explaining why they take the form that they do: the imperialist chain is the terrain on which states act, and its configuration at a given conjuncture establishes the parameters of those actions, setting limits on what can and cannot be done. But without a concept of imperialist policy, we will have only a vague system, with no theory of how imperialism actually operates: it is precisely through the individual actions of its constituent links that the imperialist chain not only comes alive, but reproduces itself, changing over time. 'Imperialism' is the relationship between both these terms, the imperialist chain and the acts of imperialist aggression in a given conjuncture.

AGAINST IMPERIALISM

While nearly all Marxist thinkers believed that theories of imperialism are not academic exercises but guides for action, they disagreed over how to engage with imperialism. In the early twentieth century, some, like Eduard Bernstein, supported imperialism because they believed it uplifted colonized peoples. Others, like Kautsky, condemned imperialism but discouraged revolts in favour of self-rule. Still others, like Lenin and Luxemburg, called for the immediate overthrow of imperialism.

But even these fervent anti-imperialists disagreed about the best way to stop imperialism (Löwy, 1976). Lenin, for example, argued that the core of anti-imperialism was the struggle for the right of nations to self-determination, which he believed was the precondition for true international unity (Lenin, 1974a). Others, like Luxemburg, disagreed, countering that national liberation would only paper over irreconcilable internal class antagonisms, that nation-states were inherently reactionary, and that capitalist development would inevitably dissolve national particularities anyway (Luxemburg, 1976). In her view, self-determination had nothing to do with socialist internationalism.

Whatever the merits of each side, Lenin's positions on the national question achieved a kind of hegemony after the Bolshevik Revolution. At the Second Congress of the Communist International in 1920, which decided the communist movement's official stance on imperialism, Lenin set the terms of the debate, arguing that the revolution in the colonies would have to pass through two stages: first, national liberation, which would be based in an alliance with progressive bourgeois elements; then, after the fundamental tasks of the bourgeois democratic revolution had been completed, the struggle for socialism proper would commence.

At the Congress, M. N. Roy objected to Lenin's call to ally with the national bourgeoisie, forcing the Comintern to nuance its approach to alliances. In addition, Roy pressured Lenin to consider the possibility that revolutions in these 'backwards' countries might bypass capitalism on the way to socialism. As Lenin explained in his report to the Comintern, 'the Communist International should advance the proposition, with the appropriate theoretical grounding, that the backwards countries, aided by the proletariat of the advanced countries, can go over to the Soviet system and, through certain stages of development, to communism, without having to pass through the capitalist stage' (Riddell, 1991: 212–13). Significantly, both Lenin and Roy assumed this path would only be possible if the communist revolution met imminent success in the West. Barring that outcome, the revolution in the colonies and semi-colonies would likely still have to pass through two stages, with Roy himself stating that the 'revolution in the colonies will not be a communist revolution in its first stages' (Riddell, 1991: 221).

Although subsequent thinkers, especially Leon Trotsky and Mao Zedong, would introduce important changes to this strategy, the Leninist problematic

fusing anti-imperialism with the right of nations to self-determination remained hegemonic among most Marxists. The assumption was that nations exist, they oppress one another, oppressed nations have the right to define their political future, and it is the duty of all anti-imperialists, especially those living in imperialist countries, to do whatever possible to lend a hand. After the Second World War, with the old empires collapsing one after the other, the right to self-determination came to mean primarily the struggle to win independent nation-states: oppressed nations would overthrow imperial rule, establish strong nation-states to construct socialism at home, and collaborate internationally to build world socialism. What this meant concretely was an internationalism of nation-states.

To be sure, some Marxists dissented from this view. Some argued that national liberation was not a genuine movement of the working class, but of the peasants led by a tiny petty bourgeoisie. Others observed that the leadership of many of these movements paid little attention to democracy, which almost guaranteed that the states created by anti-imperialist struggle would become dictatorships of one kind or another. Still others were unsure how these movements would possibly create socialism given their relative underdevelopment. While some of these criticisms had merit, those who issued them were generally either uninvolved in anti-imperialist organizing, or found themselves on the margins, which meant their positions were often ignored.

But in the 1970s and early 1980s, the limits of this Leninist problematic became clear for all to see. Some newly independent states became dictatorships. Others failed to achieve economic independence, finding themselves crushed by debt crises. Still others went so far as to align with the USA, as when China, once considered a leader of global anti-imperialist struggle, supported US foreign policy, backed the coup in Chile, and undermined national liberation movements in Africa. Most painfully, despite paeans to unity, many of these states constantly fought with each other, their disagreements at times erupting in violent conflict. In many cases, they behaved in ways that would be difficult not to characterize as imperialist. This meltdown of internationalism was most poignantly captured by the Third Indochina War, in which Vietnam, Cambodia, and China – all three nominally socialist, all three once united in the struggle against the USA, all three important reference points for movements elsewhere – went to war with one another (Anderson, 2006; Westad and Quinn-Judge, 2006). Taken together, these developments undermined the idea of national liberation, and because the right of nations to self-determination had been made on the basis of the struggle against imperialism, anti-imperialism as such entered into terminal crisis in the 1980s (Mohandesi, 2017). Although struggles continue to rage across the globe, anti-imperialism has not yet fully recovered.

Despite some important advances in theories of imperialism in the last few decades, there has been comparatively less new work on strategies of anti-imperialism, which is notable since the whole point of most Marxist theories of imperialism was to better organize struggles against it. The way forward remains

uncertain, and can only be resolved through struggles themselves, but new research highlighting the role of the state in imperialism, and the relationship between imperialist policy and the imperialist chain, may help. This approach foregrounds the need to build unity among social forces in different links of the chain. It refocuses the target of anti-imperialism to the entire chain without abandoning the need to counter individual acts of imperialism, since this is how that chain is reproduced in the first place. And it casts doubt on the state as an emancipatory vehicle, nuancing the old strategy of defending one link against another.

This last point must be emphasized, since there is still a tendency among many on the left today to defend whatever regime opposes the USA. The underlying concerns animating this response are often very real, but this kind of anti-imperialism runs the risk of substituting antagonistic relations between the social forces comprising a state with the antagonistic relations between nation-states. With classes homogenized, and internal struggle downplayed, or even erased, the subject of liberation becomes the nation-state itself. At its extreme, this kind of thinking can lead to supporting authoritarian states that destroy the domestic left and repress workers' self-activity because they are said to be embarking on an autonomous, anti-imperialist path of development in the face of 'Western' imperialist depredations. There are enormous differences between, say, US and Iranian imperialism, but for those who call themselves Marxists, the objective would have to be the abolition of both, not the defence of one against the other.

While anti-imperialism cannot be reduced to selectively countering the actions of one especially despised state while remaining silent about the other states comprising the chain, one should be careful not to bend the stick too far the other way. On the other side, some sit back with arms crossed, refusing to assist any struggle in the Global South because they fail to meet unattainable criteria abstractly established in North America or Western Europe. Here, too, the underlying concerns are real. After watching so many movements morph into oppressive states that have nothing to do with socialism, some are rightfully leery. While such circumspection is welcome, this approach, which overlooks the fundamental unevenness of the imperialist chain, risks devolving into either quietism, that is, simply waiting for the chain to collapse on its own, or into a kind of Eurocentrism in which anti-imperialist work is limited to the imperialist metropole in which one lives. Though important, it's not enough to organize in one's own country; that work has to be coordinated with movements in other links of the chain. This is the real meaning of internationalism. Anti-imperialism, then, means organizing sustained opposition to all acts of imperialism in a way that makes possible the internationalist struggle to overthrow the imperialist chain of states as such.

Totality¹

Chris O'Kane

Despite the ambiguous and incomplete status of Marx's conception of totality, a theory of totality has been central to a number of approaches to Marxism. These Marxist approaches share a double-faceted conception of totality as (1) a critique of the insufficiency of approaches – such as liberalism, political economy, idealism or positivism, but also certain variants of Marxism – that fail to grasp history and/or society as an interconnected whole; (2) a theory that grasps history and/or capitalist society as an interconnected whole from an emancipatory perspective. Yet these approaches diverge in their interpretations of Marx and in their ensuing conceptions of totality. Moreover, although the 'crisis of Marxism' in the academy coincided with criticisms of totality and a retreat from theories of the whole, there has been a return to the theories of totality in recent years. This chapter outlines the development of Marxist conceptions of totality from Marx to the contemporary revival of totality.

Part 1 provides a brief outline of Marx's relationship with Hegel, his ambiguous conception of totality in the critique of political economy and the gaps that remained in his work. Part 2 turns to the development of the classical Marxist conception of totality by Engels and its elaboration by Karl Kautsky, Eduard Bernstein, V. I. Lenin, Rosa Luxemburg and Anton Pannekoek. Part 3 turns to the Western Hegelian-Marxist conception of totality. Here it is shown that, in contrast to the scientific historical determinism and economism of classical Marxism, Western Hegelian-Marxism developed a conception of historical and capitalist totality premised on the dominating and mystifying properties of alienated

human praxis viewed from the perspective of its emancipatory overcoming. Part 4 moves to Althusserian Marxism. This section focuses on Althusser's critique of the Marxist humanist notion of totality. It then assays Althusser's notion of totality as a decentred 'structure in dominance'. Part 5 provides an overview of the critical Marxist critique of traditional Marxism and its conception of negative totality by focusing on the work of Benjamin, Adorno and Horkheimer. Part 6 provides an overview of the criticism and retreat from totality following the crisis of the workers' movement and the crisis of Marxism in the academe. Here it is shown that such a retreat also led to the development of systematic accounts of moments of the totality of capitalist society – value, the state, domestic labour and gendered subjugation, imperialism and racial subjugation, and nature – that had been neglected or excluded in the classical Marxist, Western Hegelian-Marxist, Althusserian, and critical Marxist conceptions of totality. Part 7 outlines the return to theories of totality that draws on these systematic accounts in recent theories by Jason W. Moore, John Milios, Nancy Fraser and Werner Bonefeld that likewise attempt to grasp the multifaceted problems of today from an emancipatory perspective. The conclusion summarizes and points to the further development of the Marxist conceptions of totality.

1. MARX AND TOTALITY

Eugen von Böhm-Bawerk famously characterized the critique of political economy as a 'torso' (Böhm-Bawerk, 1941: 3). For the purpose of this chapter it is more apt to think of Marx's extant work as a heart or, to invert Deleuze and Guattari, an organ without a body. This is because in Marxist approaches to totality, the critique of political economy is essential (if not sufficient) to understanding what powers the historical and social body. Moreover, as we shall see below, the changing focus and ambiguities in Marx's work and the times in which they were published are likewise essential to the different Marxist approaches to totality. For these reasons, this section eschews a reconstruction of Marx's work, focusing on these issues as they relate to the concept of totality in the critique of political economy.

Marx undertook the critique of political economy at the end of the 1850s. He famously characterized this project in a letter to Ferdinand Lasalle at this time as the 'critical expose of the system of the bourgeois economy. It is at once an expose and, by the same token, a critique of the system' (Marx and Engels, 1983: 270). Yet in the decades that Marx worked on the project, the double-faceted exposé and critique that he had envisioned went through a number of different plans and drafts. *A Contribution to the Critique of Political Economy* was published in 1859 (Marx, 1977). Yet the first volume of *Capital* was not published until 1867 (Marx, 1992). Volumes 2 and 3 were never published during Marx's lifetime, let alone his numerous preparatory manuscripts.

As we now know from the publications of Marx's manuscripts and correspondence, one of the reasons Marx revised and reformulated the plan of the critique of political economy was the difficulty Marx encountered in establishing the relationship between his research and his method of presentation. We know that Marx found re-reading Hegel's *Logic* to be helpful when working out the method of presentation of his critique and exposé of the system of bourgeois economy. Yet Marx's cryptic remarks that the 'dialectical method' he used in *Capital* was 'exactly opposite to' Hegel's does little to illuminate how he conceived of Hegel's dialectic, totality or system, nor how Marx was using them in *Capital* (Marx, 1992: 102–3).

The matter is not cleared up by examining how Hegel defined these linked concepts. As Lars Heitmann notes, 'totality is a frequently used concept in Hegelian philosophy'. The concept can be found in Hegel's work on numerous topics including logic, but also religion, anthropology, history, epistemology and social and political philosophy. In these writings,

'Totality' ... refers to a whole that is more than the sum of its individual parts that stand external to each other; this whole, therefore, does not exist on its own as such, but rather subsists in the parts. Each moment can thus only be thought in its 'mediation' with all other moments of the 'totality'. At the same time, each individual moment is always already determined as self-contradictory: it is always itself and not itself, both immediate and mediated at the same time. (Heitmann, 2018: 590)

Yet, crucially, for Hegel, the totalities mentioned in these writings are not discrete. Hegel's comprehensive 'dialectical system of science' unites nature, society, consciousness and history into a totality. Indeed, Hegel's

'system' is conceived as the conceptual reconstruction of the self-actualization of 'absolute spirit' through various forms ... In so doing, Hegel unfolds the objects from each other (or 'derives' them) by always showing how simple forms have contradictions that lead to higher forms. (Heitmann, 2018: 591)

Hegel's system thus purports to grasp the unified historical development of nature, society and consciousness as a totality. In such a process of development, humanity comes to see itself as the self-consciousness development of spirit and embodies spirit in the institutions of society, uniting subject and object, and realizing freedom. Hence referring to Hegel's system or his conception of totality does not clarify Marx's remarks, nor the matter in which Marx used these concepts.

Finally, the issue is not cleared up if we read Marx's letters, notebooks or even the published volumes from the critique of political economy he oversaw (Heinrich, 2009). For they evidence a shifting method of presentation – most notably the presentation of the value-form – and an unresolved ambivalence between Marx's neo-Ricardian and value-theoretical definitions of abstract labour and value.

Consequently, the method of presentation provided in *Capital* and the totality presented therein were interpreted in two very distinct manners. The logico-historical interpretation reads Volume 1 as the development of the totality of

economic history from simple commodity production to capitalism's breakdown and revolutionary overthrow. The logical-systematic interpretation reads Volume 1 as the systematic development of the capitalist mode of production comprising the historically specific totality of production and circulation from the most abstract historically specific form of capitalist wealth to its most complex. These different interpretations are given support by different aspects of *Capital* Volume 1. For instance, the logico-historical interpretation is lent credence in chapter 32 of Volume 1 on the historical tendency of capitalist accumulation, while the historically specific interpretation is corroborated by the first sentence of Volume 1, referring to wealth in the capitalist mode of production.

Finally, the unfinished status of *Capital* does not include an array of phenomena central to a critique of the system of bourgeois economy – such as class and the state. As a result, rather than Marx providing a definitive conception of totality, these different facets and meanings of the double-character of Marx's notion of totality would be drawn on and developed by the interpretations of totality in different Marxist traditions.

2. CLASSICAL MARXIST TOTALITY

Classical Marxism developed the first interpretation, elaboration and systematization of Marx's thought as a theory of totality. Friedrich Engels – Marx's comrade, patron and co-author – made the foremost contribution to the creation of this conception of totality. Engels edited Marx's manuscripts of 1867–8 and 1877–81 for publication in Volume 2 of *Capital* and Marx's manuscripts of 1864–5 for the publication of Volume 3. Engels also authored influential interpretations of *A Contribution to the Critique of Political Economy* and Volume 3 of *Capital*. Finally, he wrote a number of works that complemented and systematized Marx's work into a science that purportedly grasped historical development of nature and society as a totality, in particular *Anti-Dühring* (which featured a small contribution from Marx), *Ludwig Feuerbach* and *The Origin of Private Property and the Family*. They showed how the natural law of the negation of the negation was realized in the progressive contradictory development of modes of production. This process of development would culminate in classless society, in which nature was consciously subordinated, realizing freedom.

Engels' classical Marxist conception of totality was so influential in the Marxism of the Second and Third Internationals that the ambiguities in his own efforts at supplementation and systematization – especially over the relationship between the state and revolutionary tactics – served as the respective bases for the reformist and revolutionary strands of classical Marxism. Engels' account of historical development also served as a basis for the theories of finance capitalism, imperialism, state-monopoly capitalism and late capitalism that broke with but extended his progressive account of historical development. For this

reason, in a somewhat qualified manner classical Marxism has been referred to as ‘Engelsism’ (Elbe, 2012).

Yet Engels and the classical Marxists who followed him saw themselves as Marxists and referred to their approach to totality as the ‘materialist conception of history’, ‘historical materialism’ or ‘scientific socialism’, which they held had been developed by Marx. In Engels’ interpretation, later formalized by Kautsky and popularized by Lenin:

Marx was the genius who continued and consummated the three main ideological currents of the 19th century, as represented by the three most advanced countries of mankind: classical German philosophy, classical English political economy, and French socialism combined with French revolutionary doctrines in general. (Lenin, 1977)

Marx was said to have built on German philosophy by turning Hegel’s idealist system of the historical development of social and natural totality ‘on its head’, rendering it materialist. Marx’s ‘revelation of the secret of capitalist production through surplus value’ was also said to have ‘consummated’ English political economy providing a scientific explanation for the exploitation of the proletariat by the capitalist class. Finally, ‘[w]ith these discoveries socialism became a science’, consummating French socialism (Engels, 1987: 27). Consequently, in Lenin’s later popular formalization, such a ‘totality’ of ‘Marx’s views’ were said to ‘constitute modern materialism and modern scientific socialism’ (Lenin, 1977: 21).

However, just as Engels had developed this classical Marxist conception of the ‘totality’ of ‘Marx’s views’, it was Engels who developed these views into a systematic totality. In what is probably the most influential work in classical Marxism, *Anti-Dühring*, Engels synthesized his interpretation of the critique of political economy with an account of nature, society and consciousness to create the classical Marxist account of the materialist conception of history as a science of the historical development of totality.

In Engels’ account, dialectics is ‘the science of the general laws of motion and development of nature, human society and thought’ (Engels, 1987: 132). The core law of development is ‘[t]he law of negation of the negation, which is unconsciously operative in nature and history and until it has been recognised, also in our heads’ (Engels, 1987: 132). Accordingly, historical materialism was held to grasp the inner law of the progressive development of the natural and social world as a totality.

According to Engels, Marx ‘briefly outlined’ the ‘principal features’ of such an account of totality in the preface to the *A Contribution to the Critique of Political Economy*, resulting in the (in)famous classical Marxist stagist conception of natural laws of historical development (Engels, 1859: 469). In this conception of totality, the material economic base consisted in the forces and relations of production, which determined the superstructure (ideas, laws, culture). A mode of production delineated the configuration of the base and the superstructure

(Haldon, Chapter 2, this *Handbook*). Yet these modes of production were not discrete. Rather, the evolutionary ‘general laws of motion’ of the negation of the negation were expressed in the contradictory development of the productive forces and the relations of production, which proceeded from lower to higher stages of modes of production. Hence although history as a whole was characterized by the development of the productive forces, ‘[a]t a certain stage of development’ in each mode of production:

the material productive forces of society come into conflict with the existing relations of production or – this merely expresses the same thing in legal terms – with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. Then begins an era of social revolution. The changes in the economic foundation lead sooner or later to the transformation of the whole immense superstructure. (Marx, 1977, quoted in Engels, 1859)

According to Engels’ influential interpretation, *Capital* provided a systematic account of the contradictory evolution of the base in terms of the development of the socialization of production in the context of class appropriation. In Engels’ view, Marx’s method of presentation in Volume 1 thus proceeded from the early primitive stages of simple commodity production, through the rise of capitalism, to its ‘inevitable’ revolutionary succession by socialism.

Marx himself had shown why such a revolution was inevitable in chapter 32 of Volume 1. The contradiction between socialized production in the factory and private appropriation by the capitalist class would develop to the point where capitalist appropriation became a fetter on planned and socialized production. The productive forces would be developed to the point where they could produce a society of generalized abundance. Yet the majority of the population would be immiserated. Hence the negation of the negation of the capitalist mode of production would be realized in the expropriation of the expropriators and the unleashing of the productive forces under socialism.

Yet Marx himself had not provided guidance on how this process of expropriation would happen in regard to political power and political strategy nor what such a socialist society would look like. Engels himself addressed these lacunae. In his historical account of the development of private property, the family and the state, Engels offered an influential transhistorical definition of the latter. In all modes of production, the state was a semi-autonomous but neutral power manifesting class contradictions but nonetheless above society – and could thus be used by any class to achieve its own political objectives. Hence socialism necessitated taking state power. For Engels, it was only on this basis that the anarchy of production as the expression of blind historical development could be replaced by the conscious planning of society as a whole. Consequently, humanity would for the ‘first time becomes the real, conscious lord of nature’, realizing freedom and with it the development of historical totality (Engels, 1987: 270).

The paramount questions for classical Marxism were thus: how should the state be used to advance the development of socialism? And what sort of tactics

and party should enact this development? Engels himself advanced two strategies. He argued that the state would 'wither away' following the revolutionary seizure of power and the dictatorship of the proletariat. But he also argued that he and Marx had been wrong to think that the revolution was imminent or that it would be the work of a small minority party, when it should be led by a broad party that strives to establish socialism through state reforms. These two strands of Engels' thought were taken up in the debate over reform and revolution.²

Karl Kautsky, 'the socialist pope', close associate of Engels and lead theoretician of the largest workers' party in the world (the Social Democratic Party of Germany (SPD)), argued that the demise of capitalism was not imminent and so the conditions for revolution were not yet 'ripe'. Since the state was a neutral instrument, the SPD – as a big-tent workers' party – should participate in the electoral process to enact progressive reforms until conditions were indeed ripe. Eduard Bernstein, another leading theoretician of the SPD, made a more controversial case for reformism. Bernstein argued that Marx's theory of immiseration had been disproved as non-scientific: capitalism had not collapsed, and the living standards of the working class had improved. Using Engels' comments in favour of reformism as justification, Bernstein argued that reformism – and more specifically electoralism and even government by coalition – was the only road to socialism.

Left opponents of the dominant social-democratic position, including V. I. Lenin, Rosa Luxemburg and Anton Pannekoek, argued for revolution, drawing on and developing non-reformist classical Marxist accounts of historical evolution and Engels' comments on the revolutionary seizure of state power. Lenin advocated for a small revolutionary model of the party and for a revolutionary seizure of state power along the lines Engels had sketched in *The Origin of the Family, Private Property, and the State*. Lenin's *Imperialism, the Highest Stage of Capitalism* (Lenin, 1963) argued that capitalism's final crisis had been staved off by Western countries engaging in imperialism, at the behest of monopoly and finance capital, sustaining profit rates on the basis of new sources of super-exploitation, raw materials and markets. Nonetheless, this period of imperialist expansion had culminated in the First World War between imperial powers, and would culminate in revolution, spreading from the immiserated workers of the undeveloped countries to those in the developed world. Luxemburg's *The Accumulation of Capital* (2016) had previously provided a theory of imperialism on the basis of her 'under-consumptionist' reading of *Capital*. Luxemburg argued that non-capitalist markets were a necessary component of capitalist profits. This was because exploitation entailed that proletarian workers were not paid enough to ensure a profitable demand for commodities. Imperialist expansion to non-capitalist markets ensured such a demand. However, this process of expansion also transformed non-capitalist markets into capitalist markets, setting the seeds for the breakdown of capitalism. Luxemburg supported the tactic of the mass strike and, following Lenin's seizure of power, advocated for a return of power to

the Soviets. Pannekoek was a persistent believer in spontaneity, workers councils and the inevitability of the final crisis.

Yet these newer stages of capitalism did not lead to its revolutionary collapse. Following the failure of the German revolution, the death of Luxemburg and Lenin, the failure of world revolution and the rise of Fascism and Stalinism, classical Marxists developed new theories of state-monopoly capitalism and then late capitalism, which diagnosed how the productive forces had continued to develop even while the state and imperialism counteracted capitalism's collapse. These theories point to the modified persistence of the classical Marxist notion of totality, which we will return to below. In the meantime, such a historical trajectory and the legacy of reformism also help contextualize the emergence of the Western Hegelian-Marxist notion of totality.

3. WESTERN HEGELIAN-MARXISM

Western Hegelian-Marxism is an imprecise term that draws on two imprecise and anachronistic categories that are nonetheless central to the reception of Marxism: Western Marxism and Hegelian-Marxism. Despite the overlap between Eastern and Western Marxism, the persistence of Eastern Marxists in the West and important differences between thinkers in this tradition, the term Western Marxism was popularized by Merleau-Ponty (1973) and then taken up by an array of thinkers and historians as a way of designating an approach to Marx distinct from the classical Marxism of the Eastern bloc (Anderson, 1979; Jay, 1986). Despite the interpretations of Hegel and totality that were central to classical Marxism, the term Hegelian-Marxism also developed into a popular way of designating a Hegelian interpretation of Marx that centres on the concepts of alienation and totality, in contrast to the economic and historical determinism of classical Marxism. Despite the problems with these terms, and some important differences between those who employ them, I draw them together and use Western Hegelian-Marxism to designate one strand of Western Marxism as well as a particular framing of totality.

Like classical Marxism, Western Hegelian-Marxism promulgated its own interpretation of Marx's double-faceted critique of methodological approaches that fail both to grasp reality as an interconnected whole and to critique that whole. Yet unlike classical Marxism's doctrine of the unity of the three sources, the interpretation of Marx that was central to the Western Hegelian-Marxist concept of totality focused on Marx's relationship with Hegel. Moreover, in distinction to classical Marxism, the Western Hegelian-Marxist interpretation of Hegel and Marx distinguished between the realms of society and nature. Western Hegelian-Marxism was accordingly critical of classical Marxism's scientific understanding of nature, history and society, particularly its reformist interpretations. For Western Hegelian-Marxism, totality did not include nature, nor the natural laws

of historical development. Moreover, the dynamic of capitalism's emergence and overcoming was not conceived in terms of the contradictory development of the productive forces and the relations of production, nor the economic determinism of base and superstructure. Rather, in the Western Hegelian-Marxist theory of totality, history and capitalist society were grasped as an interconnected whole in terms of the historical development of the alienated separation of subject and object. Capitalist society was seen as a totality insofar as the spheres of the economy, state, bureaucracy, culture and everyday life were separated from the subjects that created them, dominating them and mystifying this process, thereby leading to alienated subjectivity. Emancipation was conceived as the overcoming of the separation of subject and objective via proletarian seizure and rule of these objects, overcoming alienation.

Karl Korsch's 1922 *Marxism and Philosophy* (Korsch, 2013) and Georg Lukács' 1923 essay collection *History and Class Consciousness* (Lukács, 1972) provided the seminal Western Hegelian-Marxist formulations of totality. In the first place, Korsch and Lukács criticized the foremost reformist thinkers of the Second International interpretation of classical Marxism – such as Kautsky, Bernstein and Hilferding – for embracing a natural and social-scientific understanding of historical development that imitated bourgeois science and failed to grasp history and society as a totality created by human praxis. In contrast, Korsch and Lukács argued that 'Orthodox Marxism refers exclusively to method' and that such a method amounted to conceiving of history and capitalist society as a reified totality created by human praxis (Lukács, 1972: 1).

Lukács' theory of reification elaborated the repercussions such a notion of totality held for capitalist society and revolutionary praxis, providing an analysis of capitalist society as reified totality from the perspective of its overcoming. Lukács conceived of such a totality in terms of the separation of subject and object creating a mystified second nature. Part one of the central essay in *History and Class Consciousness*, 'Reification and the Consciousness of the Proletariat', shows how such a process of separation and mystification leads to individuals passively following capitalism's socio-natural laws in the factory, bureaucracy and a number of other areas of capitalist society (including marriage and journalism). Part two provides an overview of the development of philosophy culminating in Hegelian philosophy, which in spite of its dialectical method cannot grasp historical development due to its idealism. Part three focuses on how the proletariat as the creators of totality, and the subject/object of history, can come to consciousness, grasp totality as their creation and seize it, thus reuniting subject and object, overcoming reification.

In the years following the publication of *History and Class Consciousness*, Lukács made a number of concessions to the official Soviet line in philosophy, leading to his self-criticism of the theory of reification. Korsch would go on to write an influential interpretation of Marx and introduction to *Capital* (Korsch, 1970, 2017). Following the publication of Marx's *Economic and Philosophical*

Manuscripts of 1844 in 1932, other thinkers would develop related and more sustained interpretations of this Western Hegelian-Marxist conception of totality, based on the young Marx's idea of alienation. More elaborate accounts of the relationship between Hegelian and Marxist notions of alienation were developed by notable Western Hegelian-Marxists such as Herbert Marcuse, Raya Dunayevskaya and Erich Fromm, who likewise developed social theories based on these interpretations (Marcuse, 1941; Dunayevskaya, 2002; Fromm, 1961). But perhaps the most sustained theorist of the Western Hegelian-Marxist conception of totality was Henri Lefebvre.

Lefebvre was not only the first translator of Marx's 1844 *Economic and Philosophical Manuscripts* into French, but his (1936) *Mystified Consciousness* (co-authored with Norbert Guterman) was the first work to place alienation at the heart of a Marxist conception of historical development and capitalist society. And in 1939, *Dialectical Materialism* (Lefebvre and Guterman, 2009) provided the seminal Western Hegelian-Marxist articulation of the relationship between Hegel and Marx, with Marx providing a materialist interpretation of dialectics, totality and alienation, and of historical development and capitalist society as alienated praxis. The multiple volumes of *Critique of Everyday Life* (collected in Lefebvre, 2014) represent a decades-long attempt to grasp how the alienated totality pervaded quotidian existence, while Lefebvre's work on space (Lefebvre, 1991) attempted to grasp how it was shaped by alienation. Lefebvre's four-volume work on the state and his writings on *autogestion* (self-management) (excerpted in Lefebvre, 2009) likewise thematized alienation and emancipation in multiple registers. While these works responded to criticisms of totality's reductionism by developing the notion of levels of totality and the interpenetration of the economy, state and space by neo-capitalism, Lefebvre's analysis of all these phenomena was firmly rooted in conceiving them as instances of alienation bolstering oppressive and mystifying realms of capitalist society that were nonetheless resisted by qualitative humane activities. His notions of revolution and *autogestion* pointed to the overcoming of this alienated reality, reuniting subject and object.

4. ALTHUSSERIAN MARXISM

Louis Althusser (1969, 1970, 2003) developed a 'structuralist' conception of totality opposed to the Western Hegelian-Marxist (or what he termed the 'Marxist humanist') position.³ Althusser's theory of totality took up motifs from classical Marxism, synthesizing them with Spinoza and an array of 'structuralist' contemporary approaches to the human and social sciences.

Mirroring the classical Marxist interpretation of Marx's double-faceted critique of political economy, Althusser distinguished between ideology and science. Althusser referred to an array of approaches to understanding history and

society as ideological because they were unable to grasp reality as a complex and evolving whole. Marxist humanism was exemplary of such a fall into ideology. Marxist humanism's essentialist notion of human nature and alienation formed the basis of its notion of expressive totality. Such an essentialist standpoint failed to grasp the creation of subjectivity by a historically contingent process of interpellation. Rather than a theory that grasped the creation of a complex whole, Marxist humanism thus possessed a monocausal essentialist theory. Finally, Marxist humanism failed to grasp the epistemological break that occurred between the early humanist and the late scientific Marx.

In contrast to the Western Hegelian-Marxism of Marxist humanism, Althusser developed a 'scientific' interpretation of *Capital* premised on a Spinozist notion of 'structural causality'. For Althusser, 'social formations are "structures of structures" integrated or articulated into a meaningful whole, yet each individual structure has a distinct existence in its own right' (Resch, 1992: 35). Consequently, by contrast with expressive totality: 'Social structures within a social formation are inscribed within a hierarchy of determinations that assigns them a place and a function, yet each possesses its own relative autonomy and mode of determination nonetheless' (Althusser quoted in Resch, 1992: 35). Nonetheless, such a 'totality of instances' is 'articulated on the basis of a determinate mode of production' (Althusser et al., 1970: 207). It is within this context that Althusser recast the classical Marxist notion of base and superstructure. Rather than the economic notion of the base determining the superstructure, Althusser's notion of structural causality holds that the superstructure possesses 'relative autonomy', but it is determined by the base in the last instance, although this last instance may never come. In a sophisticated rethinking of classical Marxism, the contradiction between the forces and relations of production, as animated by the class struggle, remains the motor of history.

5. MARXIST CRITICAL THEORY

The foremost thinkers who developed the conception of negative totality are usually grouped within Western (Hegelian) Marxism. In the most influential accounts of Western Marxism, by Perry Anderson (1979) and Martin Jay (1986), Adorno and Horkheimer are used to mark the totalizing dead end of this tradition in order to advocate for a less totalizing approach. Such a categorization makes for a neat developmental narrative that reflects the context in which Jay and Anderson's books were written. However, it fails to recognize the distinct critical Marxist approach to totality that takes issue with classical and Western Hegelian-Marxism and offers its own account of historical development and capitalist society as a negative totality.

This critique of classical and Western Hegelian-Marxism is modelled on the critical theoretical interpretation of Marx's double-faceted critique of political

economy. Classical and Western Hegelian-Marxism are said to share presuppositions akin to those of classical political economy, German idealism and positivism. Like these other approaches, classical and Western Hegelian-Marxism fail to grasp the mutual mediation of the parts and the whole, leading to a foreshortened understanding of totality that does not grasp its negativity. As a result, the classical and Western Hegelian-Marxist approaches to totality cannot account for the regressive trajectory of historical development, nor for the perpetuation of capitalist society.

Walter Benjamin's 'Theses on the Concept of History' (Benjamin, 1969) and Horkheimer and Adorno's 1944 *Dialectic of Enlightenment* (Horkheimer and Adorno, 2007) exemplify the conception of historical development as a negative totality. Both criticize the Engelsian notion of the natural laws of historical development culminating in the coming to consciousness of the proletariat, the seizure of the state, the unfettering of the productive forces and the domination of nature. Adorno's later work criticized Lukács' theory of reification and the notion of alienation along similar lines: these epiphenomenal theories could not account for the maiming of subjectivity, and their notion of emancipation via subject-object unity would perpetuate the domination of nature (Adorno, 1973). By contrast, Benjamin, Adorno and Horkheimer argued that universal history should be construed as a permanent catastrophe premised on the domination of external and internal nature that Adorno in particular, contra Engels, argued characterized human civilization up to the present.

For Adorno (as well as other contemporary theorists that can be grouped in this tradition, like Guy Debord and Jacques Camatte), then, mid-twentieth-century Western social democracy did not represent working-class gains, the Keynesian compromise or the golden age. Adorno noted that Keynesian fiscal and monetary policies had counteracted capitalism's crisis tendencies and raised standards of living. However, this had not led to the progressive realization of freedom. Late capitalism had not overcome social domination, class antagonism or misery, all of which continued to persist. Rather, Keynesianism had led to total integration and to the subsumption of the state, household, and subjectivity to the reproduction of capital by virtue of the internal relation between these spheres and their forms of negative universality. Such a negative totality represented an inversion of classical Marxism's predictions about the development of the productive forces under socialist planning, in which '[m]aterial production, distribution, consumption are administered in common. Their borders, which once separated from inside the total process of externally separated spheres, and thereby respected that which was qualitatively different, are melting away. Everything is one. The totality of the process of mediation, in truth [is] that of the exchange-principle' (Adorno, 2001), which 'confronts' individuals within class relations as a kind of 'doom' – cultivating forms of thought identical to the exchange principle, crippling autonomy and rendering individuals, as character-masks and personifications of economic categories, reliant on their own unfreedom.

In this tradition, emancipation would thus not consist in the seizure of totality via the revolutionary seizure of the state, the centralized planning of production and the conscious domination of nature, nor in subject–object unity. Instead, emancipation would entail the abolition of capitalist totality and the non-dominative relation between outer and inner nature.

6. THE CRISIS OF TOTALITY AND THEORIES OF MOMENTS

From the late 1960s through to the 1980s, the concept of totality became the object of criticism. The New Social Movements, alongside emerging poststructuralist, postmodern and system theories, called into question and criticized the classical and Western Hegelian-Marxist models of totality premised on an essentialist humanism or on the perceived conflation of oppression with the exploitation of white male industrial workers. Those working in the tradition of Adorno and Horkheimer, such as Jay and Habermas, likewise portrayed the approach to negative totality advanced by the authors of the *Dialectic of Enlightenment* as a social and political dead end. These criticisms were part of the ‘crisis of Marxism’ in the academy. While this crisis led to a retreat from theories of totality, the period also witnessed the systematic development of moments of totality, often inspired by the New Social Movements, that had been minimized or excluded by the aforementioned theories of totality.

6.1 Marx’s Theory of Value

The Marxist approaches to totality we have discussed were not greatly concerned with detailed scholastic investigations of Marx’s theory of value. Certainly, the neo-Ricardian interpretation of Marx’s labour theory of value popularized by Engels was central to classical Marxism’s account of historical development. Western Hegelian-Marxism and critical Marxism also drew on the theory of fetishism as a theory of alienation, reification or social domination. Yet the development of these theories of totality had not been influenced by any of the pioneering scholastic studies of Marx’s theory of value, and indeed these studies had been marginal to the development of Marxism.

Starting in the 1960s, scholarly investigations and debates over Marx’s theory of value began to proliferate: first between neo-Ricardian and Sraffian economists over the validity of the neo-Ricardian interpretation of Marx’s labour theory of value as an economic theory of price determination, then over the question as to whether or not Marx’s theory was neo-Ricardian or even a labour theory of value (See Redolfi Riva, Chapter 5, Bellofiore and Coveri, Chapter 10 of this Volume).

The neo-Ricardian interpretations essentially defended, formalized and further developed the classical Marxist interpretation of the labour theory of value (often by drawing on Althusser). In this interpretation, Marx’s theory of value

was a substantialist theory that had improved on Ricardo's embodied theory of value by developing the category surplus value, thus providing a scientific explanation of exploitation and class struggle. Value was created in production, wages paid to workers were less than the value they created and capitalists appropriated the remaining surplus value as profit. Contra Sraffian economists, the transformation problem could be solved, and such a labour theory of value could explain price formation. Ultimately, Marx provided a substantialist account of abstract labour, which held that value was created in the sphere of production.

The neo-Ricardian position, especially its substantialist interpretation of abstract labour, was criticized by a new approach, often termed 'value-form theory', that emerged in a number of countries in the 1960s and 1970s, partly on the basis of a rediscovery or initial translation of preparatory materials from the critique of political economy. The approach to value-form theory in West Germany (also known as the *Neue Marx-Lektüre*, the new reading of Marx) was pioneered by a number of Adorno's students – Alfred Schmidt (1968, 1981), Hans-Georg Backhaus (1980) and Helmut Reichelt (1970) – whose study of Marx had been motivated by what they saw as Horkheimer and Adorno's insightful but unsystematic comments on Marx's theory of value. Schmidt, Backhaus and Reichelt's pioneering work argued for a reconstruction of Marx's monetary theory of value. Such a theory of value was presented dialectically in a manner homologous with Hegel's logic. In distinction to Ricardo, Marx's theory did not hold that value was a substance embodied in commodities by labour, but a theory of social validity. Value was necessarily expressed in money and the value of commodities produced for the market depended on whether or not they were purchased. On this basis, capital was conceived of as negative totality, comprising production and circulation, with value mirroring the Hegelian subject, mediating individuals within the class antagonism as personifications of economic categories to reproduce capitalist society via the process of accumulation. Value-form theory was later developed by Moishe Postone (1993) into a critique of the historically specific form of labour.⁴

6.2 Marxist State Theory

Theories of the state were certainly important to the approaches to totality discussed above. Yet much like the theory of value, these unsystematic approaches to the state explicitly or implicitly relied on Engels' instrumentalist view. Such an instrumentalist state theory had been essential to the classical Marxist explanations of the new stages of capitalism that had emerged as states engaged in imperialist projects or fiscal and monetary policies that temporarily staved off capitalism's immiserating tendencies. Engelsian state theory had also been incorporated into the Western Hegelian notion of totality by conceiving of the state as an alienated instrument that could nevertheless be used to overcome alienation before dissolving itself, and into the Althusserian notion of totality,

which conceived of the state as a semi-autonomous instrument. Finally, although critical Marxism's critique of negative totality conceived of the state as immanent to capitalist totality, it did not do so in a systematic manner. Yet Marx's own comments on the state in the critique of political economy went against any instrumentalist interpretation. So too did the political-economic reality of the late 1960s and 1970s, in which states were unable to counteract anti-imperialist independence movements and crisis tendencies. Such a background informed waves of state theories and state debates.

The Poulantzas–Miliband debate is probably the best known of these debates in the Anglophone world.⁵ Miliband (1969) is often portrayed as a proponent of the instrumentalist view of the state. However, it is more accurate to say that he developed a more sophisticated classical Marxist theory that conceived of the state as a neutral institution within the context of a broader theory of the monopolization of the institutions of capitalist political economy by the ruling class. Rather than simply wielding the state as an instrument, the ruling class had 'direct and indirect control over the state apparatus as well as over the economy and over the means of legitimating its rule' (Clarke, 1991a: 19). On this basis, Miliband turned to documenting how capital exercised control over the state, thus limiting the extent of social-democratic reforms. Drawing on and developing the Althusserian interpretation of Marx, Poulantzas argues that the capitalist state is a semi-autonomous entity by virtue of the structural role it plays in reproducing capitalist society. According to Poulantzas, the capitalist state does this within particular historical conjunctures by securing the reproduction of capitalism through ideological (as well as repressive) means that represent the interests of the capitalist class as a whole in opposition to those of particular capitalists, while simultaneously fragmenting the working class (Poulantzas, 2008).

The West German 'state-derivation debate' proceeded from value-form-theoretical premises.⁶ This debate was occasioned by the economic crisis that put an end to the *Wirtschaftswunder* (economic miracle) of the 1970s and Jürgen Habermas and Claus Offe's state theories. As the term indicates, the conceptual framework of this debate was influenced by the New German Reading of Marx and the later rediscovery of Soviet legal scholar Evgeny Pashukanis. Pashukanis' theory had differentiated itself from Marxist theories of the content of the state and come to focus on why the dominance of the capitalist class takes on the form of official state domination; it had done so by deriving the form of capitalist law and the capitalist state from commodity exchange (Knox, Chapter 48, this *Handbook*). Contributions to the state-derivation debate focused on explaining the necessary functions of the capitalist state and its limits, by deriving the form of the state from the dynamic of capital accumulation. The ensuing 'world-market debate', which featured many of the same participants, revolved around the issue of grounding a form-analytic conception of the state in the concrete context of the world market.⁷

The CSE (Conference of Socialist Economists) state debate integrated insights from the Poulantzas–Miliband debate, the state-derivation debate and

the world-market debate in an effort to answer the question of how to conceive the capitalist state within the context of the crisis of Keynesianism and the rise of monetarism in the UK. At the same time, participants in this debate sought to address the shortcomings of earlier debates in two ways: by developing a theory of capital and the state as forms of class struggle (Clarke, 1991b; Holloway and Picciotto, 1991) or by refining and integrating this theory into a Poulantzasian framework (Hirsch, 1991). Following the electoral victories of the New Right, participants in the CSE developed accounts of the restructuring and recomposition of the British state in the context of post-Fordism that built on their contributions to the original CSE state debate.⁸

6.3 Domestic Labour and the Subjugation of Gender

Engels, Kollontai and a number of other classical Marxists had written about women and the family. However, these theories treated women and the family as part of the superstructure, determined by the historical development of the class struggle and the productive forces. And despite Hegel's focus on the family, Western Hegelian-Marxists had almost entirely neglected these topics. Althusser conceived of the family as a site of reproduction and interpellation. Horkheimer and Adorno critiqued the family as a site of socialization integral to the negative totality of capitalist society. Yet it was not until the rise of the feminist movement in the 1960s that Marxist feminists began to develop systematic theories of household production, domestic labour and the oppression of women (See Ferguson, Bhattacharya and Farris, Chapter 3, Farris, Chapter 15, Aruzza Chapter 74, Hensmen Chapter 78 of This Handbook).

Participants in the domestic-labour debate took up these issues by developing accounts of the role that domestic labour played in capital accumulation and reproduction. Some of the participants argued that domestic labour was productive labour and created surplus value. Others argued that domestic labour was non-productive but nevertheless essential to understanding capitalist accumulation and reproduction. While the former position was popularized by the work of Dalla Costa and James (1975), the latter was systematized by Vogel (2013). Drawing on Marx's comments in *Capital*, Vogel argued that non-productive labour that contributed to the maintenance of current and future generations of labour-power was reproductive labour. Vogel then proceeded to provide an account of how reproductive labour contributed to the reproduction of class and capitalist society. She developed a concept of domestic labour specific to capitalism without fixed gender assignment.

Later work by Roswitha Scholz (2014) went against Vogel, providing historical and value-theoretical accounts of the creation and subjugation of gender, the family and the gendered private sphere. Where Federici (2004) argued that these identities and institutions were created as part of the process of primitive accumulation, Scholz's 'value dissociation theory' posited that feminized identity,

domestic labour and the private sphere were created through a process of dissociation and mutual mediation with value. Hence the gendered identity of women and household production took on the opposite qualities of masculine labour in the productive sphere. As moments in the negative totality of capitalist society, gender, domestic production and the private sphere must accordingly be abolished alongside productive labour and value.

6.4 Imperialism and Racial Subjugation

The national liberation and civil rights movements that preceded and were sometimes continuous with the New Social Movements likewise animated new Marxist theories of imperialism and racial formation. Since these issues had essentially been neglected by Western Hegelian-Marxism, Althusserian Marxism and critical Marxism (with the partial exception of the study of anti-Semitism), the development of systematic theories of these moments of totality harkened back to classical Marxist theories of imperialism, super-exploitation and racial formation, developed by Lenin and others (See Bhandar, Chapter 13 and Mohandesi, Chapter 12, Haider Chapter 58, Wilson Chapter 60 of this Handbook).⁹

The proponents of dependency theory – such as Paul Baran, Paul Sweezy, Andre Gunder Frank and Walter Rodney – argued that the prosperity of the capitalist economies in the global North was premised on the colonization and underdevelopment of economies in the global South, which provided the developed economies in the global North with cheap labour and cheap raw materials that were the key to prosperity in these countries. World systems theorists – such as Immanuel Wallerstein, Samir Amin, Giovanni Arrighi and Beverly Silver – took up this core–periphery relation and analysed it in terms of the hegemonic rule of core countries over world systems characterized by global value chains realized as profits in the core.

The formation of race and racism was analysed within this context of capitalist and imperialist subjugation on an international and national level on the basis of dependency theory and world systems theory. Taking up and developing earlier theories of racial formation, which conceived of race in terms of imperialist subjugation or the internal fragmentation of the working class, Balibar and Wallerstein (2011) argued that racial identities were created by the subordinate position of groups in the global capitalist division of labour.

In contrast to these approaches, critical Marxist thinkers such as Postone (2006) argued that the core–periphery and imperialist relations were elements of the totality of the capitalist world market. Anti-imperialism and national liberation were not anti-capitalist movements. Racism was a pernicious type of identity formation premised on abjecting subjugated identities, while anti-Semitism presupposed the personalization of capitalist exploitation. Both of these types of racism scapegoated oppressed minorities and failed to grasp totality. Along with anti-imperialism and national liberation, they contributed to the reproduction of capitalism.

6.5 Nature and Ecology

Finally, the environmental movement and environmental devastation wrought by capitalism was mirrored in the proliferation of Marxist theories of nature. While nature had essentially been neglected by Western Hegelian-Marxism, Adorno and Horkheimer's idea of nature was essential to their critique of negative totality. However, the wave of theories that developed in this period returned to and sought to develop a Marxist concept of nature on the basis of Marx's comments on nature in his critique of political economy, with especial focus on its ecological dimension (Huber, Chapter 39, and Saito, Chapter 37, this *Handbook*).

This philological approach was pioneered by Schmidt (1971), who also first drew attention to Marx's concept of metabolism. However, in distinction to the ecological approaches to Marx's conception of nature, Schmidt was interested in providing a more thorough grounding for Adorno and Horkheimer's idea of nature in a Marxist conception of nature that distinguished itself from classical Marxism. In contrast to Engels, Schmidt argued that Marx's idea of the metabolism with nature held that 'the whole of nature is socially mediated and, inversely, society is mediated through nature as a component of total reality' (Schmidt, 1971: 79). This is because Marx states that 'by acting on the external world and changing it', humanity 'at the same time changes his own nature'. Consequently, contra Engels and classical Marxism, 'In a wrongly organized society, the control of nature, however highly developed, remains at the same time an utter subjection to nature' (Schmidt, 1971: 42).

The ensuing work on Marx's theory of nature followed Schmidt's method from an ecological perspective. James O'Connor (1991) developed an ecological-crisis theory on the basis of what he termed the 'second contradiction of capital'. Mirroring some of the arguments in the domestic-labour debate, and drawing on *Capital*, O'Connor argued that capitalist production treats nature as a free gift, realized in profits, but also in the destruction and crises of nature. Foster (2000) drew together Marx's theory of alienation and the notion of metabolic rift to develop his influential approach to eco-Marxism. He argued that capitalism separates humanity from nature, while accumulation leads to ecological depletion and crisis.

7. THE RETURN TO TOTALITY

The revival of Marxism that followed the 2007–8 crisis has led to a return to theories of totality. These new theories of totality draw on and incorporate different approaches to the systematic development of the moments that the earlier approaches to totality had neglected, and they try to overcome the criticisms of economism, essentialism and one-dimensionality levelled at earlier approaches to totality. Nonetheless, these new approaches draw on and share premises with the theories of totality discussed above.

The approach Jason W. Moore has developed incorporates the classical Marxist notion of capitalism as a historical totality into his account of the historical emergence and impending decline of capitalism as a world ecological system. Moore (2015) draws together and extends the classical Marxist neo-Ricardian notion of exploitation to conceive of capitalism as a way of managing nature premised on 'four cheaps': labour, food, energy and raw materials that are realized in profit. Patel and Moore (2018) add three more 'cheaps' to this theory: money, care and lives. In conjunction with world systems theory's neo-classical Marxist theory of imperialism, Moore argues that capitalism has developed as a historical totality driven by strategies of cheapness. The impending decline of capitalism is due to a crisis of cheapness, stemming from the fact that this process of expansion has reached its limits. To move beyond capitalism, Moore calls for ecological reparations, the overcoming of cheapness and the creation of an ecological democracy.

John Milios and a number of co-authors (Milios et al., 2002; Milios and Sotiropoulos, 2009) have developed a neo-Althusserian theory of totality that articulates value-form theory and imperialism. Following the Althusserian conception of the 'primacy of class struggle', Milios contends that the capitalist mode of production (CMP) is constituted by two contradictions. The 'principal contradiction' is the 'contradiction' of the relations of production, which 'divides society into two fundamental (and unequal) classes: the capitalist and working classes' (Milios and Sotiropoulos, 2009: 131). Yet in the CMP, these 'agents of production embody other secondary power relations (contradictions)' because 'certain relations of production presuppose the existence of specific legal-political and ideological relations: the so-called superstructure' (Milios and Sotiropoulos, 2009: 132). Therefore, while these 'secondary contradictions are not the pure expressions of the principal contradiction', they 'actually constitute its condition of existence, just as the principal contradiction constitutes their condition of existence' (Milios and Sotiropoulos, 2009: 132). Thus, rather than a one-way determinism, for Milios, the relationship between these contradictions is reciprocal; for, while in the 'last instance' the relations of production ultimately 'determine the general form of the superstructure', these secondary determinations also possess 'relative autonomy' and act on the base (Milios and Sotiropoulos, 2009: 132). Consequently, the CMP 'is not exclusively an economic relation. It applies at all levels of society (social instances). It also includes the core of (capitalist) political and ideological relations of power, that is the particular structure of the capitalist state' (Milios and Sotiropoulos, 2009: 105). Adapting Lenin, the CMP also manifests itself in a global imperialist chain. Multiple capitals and states vie for accumulation and expansion, encapsulating a complex internally contradictory global class struggle. Overcoming capitalism thus consists in breaking the chain via the conquest of state power.

Nancy Fraser's systematic 'crisis-critique of capitalism as an institutionalized social order' sets out to overcome the economism of classical Marxism and the essentialism of Western Hegelian-Marxism (Fraser and Jaeggi, 2018). Drawing on Vogel, Federici, Habermas, Offe, O'Connor, Bellamy-Foster, Moore and

world systems theory, Fraser develops a conception of capitalism as a crisis-prone totality premised on the contradictory relationship between the ‘foreground’ of the economy and the ‘background’ of social reproduction, nature and the state.¹⁰ In a manner akin to Moore’s extension of the classical Marxist notion of exploitation, Fraser argues that these foreground–background conditions are contradictory and crisis-prone because the capitalist economy treats the background conditions as free gifts that are realized in profit. This consequently undermines social reproduction, nature and/or the state, leading to crises. Fraser advocates for a new idea of socialism in which the foreground–background relationship of these domains constitutive of capitalism is overcome and, mirroring Hegel and Western Hegelian-Marxism, in which the norms in these domains take on a relationship of equality that is expressed in a democratic market socialist state.

In contrast to the economism of classical Marxism and the woolly humanism of Western Hegelian-Marxism, Bonefeld (2014) draws on the work of Horkheimer, Adorno, Backhaus, Reichelt, Postone, Johannes Agnoli, Simon Clarke and others to develop a critique of negative totality as a critique of economic and social objectivity. Bonefeld conceives of such a historically specific totality as dependent on primitive accumulation. The ensuing class dynamic of antagonistic reproduction that issues from these conditions thus constitutes and reproduces the ‘perverted’ and autonomous social whole in which the supersensible real abstractions of value subsist through the sensuous practice of class struggle. The capitalist state, which is separate from yet integral to the economy, perpetuates class relations by ‘facilitating the (free) economy as a politically ordered freedom’. My own recent work (O’Kane, 2021a, 2021b) has sought further to develop this notion of negative totality, drawing on Schmidt and Adorno’s notion of domination of nature, Horkheimer and Adorno’s account of maimed subjectivity and Kirstin Munro’s (2019) critique of reproductive labour to provide an account of how these moments of society are mediated by and mediate accumulation and reproduction, thus incorporating early critical theory and the new reading of Marx into a new interpretation of the negative totality of capitalist society. In this approach, in contrast to the anti-imperialist, nationalist and state-centric approaches of the other new theories, emancipation is conceived as the abolition of negative totality.

CONCLUSION

Rather than providing a definitive Marxist approach to totality, this chapter has shown how a variety of approaches to totality have sought to extend and complete Marx’s critique of political economy as a double-faceted critique of (1) approaches that fail to grasp history and society as a totality and (2) the system of bourgeois society as a whole from the perspective of its emancipatory overcoming. Following the crisis of Marxism and of theories of totality, I have also outlined the return to

theories of totality in the wake of the 2007–8 crisis that have drawn on systematic theories of the moments of totality – value, the state, domestic labour and the subjugation of women, imperialism and racial subjugation, nature and ecology – that were neglected or under-systemized in earlier approaches. Barring the emancipatory transformation of capitalist totality, we can expect that the development of Marxist theories that seek to grasp capitalism as totality from the perspective of its emancipatory transformation will continue to flourish.

Notes

- 1 I would like to thank the anonymous readers for their detailed comments and the editors for their support and patience. Any errors or foreshortened understandings of totality in what follows stem from the author's partial grasp of the whole.

Dialectics

Harrison Fluss

INTRODUCTION

As the logic of contradiction, dialectics has a long pre-history before Marx, one as long as the history of philosophy itself. But the adventure of the dialectic, as Maurice Merleau-Ponty put it (1973), did not start again until the late modern period, when Immanuel Kant rediscovered the problem of the dialectic in *The Critique of Pure Reason*. This rediscovery had massive implications for the rest of the history of philosophy and constitutes the essential pre-history of Marxist dialectics. Kant's rediscovery also shapes the contemporary reception of Marx's dialectic, since the debate between Kant and Hegel on the limits and scope of dialectical reason has never ended. In appropriating Hegel's dialectic for the critique of political economy, the status of dialectics in Marxism has been ambiguous, oscillating between efforts to circumscribe dialectics to a particular field of knowledge production and affirmations of dialectics as a universal science of being and thinking. What one might call the main tension between Kant and Hegel, or the tension between critique or system, runs throughout the conceptual history of Marxist dialectics.

KANT'S REHABILITATION OF DIALECTICS

In his 1763 work, 'An Essay to Introduce the Concept of Negative Magnitudes into Philosophy', Kant argues that nature exhibits real oppositions that go

beyond the formal ones that only exist in thought. Real oppositions are a ‘law of reality’ that Newtonian physics accepts in the mathematical concept of negative magnitudes. As Kant states, anticipating Hegel’s discussion of magnitude in the *Science of Logic*, ‘negative magnitudes are not negations of magnitudes ... but something truly positive in themselves, only opposed to the other’ (Kant, 1992: 215; Marcuse, 2014: 139). But Kant’s discussion of real opposition was limited to natural science and did not rise to the level of general thought-determinations for reality itself. In other words, the dialectic for Kant could not be a universal science of being, or any kind of ontology.

In his critical period, Kant elaborates what he means by dialectical thinking in the discussion of the ‘transcendental dialectic’ in *The Critique of Pure Reason*. Here, dialectical thinking is at once necessary for human reason, and yet illusory. The illusion of dialectical thinking arises when concepts go beyond the limits of possible experience, and hence thinking arrives at what Kant refers to as the antinomies: that the universe can be understood as infinite or finite, or that human freedom can be thought of as determined or as irreducible to the laws of nature. These positions have equal weight, because they are not bounded by empirical intuitions; for instance, concepts such as totality can only be grasped as something postulated, i.e. as a regulative ideal. It is important to stress that for Kant, this transcendental dialectic is part of our thinking, even if it produces illusions. We cannot give up dialectics or metaphysical speculation, any more than one may give up breathing (Kant, 2002: 156).

As Kant famously sought to limit knowledge to make room for faith, he likewise limited the scope of dialectics, denying its ontological claims. In contrast to Spinoza, Kant abjures the idea of intellectual intuition of the infinite. Instead, for Kant, we can only *think* the infinite without ever hoping to *know* it. Against medieval and Leibnizian metaphysics, traditional concepts like God and freedom were reconstituted as assumptions for practical reason, as regulative ideas to strive for, but not as knowable things of theoretical reason.

FICHTE AND SCHELLING

It is Johann Gottlieb Fichte who resurrected the idea of intellectual intuition against Kant. But in contrast to Spinoza, intellectual intuition is not an intuition of the infinite as a substantial reality, but an intuition of the activity of the Ego. The Fichtean Ego, or ‘I’, attempts in its activity to overcome what is other than itself, i.e. it strives to overcome the ‘non-ego’ as an act of practical reason. Put differently, Fichte posits a never-ending process of the Ego trying to overcome empirical intuition, without any moment of reconciliation. The truth for Fichte must be proved through activity, or through the movement of the concept overcoming (i.e. sublating) what is external to itself. The immediacy of experience is thus negated and overcome in favor of a mediating process. For Fichte, however,

it is not a question of positing the mere givenness of certain conceptual categories, as Kant had done, but of showing how concepts overturn and develop into one another. This development and overturning of concepts is possible through the attempt of the 'I' to be free of external matter, and Fichte classifies philosophers as 'dogmatic realists' (such as Spinoza and the French materialists) or as critical 'idealists' like Kant and himself. Either one understands the ideality of the world as a structure of subjectivity with Kant, or one dogmatically asserts the objectivity of the world by forgetting one's own freedom (Fichte, 1992: 92).

Friedrich Schelling went on to challenge his mentor Fichte, accusing him of privileging subjective concepts over objective intuitions. Put otherwise, this meant Schelling challenged the Fichtean Ego's domination over nature. In their correspondence, Fichte accused Schelling (and, by extension, Schelling's intellectual partner from the Tübingen seminary, Hegel) of returning to a dogmatic realism against a proper idealism. By giving equal weight to a philosophy of nature, Schelling was breaking from Fichte's subjectivism, and hence returning to 'Spinozism'. Fichte initially wished to paper over these differences with Schelling, declaring to the latter: 'I do not want to make you [and Hegel], but solely Spinoza, into my opponent' ((Fichte and Schelling, 2012: 73). But Schelling made it clear that the differences between them were too real to ignore. 'Your view that you have annihilated nature with your system is not unintelligible, though for the greater part of it, on the contrary, you do not get beyond nature' ((Fichte and Schelling, 2012: 64). For Schelling, it made no difference to grasp the absolute from the side of the idea or the side of nature, or what Spinoza previously had discovered as the parallel attributes of mind and extension. Relative to these two, the absolute was a 'point of indifference', with the subjective and the objective sides functioning like negative and positive poles of a magnet. In one of his final letters to his old mentor, Schelling located Fichte's main problem as follows: 'You believe you have fulfilled the whole demand of speculation through the latter [viz. taking the path of the finite ego]; and here is one chief point on which we differ' (Fichte, 1992: 241–85).

HEGEL'S DIALECTIC

According to Hegel, insofar as Schelling accepted the rigid distinction between the understanding (i.e. the faculty comprising those formal categories that grasp finite objects) and reason proper (i.e. the faculty that can grasp the infinite), he remained within the confines of Kant and Fichte's critical philosophies. Schelling had inherited from Fichte the dialectical overcoming of conceptual moments into larger wholes, but he also inherited Fichte's inability to resolve the contradiction between thinking and reality. Further, when it came to the absolute itself, Schelling did not see it as resulting from a dialectical process of thinking, but as something intuited in an undialectical leap from the finite into the infinite. The

standpoint of reason in Schelling annihilates the position of the understanding, as the absolute cannot be understood via proofs or other mediating principles. Instead, reason for Schelling is entirely free of proofs. To know reality, then, is not a question of discursive reason, and art replaces philosophy as the real organon for intuiting the absolute. The dialectical reason of the philosopher is incapable of knowing the absolute, unlike the savant or artistic genius who knows through immediate intuition (Lukács, 1980: 144).

The meaning of negation in Hegel has a different meaning than a simple break from what is finite. Dialectical negativity now means a movement of negation, preservation, and elevation towards a higher determinate whole. What Hegel means by the German phrase *Aufhebung*, or sublation, is not to simply to ‘cancel’ something, but to overcome what is merely contingent about a thing in favor of what is necessary and essential. Put differently, to sublimate something does not just mean to erase, but to deepen. The main programmatic thesis of Hegel’s Jena *Phenomenology*, that the truth is the whole, grasps totality not as something immediate or abstract – as in Schelling’s ‘intellectual intuition’ – but as the result of a process of human cognition and history. This human activity, or the structures of consciousness, history, and culture that humans traverse to know the absolute, is what Hegel calls ‘spirit’, or ‘mind’ (*Geist*). The labor of spirit, or what Hegel refers to in the *Phenomenology* as ‘the tremendous power of the negative’, replaces the aristocratic intuition of the absolute with what the late Schelling will call a ‘plebeian’ form of philosophizing: that knowledge of the absolute is inseparable from the mundane activities of human beings laboring, struggling, and thinking (Hegel, 1977: 19; Schelling, 2007: 145).

This contrast to Schelling helps shed more light on the nature of the Hegelian dialectic in the *Phenomenology*. It also helps to illuminate famous, but equally obscure, passages. For instance, when Hegel argues that it is not enough to comprehend truth as substance but that it must be grasped as subject as well, he is not simply negating Schellingean substance in favor of a Fichtean subject. He is arguing that the absolute in Schelling’s system is undifferentiated and barren, precisely because it is assumed ‘like a shot from a pistol’ instead of something that is proven in a system. Schelling’s romantic Spinozism thus degenerates into a kind of Parmenideanism, where the absolute is ‘the metaphysical night’ where all difference is obliterated and ‘all cows are black’ (Hegel, 1977: 7). If the absolute lacks a systematic structure, if we do not appreciate this motor of negation and development as inherent to the whole itself, then the whole can only be dogmatically assumed, but not grasped scientifically. The absolute is a syllogism, and the ‘autobiography of God’ that Hegel can be seen to write is an extended proof of his existence (Hegel, 2008: 192).

Philosophy as described in Plato’s *Symposium* is a love of wisdom but is not itself *knowledge* of wisdom. If this is what philosophy means in its strict sense, then Hegel cannot be strictly speaking a philosopher. In Hegel’s system, the absolute is cognized as the essential moment in a system of knowledge. Wisdom is not

only possible, but something already achieved. We thus transition from philosophy to science (in the expansive sense connoted by the German *Wissenschaft*), i.e. from the love of wisdom to actual wisdom (Hegel, 1977: 3). In *Reason and Revolution*, Marcuse makes the point that ‘The Preface to the *Phenomenology* is one of the greatest philosophical undertakings of all times, constituting no less an attempt than to reinstate philosophy [not merely as the love of wisdom, but] as the highest form of human knowledge, as “the Science”’ (Marcuse, 2000: 97).

Within the context of Hegel’s metaphysical logic, he defines the dialectic as ‘the immanent self-activity of the object of thought going beyond itself, but this activity remains within the scope of the original determination itself’ (Hegel, 2008: 73). The dialectic of the *Science of Logic* shows how the absolute Idea differentiates and realizes itself as a concrete reality, through what Hegel calls ‘the tremendous power of the negative’ (Hegel, 1977: 19). These negations of the Idea from more abstract expressions to more concrete ones follow the Idea through three distinct phases. The first phase grasps the Idea in its pure immediacy in the doctrine of Being; the second phase grasps the Idea as a negative unity of opposites in the doctrine of Essence; and finally, the third phase grasps the Idea as a positive unity of itself with what is other in the doctrine of the Concept. Throughout these conceptual transitions, the movement the dialectic traces are the movements of the same Idea. For Hegel, progress in knowledge is a return to what was always already at the beginning, and so real progress is achieved when we recognize the circular nature of the infinite (Hegel, 1991: 39).

At the end of the *Science of Logic*, the Idea recognizes itself as complete, or as able to integrate within itself all the essential moments and categories of thinking. The Idea does not undergo any more mediation or negation at the very end of its development, but instead ‘releases’ (or ‘freely discharges’) itself into Nature, i.e. the totality of finite matter in motion (Hegel, 2010: 753). Or, as the *Lectures on Logic* puts it, ‘[t]he difference between God and the world exists only for the consciousness which makes such a distinction’ (Hegel, 2008: 227). Since there is no absolute or real difference between the Idea and the world in Hegel, we can also say that the Idea at the end of the *Logic* reveals itself to be Nature. This is what Lenin called the tendency of absolute idealism to transform itself into dialectical materialism, since, as he puts it, the Idea ‘stretches its hand’ towards nature (Anderson, 1995: 244).

THE YOUNG HEGELIANS

It is a misnomer to call Bruno Bauer or Ludwig Feuerbach Hegelians in the strict sense of the word. They were stamped with the birthmarks of the Hegelian system, but their break from Hegel incorporated older Kantian and Fichtean themes into their respective theoretical positions. Bauer characterized Hegel as a philosopher who tried to synthesize the opposite poles of Fichtean self-consciousness and

Spinozian substance, ultimately building a house that was divided against itself (Moggach, 2003: 108). Bauer called for a more activist conception of dialectics that went beyond the perceived stolid edifice of the Hegelian system; he inaugurated an entire trend of left-criticism of Hegel that tried to – in Georg Lukács’ turn of phrase – ‘out-Hegel Hegel’ (Lukács, 1971: xxiii). However, in this attempt to go beyond Hegel, Bauer merely returned to Fichte, and specifically back to Fichte’s criticisms of the Spinozistic (i.e. materialist) elements in Schelling and Hegel. This opposition of self-consciousness as opposed to substance is also reproduced in Bauer’s distinction between the progressiveness of Hegel’s method as opposed to the perceived static nature of the system. This opposition between method and system that we find in Marx and Engels originates in Bauer’s own theory of critique, along with their shared rejection of the absolute Idea as the lynchpin of Hegel’s conservative system.

Another important source of young Hegelian criticism is not so obvious at first, but scholars like Manfred Frank have made this connection clearer. The late Schelling’s critique of Hegel, even if couched in a new philosophy of mythology and revelation, had a profound if indirect influence on the young Hegelians, including Feuerbach (Frank, 1989). As liberals, republicans, and radical democrats, the young Hegelians denounced the conservative Schelling as a lackey of throne and altar. But Schelling’s criticisms of Hegel’s alleged weaknesses did not go unnoticed, and in construing Hegel’s philosophy as essentially ‘negative’, i.e. formal and abstract, Schelling emphasized ‘positive’ existence over the concept. Schelling’s claim that Hegel’s identity of subject and object was a conceptual farago helped influence the evolution of Feuerbach to completely abandon the absolute in favor of the finite and philosophical anthropology (Breckman, 2001: 102).

THE YOUNG MARX AND THE DIALECTIC

In collaborating against the Bauer brothers in *The Holy Family* (1845), Marx and Engels took up Feuerbach’s humanist criticism of metaphysics and Hegelianism. Specifically, they accepted that the metaphysics of Descartes, Spinoza, and Leibniz had already been ‘overthrown’ in the criticisms of Pierre Bayle, and they subjected the dialectic of Bauer’s ‘critical criticism’ to hilarious parody. It is hard to demarcate where their criticism of Bauer begins and where the criticism of Hegel ends, but Marx and Engels make clear that the empiricism of Feuerbach’s anthropology and the philosophical legacy of French materialism provide the main philosophical orientation of the communist proletariat. John Locke’s empiricism, as refined by Helvetius, in turn contributes the logical basis for Babeuf’s conspiracy, from which modern socialism is born (Marx and Engels, 1975a: 131).

Marx and Engels also elaborated upon Feuerbach’s critique of dialectics’ ‘magical’ transformation and inversion of abstract concepts into things. In contrast to the position of materialism, Hegel was an idealist, and the Bauer brothers

vulgar idealists, since all of them reified abstractions (such as the absolute Idea or self-consciousness) into concrete entities. Substituting the idea for the real leads to the liquidation of experience, putting the conceptual cart before the material horse (Marx and Engels, 1975b: 58). In the *German Ideology* (1845), Marx and Engels go further in accusing Feuerbach of liquidating real history in favor of the conceptual abstractions of humanism (Marx and Engels, 1998); Marx will repeat many of the same charges about the formalism of Hegel's 'absolute method' in his polemic against Proudhon, *The Poverty of Philosophy* (1847). While Marx pillories Proudhon for misunderstanding certain nuances of Hegel, he also repeats what Marx calls Hegel's 'sacramental formula' of 'thesis, antithesis, synthesis', or 'affirmation, negation, negation of negation' (Marx and Engels, 1975c: 163).

The *German Ideology* announced that the absolute Idea was not only dead, but rotting, obscuring the real misery and backwardness of German class society. In contrast to the formal abstractions of the German Idealists, which leave the status quo intact, material analysis and social critique had to be resolutely empirical and historical, constituting what Marx and Engels called the materialistic conception of history. There was only one science and that was the science of history. But in radicalizing Feuerbach's critique of Hegel and historicizing it, at this early stage Marx and Engels lost the Hegelian process of abstraction and the emphasis on logical forms needed to grasp history. This tarrying with concepts, or what Marx will call the determinate abstractions of economic categories in *Capital*, is missing, and instead we are offered in the *German Ideology* a historical empiricism with faint Hegelian overtones (Morris, 2016). Further, this historical empiricism assumes not only the Kantian dualism between intuitions and concepts, but also the Fichtean dualism between human activity and nature. We see this Fichtean dualism emerge explicitly in Marx's first thesis on Feuerbach, when Marx contrasts active praxis with the sensuous object (Rose, 1981: 215).

Nonetheless, the early Marx did go further in his appreciation of Hegelian dialectics than Feuerbach, and we find elements of this appreciation in the 1844 Paris Manuscripts. Marx argues in Hegelian terms that communism represents 'the negation of the negation' of social contradictions. It is the solution to the riddle of history (Marx, 1959: 43). The contradictions of essence and appearance, freedom and necessity, will have found resolution under communism, and man as a universal being of nature – a 'species-being' that reproduces the whole of nature through its activity – will flourish. Further, however much Marx criticizes the *Phenomenology of Spirit* as a mystical story of alienated self-consciousness (which reminds one more of Bauer than of Hegel), Marx understands the esoteric side of the *Phenomenology* as a story about alienated human labor in history (Marx, 1959: 67). Hegel's idea of absolute negativity and the negation of the negation, categories that Feuerbach outright rejected as idealist, Marx assimilates as the essential logic of history, of human beings negating their immediate experience through appropriating and humanizing their environment. This

negativity, or the externalization and objectification of human powers in science, art, technology, and industry, is itself alienated under capitalism, and requires the second negation enacted by communism (Marx, 1959: 43).

MARX RETURNS TO THE SCIENCE OF LOGIC

If the young Marx appropriated certain categories and styles of thinking from the *Phenomenology of Spirit*, the later Marx appropriated from Hegel a second time in 1857–8. In the *Grundrisse*, Marx is arguably much more Hegelian at the level of methodology than he ever was (Dunayevskaya, 2003: 61). But this time, it was mostly from Hegel's *Science of Logic* that Marx gained inspiration. He wrote to Engels in January of 1858 how their friend Freiligrath 'found and made a present of several volumes of Hegel, originally the property of Bakunin'. Marx explains the tremendous effect re-reading Hegel had on him: 'I have thrown over the whole doctrine of profit as it existed up to now. In the method of treatment the fact that by mere accident I have again glanced through Hegel's *Logic* has been of great service to me' (Marx and Engels, 1942: 102).

In his correspondence with Lassalle, Marx had admitted that the Hegelian dialectic was the 'last word' in philosophy: 'This [Hegelian] dialectic is, to be sure, the ultimate word in philosophy and hence there is all the more need to divest it of the mystical aura given it by Hegel' (Marx and Engels, 1983: 316). Marx confided to Engels his rather low opinion of Lassalle's own felicity with Hegelian dialectics. Writing about Lassalle's *Heraclitus* study, Marx told Engels that Lassalle 'will learn to his cost that to bring a science by criticism to the point where it can be dialectically presented is an altogether different thing from applying an abstract ready-made system of logic to mere inklings of such a system' (Marx and Engels, 1942: 123). Here, Marx argues that one cannot apply the dialectic as a formal method of categories to a ready-made object. Rather, it is imperative to show how the object of science itself develops dialectically. In another letter, Marx returns to Lassalle's formalistic handling of the dialectic: 'The ideologising [of Lassalle] pervades everything and the dialectical method is falsely applied. Hegel never called dialectics the subsumption of a mass of "cases" under a general principle' (Marx and Engels, 1942: 129).

In these statements, we see how far Marx had come from the Feuerbachian criticism that the Hegelian dialectic is a pan-logical system of abstract reifications. The conceptual categories used to understand an object are not separate from that object's own development, and hence we return to Hegel's point that the conceptual method is one with its content. Marx's re-acquaintance with the *Science of Logic* also goaded him to criticize Feuerbach, but from a Hegelian position, as we see in another letter to Engels: 'The gentlemen in Germany (all except the theological reactionaries) think Hegel's dialectic is a "dead horse." Feuerbach has much to answer for in this respect' (Marx and Engels, 1942: 233).

Marx goes beyond the Kantian dualism of concept and intuition, or thinking and matter, when he invokes Hegelian dialectics as the organon for understanding matter. In a letter to Kugelmann from 1870, he writes about Friedrich Albert Lange's empiricist reaction to his economic writings: 'Lange is naïve enough to say that I "move with rare freedom" in empirical matter. He has not the slightest idea that this "free movement in matter" is nothing but a paraphrase for the method of dealing with matter – that is, the dialectical method' (Marx and Engels, 1942: 201).

For Marx, the Hegelian dialectic is the essential method for understanding the laws of thinking and material motion. Further, the method was not only limited to the critique of political economy, as we shall see below. In letters to Joseph Dietzgen, Engels, and others, Marx on a few occasions expressed his wish to write an independent treatise on dialectics. He told Dietzgen that 'once my work on economics is finished, I shall write a Dialectics. The laws of Dialectics have been formulated by Hegel, though in mystical form. What we have to do has to strip it of that form' (Dietzgen, 1917: 180). Thus, it was Marx's intention to materialistically reconstruct Hegel's dialectic (something he will mention again in the afterword to the second German edition of *Capital*), and it should be noted that this was no idle wish. Marx projected '2–3 sheets' (around 80 pages) on the 'rational aspect' of Hegel's dialectic, and we see the elements of such a long essay in a notebook of Marx's from 1860–1, which 'includes the beginnings of a summary of Hegel's Logic; the summary [specifically] includes Hegel's doctrine of "Being", and it breaks off after a few lines on the doctrine on "Essence"' (O'Malley, 1977: 30).

DIALECTICAL METHOD AND SYSTEM IN MARX AND ENGELS

In his writings, Engels distinguished scientific socialism and dialectics from 'metaphysics'. If Hegel's absolute Idea was outmoded, then the dialectical method remained essential to understanding natural and social phenomena. But however insightful and brilliant Engels' explanations of dialectics against Eugen Dühring were, there remained a fundamental flaw in Engels' presentation. Since he repeated the young Hegelians' separation of method and system, Engels also repeated their dualisms (Engels, 1954: 39). The forms of thought essential to dialectics are not deduced from a concept of reality (as they are in Hegel's movement of categories from being to the absolute Idea) but are posited and assumed as products of empirical investigation and natural science. The problem is that the necessity of these dialectical laws cannot be demonstrated through sense-perception; it cannot be seen with the naked eye. They are verifiable as essential concepts of reality and thought but cannot be treated like inductive generalizations to be falsified by further experimentation. Thus, the necessity of Engels' three dialectical laws – the law of the unity and conflict of opposites, the law of the passage of quantitative changes into qualitative changes, and the law of the

negation of the negation – are more postulated than actually proven (Engels, 1954: 165–79).

Marx was also inspired by Eugen Dühring's attacks to write a new afterword for the second German edition of *Capital*. There, he explicates what he means by dialectical method, quoting favorably from a review of *Capital* written by I. I. Kaufmann. As Kaufmann put it:

The one thing which is important for Marx is to find the law of the phenomena ... Of still greater importance to him is the law ... of their development, i.e., of their transition from one form into another ... Marx treats the social movement as a process of natural history governed by laws. (Marx, 1982: 102)

Marx found this formulation absolutely congenial to his scientific approach: 'Here the reviewer pictures what he takes to be my own actual method, in a striking and, as far as concerns my own application of it, generous way. But what else is he depicting but the dialectical method?' (Marx, 1982: 102). The movement from the abstract to the concrete, the conceptual determinations and transitions of the commodity-form, as an 'economic germ cell' that Marx traces to grasp value in its 'pure form', echoes, as Engels knew, the movement of categories we see in Hegel's *Science of Logic*, particularly in the transition from Being to Essence (Marx and Engels, 1942: 495).

According to Marx, one needs the force of abstraction to break through appearances, and such a critical moment of negation is necessary to break up the blur that reality initially presents itself as to us (Marx, 1982: 90). We do this by elucidating the conceptual form of the object, and thereby unlock its essence. In terms of the critique of political economy, the logic of the value-form must be resolved and comprehended before we can understand the empirical history of capitalism. Indeed, Marx does not start with the pure contingent fact of capitalism divorced from its conceptual logic; he does not start with the pure fact, but sees, like Hegel, how the empirical is a universal (or, as Lenin expresses it in his notebooks on Hegel, 'the sensuous is a universal' (Lenin, 1976: 277)). According to Engels, value for Marx is not a conceptual fiction, or a Kantian postulate, but an essential determination of capitalism as a historical system (Marx and Engels, 1942: 527). It is part of its definition.

In various passages in *Capital*, Marx affirms what Engels will later codify in *Anti-Dühring* as the three 'dialectical laws'. From describing the proletariat's 'expropriation of the expropriators [the bourgeoisie]' as a negation of the negation (Marx, 1982: 929), to accepting in another passage the dialectics of quantitative changes turning into qualitative ones (Marx, 1982: 423), Marx repeats what he told his correspondents: that dialectics is a science for understanding the laws of nature and society. In *Capital*, Marx states that the essence of the Hegelian dialectic is its understanding of 'contradiction' (Marx, 1982: 744), and this dialectic is just as applicable to the seeming paradoxes of elliptical motion as to the economic law of the motion of capital (Marx, 1982: 198). Further, in the

third volume of *Capital*, Marx repeats the old categories of German Idealism to comprehend the transition from a realm of necessity to a realm of freedom under communism. As categories, freedom and necessity are not treated formally, but as the real conceptual determinations of human beings in society and in nature (Marx, 1991: 958–9). They have ontological, and not merely formal, import.

What Marx, alongside Engels, retains is a Feuerbachian interpretation of Hegel's Idea as a kind of Platonic demiurge. This understanding of Hegel's absolute as a formal and negative abstraction stems ultimately from Feuerbach's empiricist style of critique, with all its late Schellingian overtones. Such a contrast with Hegel's idealism enables Marx to cast his method as materialist, while Hegel's idealism can only mystify and distort the 'critical and revolutionary' nature of his own dialectics. For Marx, who declares himself a pupil of Hegel, we should not treat Hegel like a 'dead dog' *à la* Dühring but acknowledge that idealism has turned Hegel upside down. The point is not to reject or to refute Hegel as much as to put him back on his head, so that the absolute Idea is rejected in favor of an idea that reflects 'material reality', or the objective material world (Marx, 1982: 103).

This inversion of Hegel that Marx shares with Engels contains its own Hegelian quality. What is Hegelian is the movement from the absolute Idea to material reality, which parallels the 'inversion' at the end of Hegel's *Science of Logic*, when the Idea reveals itself to be nature. Since Marx does not accept Feuerbach's rejection of Hegel's categories, or his extra-logical rejection of them in favor of something irreducibly finite and empirical, he assumes that matter and society must come with conceptual determinations that only dialectical logic can grasp. Marx and Engels do have a dialectical and Hegelian understanding of the material world, but they lack a dialectical argument for the necessity of the material world itself. Their dialectic ironically suffers from its own dialectical deficit.

Engels seems to remedy such a deficit in the *Dialectics of Nature*. He rehabilitates more elements from Hegel's philosophy of nature, and even argues for human cognition of the infinite (Engels, 1946: 326). He also emphasizes the primacy of theoretical philosophy in understanding the empirical world, and how the current fads of seances and psychics do not suffer from a lack of empiricism but from a lack of conceptual and theoretical coherence about the nature of reality (Engels, 1946: 309). However, as much as Engels makes progress, he falls back on positivistic arguments, and argues that we know things wholly through experimental 'practice' (Engels, 1946: 171). This is true in the sense that experimental practice is a necessary moment in our knowledge of the finite world, but it is not sufficient for knowing the conceptual form of an object, much less the essential characteristic of reality as a unified material thing. Engels still lacks a conceptual argument for the necessity of materialism.

It is ironic that such an argument for materialism can be found in what Lenin paradoxically called the most 'materialist and idealist' section of Hegel's *Science of Logic*: the section on the Absolute. In the externalization of the Idea as nature, we have the conceptual movement of the infinite Idea revealing itself as Nature.

Lenin noticed what Hegel's old romantic critics Schelling and Franz von Baader said before, that Hegel's dialectics of the Absolute is a 'sophisticated Spinozism' and a materialism (Fluss, 2016). Lenin understood how the most idealistic section in Hegel was also the most materialistic, that this was a 'contradictory' fact (Lenin, 1976: 233).

DIALECTICS AFTER ENGELS

After the death of Engels and before the First World War, dialectics suffered neglect or rejection among the dominant center and right-wing political elements in European socialism. Karl Kautsky, the acknowledged theoretician of German social democracy, took up an agnostic attitude regarding Marxism's philosophical foundations, remaining largely indifferent to philosophical questions. Eduard Bernstein on the other hand openly repudiated Hegel in favor of neo-Kantianism, or, as he made clear, not so much a return to Kant, but to the anti-materialism of Friedrich Lange (Bernstein, 2004: 210). Bernstein rejected materialism and dialectics for a descriptive sociology, dualistically separating what we can describe from formal ethical ideals. Georgi Plekhanov and Rosa Luxemburg militantly fought against Bernstein's revisionism, with Plekhanov taking up the task of defending 'dialectical materialism' against neo-Kantian trends in social democracy (Marcuse, 2000: 400).

Lenin returned to Hegel in 1914 after the guns of August fired, specifically to Hegel's *Science of Logic*. Building on the work of C. L. R. James and Raya Dunayevskaya, Kevin Anderson has demonstrated how Lenin's return to Hegel's *Logic* philosophically equipped him to avoid the limits of the mechanical positivism of the Second International, while stimulating Lenin to advance new conceptions of revolution, the state, and anti-colonial struggle (Anderson, 1995). Lenin was not the only Bolshevik leader who felt the need to seriously engage Hegel; Leon Trotsky's notebooks from exile and Nikolai Bukharin's prison notebooks (Pomper, 1998; Bukharin, 2005) are noteworthy efforts at examining the relationship between Marxism and Hegelian dialectics.

Russell Jacoby makes a distinction between Soviet dialectics and the dialectics of the first generation of Western Marxists. While Soviet philosophers such as Abram Deborin emphasized Hegel's *Logic* with its objective categories of being, the young Lukács and members of the Frankfurt School focused on the subjective dialectic of consciousness (Jacoby, 2002). This debate between a dialectic of being and a dialectic of consciousness reached its first expression in the controversy surrounding Lukács' *History and Class Consciousness*, with Deborin accusing Lukács of not only evacuating Marxism of the dialectics of nature, but of putting Marxism on 'neo-Hegelian' and idealist foundations. Lukács responded to Deborin's criticisms in 'Tailism and the Dialectic,' where he affirmed the dialectics of nature (Rees, 2002).

Theodor Adorno and Max Horkheimer's critical theory made more explicit what was implicit in *History and Class Consciousness*, separating a dialectic of society from what was considered mechanical and shallow about Engels' laws of dialectics. But unlike Lucio Colletti and Louis Althusser, who shared in some respects the early Frankfurt School's rejection of Engels' Marxism, the Frankfurt School did not entirely reject Hegel. Instead, it sought to limit the claims of Hegel's absolute reason for the sake of a critical theory capable of overcoming a reified present. Hence Adorno's dictum 'the whole is false', which clearly contrasts with Hegelian monism (Adorno, 1973: 50). This critique of the absolute was something shared by Adorno, Horkheimer, Marcuse, and the second generation of Frankfurt School criticism represented by Jurgen Habermas (Adorno, 1973; Jay, 1984).

While the early Frankfurt School repeated many of Marx and Engels' criticisms of the Hegelian dialectic, they went further in the direction of separating method not just from system, but also from ontology. Adorno affirmed this in his lectures on dialectics: that we must remain skeptical of metaphysical ontology if we are to maintain a critical dialectics (Adorno, 2017: 108). Horkheimer went furthest in rejecting Hegelian dialectics itself in his *Dawn and Decline* aphorisms from the 1960s, as a metaphysical atavism pervading idealistic systems (Horkheimer, 1978: 124). Unlike the Frankfurt School or the later Marxism of Jean-Paul Sartre, Lucio Colletti and Louis Althusser sought to overcome a dialectic of consciousness with Hegelian overtones. If Althusser was trying to overcome the legacy of French Hegelianism in phenomenology and existentialism, then Colletti continued Galvano Della Volpe's overcoming of Italian Hegelianism in the guise of historicism. But what Colletti appreciated about Marx's critique of Hegel was not the same as what Althusser had emphasized (Anderson, 1976: 70). Indeed, the difference can be located in the distance between Colletti's Kantianism and Althusser's theoretical anti-humanism, as even Althusser was willing to accept the category of contradiction that so irked Colletti and the Della Volpean school (Althusser, 1976: 141). Althusser was not so vehement as to outrightly dismiss the dialectics of nature but rejected Hegel's metaphysics of the subject in favor of viewing history as a process without a subject. As for Colletti, he attacked the Hegelian absolute and its alleged obliteration of finite positive knowledge (Colletti, 1979). In later writings, Althusser rejected Engels' idea of dialectical laws for provisional 'dialectical theses' (Althusser, 2017: 188), while the later Colletti abandoned Marxism as hopelessly Hegelian (Jay, 1984: 461).

The status of dialectics in contemporary Marxism can be roughly schematized according to Fredric Jameson's 'three names of the dialectic' (Jameson, 2009: 3–70). Those who subscribe to 'the Dialectic' with a capital D tend to remain stuck for Jameson in Hegel's metaphysics, and those who use 'dialectics' to denote a set of specific logical operations may find themselves locked into a similar rigidity. But treating dialectics as naming an effect – declaring something to be 'dialectical' – keeps dialectics open in terms of describing new phenomena

that cannot be locked into a system or philosophical monism. Jameson does not say we can totally do without the first two names, but he humbles them, reactivating post-structuralist criticism of Hegel for a pluralistic kind of dialectics. This kind of dialectics, what Jameson calls (following Saussure) ‘difference without positive terms’, and without the absolute, dominates much of the current theoretical conjuncture (Jameson, 2009: 17).

Contra Jameson, Slavoj Žižek and Alain Badiou want to return to some notion of absolute truth, but with echoes of Heidegger as a dialectics of the ‘event’. For Žižek, Hegel’s absolute is an empty placeholder that reveals reality itself to be a gap that allows for the totally new to appear. Rather than the absolute being a metaphysical substrate of the universe, it is reconceptualized as a void, or a crack within Being (Žižek, 2004: 45). Like Žižek, Badiou wants to think the new as an event, i.e. as something that ruptures from Being. Unlike Žižek, Badiou is not committed to Hegel; Hegel, like Spinoza for Badiou, is a philosopher of the monistic ‘one’ that cannot think chance and the production of new truths. Whether Badiou is offering an anti-dialectics or a new dialectics has been a subject of controversy between Peter Hallward and Bruno Bosteels (Hallward, 2003: 50; Bosteels, 2011: 8).

The question of dialectics and colonialism is directly addressed in the work of George Ciccariello-Maher, who builds on the work of Frantz Fanon. From the perspective of decolonial theory, Ciccariello-Maher criticizes the Eurocentrism of Hegel and Marx as linked to their understanding of universal dialectics. The universalizing tendency of dialectics tends to efface the concrete struggles of the colonized in favor of abstract notions of progress, which often mask the interests of European chauvinism (Ciccariello-Maher, 2017). Timothy Brennan has a different reading of the Hegelian dialectic as implicitly anti-colonial and defends the slogans of modernization invoked in anti-imperialist revolts of the twentieth century. The dialectics of anti-colonialism thus are not to be confused with the perspective of a decolonial theory fundamentally suspicious of modernity (Brennan, 2014). Domenico Losurdo likewise traces the anti-colonial dimension of universalist dialectics in his studies in Hegel and class struggle (Losurdo, 2016).

We will end our discussion of contemporary Marxist dialectics with the debate between those who endorse what Tony Smith and Chris Arthur call a ‘new dialectics’ of formal systematization over and against those Marxists who want to return to Hegel’s absolute. Its terms were clearly expressed in Kevin Anderson’s debate with Chris Arthur. First, Arthur agrees with Anderson that Marx took over Hegel’s logical schema for his mature critique of capital but disagrees that Marx also adopted Hegel’s other philosophical commitments by doing so (Arthur, 2006). Anderson’s critique of Arthur stems from the tradition of Raya Dunayevskaya’s Marxist-Humanism, which was unique in urging Marxists to return to what Dunayevskaya called ‘Hegel’s Absolutes’. Dunayevskaya distinguished herself from C. L. R. James (Anderson, 1995: 205) and Herbert Marcuse (2000: 86) in rehabilitating not only the importance of Hegelian dialectics in

Marx, but the absolute Idea as well. Dunayevskaya anticipated Gillian Rose's own return to Hegel's absolute in her study *Hegel Contra Sociology* (Rose, 1981). The efforts of these two thinkers have yet to be systematically compared.

However, the Marxist-Humanist tradition seems hostile to Engels' dialectics of nature or the dialectics of an ontological system, opting for a more historicized and pluralistic dialectic. As Dunayevskaya put it, they are not returning to Hegel's absolute as much as his 'absolutes'. Even Rose's conception of the absolute in Hegel has an Adornian inflection, since the absolute is thought of as part of a phenomenological process that reveals the non-identical (Latz, 2018: 112). The absolute for these thinkers is not the always already present logic of the objective universe, but a concrete result of human activity. Such a historicist and phenomenological approach renders the structure of being something indeterminate, where reality itself is renewed through social forces. This approach to dialectics again separates a societal dialectic from an ontological one, repeating the theoretical problematic of the young Lukács.

The separation of a historical dialectic from a dialectic of nature repeats at a deeper level not only the theoretical problematic of the first generation of Western Marxists, but the separation of method from system we witnessed under the Young Hegelians. These separations are what govern the adventures of the dialectic in the twentieth century, but they are adventures that retrace and repeat the same conceptual maneuvers (and arguably mistakes) inherited from the nineteenth century. In overcoming this separation between method and system, the Kantian wedge that rests on Kant's own separation between concepts and intuitions, we can start a new adventure for a dialectic unafraid to make ontological claims on the world. This would be a non-formal and rational dialectic, closer to Hegel's original project, without any self-imposed limits from positivism or neo-Kantianism. As Hegel showed, a dialectic without ontology will lead to skepticism, while an ontology without dialectics leads to dogmatism. We must steer clear of these dangers, if the adventure of the dialectic is to continue.

Time

Massimiliano Tomba

THE VALUE OF TIME

The capitalist mode of production not only develops in space and time but changes space and time. If Kant elevated these two categories to pure, metahistorical and universal forms, Marx showed their historically determined nature. By doing so, Marx took time and space out of the paradise of the pure forms in which Kant had confined them and brought them into the hell of capitalist production processes. Time and space do not cease to function as categories that organize knowledge and human practice, rather they become categories of capital and, as such, organize human life and social relationships well beyond the intent and will of individual people. Kant had placed the transcendental subject at the center of the universe and called this shift in perspective the ‘Copernican Revolution’. Marx made a second Copernican revolution by decentralizing the self-important modern subject and showing it as a function of supra-personal processes: ‘by an exchange, we equate as values our different products, by that very act, we also equate, as human labour, the different kinds of labour expended upon them. We are not aware of this, nevertheless we do it’ (Marx, 1996: 85–6).

Before looking at the implications of the Marxian concept of value on the concept of time, it is useful to pursue the shift in perspective of *Capital*. In the preface to the first German edition (1867), Marx wrote that ‘individuals are dealt with only in so far as they are the personifications of economic categories’ (Marx, 1996: 10). This means that the capitalist is not considered a moral

subject to whom the cruelty of exploitation can be attributed. Rather, exploitation is intrinsic to the capitalist mode of production, in which the individual subject is a personified economic category. For the analysis of the time we will do here, this means that the pace of work is not simply dictated by the individual capitalist's greed for profit, but by the economic laws governing capitalism and competition between capitals.

In *The Poverty of Philosophy* (1976 [1847]), Marx showed, for the first time, how time had become a central category of the capitalist mode of production: 'Time is everything, man is nothing; he is, at the most, time's carcass. Quality no longer matters. Quantity alone decides everything; hour for hour, day for day; but this equalizing of labor ... is purely and simply a fact of modern industry' (Marx, 1976 [1847]: 127). This reduction of quality for quantity would be analyzed in *Capital* in terms of abstract labor and time. Specifically, Marx investigates the concrete time of human life reduced to the abstract time of work from a dual perspective: from the points of view of circulation and production. The point of contact between these two spheres is work, or rather the workers that have become the 'carcass' of their force of labor, which is measured in terms of abstract labor. In Marx's analysis, there are different implications for the notion of time in play depending on whether the circulation of goods or their production is favored.

If, with Marx, the starting point for developing a criticism of the capitalist mode of production is the commodity and its dual nature – value and use value – this same *incipit* must also be the starting point for an analysis of capitalist temporality. Schematically, we can say that use value expresses the quality of concrete labor supplied in view of the production of objects suitable for human needs. Instead, value corresponds to abstract labor, labor without a specific quality, if nothing other than to be supplied in view of valorizing value. In other words, these are commodities that are produced in order to be sold so as to make a profit that will allow the production process to begin again in an extended fashion. This is the cyclical-expansive temporality of capital: M-C-M'. You invest money (M) to produce commodities (C) which, given their increased value of a surplus value, provide a greater amount of money (M') to resume the cycle. One can already see that production and circulation are not separate spheres, but involve each other.

What characterizes the capitalist mode of production and constitutes its uniqueness from a historical point of view is neither the value nor the use value as such, but their relationship, which modifies their essence. Indeed, in the capitalist mode of production, unlike other modes of production, production and exchange do *not* occur in view of satisfying human needs and their qualitative differences. What is exchanged are definite quantities of congealed labor time. With the capitalist mode of production, an enormous *inversion* takes place: the exchange value of the commodity becomes the true engine and the aim of production, while the use value, the specific quality of the commodities, becomes the mere bearer of value. Starting from this inversion, and therefore this relative indifference of

use value with respect to value, objectified time in commodities also undergoes a transformation: it is not considered as the specifically qualitative time of the manufacturer's skill, but as abstract time. Hence the emergence of clock-time in the hegemonic position in the hierarchy of various temporalities (Martineau, 2015). What needs to be determined is what measures the clock-time when it becomes a universal category of the capitalist mode of production.

Indeed, from the Marxian point of view, the question is not that time is also beat and measured in non-capitalist social forms, or that the hourglass was invented well before the birth of the capitalist mode of production. The question is how the concept of time changes and what it measures when it is reconfigured in a social form dominated by the capitalist mode of production. What Marx has to demonstrate, and what lies at the heart of his notion of value, is that if a producer takes five hours to produce a given commodity while another producer only takes two hours to produce the same commodity, that commodity contains the same amount of abstract labor time and is exchanged at the same value, which does not correspond to the individually delivered and objectified labor time put into the commodity but to the socially necessary labor time. This is a crucial step in dealing with the question of time in Marx. Time, measured in relation to socially necessary labor time, can be expanded or compressed. A workday whose productivity is more substantial than that of a socially necessary workday, takes substantially more time and therefore can be greater than the 24 hours marking a calendar day.

The confusion in the distinction between value and exchange value, abstract labor and socially necessary labor, together with the lack of distinction between capital in general and competition between many capitals, has led to all kinds of misunderstandings. Marx only managed to clarify those differences for himself in the 1860s. It is no coincidence that the *Grundrisse* still lacks a chapter devoted to the analysis of value and that Marx repeatedly re-elaborated the chapter on it in *Capital*, even after the first edition was printed. The *Grundrisse*, while containing extremely original theoretical and political ideas, operates at a very abstract level, favoring the point of view of capital in general, and not yet addressing the issue of competition among capitals, which was key in the 1860s.

Depending on whether one looks at capital in general or at production in a context of competition among capitals, different theoretical and political perspectives emerge. Schematically it is possible to trace these differences back to two different conceptions of temporality. On the one hand, the inversion between use value and value, and thus between concrete labor and abstract labor, places the temporality of the latter as dominant. Qualitative differences are canceled in the abstraction of exchange between equivalents. Quality is subsumed in quantity. The abstract nature of labor is derived from the exchange of equivalents. And since capital, starting from the commodification of human labor, tends to commodify every kind of relationship, in this perspective it becomes possible to understand abstract time as a totalizing concept, which not only tends to subsume

any other concrete temporality but also becomes the temporalizing principle of time as clock-time. This is an analysis that can be entirely carried out from the point of view of circulation – as the Frankfurt school has done.

On the other hand, if we look at the spheres of production and socially necessary labor time, various types of temporal conflicts arise: conflicts and friction between the different temporalities of the forms of exploitation in the world market. And conflicts between the normative temporality of capitalist production and the resistance of bodies and forms of life of laborers in the spheres of production and reproduction.

Before analyzing these two perspectives at work, I need to clarify the difference between time and temporality. The former is the normative time of the socially necessary labor which imposes a specific pace and rhythm on diverse pre-existing social and economic configurations. The result is a conflict of temporalities expressing different forms of life. I use the term temporality to denote the collective experience of time through traditional, social, political and economic practices. A historical example can help to clarify this distinction. With the affirmation of the capitalist modernity, the old time of the Church, organized around prayer and work on the field, was replaced by abstract time measured by clocks and merchants (Le Goff, 1980: 29ff.). Workers' lives got marked by the 'despotic bell', at the command of which they had to wake up, eat, drink, work and sleep (Engels, 1975 [1844]: 467–8). This was the new capitalist temporality, whose affirmation, however, has been challenged and syncopated by the counter-temporalities of workers' uprisings that aimed to silence the *Werkglocke* (Le Goff, 1980: 29). What is at stake is not the choice between the dominant temporality of socially necessary labor or the nation-state and local temporalities anchored in traditional relationships. Rather, it is about considering the tension between those different temporalities as a field of possibility open to different political outcomes. Late Marx, as we will see, worked on these alternatives.

LABOR PRODUCTIVITY AND TIME COMPRESSION

In several famous pages of the *Grundrisse*, which were widely reviewed in analyses during the twentieth century, Marx sought to predict the implications of an increase in labor productivity through the use of machines: 'the creation of real wealth becomes less dependent upon labour time and the quantity of labour employed than upon the power of the agents set in motion *during* labour time' (Marx, 1987: 90–1). As is well known, according to the law of value, it is human labor objectified in a commodity that represents its value. For this reason, considering an increase in labor productivity through machines and the replacement of living labor with machines, the value objectified in the products should decrease. It results that 'capital works to dissolve itself' (Marx, 1987: 86). Marx dismisses the contradiction between value and real wealth in a teleological

philosophy of history. This reading is fascinating because of the tendential nature of Marx's analysis, especially in view of an apparent marginalization of industrial labor in more developed countries. Whoever harks back to these pages of the *Grundrisse* finds themselves sharing, consciously or not, a Eurocentric vision that sees in technological development the tendency on which to consider progress and backwardness of production modes.

In *Time, Labor and Social Domination*, Moishe Postone (1993) analyzes capital as a process of self-valorization governed by abstract labor, which assumes the totalizing nature of universal mediation. Postone's analysis essentially takes up what Hans-Georg Backhaus (1997) and Roman Rosdolsky (1977) have already written. The latter focused on capital in general, the former on the form of value as a form of universal mediation that was unique to the capitalist mode of production. In Postone's analysis, abstract labor as a social form of mediation assumes the nature of what he calls 'social domination' (Postone, 1993: 30, 125, 158, 295, 300). In essence, in reading Postone, the abstract time of capital acts as totalizing time, universal measure and the principle of temporalization of historical time. The latter is characterized by the tendency toward a general increase in productivity through machinery and technological innovation. Postone distinguishes between the abstract time of value and the historical temporality, in which the dialectical and contradictory relationship between value and wealth is historically configured. Recalling the Marxian analysis of the *Grundrisse*, Postone (2008) highlights a dialectic between total product value, which would remain constant or tend to decrease with the diminished number of workers employed in automated production, and wealth produced, which instead would tend to increase as a result of increased productivity. From this, Postone reaches the conclusion that the value and the industrial production process would acquire an 'increasingly anachronistic character' (2008: 126). This contradiction between increasing wealth and diminishing value is the basis of temporalization of the historical time of capital, articulating its various phases: from Fordism to post-Fordism to neo-liberalism. The point of view of the *Grundrisse* allowed Postone to indicate a tendency of the historical temporality of capital, which would lead to an ever-increasing development of automation, thereby making the industrial proletariat an increasingly marginal category. It is a vision that looks at a geographical fragment of capitalist production as it is presented in some countries without taking into account the combination of forms of exploitation and their different temporalities at a global level.

Texts inspired by the *Grundrisse* generally take up the idea of an increase in material wealth and a decrease in value because of less labor time used in production following the use of machinery. This conception, however, is built on the absolutization of *one* historical temporality that is elevated to a normative tendency for the whole planet, as if there were only one overall, abstract, single capital at stake. It is a Eurocentric vision that assumes the marginalization of industrial labor and the production of absolute surplus value as general

and normative tendencies without considering the reciprocal implication of capitals with different organic compositions. It should not be surprising that in the *Grundrisse*, Marx spoke of a ‘propagandistic (civilising) tendency’ of capital (Marx, 1986: 466) and justified colonialism in India assigning England a double mission: ‘one destructive, the other regenerating – the annihilation of old Asiatic society, and the laying of the material foundations of Western society in Asia’ (Marx, 1979: 217–8). This vision comes from a way of considering history from the centrality of a single historical temporality: the normative one of the modern West. It is, unfortunately, the basis of many Marxist concepts of the twentieth century.

If, instead, we look at the competition of capitals straining under the tension of the dominant temporality of socially necessary labor time, the scenario changes significantly. There are multiple intracapitalistic temporalities and counter-temporalities that complicate, hinder and reorient that tendency. For this reason, Marx himself, in the 1860s, analyzing the competition between many capitals, abandoned the implications outlined in the *Grundrisse* beginning from a growing automation of production.

Only in *Capital* does Marx analyze the establishment of total social capital at the three levels of the immediate process of production, the process of circulation and the whole process as a unit of production and circulation. Tombazos is credited (2015) with focusing attention on the different temporal levels at stake in these three levels. In fact, the categories of the three books of *Capital* fall differently in time: the first book obeys a linear and abstract temporality that is homogeneous and measurable – the time of production; the resolutions of the second book fall under a cyclical temporality, that of the time of circulation; the third book deals with the organic time of capital, the unit of production time and circulation. Time, in its various articulations, is the central category of the capitalist mode of production:

We have seen that the movement of capital through the sphere of production and the two phases of the sphere of circulation takes place in a series of periods of time (*Zeitliche Reihenfolge*) ... The total time (*Gesamtzeit*) during which it describes its circuit (*Kreislauf*) is therefore equal to the sum of its time of production and its time of circulation (*Umlaufszeit*). (Marx, 1997: 125)

The movement of capital takes place over time: it will therefore seek to prolong and condense the time of valorization and to diminish the negative times of interruptions.

However, this temporality of capital conflicts with other temporalities, first that of the bodies and the lives of laborers, which pose a limit to exploitation. Indeed, the history of capital, as Bensaïd observes, is always subject to the discontinuous times of the relationships of exchange, exploitation and dominion, showing itself to be ‘a process of rhythmical determination’, constantly inventing new harmonies and disharmonies. Irregular sequences, aperiodic forms, unpredictable recurrences,

fractal motifs, magnificent shapes of determinate complexity, a marvelous galaxy of 'topologies, choreographies and genealogies' – these herald an 'authentically multidimensional and dynamic new logic' (Bensaïd, 2009: 270).

As William H. Sewell has shown (2008), the different temporalities of capital are expansive but without direction: they are loaded with novelty, on the one hand, but essentially repetitive and circular, on the other. The abstract logic of capital would give rise to a temporality that Sewell defines 'stillness-in-motion' (Sewell, 2008: 526). In other words, there is constant movement around the M-C-M' sequence, but the movement is, in fact, consistently repetitive. From a historiographic point of view, however, Sewell tells us that despite the time of capital appearing to be perpetually repetitive, this mode of production has emerged in a historically contingent way, from the political, social and economic struggles between the fifteenth century and the end of the eighteenth century. Capitalism, as a result of history packed with events, has to be investigated in its various historical temporalities in order to figure out how its logic can or will be overcome. Therefore, capitalist time has to be considered from the perspective of its historical temporalities and their friction, both among themselves and with other temporalities.

As an abstract, time takes on concreteness in the temporal tensions, in the friction that always arises between the immeasurable nature of the process of the valorization of value, and the finiteness and limit imposed by the corporeality and life of laborers. Peter Osborne (2008) tried to introduce the dimension of finitude by having Marx interact with Heidegger and reclaiming from Heidegger the idea of finitude grounded in mortality. That way, Osborne places time in the context of a complex ontology of the human. But in doing so, Osborne opens up an autonomous way of thinking about historical time and its temporalization that moves away from the manner in which Marx put the question. That is, beginning from production. In Marx, using Heideggerian terminology, time is temporalized in multiple layers: abstract time and its discipline on the life of workers; the time of socially necessary labor, which dictates the pace of the world market; and the time of associated labor (*assoziierte Arbeit*), that is, the collective dimension of laborers who exercise their freedom by controlling value in use of production and products. Not their control over value, which would be just another way of staying in the market by accepting its normative measure, but control over use value, quality of work and social relationships.

If capital is the dominion of dead labor over living labor, it is in the tension between these two elements that a temporal tension loaded with implications opens up. To capture this tension one must always look at production. If in fact, from the sphere of circulation, we move toward the sphere of production, to which three-quarters of *Capital* is dedicated, the temporality of abstract labor is far from abstract. Here workers are disciplined body and soul to the normativeness of capitalist time, which confiscates every atom of freedom of the worker and imposes the rhythm to which human arts must be synchronized through factory discipline.

Historically, as shown by E. P. Thompson (1967), it was a long and violent process of disciplining the laborers and interiorizing working-time-discipline. Thompson wrote that ‘without time-discipline we could not have the insistent energy of the industrial man; and whether this discipline comes in the form of Methodism, or of Stalinism, or of nationalism, it will come to the developing world’ (1967: 93). This observation is important. It is the process of disciplining not the free will of a master, but the universal category of socially necessary labor. But what is important in Thompson’s observation is that different political forms, from Stalinism to nationalism, use the same process of synchronization to a normative time of capital. And it is here that a differentiation between the concept of abstract labor time and socially necessary labor time must be carried out. It is this differentiation that allows the pluralization of the times of capital.

PLURALIZING HISTORICAL TIMES

In *Reading Capital*, Althusser aims to build ‘the Marxist concept of historical time on the basis of the Marxist conception of the social totality’ (Althusser and Balibar, 2009: 108). To this end, they question both the homogeneous continuity of time and its contemporaneity, meant in the Hegelian sense that all elements of the present coexist as moments of a single historical present. Althusser calls this vision ‘essential section’, that is, the intellectual operation through which one makes a vertical slice in the present, so that all of its elements can be found in their immediate relationship. According to Althusser, this kind of totality never exists, because the whole structure is articulated hierarchically and subjected to the order of a dominant structure. Interpreting social totality in this way, Althusser speaks of a ‘determination “in the last instance” of the non-economic structures by the economic structure’ (Althusser and Balibar, 2009: 110). On the one hand, he prolifically manages to pluralize historical times: in a given historical time there are various temporal levels, which not only can be differentiated, but to which a relatively independent time must also be assigned. Therefore, several temporal levels, such as art, philosophy, politics, economics, etc., would coexist, each at its own pace, but structured in hierarchical terms. These times lead back ‘in the last instance’ to the time of economic production, which is defined by Althusse as ‘a time of times’, a ‘complex and non-linear time’. On the other hand, the internal structure of his conception of plural times within the economic production lacks a synchronizing principle. In other words, if, on the one hand, Althusser gathers the presence of multiple levels within a single level, on the other, he fails to identify the organizational, or synchronizing, principle of the different temporalities of production. It is here that the analysis must proceed toward the socially necessary labor time.

In the 1860s, when making allowance for the competition of capitals in the world market, Marx considers ‘every individual capital ... as a part of the total

capital, and every capitalist actually as a shareholder in the total social enterprise, each sharing in the total profit *pro rata* to the magnitude of his share of capital' (Marx, 1998: 207). From Marx's point of view, since it is the socially necessary labor time that is objectified in the value of the commodity, not the labor individually carried out by a single capital, the extraordinary surplus value that can be produced through the introduction of machinery depends on the difference between the increased productivity yielded by the capitalist who uses an automated production system, and the average productivity of socially necessary labor. The latter can be kept low by creating obstacles against the general use of technological innovation. Indeed, when technological innovation becomes widespread, the growing productivity of labor obtained through its employment becomes socially dominant:

As machinery comes into general use in a particular branch of production, the social value of the machine's product sinks down to its individual value, and the following law asserts itself: surplus-value does not arise from the labour-power that has been replaced by the machinery, but from the labour-power actually employed in working with the machinery. (Marx, 1989: 530)

The capitalist can no longer gain social surplus value through the use of the increased productive force provided by the machine (Tomba, 2013).

Capital needs to create geographical areas or productive sectors where it can produce an enormous quantity of absolute surplus value to support the production of extraordinary surplus value, relative surplus value produced through mechanical innovations. Indeed, the capitalist that cannot use the new machinery, can only ruthlessly prolong the working day. The extraction of relative surplus value requires differentials in the productive labor-force. Therefore, through different processes of accumulation, capital generates a great mass of absolute exploitation in those parts of the world where workers' resistance is lower or authoritarian government can repress their rebelliousness. The introduction of machinery in one branch of industry not only '*prolong[s]* the labour-time of those workers who continue to work with the old, imperfect means of production' (Marx, 1988: 327–8), it is also 'the most powerful means for increasing the productiveness of labour ... for lengthening the working day beyond all bounds set by human nature' (Marx, 1996: 406). In this scenario Marx begins to rethink the categorial context of his analysis. He begins to conceive capital not according to the linear scheme *genesis, development, crisis*, but in the combination of these moments and their temporalities (Bensaïd, 2009; Tomba, 2013; Tombazos, 2015). He abandons the scheme of the progressive epochs of economic development in favor of a historiography of originary accumulation, which he will work on and reshape in the diverse editions of *Capital*.

The different conception of time, or rather of interweaving times, allows Marx to think of history differently. Marx stated that the capitalist mode of production encounters pre-existing forms 'as antecedents, but not as antecedents established

by itself, not as forms of its own life process' (Marx, 2000: 468). The result of this encounter gives rise, as Harry Harootunian pointed out, to a 'heterogeneous mix rather than the destruction of one made by another' (Harootunian, 2015: 206). In the 'heterogeneous mix' of temporalities 'archaic' forms coexist and overlap with new forms. This encounter gives rise to conflicts whose outcomes are not predetermined. In order to think about these possible outcomes, later-day Marx, in dialogue with the Russian Populists, abandoned his previous philosophy of history and depicted history through the geological image of historical layers. This later-day Marx's view on temporalities was developed by the heterodox stream of Marxism, by thinkers such as Walter Benjamin and Ernst Bloch.

In the encounter of different temporal trajectories, capital subsumes and reconfigures pre-existing forms of production in a new framework, and the result is a 'heterogeneous mix' of temporalities and forms of life and production. From this perspective, formal subsumption does not constitute a historical stage that precedes real subsumption, but it denotes how the capitalist mode of production encounters and subsumes existing forms without creating a homogeneous world. Formal subsumption, that is the subsumption as form, does not belong to a specific historical stage but, more generally, it characterizes the encounter/collision between the temporality of the capitalist mode of production and different temporalities (Tomba, 2013; Harootunian, 2015). Indeed, the capitalist mode of production requires and utilizes hierarchies and differences, which it configures in terms of temporalities. The expansion of capital and its constant attempt to subsume different forms of production into the global market generates a multiplicity of temporal frictions, asynchronies and anachronisms that, on the one hand, capital uses to its own advantage, and, on the other, give rise to a multiplicity of conflicting elements and possibilities for the reorientation of the trajectories of modernity.

The combination of different modes of production is investigated starting from concrete historical situations such as Italy through the lens of Antonio Gramsci (2011), Latin America with José Carlos Mariátegui (2011) and Japan with Uno Kozo (2018). The latter observed that the failure of capitalism to develop from the dissolution of feudalism meant that Japan did not have to go through the catastrophic phase of so-called primitive accumulation the way it had taken place in England 300 years earlier. In other words, the combination of different forms and ways of production allowed and allows for different trajectories compared to that taken by England.

From this perspective, not only does the stage-theory of modes of production have to be abandoned, but one also has to reconsider the concepts of time and history that lie at its foundation. In general terms, one has to abandon the (Eurocentric) idea of a necessary historical trajectory that, through the necessary stage of primitive accumulation of capital, goes from feudalism to capitalism and, finally, to ... socialism. Questioning this unilinear vision of historical time means thinking about how different modes of production can be combined,

without making judgments, typical of the philosophy of history, on the supposed residual nature or backwardness of non-capitalist forms of production.

Making history in a global age requires both a different temporal and historiographical paradigm. It is from this standpoint that one can re-read Marx from his late works. If until the 1860s Marx was inclined to think about the trajectory of each country in terms of universal history, and therefore to see the transition to the capitalist mode of production as a necessary stage in the progress toward socialism, in his dialogue with the Russian Populists he began to reconsider his own positions. His reply to a letter from Vera Zasulich is famous. In 1881 she wrote to Marx:

Nowadays, we often hear it said that the rural commune is an archaic form condemned to perish by history, scientific socialism and, in short, everything above debate. Those who preach such a view call themselves your disciples par excellence: 'Marxists' ... So you will understand, Citizen, how interested we are in Your opinion. You would be doing us a very great favor if you were to set forth Your ideas on the possible fate of our rural commune, and on the theory that it is historically necessary for every country in the world to pass through all the phases of capitalist production. (Shanin, 1983: 98–9)

Marx hesitated before answering. In his final letter to Zasulich, Marx wrote that the analysis of *Capital* 'provides no reasons either for or against the vitality of the Russian commune. But the special study I have made of it ... has convinced me that the commune is the fulcrum for social regeneration in Russia' (Shanin, 1983: 124). In the first draft of the letter, Marx wrote that Russia is not constrained to pass through the 'the fatal dissolution of the Russian peasants' commune' (Shanin, 1983: 121), which could instead become 'an element of collective production on a nationwide scale' (Shanin, 1983: 121). With this, Marx showed himself to be much closer to the Russian Populists than to the Marxists.

For us today, it is not about taking a position in favor of the Populists or the Marxists. It is about re-reading that debate and that political confrontation in light of today's problems, of the expansion of capitalism and the encounter/collision with pre-existing economic forms. Following Plekhanov, Lenin was convinced of the inevitable progress of capitalism in Russia. In his critique of the Populists, Lenin made fun of the Populist idea of 'different paths for the fatherland' (Lenin, 1977a [1894]: 330–1). He maintained that 'the path has already been chosen' and it was the capitalist path already trod by England. It was only a matter of developing large-scale capitalism and its antagonisms, whereas 'to dream of different paths means to be a naive romanticist' (Lenin, 1977a [1894]: 361–79). A few years later, in *The Development of Capitalism in Russia* (1977b [1899]), making a very selective use of statistics, read and interpreted in the light of an inevitable historical trend, Lenin wrote that capitalism had already created 'large-scale agricultural production' in Russia and praised the progressive 'destructive work' of agricultural capitalism, which was destroying all the 'obsolete institutions' that provoked a 'tremendous delay in social development as a whole' (Lenin, 1977b [1899]: 314–25). Lenin's belief was based on the

unilinear conception of historical time, according to which the collision between different temporal layers did not lead to any alternative road other than that of capitalist avenue. The question that arises instead is how to read the co-presence of different temporalities.

For historicist Marxism, the Russian commune, like any other 'archaic' form of production, constitutes a 'tremendous delay in social development', an obstacle to brush away. For this conception, historical time runs along the predetermined tracks of universal history. It is as if we were waiting in a subway station, and on hearing the announcement of a delay in our train, we imagine how many stations away our train is.

But later-day Marx had realized that perhaps the train was not late, but in meeting with the 'archaic', it could be rerouted in another direction. For this reason, Marx noted, 'we should not, then, be too frightened by the word "archaic"' (Shanin, 1983: 107). In order to elucidate the simultaneous presence of several layers of time, Marx recurred to a geological metaphor, according to which a series of layers from various ages are superimposed on each other. The encounter of the capitalist mode of production with pre-existing forms gives rise to a heterogeneous mix of forms of production, which are reconfigured and subsumed in a new framework, but they also provoke frictions among different layers. From these frictions, different outcomes can arise. 'For archaism', writes Harootunian, 'when self-consciously yoked to capitalism, as in Germany, Italy, and Japan during the 1930s, played a role reversal to become the "frightful" foundation for fascist cultural ideology, as both Ernst Bloch and Tosaka Jun observed' (Harootunian, 2015: 55). In a brilliant piece of writing on the rise to power of National Socialism, Ernst Bloch blended together analyses of social classes and social strata that, while living in the same historical present, do not share the same time: 'Not all people exist in the same Now' (Bloch, 1977 [1932]: 22). Nazism is interpreted by Bloch as the result of a conflict between asynchronous temporalities, which the Communists, branding it simply as romantic or reactionary, failed to organize in an emancipatory way. The energy generated by the friction between those temporalities was thus left in the hands of the Nazis. Similarly, in the same years, Walter Benjamin, in his theses *On the Concept of History*, reconsidered historical materialism and its tradition beyond the concept of progress and the unilinear conception of homogeneous and empty time (Benjamin, 2006).

The collision between different temporalities is not solved by taking a stand for the tendency of the dominant temporality of capitalist expansion or for the romantic archaic one. The latter perspective is often played by fascist regimes. The issue lies in the tension between temporalities, where anachronisms can disturb the homogenous linear time of capitalism and the nation-state, and can orient the trajectory of political modernity in a different direction. Going back to the train metaphor, the anachronisms constitute possibilities for derailing the train in another direction. However, this possibility is always the matter of a political intervention, never a guarantee. The opening up of these alternative possibilities requires a historiographic approach that abandons the unilinear vision of historical

time in favor of what Ernst Bloch called ‘a broad, flexible and thoroughly dynamic “multiverse”: the voices of history joined in perpetual and often intricate counterpoint’ (Bloch, 1970 [1955]: 143). Indeed, stated Bloch, a ‘unilinear model must be found obsolete if justice is to be done to the considerable amount of non-European material’ (Bloch, 1970 [1955]: 143).

In the vision of time that Benjamin called ‘empty and homogenous’ (Benjamin, 2006: 402), when other temporalities and trajectories are compared with the dominant modernity, qualitative differences are transformed into quantitative differences and delays. One can experience this whenever a non-European culture is likened to ‘medieval Europe’ or is defined as ‘primitive’. In fact, only based on the normative and absolute time of European modernity, some cultures may have ‘wasted time’ and are therefore considered late (economically, politically, socially). But there is no such thing as having wasted time or used it poorly. Time is used in a different way, and this qualitative difference impresses upon time a temporality.

SPACE–TIME

To conclude, and rewind the tape of this discourse, it is possible to return to the *Grundrisse* to seize on a different starting point, especially if integrated with the analysis of *Capital*. It is in the *Grundrisse* that Marx defines capital as the process of ‘the annihilation of space by time’ (Marx, 1986: 448). David Harvey develops this Marxian concept in terms of a ‘Time–Space Compression’ (Harvey, 1989). Indeed, the process of valorization takes place in time and space: time has to be compressed and intensified in order to become as productive as possible; space has to be shaped according to the needs of circulation and reproduction. David Harvey is credited with having called attention to this interweaving of space and time and to the ‘necessary creation of a geographical landscape to facilitate accumulation through production and circulation’ (Harvey, 2001: 266). Commodities, including the force of labor, must be transported and space constitutes an obstacle that capital overcomes through infrastructures, railways, airplanes. Not only do commodities have to be moved in order to be sold, but also the specific commodity ‘labor-force’ has to reach the abode of production as quickly as possible. In Harvey’s analysis, which focuses more on space in order to compensate for what he thinks was an excessive emphasis on the Marxian concept of time, ‘spatial organization is necessary to overcome space. The task of spatial theory in the context of capitalism is to construct dynamic representations of how that contradiction is expressed through historical-geographical transformations’ (Harvey, 2001: 328). Capital constantly carries out a spatial-temporal fix to maximize the production of surplus value through not just spatial differentials but also temporal differentials.

Harvey’s analysis is supplemented by Bob Jessop (Jessop, 2002, 2009), according to whom the economy of time shapes the spatial-temporal dynamics

of capitalist accumulation. The result is that the current phase of globalization creates not only spatial contradictions but also temporal contradictions, which coexist in the current world market. All of this poses threats to the sovereignty of the nation-state, as we came to know it during the Fordist period.

Capital ‘uses’ space and time in all its processes. The process of accumulation requires a new spatial organization of society and a new temporal discipline. Surplus value, after being produced, must be realized and therefore the circulation process needs functional infrastructures: the transportation and communication systems modify space to compress time in a functional way for the circulation of commodities. Likewise, the process of social reproduction molds space and organizes time into times of reproduction of the labor-force, entertainment, health care, etc. These spatial-temporal differentiations are hierarchically articulated both in terms of wages and in terms of racial, ethnic and gender divisions of labor. The valorization of capital integrates waged as well as unwaged labor, where the latter is mainly composed of the labor involved in social reproduction (Dalla Costa and James, 1972). The articulation between production and social reproduction occurs not only through public and private categories but also by turning a profit from pre-existing and new divisions. Categories such as sex, race and nationality produce hierarchical and conflicting differentials between waged and non-waged laborers, employed and unemployed workers, all of which are functional in the process of valorization (Vogel, 2014).

Capital, structured for the competition between capitals around wage differentials and productivity, needs asymmetries both inside and outside of the nation-state borders. Capital takes them as it finds them, or meets them as moments of its own articulation and development. Time has to be compressed and intensified in order to become as productive as possible; space has to be shaped according to the needs of circulation and reproduction. Capital aims to prolong the time of labor and, when that is not possible, to render the distinction between labor time and free time extremely vague. When production time cannot be further compressed, capital compresses reproduction time by bringing dormitories into the factory – as in the case with Foxconn, huge factories located mostly in China, which produce hardware for the information technology company. Times of production and reproduction must be considered together, especially in an era that tends to increasingly blur the lines between free time and working time.

In *Value, Price and Profit*, which is the text of a conference held by Marx in 1865 at the General Council of the International Workingmen’s Association, Marx asserted:

Time is the room of human development. A man who has no free time to dispose of, whose whole lifetime, apart from the mere physical interruptions by sleep, meals, and so forth, is absorbed by his labour for the capitalist, is less than a beast of burden. He is a mere machine for producing Foreign Wealth, broken in body and brutalized in mind. (Marx, 1985: 142)

A further question arises. It concerns the conflict between the temporality of capital and that of the ‘living corporeality (*lebendige Leiblichkeit*)’ of workers,

who sell and make available their own labor-power (Marx, 1996: 179). Indeed, capitalists are interested in a ‘special commodity (*spezifische Ware*)’ (Marx, 1996: 177), that is the labor-power, which they find in the market. But – and this is what really makes it *special* and distinguishes it from other commodities – the labor-power is attached to a body whose temporality not only differs but also conflicts with that of capital. The tension between the special use value of the labor-power and the valorization process represents the political peak of the tension between value and use value, which is how *Capital* begins. This tension is mainly a tension between temporalities, the abstract and limitless temporality of capital, and the concrete and limited temporality of the worker living body. This tension configures the capitalist mode of production as the process of destruction of ‘the original sources of all wealth – the soil and the labourer’ (Marx, 1996: 508).

Setting a limit on the unlimited tendency of capital to subsume all time into the time of valorization is necessary but not sufficient. The interruption of capitalist labor time should not simply correspond to hours of free time for eating and reproducing the labor-force but should be ‘the room of human development’. That is, it should be a qualitatively different time in which associated workers experience new institutional forms of togetherness. A time in which art and labor can be reunited and recombined, as it was during the Paris Commune (Ross, 2015) and in many insurgencies which have experimented with the interruption of time and its transformation in the insurrectional dimension of everyday life (Lefebvre, 1978; Jesi, 2014: 46–8, 2013).

Space

Kanishka Goonewardena

THE 'SPATIAL TURN'

Space as a keyword is ubiquitous in critical-theoretical discourse today. But this term was symptomatically missing from the last edition of *A Dictionary of Marxist Thought* edited by Tom Bottomore (1991), which coincided with Fredric Jameson's now classic work of Marxist cultural theory, *Postmodernism, or, The Cultural Logic of Late Capitalism* (1991), and two crucial essays by geographer Doreen Massey, 'A Global Sense of Place' (1991a) and 'Flexible Sexism' (1991b). The latter of these essays is now a well-known response to Marxist geographer David Harvey's celebrated work on postmodern time-space, *The Condition of Postmodernity* (1989). These pioneering texts, and the debates they elicited, have since come to mark the so-called 'spatial turn' in Marxist thought and even critical theory more broadly. The curious and contemporaneous absence of 'space' from the said *Dictionary* – a very useful guide for the most part – suggests that Marxist theory itself obeys a law that is at work in the capitalist real world it seeks to interpret and change: uneven development.

Just as capitalism as a new mode of production emerged in particular places of the world and sectors of society and then developed intensively (socially) and extensively (spatially) in an uneven and combined manner, so conceptions of space appeared in Marxism with reference to specific conceptions of capitalism and particular strategies of socialist politics. The well-advertised 'spatial turn' of

the 1980s, most emphatically announced in Ed Soja's *Postmodern Geographies* in 1989, coincided above all with questions concerning postmodernism, globalization and urbanization, although the still growing influence of spatial considerations in left theory and practice is now evident in virtually every inquiry into what the Marxist philosophical tradition calls totality.

SPACE AND RADICAL POLITICAL TRADITIONS

It would be an error of historical perspective, however, to suggest that Marxist preoccupations with space only originated with this postmodern 'spatial turn', the handiwork mostly of some geographers and cultural theorists. Space as such was not among the most prominent concepts singled out for critique by Marx, such as the economy, state or ideology; so the word does not typically feature in otherwise wide-ranging surveys such as the *Dictionary*. But that does not mean the founders of historical materialism were by any means inattentive to space and specifically spatial problems of politics – as can be seen in their radical reflections on 'town and country' and 'the housing question' (Holgersen, Chapter 82, this *Handbook*). The same must be said about Marxism after Marx, especially with reference to the revolutionary political generation of Lenin, Trotsky, Luxemburg and Gramsci, who contributed vigorously to the spatial sensibility of Marxism and related radical political traditions with a series of original concepts including imperialism, colonialism, hegemony, the subaltern and, of course, uneven and combined development.

Given that imperialism and colonialism in particular are inherently spatial phenomena, one also thinks here of the signal interventions into Marxist engagements with space by kindred if critical political-theoretical efforts in the revolutionary anti-colonial tradition, from C. L. R. James to Aimé Césaire, from Frantz Fanon to Walter Rodney – especially on the centrality of colonialism and slavery to the historical development of capitalism, as forcefully argued by Cedric Robinson in *Black Marxism* (1983), an indispensable reference for ongoing discussions of 'racial capitalism' involving historians such as Robin D. G. Kelley and geographers such as Ruth Wilson Gilmore (Bhandar, Chapter 13, and Haider, Chapter 58, this *Handbook*).

Complementary to these writings were the attempts to historicize and update the classical theories of imperialism of Lenin's conjuncture for the post-war era of US hegemony by 'dependency' and 'world-systems theorists' – including Andre Gunder Frank, Samir Amin, Immanuel Wallerstein and Giovanni Arrighi, who introduced into our lexicon such phrases as 'development of underdevelopment', 'unequal exchange' and 'core and periphery'. Not far from these works lay a series of socialist-feminist theorizations of socio-historical totality, including Maria Mies' landmark work of 2014 [1986], *Patriarchy and Accumulation on a World Scale*, which focuses our attention on the constitutive relation between

colonization and the domestic servitude of women ('housewifization') within an unequal global division of labour; or Silvia Federici's more recent *Caliban and the Witch* (2004), which introduces an entirely new scale and gender perspective to the problem of 'so-called original accumulation' of capitalism, by way of the female body.

WHAT IS SPACE?

Those are some of the main itineraries of the concept of space before the 'spatial turn' in Marxism and allied political currents. But what can be said of it in contemporary theory and practice? One difficulty with this question lies in the sheer multiplicity of meanings attached to the term 'space' in critical discourse today, which includes the classical problems of imperialism, colonialism and urbanization, but also exceeds and even departs from them in a bewildering variety of directions.

Consider, for example, the call for 'safe space' issued in some activist milieus. The ostensible purpose of this demand is to safeguard marginalized bodies, relationships, homes, workplaces, habitats, discourses and imaginaries from dominant social forces, although this largely Anglo-American formulation of 'safe space' has also been criticized in the same venues for its tendency to avoid productive conflict and achieve only a false sense of security. Even in this particular and contested usage, to be sure, the word 'space' assumes many meanings: physical space (body, bedroom, classroom, street, square, neighbourhood, nation-state, etc.), social space (domestic space, private space, workspace, public space, national space, etc.) and discursive space (what can and cannot be safely said, even imagined).

Likewise, the path-breaking feminist conceptual distinction between 'public' and 'private' space stretches across various spatial scales from the body to the city, the nation and beyond, while the public-private divide itself cuts across the dimensions of physical space, symbolic space and all manner of spatial practices essential to social life. But just as the rampant polysemy of space surely enhances the current popularity of the term, this surplus of signification also risks trivializing it as a theoretical concept, as we see in the banal assertion that somehow 'everything is spatial'. How, then, to raise space above the level of a free-floating signifier, to that of a concept with some analytical purchase and political purpose?

LEFEBVRE'S LESSONS

To make sense of space in a holistic and radical way, we can do worse than to turn to Henri Lefebvre, the greatest Marxist theoretician of space in the twentieth century. Space poses for him, among other things, an organizational problem, similar to the one confronted by Fernand Braudel in his magisterial history of

capitalism, i.e. finding a form to fit the content of his research, that immense accumulation of data gathered from around the world, spanning several centuries. His legendary solution to this problem, as succinctly explained in *Afterthoughts on Material Civilization and Capitalism* (1977), consisted in delineating the great narrative of capitalism into three related yet distinct levels of social reality characterized by their own temporalities: material life or the everyday at the ground level; infrastructures of commerce or market exchange at the intermediate level; and the combined operations of state and capitalism at the most global and abstracted level, which he provocatively called the ‘world’ and described as the ‘counter-market’. These three levels correspond directly to the tripartite division of Braudel’s (1981–1984) magnum opus *Civilisation matérielle, économie et capitalisme, xv^e–xviii^e siècle*: 1. *Les Structures du quotidien*; 2. *Les Jeux de l’échange*; 3. *Le Temps du monde*.

Lefebvre’s Marxist perspective on the world – more precisely, his conception of totality – reveals a remarkably similar form involving three dialectically articulated levels of social reality: ‘everyday life’, ‘the urban’ and the ‘global’. While these levels of social reality correspond closely to three of Lefebvre’s most striking contributions to an ‘open Marxism’ – three volumes of *Critique of Everyday Life* (2014) and other writings on the everyday from 1947 to 1988; a truly original intervention on the social production of space ranging from his studies of rural sociology such as *La Vallée de Campan: Étude de sociologie rurale* (1963) through *La proclamation de la commune* (1965) and *La droite à la ville* (1968) to *The Production of Space* (1991 [1974]); and four tomes of *De l’État* (1976–1978) that critically surveyed Marxist theories of the state, imperialism and colonialism by way of such conceptions as *mode de production étatique* (state mode of production) and its political antidote *autogestion* (self-management) – the manner of their mediated articulation is most succinctly laid out in his 1970 classic, *The Urban Revolution*.

SPACE AS A LEVEL OF SOCIAL TOTALITY

The Urban Revolution (2003 [1970]) turns on at least three of Lefebvre’s most influential ideas on space: first, the significance of the production of space for the survival of capitalism, especially in the post-war, late-capitalist era; second, the notion of the right to the city, or the centrality of the struggle over the production of space for socialist political strategy, aimed at building a different city for a different society; and, third, the aforementioned theoretical perspective on levels of totality, which posits urbanization, the decisive mode of production of capitalist space, as the key intermediate or mixed level of social reality, positioned between the global and the everyday. ‘Between [people] and nature, between their home ... and the world, lies the urban reality’, which for Lefebvre (2003 [1970]: 12) is ‘an essential mediating factor’. That is to say, the production

of space for him constitutes the crucial *mediating* level that projects the global logics of state and capital through to the level of everyday life, while also transmitting, in the opposite direction, forms of opposition to those logics originating in the struggles between the routines and aspirations of the everyday back towards the global level, with the potential radically to transform it according to communist principles. What's called the production of space in this sense lies at the contested crossroads of the global and everyday levels, occupying a decisive central location in the social totality.

The Urban Revolution (Lefebvre, 2003 [1970]) charts the historical emergence of this politically pivotal level of the social, by advancing the seemingly audacious (hypo)thesis that urbanization has now superseded industrialization as the socio-spatial process in charge of late capitalism. It is not only that land and nature have been relentlessly commodified in advanced capitalism to manage crises of accumulation and reproduce the regnant mode of production, but also that the production of space, both natural (raw material, energy) and social (habitat of human life), has become increasingly synonymous with sustaining the unsustainable conditions of possibility of commodification. In this sense, space is no longer the mere container or residuum of social relations, but dialectically productive of them. With what Lefebvre announced here as the 'complete urbanization of society', a truism of radical geographers thus assumes unprecedented salience: space is a social product; society is spatially constituted. Or, as Lefebvre's one-time collaborator Guy Debord theorized as the social division of labour and the formation of classes (i.e. 'separation') underlying commodification in *The Society of the Spectacle* (Debord, 1967: §171): 'While all the technical forces of capitalism contribute towards various forms of separation, urbanism provides the material foundation for those forces and prepares the ground for their deployment. It is the technology of separation'. Hence 'no' is the answer to Lefebvre's (1991 [1974]: 11) often-quoted and rather rhetorical question: 'Is it conceivable that the exercise of hegemony might leave space untouched?'

THE URBAN REVOLUTION

Lefebvre's notion of 'the urban revolution', however, has two related meanings. The first pertains to the historical trajectory of urbanization – through predominantly political, mercantile and industrial forms of the city to the worldwide 'implosion' and 'explosion' of urban society – culminating in the now planetary scope of 'the urban phenomenon', a condition deemed essential for the survival of capitalism today. The second meaning, derived from his *La droite à la ville* (1968), a work originally meant to be a contribution to the 100th anniversary of the first volume of Marx's *Capital*, points to the necessity of revolutionizing space in order to revolutionize society. 'The Right to the City' was a slogan and concept

coined by Lefebvre in the ferment of May '68 in Paris, while he was a professor at the University of Nanterre. As Kristin Ross aptly observes of this moment:

The functionalist campus at Nanterre, inaugurated in 1964 and built on the site of the worst immigrant slums outside Paris, provided students with a direct 'lived' lesson in uneven development – a daily experience that Henri Lefebvre, for one, never tired of remarking was the foremost 'cause' of May '68. Nanterre students ... acted as a catalyst for distinctly new forms of expression, representation, and mobilization of immigrant workers; by 1970, rent strikes, hunger strikes, squatting, and other collective struggles unseen before May '68 began to bring immigrants into direct confrontation with the state apparatus. (Ross, 2002: 95–6)

While being profoundly struck by the revolutionary potential of such (sub)urban 'irruptions' as May '68, Lefebvre also registered the fact that the city is no longer what it used to be. Between *La droit à la ville* and *The Urban Revolution* – 1968 and 1970 – a certain shift of emphasis appears in his writings: one that moves from the city to 'the urban phenomenon', although the two are not so neatly separated like water and oil. 'The urban phenomenon' appears on a planetary scale due to the 'implosion–explosion' of classical forms of the city under the impact of capitalist industry and its imperative of expanded accumulation; in brief, says Lefebvre (2003 [1970]: 127–128): 'The merchant bourgeoisie, the intellectuals, and politicians modeled the city. The industrialists demolished it'.

As Brazilian architect and political economist Roberto Luís Monte-Mór (2014) clarifies, Lefebvre theorizes here an important distinction between 'the city' and 'the urban'; this much misunderstood latter term ('the urban phenomenon' and 'urban society' are its equivalents) refers to the socio-spatial reality that emerges from advanced capitalism's state-led sublation of the classical contradiction between city and country that Marx and Engels wrote about in *The German Ideology* (1998 [1845]) and singled out as something to be resolved in communism in the *Communist Manifesto* (1848). Thus 'the urban' is neither city nor country understood as distinct if hierarchically related types of human settlements: it is rather their Hegelian *Aufhebung*, resulting from the progressive domination of the country by the city alongside the 'implosion' and 'explosion' of the latter, i.e. a new worldwide space of state, capital and struggles of everyday life.

Following Lefebvre, Neil Brenner and Christian Schmid (2015) have theorized this space – which now includes city-centres, suburbs, exurbs, small towns, rural areas, residences, schools, malls, farms, feedlots, sweatshops, factories, highways, airports, ports, shipping lanes, warehouses, mines, oil fields, military bases, waterfalls, rivers, energy grids, communication networks, infrastructure projects of various scales and other such entities within the reach of commodity form and state power – as one of 'planetary urbanization', with special attention to its 'concentrated', 'extended' and 'differential' moments. Yet the *formal* features of what used to be called the city – centrality, difference and intercourse (*Verkehr* à la Marx) – persist into the now 'planetary' phenomenon of 'the urban', as possibilities to be actualized, and remain essential for the urban revolution that Lefebvre sees as integral to the socialist revolution:

What does the city create? Nothing. It centralized creation. And yet it creates everything. Nothing exists without exchange, without union, without proximity, that is, without relationships. The city creates a situation, the urban situation, where different things occur one after the other and do not exist separately but according to their differences. The urban, which is indifferent to each difference it contains, often seems to be as indifferent as nature, but with a cruelty all its own. However, the urban is not indifferent to all differences, precisely because it unites them. In this sense, the city constructs, identifies and delivers the essence of social relationships: the reciprocal existence and manifestation of differences arising from or resulting in conflicts. Isn't this the rational delirium known as the city, the urban? (Lefebvre, 2003 [1970]: 117–118)

EVERYDAY LIFE AND STATE

Lefebvre's oeuvre on space is best approached by recalling the abiding political question animating his enquiries into levels of totality: how has capitalism, in spite of its contradictions and crises, managed to survive for so long? Especially since the end of the Second World War, Lefebvre felt keenly the need for Marxists to broaden their strategic horizons beyond a party-political focus on the factory floor of the exploitative labour–capital relation, and venture into hitherto sidelined domains of social life. And he came to regard these as ever more central sites of political struggle, rather like how feminist critics have identified the centrality of the sphere of social reproduction for the survival of capitalism. A prime case in point is Lefebvre's most durable thematic preoccupation lasting over four decades: everyday life.

He theorized it as a terrain of the social torn between radical aspirations and alienated routines of late-capitalist subjects; a chosen site for post-war regimes of accumulation to entrench and expand their operations, as Kristin Ross demonstrates from a feminist and anti-colonial standpoint in *Fast Cars, Clean Bodies* (1995), a superb study of French modernization in the aftermath of decolonization that draws insightfully from Lefebvre and Fanon. But for Lefebvre everyday life still harbours vital if diminishing reservoirs of revolutionary-utopian energy opposed to state and capital. Echoing the contemporaneous if more pessimistic diagnosis of a 'culture industry' by Theodor Adorno and Max Horkheimer, he coined the phrase 'bureaucratic society of controlled consumption' in *Everyday Life in the Modern World* (1971 [1968]) to highlight the burgeoning preponderance of capital and state logics in the everyday – in the face of its promising moments of disalienation, spontaneously expressed as 'love', 'comradship', 'play' and so on. In contrast to these ingredients of communism, the alienating moments of capital and state ('neo-liberalism' and 'neo-dirigisme') are concentrated and rooted in what Lefebvre called the global level, characterized by its tendencies of abstraction and universalization.

The four volumes of *De l'État* (1976–1978) present Lefebvre's most sustained engagement with this level of the social order, offering a critical review of Marxist writings on this subject from Marx to Lenin to Mao with special attention to Rosa Luxemburg's (2015 [1913]) geographical account of expanded reproduction of capital. And they culminate in a new perspective on the state as the territorial

organizer of hierarchical social relations. Yet in so doing ‘the State engenders social relations in space’ according to a self-aggrandizing logic of its own, i.e. the *mode de production étatique*, which for Lefebvre (2009 [1978]: 225) is the antithesis of the Marxist and Leninist (Lenin, 1976 [1917]) project of the ‘withering away of the state’, i.e. the goal of *autogestion*.

HISTORY OF SPACE

In both *The Production of Space* (1991 [1974]) and *De l'État*, Lefebvre (2009 [1978]: 234) speaks of a ‘history of space’ – a diachrony of ‘analogical, cosmological, symbolic, and logic[al] or logistical’ space – arguing that ‘each mode of production has had its space’, a dominant space that did not exclude residual and emergent spaces. ‘Analogic space’ in Lefebvre’s (2009 [1978]: 230–1) historical perspective corresponds to the ‘primitive community’, where the ‘village and its organization is supposed to represent, or rather reproduce, a divine body, itself a projection of the human body’. Likewise, the ‘Asiatic’ or ‘ancient mode of production (city, slaves) is linked to a cosmological space’, such that ‘the town is an “*imago mundi*”’, a veritable cognitive map of the cosmos. The medieval town of feudalism in this narrative exemplifies ‘symbolic space’, with Gothic cathedrals figuring ‘the emergence of the city above the earth and the momentum of a whole society toward a clarity which is ... conceived as that of *Logos*, i.e. the Word, Christ’; and unlike ‘cryptic space’, where ‘truth remains hidden in the tomb’, this space tends towards ‘decryption, an ascent toward the light’. While warning against reductive readings of space–society relations, Lefebvre notes that ‘this is also the moment of the great class struggle’ of ‘the urban bourgeoisie against the landed gentry’, which is the substance of ‘a double-sided symbolism: religious and political’. Meanwhile, ‘perspectival space’ dating from the Renaissance corresponds to the ‘ascent of cities (Florence, Siena, Lucca and Pisa) on the basis of merchant capital and banking capital’:

These bankers, like the Medici family, build stately homes in the countryside, and around these homes, smallholdings. The roads that link their homes to others are planted with cypress trees, and the countryside takes on a depth and magnitude that it did not have before. The lines towards the horizon are marked out by avenues of cypress, symbols of both property and longevity; and from this moment perspective appears ... derived from the reciprocal influence of towns on the countryside. (Lefebvre, 2009 [1978]: 231–2)

This ‘perspectival space’ also ‘takes over nature in measuring it and subordinating it to the requirements of society, under the domination of the eye and no longer of the entire body’. Moreover, it is ‘an entire space that is organized, governing the whole of the arts (painting, sculpture, architecture, and town planning), a space that is common to all; the inhabitants situated themselves in this space; the architects and political authorities know how to control it’ (2009 [1978]: 232). Subsequent ‘capitalist space’, however, destroys ‘perspectival

space', as evidenced for example by 'Picasso's analytic cubism and the paintings of Kandinsky' (2009 [1978]: 233):

This destruction of perspectival space is characterized by the fact that a monument, a work of architecture, any object, is situated in a homogeneous space and no longer in a qualified (qualitative) space ... Picasso, Klee and members of the Bauhaus simultaneously discovered that one can represent objects in space such that they no longer have a privileged side or façade ... They are in an indifferent space and are themselves indifferent to this space tending towards complete quantification. The tower block for which Mies van der Rohe designed the prototype is located in a space of the type we can pivot around; it is an object with neither face nor façade ... Perspectival space is thus replaced by an entirely new space. An ambiguity follows from what Le Corbusier and the members of the Bauhaus believed to constitute a revolution. We took them for Bolsheviks when actually they inaugurated capitalist space. (Lefebvre, 2009 [1978]: 233)

SPACE, STATE, CAPITAL

Is it even possible to define capitalism without reference to space? Not for the radical geographer David Harvey (2018a [1982]), who in tune with Lefebvre recommends that we replace the term 'historical materialism' with 'historical-geographical materialism'. To be sure, conventional political-economic exegeses of Marx's critique of capitalism tend to rely heavily on core categories such as the relations and forces of production, and the commodification of labour power and the consequent reformatting of production processes, leading from formal to real subsumption. This yields analyses of the production of surplus value and the problem of 'how surplus value is *realized* (trade patterns) and how it is *allocated* (investment patterns)' (Lefebvre, 2009 [1978]: 241); as well as conceptions of crises of overproduction, underconsumption and accumulation.

Yet, for Lefebvre, 'this is not all', because a holistic perspective on the capitalist mode of production must also address 'the production of social and political relations' that are spatially constituted. So it is also defined by the 'production of a spatial support', i.e. 'a foundation for the relations of production and for their renewal or reproduction' (2009 [1978]: 241). It would seem that Lefebvre here replaces the 'base' of the traditional Marxist base-superstructure model with 'space', by using the terms 'foundation' and 'support' in a palpably literal sense, with no prejudice at all against enquiries into the ideological and symbolic significance of space. It is clear too that this spatial 'support' and 'foundation' of capitalism is itself a social product: 'it is shaped out of pre-existing space', which capitalism both destroys and appropriates according to its own purposes, and made by 'definite agents – developers, bankers, urbanists, architects, landowners, political authorities ... and sometime by "users"' (2009 [1978]: 241). Such space is social as well 'in the sense that it is not a thing among things, but the system of links, connections, networks and circuits' that makes all things capitalist possible and real. In short: 'The capitalist mode of production produces its own space; in so doing, it is transformed' (2009 [1978]: 241).

In *The Production of Space* (1991 [1974]), Lefebvre characterizes this space as *abstract space*, locating it in a historical arc stretching from pre-capitalist forms of ‘absolute space’ to the post-capitalist possibility of ‘differential space’, i.e. a space of *autogestion*, which it is the indispensable task of socialism to produce as *its own space*. The abstract space of capitalism is at once *homogenous, fragmented and hierarchical* – and therefore *contradictory*. It is homogeneous because it is subject to the commodity form privileging exchange value over use value, identity over difference, rendering it ‘equivalent, exchangeable, interchangeable’ (1991 [1974]: 233). Yet ‘on the other hand, this space is fractured because it is processed in the form of lots and parcels, and sold on this basis’ within a juridical-political regime of private property: ‘it is thus fragmented’ (1991 [1974]: 233). In addition, abstract space, which Lefebvre revealingly compared to Marx’s conception of *abstract labour*, becomes hierarchical, as inequalities result from exchange and ‘places are arranged unequally in relation to centres, which are themselves unequal’ (1991 [1974]: 243). Relations of centre and periphery, dominant and dominated space, thus develop as social struggles and spatial forms are dialectically mediated. This state of affairs however does not amount to any automatically self-reproducing totality; it is riven by crises of accumulation, social reproduction and spatial production, which threaten its demise:

The moment at which space becomes predominant, i.e. when a dominant (political) space is constituted, is also the moment when production no longer spontaneously and blindly guarantees the reproduction of social relations. Although necessary, reproduction inside the corporation (investments and amortizations) and beyond (reproduction of the labour force in and by the working-class family) is no longer sufficient. The primary role of the modern State is to prevent the collapse of the edifice that extends from the labour force to the political caste – to maintain a hierarchized system of places, functions and institutions. (1991 [1974]: 242)

POLITICAL ECONOMY AND URBAN SPACE

In *The Urban Revolution*, Lefebvre (2003 [1970]: 159–160) mentions in passing ‘real estate (speculation, construction) in neocapitalist society’, which ‘functions as a second sector, a circuit that runs parallel to that of industrial production’, the primary circuit of commodity production, ‘which serves the nondurable assets market, or at least those that are less durable than buildings’. Urbanism, he says, ‘is situated at the intersection of these two sectors (the production of movable goods and the production of real estate)’, but in a way that ‘conceals that intersection’. Crucially, in the face of crises of accumulation:

[t]his second sector serves as a buffer. It is where capital flows in the event of a depression, although enormous profits soon slow to a trickle. In this sector, there are few ‘multipliers’, spin-offs. Capital is tied up in real estate. Although the overall economy (so-called domestic economy) soon begins to suffer, the role and function of this sector continue to grow.

As the principal circuit – current industrial production and the movable property that results – begins to slow down, capital shifts to the second sector, real estate. It can even happen that real-estate speculation becomes the principal source for the formation of capital, that is, the realization of surplus value. (Lefebvre, 2003 [1970]: 159–160)

Not an insignificant portion of Harvey's legendary contribution to radical geography and Marxist political economy lies in his detailed elaboration of this prescient point made by Lefebvre. As readers of *Limits to Capital* (Harvey, 2018a [1982]) would attest, it is in this path-breaking book that Harvey fully fleshes out his highly influential theorization of the 'spatial fix' as a contribution to crisis theory, in the midst of a powerful exegesis, reconstruction and extension of Marx's *Capital*. One measure of the versatility of this concept is its explanatory force well beyond the scale and temporality to which it initially referred, as demonstrated by Giovanni Arrighi's (2004) adoption of the notion of 'spatio-temporal fix' in conjunction with a couple of Harvey's related conceptual contributions, 'switching circuits' and 'accumulation by dispossession', to account for political-economic-military struggles over the shifting hegemonies of historical capitalism. If Harvey himself switched scales from the urban to the world-historical in *The New Imperialism* (2003) while reviving Marx's concept of 'so-called original accumulation', then in more recent works from *Rebel Cities* (2012) to *Marx, Capital and the Madness of Economic Reason* (2018b), a dialectical bridging of the urban and the global scales is more apparent, for example, in his writings on the 'urban roots of the financial crisis' of 2007 and on the contemporary relevance of Lefebvre's notion of the 'right to the city'.

A similar range of spatial scales figures in the work of Harvey's ground-breaking student Neil Smith, whose *Uneven Development: Nature, Capital and the Production of Space* (2008 [1984]) is possibly the most original Marxist theoretical work to emerge from the academic discipline of geography. The concept of uneven development, first elaborated by Lenin and Trotsky in the context of debates about the possibility of a socialist revolution in Russia, is extended by Smith with impressive imagination, to address a broad range of questions operating at different spatial scales, from the dynamics of gentrification in 'revanchist cities' to the dialectics of nature-society relations. By radically revisiting Marx's concepts of nature and capital in relation to society and space, Smith anticipates a subsequent generation of critical political-ecological writers such as John Bellamy Foster, Jason Moore and Andreas Malm.

THE HOUSING QUESTION

In *Marxist Thought and the City* (2016 [1972]), Lefebvre suggests that although Marx and Engels seriously engaged the politics of space in their conception of historical materialism, they presented their thoughts on this subject in a scattered rather than systematic way. Yet some of their works on space are well known and

still inspire both scholars and activists. Perhaps the most significant among these is their first, Engels' (1958 [1845]) *The Condition of the Working Class in England in 1844*, which Mike Davis credits as the prime inspiration for his ground-breaking trilogy on Los Angeles – *City of Quartz* (1990), *Ecology of Fear* (1998) and *Magical Urbanism* (2000), now benchmarks of radical urban studies. Engels' old classic still remains instructive for historical materialists, as it vividly illustrates how he 'discovers Marxism' in and by means of the city and its relationship to the countryside, even before properly beginning his life-long collaboration with Marx. It also helped Marx to become a historical materialist, if not a Marxist.

Upon encountering a novel socio-spatial reality triangulated by emergent bourgeois social relations, industrial technology and rapid urbanization, Engels possessed the good sense in that situation to *not* make a contrived distinction between urban struggle (living conditions) and class struggle (working conditions) en route to socialism. This organic unity between urban and class struggles was later seen most paradigmatically by Marx and Engels in the Paris Commune, which both Lefebvre and Debord understood as an urban revolution as much as a social(ist) revolution. Yet some of this socio-spatial common sense has been lost in the mainstreams of both socialism and urbanism, as proletarian parties tended to focus on the factory floor and experts of space took over matters of city and country into their own economic-corporate hands. Engels' post-Commune tract *The Housing Question* (1872/1873) could be read as a prophetic response to this kind of separation of the social from the spatial, i.e. the divorce of critical spatial struggles from radical socialist movements, to the detriment of both. For here he warned: 'it is not that the solution of the housing question simultaneously solves the social question, but that only by the solution of the social question, that is, by the abolition of the capitalist mode of production, is the solution of the housing question made possible'; the *bourgeoisie* cannot therefore solve the housing question, but can only move it around.

The point is pertinent even today for urban activists confronting issues of gentrification, affordable housing and their 'right to the city', as David Madden and Peter Marcuse argue in *In Defense of Housing*:

We take from Engels the idea that the housing question is embedded within the structures of class society. Posing the housing question today means uncovering the connections between societal power and the residential experience. It means asking who and what housing is for, who controls it, who it empowers, who it oppresses. It means questioning the function of housing within globalized neoliberal capitalism. (2017: 6)

The socio-spatial dialectic of *The Housing Question* has become ever more relevant, as 'housing and urban development today are not secondary phenomena', but rank among 'the main processes driving contemporary capitalism' (2017: 8). Following Engels, who registered with unparalleled force the nefarious consequences of 'the commodification of housing', Madden and Marcuse add that the

latter no longer serves as a mere ‘infrastructure for living’, but functions also as ‘an instrument for financial accumulation’ (2017: 26). Yet in their view ‘no other modern commodity is as important for organizing citizenship, work, identities, solidarities and politics’ (2017: 12); moreover, ‘in all social settings, dwelling space structures power relations’, so that ‘it can be used to maintain the social order, or to support challenges to it’. To the latter end, the most potent reading of the ‘housing question’ has come in effect from socialist feminists such as Lise Vogel (2013 [1983]), Tithi Bhattacharya (2017) and Sue Ferguson (2019), who have clarified its umbilical connection to what was once called the ‘woman question’, with reference to the sexual division of labour traversing the relation between working and living conditions detected by Engels. Due attention to problems concerning ‘social reproduction’ has led not only to inquiries into the fundamentally gendered nature of the restructuring of late-capitalist social space and everyday life, as exemplified in Massey’s trail-blazing work *Space, Place and Gender* (1994), but also to a spatial question essential for socialism famously raised by Dolores Hayden (1980): ‘What Would a Non-Sexist City Look Like?’.

SPACE AND REVOLUTION

These insights on the dialectically mediated relation between the social and the spatial also shed useful light on a series of iconoclastic attempts to revolutionize the world by a range of radical architects and urban planners, often mislabelled modernist and almost universally derided in the ‘postmodern’ academic discourses of architecture and urban planning for their alleged sin of totalizing and totalitarianism. What actually happened with such attempts to change the world is better approached by way of the words of the protagonists themselves. In *Towards a New Architecture* (1986 [1923]), Le Corbusier reflected on the epochal crisis of interwar Europe – discerned by him above all in the problems of actually existing urban space, which had not kept up with the emancipatory potential offered by the technologies of the Second Industrial Revolution and the sense of possibility of political revolution that was in the air – with a poignant question: ‘Architecture or Revolution?’. And he responded provocatively to his own question in the famous last words of this classic of modern architecture: ‘Revolution can be avoided’ (1986 [1923]: 289). The message, in case anyone missed it, was that architecture and urban planning could resolve the urgent problems of Europe, without having to bother with revolution. This formulation of Le Corbusier advances the antithesis of Engels’ inescapable conclusion in *The Housing Question* (1872/1873) and it is still typical of so many experts who fetishize space, abstract spatial form from social form and bypass radical politics – by means of not modernism but modernization.

In that interwar historical conjuncture, modernism – as Perry Anderson (1984) argues in a review of Marshall Berman’s influential book on modernity *All That*

Is Solid Melts Into Air (1982) – consisted of radical innovations in three related domains: art (futurism, constructivism, cubism, surrealism), technology (automobile, airplane, telephone) and politics (communism, anarchism, fascism). It is the explosive fusion of this triad in Germany, Italy, France and especially the nascent Soviet Union that defined the moment of modernism in Europe, as vividly recounted in *Town and Revolution* (1970 [1967]) and *Changer la vie, changer la ville* (1975) by Anatole Kopp – who inspired Lefebvre to intervene critically in numerous debates and projects on architecture and urbanism, as Lukasz Stanek (2011) has impressively documented. Surveyed by Kopp, who understood that ‘modernism is not a style but a project’, and by other kindred spirits such as Owen Hatherley in *Militant Modernism* (2009), are more than a handful of architects and planners who aligned – under the auspices of a radical conjunction of art, technology and politics – their vocation with that of revolution. Their thinking found expression not in a question but a slogan: ‘Architecture and Revolution!’. But how did their attempts to change the world – both space and society – miscarry?

The answer lies in the withering away of the revolution rather than the state or capital, which robbed radical modernism of its essential political dimension, leaving art and technology in a state that made them liable to rapid cooptation by capital and the ‘state mode of production’, upon the Stalinization of the Soviet bloc and the consolidation of what Gramsci called ‘Americanism and Fordism’ in the overdeveloped capitalist world. The result of that was modernization, not modernism. Varieties of the modernist project of changing both spatial and social relations persisted, however, in the interstices of post-war capitalist hegemony – from the urban activism of the Situationist International through the alliances of workerist and autonomist tendencies in Italy with radical architects such as Aldo Rossi and Manfredo Tafuri documented in Pier Vittorio Aureli’s *The Project of Autonomy: Politics and Architecture Within and Against Capitalism* (2008) to the Occupy Movement, even if the capacity of these mobilizations to approximate anything like the Universal Republic – a ‘confederation of free peoples’ (Ross, 2015: 35) – envisaged by the Communards remains in dispute.

COUNTRY, CITY, COMMUNISM

The socio-spatial dialectic of Marx and Engels, while predating its reincarnation in Soja’s 1989 *Postmodern Geographies* by more than a century and half, also addressed in some detail the historical geography of emergent capitalism. ‘The division of labour inside a nation’, they wrote in *The German Ideology*, ‘leads at first to the separation of industrial and commercial from agricultural labour, and hence to the separation of town and country and to the conflict of their interests’ (Marx and Engels, 1998 [1845]: 38). In this text, the authors linked the social division of labour of successive modes of production to the evolving spatial

forms of town and country and the political–economic–military relations between them. Even ‘the most important division of material and mental labour’ correlates in their view with ‘the separation of town and country’, which ‘begins with the transition from barbarism to civilisation ... and runs through the whole history of civilization to the present day’. In the course of the latter, as capitalism becomes the dominant mode of production, ‘the separation of town and country can also be understood as the separation of capital and landed property’ (Marx and Engels, 1998 [1845]: 72). Concomitantly, ‘universal competition’ in the ‘modern world market’:

[p]roduced world history for the first time, insofar as it made all civilised nations and every individual member of them dependent for the satisfaction of their wants on the whole world, thus destroying the former natural exclusiveness of separate nations. It ... took from the division of labour the last semblance of its natural character ... and resolved all natural relations into money relations. In the place of naturally grown towns it created modern, large industrial cities which have sprung up overnight ... It completed the victory of the town over the country. (Marx and Engels, 1998 [1845]: 81–2)

In their survey of ‘the contradiction between town and country’, Marx and Engels maintain that it ‘can only exist within the framework of private property’, while insisting that ‘the abolition of the contradiction between town and country is one of the first conditions of communal life’ (Marx and Engels, 1998 [1845]: 72), i.e. communism. Readers of *The Manifesto of the Communist Party* (Marx and Engels, 1848) will recognize the same point in a famous – if controversial, given its apparent Eurocentric and metropolitan bias – passage:

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilized ones, nations of peasants on nations of bourgeois, the East on the West. (Marx and Engels, 1848)

While *The German Ideology* (1998 [1845]) conceived of the passage from ‘barbarism to civilization’ as a socio-spatial process involving the contradictory city–country relation, the broader historical-geographical sketch of the *Manifesto* (Marx and Engels, 1848) adds a telling scalar perspective to it. Now the basic spatial structure of capitalism stretches across several scales, from the more close-to-home country–city separation through the borders between unequal nations to a worldwide East–West divide – suggesting a multi-scalar extension of the centre–periphery form that territorializes capitalism as a mode of imperialism and colonization. The seeds of a theory of combined and uneven development are also present in the *Manifesto*, as is the recognition that communism must produce its own space, in anti-colonial and anti-imperialist opposition to the bourgeoisie that runs amok around the world to remake it ‘in its own image’. Hence the ninth item in the ten-point programme briskly laid out in the *Manifesto*, demanding the ‘gradual abolition of the distinctions between town and country’.

SPACE, CULTURE, HEGEMONY

Few have studied the town–country relation more fruitfully than Raymond Williams in *The Country and the City* (1973). This magnificent book, British Marxism’s pre-eminent work on space, begs to be read alongside Lefebvre’s writings. For it addresses nothing less than the role played by the production, representation and experience of *space* in the exemplary – and contentious – development of capitalism in England. Williams extracts here the historical–cultural–political–economic geography of the latter, in a peerless exercise of imaginative interpretation, from two of the most loaded words in the English language: country and city. The essence of the ‘underlying social, economic and historical’ analysis of this work is best summed up in its author’s own words: ‘My central case in *The Country and the City* was that these two apparently opposite and separate projections – country and city – were in fact indissolubly linked, within the general and crisis-ridden development of a capitalist economy which has itself produced this division in its modern forms’ (Williams, 1989: 227).

In his narrative of the latter, Williams’s awareness of what happened in his own country – like Marx and Engels in the *Manifesto* – is refreshingly global. And it is palpable even or especially in his treatment of that most iconic concentration of social and symbolic power in the English landscape: as Robin Blackburn (1989: xi) observes, Williams unearths in no uncertain terms ‘the process of capitalist despoliation at home and colonial slavery abroad behind the culture of the English “country house” and the conventions of a pastoral mode that conjured them away’ (see also Williams, 1989). Indeed, ‘much of the real history of city and country, within England itself, is from an early date a history of the extension of a dominant model of capitalist development to include other regions of the world’ (Williams, 1973: 279). Thus the much admired ‘country-houses which were the apex of a local system of exploitation’ in fact ‘had many connections to distant lands’, being if not becoming ‘country-houses of capital rather than land’ (1973: 280, 282).

Though his focus is on English literature, Williams’ perspective therefore does not spare the radical socio-spatial transformations witnessed in the colonies themselves, as relations between them and the colonizing countries shifted from a predominantly mercantile mode of metropolitan profiteering to one premised on what Marx called ‘so-called original accumulation’, typically coupled with the ‘development of underdevelopment’ (Frank, 1978) and ‘core–periphery’ relations characteristic of the ‘modern world system’ (Wallerstein, 2004). Williams refers in this regard to ‘the slave trade from Africa’, ‘the new rural economy of the tropical plantations’ and other forms of colonial dispossession recorded in the novels of R. K. Narayan, Mulk Raj Anand, James Ngugi, Elechi Amadi, Chinua Achebe and Wilson Harris, urging English readers to read *these* authors in order to ‘get a different and necessary perspective’ on their *own* country that they will not find in Kipling, Forster or Orwell (Williams, 1973: 282, 285).

As to what this relationship between England and ‘distant lands’ has to do with Williams’ key terms of analysis, he is abundantly clear: ‘one of the last models of “city and country” is the system we now know as imperialism’ (1973: 279). This recalls a striking formulation by Lefebvre (1976–1978: 174) in *De l’État*: ‘Wherever a dominated space is generated and mastered by a dominant space – where there is periphery and centre – there is colonization’. Williams’ ‘cultural materialist’ approach to the English experience of capitalism also suggests a methodological and thematic kinship with Antonio Gramsci, whose acute spatial sensibilities are generally submerged in the secondary literature – Stefan Kipfer (2013, 2017) being an excellent exception. The city–country relation was a longstanding strategic preoccupation for the Sardinian Marxist too, as his influential essay *Some Aspects of the Southern Question* (Gramsci, 2005 [1926]) reveals with regard to the problem of hegemony, i.e. the need for an alliance of urban workers and rural peasants to combat fascism with communism. Kipfer’s (2017) sharp view of Gramsci’s experience of that Italian conjuncture is not without contemporary relevance in much of the world:

Given his biography and his political trajectory from Sardegna to the Piemonte, the Southern Question had to impose itself upon Gramsci one way or the other. But it is of course true that he elevated this question, which is itself criss-crossed in complex ways by the city–country question, to the highest strategic importance ... *Southern Question* (1926) was a response to the reality of Mussolini’s fascism ... Mussolini’s hordes managed to impose themselves not the least due to the defeat of the Factory Council movement of 1919–1920 and the latter’s relative isolation from other subaltern spaces in Italy. The rise and temporary consolidation of Italian fascism illustrated to Gramsci how uneven development in Italy was not only a structural limit on bourgeois rule but also a problem with deadly consequences for socialist and communist politics and the capacity of the proletariat to exercise leadership.

WHITHER SPACE?

The essential insight for historical materialism to draw from Lefebvre, Williams, Gramsci and kindred spirits is simple: as Kipfer (2017) puts it, the point is to ‘discuss space dialectically, as a product of history and an active historical force’. The tendencies to avoid, consequently, should be equally clear: either to neglect or to fetishize space. Massey’s (1994: 269) words are therefore apt: ‘the spatial is integral to the production of history, and thus to the possibility of politics, just as the temporal is to geography’. In relation to these propositions, three lessons on space from Lefebvre are especially worth remembering. First, it is unwise and in any case erroneous to think of Marxism’s approach to space as merely ‘political economic’, not least because in advanced capitalism space is not just one commodity among others, but the necessary basis of commodification itself; and because the production of space is essential for the reproduction of labour power and social relations, as well as for the appropriation of ‘nature’. Second, the production of space is a decisive mediation of totality, the level of social reality at which the rubber of state and capital hits the road of everyday life, which also

opens up the possibility of the former being mortally punctured and deflated by the latter, ideally in line with the communist project of ‘the withering of the state’ and generalized *autogestion*. Third, space is physical, social and mental, all at once. Indeed, the signal methodological achievement of *The Production of Space* (Lefebvre, 1991 [1974]) is the radically holistic perspective it brings to the study of space, seamlessly integrating into a single inquiry the historical varieties of ‘lived’, ‘perceived’ and ‘conceived’ space, to speak in Lefebvre’s celebrated terms. In other words, the subject of space disobeys the boundaries between academic disciplines, revealing their provincialisms. The political corollary and implication of this undisciplined nature of space is more promising. Not only does the consideration of space usefully broaden our conception of the terrain of radical political struggle, from the factory to the prison to the kitchen to the city to the nation to the body to ‘nature’, not to speak of the powers of logistics and infrastructures connecting and separating them, as Deborah Cowen (2014) and Laleh Khalili (2020) have shown us; but the focus on space also establishes productive links between otherwise disparate sites, issues and activists, strengthening the grounds of radical political solidarity, but with close attention to Massey’s (1994) conceptualization of ‘power geometry’, which explains how the capitalist reformatting of time–space works to the advantage of some at the expense of others. But the political point of all this is clear enough: the multitude of struggles over space today is integral to the choice between the actually existing and other possible worlds. The stakes of adequately registering space as a decisive mediation of totality – with new implications for the politics of time as well – are aptly captured in a rhetorical flourish by Fredric Jameson (2015: 130–131) on the ‘preponderance of space over time in late capitalism’:

The political conclusion to draw from this development is plain: namely, that in our time all politics is about real estate; and this from the loftiest statecraft to the most petty manoeuvring around local advantage. Postmodern politics is essentially a matter of land grabs, on a local as well as global scale. Whether you think of the issue of Palestine or of gentrification and zoning in American small towns, it is that peculiar and imaginary thing called private property in land which is at stake. The land is not only an object of struggle between the classes, between rich and poor; it defines their very existence and the separation between them. Capitalism began with enclosure and with the occupation of the Aztec and Inca empires; and is ending with foreclosure and dispossession, with homelessness on the individual as well as the collective level, and with the unemployment dictated by austerity and outsourcing, the abandonment of factories and rustbelts. Whether you think of the dispossession of peasants to make way for industrial parks, or of ecology and the destruction of rain forests; whether you think of the abstract legalities of federalism, citizenship and immigration, or the politics of urban renewal and the growth of *bidonvilles*, *favelas* and townships, not to speak of the great movements of the landless or of Occupy – today everything is about land.

Alienation

Amy E. Wendling

ORIGINS OF THE CONCEPT OF ALIENATION IN POLITICAL ECONOMY AND SOCIAL CONTRACT THEORY

The concept of alienation has two distinct origins. The first is eighteenth-century political economy and social contract theory. The second is theological. Following Hegel, Marx powerfully synthesizes these origins into a concept of enduring reach, gravity, and explanatory power.

The German term *Entäußerung* is the decisive beginning for the development of the concept of alienation in Hegel and Marx. Lukács writes that, in Hegel, *Entäußerung* translates an eighteenth-century English word into German (1975: 538). Sean Sayers follows him in this, emphasizing especially the definition of alienation as, on the one hand, the sale or transfer of a commodity and, on the other, the relinquishment of a right or freedom into the social contract structure (2011: ix). In both English and French, where it is a cognate, the concept of alienation translated by Hegel includes both the transfer of concrete goods, like chattels, and the transfer of abstract goods, like rights. Because of this capacity, the concept of alienation links two exemplary eighteenth-century discourses: political economy and the social contract. The capaciousness of the concept ripens it for the additional transformations it will undergo in Hegel's usage.

The *Oxford English Dictionary's* entries for *alien*, *alienable*, *alienate*, *alienating*, and, finally, *alienation* can help us to map the terrain of the concept. In all cases, usage begins in the fourteenth century, and so in early modernity.

The concept binds together two distinct, though related, ideas. The first of these is the idea of emotional estrangement: especially, though not exclusively, with regard to a political body. The second idea is explicitly about the transfer of property, best understood against the backdrop of the first idea. The notion of being estranged or withdrawn in feeling and affection is elaborated in the seventeenth and eighteenth centuries with examples taken from political discourse. In Clarendon's 1674 usage, 'the hearts of the King's subjects were not "alien'd" from their duty to the King' (*Oxford English Dictionary*, 1989: 315), but by 1770, Edmund Burke worries that discontents 'grow every day into alienation from this country' (*Oxford English Dictionary*, 1989: 316). But the usage is not limited to political discourse. As early as the fifteenth century, alienation of the mind is a synonym for madness.

In the eighteenth century, Rousseau's social contract theory requires 'the total alienation [*alienation*] to the whole community of each associate with all of his rights' (2002: 163; 1822: 17). Conversely, Thomas Jefferson's version of Locke's natural law theory, which speaks of 'unalienable' rights, limits alienation into a sovereign power (1776). Locke himself does not actually use the concept of alienation in the *Second Treatise* to describe the transfer of rights to the social body (Simmons, 1983: 185). He prefers instead a vocabulary of 'quitting' and 'resignation' of natural powers (1960: 324), and then only after his discussion of property. Locke does, however, use the concept of alienation in the *First Treatise*, where he writes, 'a Father cannot alien the Power he has over his Child, he may perhaps to some degrees forfeit it, but he cannot transfer it' (1960: 214; quoted in Simmons, 1983: 186). In this usage of the term, 'to alien' – and later, 'to alienate' – is 'to transfer the property or ownership of anything; to make over to another owner' (*Oxford English Dictionary*, 1989: 315).

As we have seen, the concept of alienation can govern both concrete and abstract property claims, and still more abstract entities, like the rights that are increasingly determinate for modern selves. The sentiment behind the earliest usage, in 1413, where 'a servant may make no testament ... to alyene any goods out of his lord's hands' (*Oxford English Dictionary*, 1989: 315), captures all of these dimensions. In this case, the good may be a chattel, but the testament is the right to say what becomes of it. The usage is repeated by Adam Smith in 1776: 'the vassal could not alienate without the consent of his superior' (*Oxford English Dictionary*, 1989: 315). In this case, a consent structure makes it possible to deputize the right to alienate. Whether a concrete or abstract good is subject to the alienating act is unclear: both are possible. Various other entries make it clear that it is possible to transfer money, titles, lands, and offices, elucidating some of the conditions of legitimacy and illegitimacy that qualify these transfers. Finally, it is possible to transfer persons. Hobbes writes, in 1651, that 'The Lord may sell his Servant, or alienate him by Testament' (*Oxford English Dictionary*, 1989: 315).

Many of these examples suggest that the transfers they describe might somehow be improperly conducted or suspect. This is already very clear in the discussions of how one should feel about king and country, and in Rousseau's demand that alienation should be total. But notice that the examples from the domain of

property law also carry this suspicion. Who can alienate what to whom, and under what conditions, is a staple feature of these discussions of alienation. Significantly, the contrast between master and servant also emerges in many of the examples. Discussions of rights, their transfer, and the conditions of the transfer's legitimacy have a relationship to status. The move from the act of alienation, which deploys a verbal form of the concept, to an alienated state, which deploys a substantivized, nominal form, marks an important transition. Such a form is already at work as early as the mid fifteenth-century, as evidenced by the earliest example in the 'alienation' entry, from 1430. A king slain in his bed has his title extorted, and a false succession ensues, enabled by this 'alyenacyon' (*Oxford English Dictionary*, 1989: 316). In the substantivized nominal form, alienation harbours a suspicion about the transfer of power: the example is regicide, and so could not possibly be more extreme.

Thus the idea that Hegel translates has significant conceptual content, even prior to his development of the term. Alienation is an emotional estrangement to which political transactions make one especially vulnerable. It is also transfer – but when it is transfer, it is potentially suspect. We see this very evidently in the way Hegel – and, following him in this, Marx – deploys a concept of alienation that firmly binds all of these senses of the concept together. Indeed, Hegel identifies emotional imbalances that are a result of changes to the modern work process. These imbalances impact the transfer of rights, both within the work process itself and within social relations more broadly. Hegel understands that abstract rights are nearly always tied to the concrete human practices that make humans rights-bearing in the first place: especially to property and contract and, beneath this, to the material forms of work and labour. In this limited way, he resembles Locke. In order to describe Hegel's account of labour, Sayers draws our attention to a set of passages from Hegel's *Aesthetics* which are rarely attended to but which do indeed contain some of his richest accounts of labour and its accomplishments (2011: 26–9). Here Hegel imagines both alienated and unalienated ways of relating to the work process. Importantly, Hegel explicitly recognizes that alienation is possible both for the poor and the wealthy in the modern world (1975: 260).

The passage Sayers draws on most extensively comes from a section focused on the nature of externality and external expressions of ideals (1975: 244–8). The idea of externality being explicated, unsurprisingly, is *Äusserlichkeit* in the original German (1842: 306), and so shares a key root with *Enttäusserung*. The more straightforward translation for the basic English term 'alien', '*fremd*', is also in the passage as a descriptor of what modern citizens must rely upon for their needs (1842: 327). Here Knox misses an opportunity to underscore this by opting for 'foreign' over 'alien'. Hegel writes:

the individual is not at home even in his immediate environment, because it does not appear as his own work. What he surrounds himself with here has not been brought about by himself; it has been taken from the supply of what was already available, produced by others, and acquired by him only through a long chain of efforts and needs foreign [*frem*] to himself. (1975: 260)

Drawing on a set of passages from the Jena manuscripts, Lukács draws our attention to the ways in which Hegel realizes the effects of introducing machinery to the work process. If you had to guess the author of the following passage, it would be tempting, though incorrect, to guess Marx: ‘For the more he profits from the machine ... the more degraded he himself becomes ... the abstraction of labour ... dulls his mind and his senses’ (Hegel in Lukács, 1975: 330–1). Ultimately, Hegel criticizes the notion of a social contract altogether. This comes out very clearly in the *Philosophy of Right*, where he considers, and then rejects, the possibility of the alienation [*Entäusserung*] of the personality and substantive being that Rousseau embraces (1991: 96; 1911: 67–8). Hegel argues that the kinds of rights captured in the social contract are inalienable [*unveräusserlich*]; responsible beings may be able to contemplate their capacity for rights and their ethical and religious rights in a practical context, but they cannot permanently alienate such fundamental aspects of their being (1991: 96; 1911: 67–8).

The concept of alienation that Marx will develop, albeit with a much more acute understanding of the complex development of capitalist modernity, begins here. In the loss of self-recognition that accompanies modern labour processes, workers and capitalists alike become estranged or withdrawn emotionally, both in relationship to the political body and to their own bodies – a state of being that, as we shall see, is still usefully associated with madness. Marx also imports the suspicion about potential unfairness in transfers of right, especially in contract. Even though the labour contract is *prima facie* neutral and thus fair, by giving up his or her working day to the capitalist for the pittance of a wage, the worker relinquishes too much. As for the social contract, Marx will argue that it only advances bourgeois property interests and then feeds these limited interests back to us as if they were universally normative. Thus Lukács and Sayers are correct to situate the origins of the concept of alienation in an eighteenth-century term that is translated into German by Hegel as *Entäusserung*. As we have seen, however, even prior to Hegel this term is already very rich, binding together the discourse of political economy with that of the social contract – and with a hint that something improper may be afoot.

THEOLOGICAL ORIGINS OF THE CONCEPT OF ALIENATION

To translate is never simply to translate. In the move to German, the concept of alienation becomes enriched by a resonance that is not present in English or French. As Robert Pippin reminds us, *Entäusserung* was Luther’s translation of the Ancient Greek term *kenosis* (2018). The relevant passage from the New Testament, Paul’s letter to the Philippians, is as follows:

Let the same mind be in you that was in Christ Jesus, who, though he was in the form of God, did not regard equality with God as something to be exploited, but emptied himself [ἐκένωσεν], taking the form of a slave [μορφή δοῦλον λαβών], being born in human likeness.

And being found in human form, he humbled himself and became obedient even to the point of death – even death on a cross. (Philippians 2: 5–11; Coogan, 2010: 2064; Ancient Greek from the Nestle-Aland, 1986: 517)

The concept of *kenosis* elaborates an emptying of the high into the low. Indeed, the high and the low are bound together here, since it is only by a passage through the low that the high will become exalted. Marx's account of alienation will retain the structure of passing through the low in order to reach the high. As Sayers puts it:

[Marx] does not regard alienation and the disharmony of modern society as a merely negative condition. Rather its impact is contradictory. Although it results in the division and fragmentation of people, at the same time it is also the means by which individuality, subjectivity, and freedom develop. (2011: 13)

In the passage from Philippians, two concepts define the act of incarnation: first slavery, and then death. The slavery reference is very important, as it is here that the concept of *kenosis* will be open to an assimilation to that of labour. Both slavery and death are used to explain what it means to take human form. They are the exemplary markers of the human. Indeed, the passage already prescribes the two great modern ontologies of the human that will emerge in German idealism, one based on labour and the other on being-towards-death.

Here is Luther's German translation:

Seid so unter euch gesinnt, wie es auch der Gemeinschaft in Christus Jesus entspricht: Er, der in göttlicher Gestalt war, hielt es nicht für einen Raub, Gott gleich zu sein, sondern entäußerte sich selbst [ἐκένωσεν] und nahm Knechtsgestalt an [μορφή δοῦλον λαβών], ward den Menschen gleich und der Erscheinung nach als Mensch erkannt. Er erniedrigte sich selbst und ward gehorsam bis zum Tode, ja zume Tode am Kreuz. (1999: 227)

We see *kenosis* being translated by Luther as *Entäußerung*, here with a reflexive construction. We see the Ancient Greek word for slave translated as *Knecht*. Only here can Hegel's famed dialectic from the *Phenomenology* resonate with its fullest range, as *Herrschaft und Knechtschaft*. This textual lineage also supports a point that Paolo Diego Bubbio makes conceptually when he elaborates the correlation between *kenosis* and all of the major themes of Kantian and post-Kantian idealism (2014). As Chris Arthur writes,

Entäußerung is a rather unusual German word ... the root 'äußerung' means manifestation (from *äusser* – 'outer') and the prefix 'Ent' indicates establishment of or entry into a new state or relinquishment of an old state; thus, in combination, the sense is that something is manifested in such a way as to change its state. (1986: Appendix)

Here remembering the *kenotic* resonance of the term is essential to understanding its functioning.

As with *Aufhebung* – to which it related – *Entäußerung* will be enormously important to Hegel. As Lukács writes, 'In the *Phenomenology* the term *Entäußerung* is deployed at a very high level of philosophical generality. It has

flown far above its original use in economics and social theory' (1975: 538). It is precisely the kenotic basis for *Entäußerung* that causes it to transcend its original usage. In English translation, however, this usage is not particularly easy to track. The term *Entäußerung* is variously rendered as externalization, alienation, and even as relinquishment (Arthur, 1986: appendix). Interestingly, Miller's translation inserts 'kenosis' as an explanatory term for *Entäußerung* in the final paragraph of Hegel's *Phenomenology*. The German '*diese Entäußerung, ist ebenso die Entäußerung ihrer selbst*' (1970: 590) is rendered as 'this externalization, this kenosis, is equally an externalization of itself' (1977: 492). Miller inserts the Greek term in order to capture the sense the German term carries with it in Hegel's usage.

Lukács (1975: 537–67) and Arthur (1986: chapter 5) both draw our attention to this very same final paragraph of the *Phenomenology*. Here *Entäußerung* is deployed in its full richness and in its deepest connection with other concepts. Transformation occurs in cycles of self-externalization and contemplative re-internalization. In both Hegel and Marx, this becomes the model for labour. Indeed, some of the problems of capitalist labour emerge because work acquires a divided and abstract form that renders its contemplative re-internalization impossible. Labour under capitalism can never know itself in all of its fullness; it knows itself only partially and through abstraction. Accordingly, it can never achieve the fulfilment of perfectly knowing its substance. It goes out without ever coming back.

In Hegel, kenotic self-transformation occurs both in a context of repetition and in one of progressive development. Spirit feels that it has to begin anew each time, but it does so on the basis of what came before, even when it cannot or does not recognize this. We are already not very far from Marx's idea, from the *German Ideology*, that humans produce their lives based on what they find in existence and have to reproduce these lives as a condition of transforming them (1978b: 150). In the final paragraph of the *Phenomenology*, Hegel uses the concept of *Aufhebung* as a name for the raising up that follows *Entäußerung*, understood as kenosis. He also reflects on temporality, conceived as the duration that necessarily accompanies kenotic transformation. Lastly, he specifically invokes Christ. Any given historical political realm [*Reich*] expresses the reign of God on earth only incompletely. This is Hegel's political interpretation of kenosis, of what it means for God to be poured out into the world. Hegel takes up the same issue, albeit with a different goal, in his account of nature. At the very end of the passage Hegel also addresses the question of why God would need to undergo kenosis: without kenosis God would be lifeless, alone, and finite. On Hegel's account, God achieves infinity precisely by entering human finitude.

Feuerbach's very interesting claims about the anthropomorphic essence of Christianity must also be read with kenosis in mind (1957). For while Feuerbach definitively reverses the direction of who is emptied into what, the structure of emptying is the same. From this perspective, who is emptied into what first may matter less than Feuerbach seems to think. Already in the Christian anthropology, God somehow self-actualizes in a human form. The kenotic element occurs

because the two points, the high and low, mutually define one another. In light of this, the low defines and exemplifies the high long before Feuerbach decides to point this out.

A theme of Marx's work throughout his life is the issue of how one thing can be transformed into another – especially when its properties are hidden, obscured, or contradicted in some way by the transformation. The transformation theme goes beyond an analysis of appearance versus reality, since in transformation reality itself changes shape. The theme will run through numerous issues surrounding how labour functions in Marx's early work. It will still be one of the main theoretical mechanisms at stake when Marx diagnoses the commodity fetish in his later work. In light of this history, the most accurate characterization of Hegel and Marx's enduring achievement with the concept of *kenosis/Entäußerung* is their enormous synthesis of a range of modern discourses. They have put together the concept of *kenosis/Entäußerung*, as it was derived from Luther's theology, with the already very rich eighteenth-century concept of alienation, as it was derived from political economy and social contract theory. Alienation is thus an English and French concept that moved into German philosophy, and then returned home enriched by this contact, in tandem with Marx's own migrations. In the return home, the concept imports Hegel and Marx's synthesis of the German interpretation of *kenosis* as *Entäußerung* – originally in Luther, and later in German idealism more broadly – with the eighteenth-century idea of alienation that sets the transfer of rights, capacities, and goods alongside an imbalanced existential state.

Marx's transformation of the concept of alienation occurs most powerfully in his *1844 Manuscripts*: the definitive account of alienation in Marx, and one that will remain relevant throughout all of Marx's mature works. In the *1844 Manuscripts*, human beings as labouring beings will externalize their very substance in the labour process – indeed, we have no other substance beyond the capacity to develop in this process. However, in capitalist labour the cycle of re-internalization and self-contemplation will be blocked. Because labour builds not only objects but also a world, the blockage is existential and political in addition to material and epistemological. Marx will do the historical work to connect this blockage to well-researched details about eighteenth- and nineteenth-century industrial and commercial life. In light of that research, Marx will name the state in which all capitalist subjects dwell alienation.

ALIENATION IN MARX'S 1844 MANUSCRIPTS: FROM ENTÄUSSERUNG TO ENTFREMDUNG AND BACK

In the *1844 Manuscripts*, the concept of alienation develops, primarily, as a modifier for the concept of labour. This is because the concept of labour powerfully binds together the theological discourse with the discourses of political economy and social contract. The idea of labour attempts a purification of the

slavery concept, such that the status of the person performing the labour is no longer an issue. Bourgeois theories of right and its transfer cannot be explained without the concept of labour. Already in Hegel, the *Entäusserung* is used to describe labouring acts. In this context, it is set alongside several important companion concepts, especially *Entfremdung* (Arthur, 1986). This is also true in Marx. However, Marx will ultimately develop a distinction between *Entäusserung* and *Entfremdung*, albeit one that is subtle and can be difficult to see.

The title of the famous section on alienated labour from the *1844 Manuscripts* is '*Die entfremdete Arbeit*' (2000: 510). Here Marx uses the less abstract, more normative, term in order to capture the type of labour particular to the discourse of political economy and, more broadly, to capture the forms of work process increasingly characteristic of nineteenth-century life. In many passages, Marx will seem to use the *Entäusserung* and *Entfremdung* concepts synonymously or interchangeably. For example, he writes, 'Labour's realization is its objectification. In the conditions dealt with by political economy this realization of labour appears as loss of reality for the workers; objectification as loss of the object and object-bondage [*Verlust und Knechtschaft des Gegenstandes*], appropriation as estrangement [*Entfremdung*], as alienation [*Entäusserung*]' (2000: 512; 1978a: 71–2).

Though the terms thus appear to be interchangeable, this is imprecise. We have been told explicitly that we are viewing things from the perspective of political economy, that we have accepted its language and its laws (2000: 510; 1978a: 80). The terms are interchangeable only from this perspective. In fact, with *Entfremdung*, Marx seeks to highlight the important blockages capitalism creates in the *Entäusserung* process. As we learned from Hegel, on its own *Entäusserung* could be neutral or even positive, so long as it is accompanied by a suitable *Erinnerung* [recollection]. But when the form of labour is such that *Erinnerung* is impossible, *Entäusserung* only ever appears as *Entfremdung*. Even in the passage above that appears to take the terms interchangeably, the concept of alienation as *Entfremdung* precedes the concept of alienation as *Entäusserung*. The second concept does not explicate the first one so much as it is defined by it.

The use of the two terms and their derivatives in the *1844 Manuscripts* supports this reading. When the two terms occur together, *Entfremdung* precedes *Entäusserung* every single time. In addition, Marx very often qualifies *Entäusserung* as '*die Entäusserung der Arbeit*', and so as the alienation of workers undertaking a particular historical form of the work process. Marx calls work that is *fremd*, or alien, *feindlich*, or hostile (2000: 512, 519; 1978a: 72, 78). Such hostility is an extremely negative term that is thrice associated with the *Entfremdung* concept but never with the *Entäusserung* concept. Marx uses the *Entfremdung* concept about twice as frequently as he uses the *Entäusserung* concept. Finally, the *Entäusserung* concept returns at telling times, and especially when Marx is trying to measure how much damage alienation has done to how human beings are defined. For this reason, the term returns with some frequency when Marx is describing alienation's second moment, the alienation

from activity, and in the conclusion of the text when he returns to his critique of the key concepts of political economy. Marx's usage of the two terms thus backs up Sayers' thesis that for Marx, alienation is not a general existential or moral condition but a condition specific to capitalist social forms: one that is both an indictment of this society and a call for its overcoming (2011).

The point can be made with a greater degree of specificity. Alienated existential and moral conditions have been produced by capitalist society. Capitalist social forms also hide their own operations by imposing naturalizing definitions of human persons and social life. In its most complete form, capitalist alienation effectively portrays alienation as a general existential and moral condition, an ontology of the human. Similarly, it portrays alienated, abstract labour as an ontology of the human, abetted here by Christianity's associations between taking human form and the sufferings of labour and death. Once such a set of ontologies is in place, neither an indictment of society nor a call for its overcoming will have any place. And yet it is exactly such a call that Marx is issuing, and very strongly at this period of his thinking.

ALIENATION'S FOUR MOMENTS IN THE 1844 MANUSCRIPTS AND BEYOND

Because of their foundational importance for the concept of alienation, each of the four moments of alienated labour that Marx highlights in the *1844 Manuscripts* must be understood with some specificity.

The first moment of alienated labour is the alienation from the object of labour, and, relatedly, from the things one needs to survive. Marx makes the point poignantly, and jarringly, when he invokes the prospect of working hard while starving to death (1978a: 72). Labourers also no longer have the objects that they need to work: this will develop, in Marx's later work, into the discussion of who owns the means of production, such as tools and machinery. In addition, labour itself is hard to come by: the worker can get hold of it 'only with the greatest of effort and with the most regular interruptions' (1978a: 72). The worker's life substance becomes external to him or her, and the worker is given over to what Marx is already calling 'capital' alongside 'object-bondage' (1978a: 72). Marx develops the first moment analogously with the religious inversion from Feuerbach: just as we humans have put too much into God, not realizing it is only a projection of our own properties, so the worker 'puts his life into the object; but now his life no longer belongs to him but to the object' (1978a: 72). The religious analogies will continue throughout each of alienation's remaining aspects.

The point about object-bondage will ultimately reach full development in Marx's concept of the commodity, and in his discussion of the commodity fetish and its functioning in *Capital*. There he writes, 'the mutual relations of the producers, within which the social character of their labour affirms itself, take the

form of a social relation between the products' (1990: 62). In the following paragraph and rather more elegantly, Marx writes, 'There it is a definite social relation between men, that assumes, in their eyes, the fantastic form of a relation between things' (1990: 63). The issue of wage labour, or labour recompensed in the monetary form, is also relevant to the first moment of alienation. In the section from the *1844 Manuscripts* on alienated labour, the wage-labour concept appears, at the end of the text, as private property's counterpart from the perspective of the worker. Marx writes that 'the wage is but a necessary consequence of labour's estrangement [*Entfremdung*], for after all in the wage of labour, labour does not appear as an end in itself but as the servant of the wage' (1978a: 79). Money then mediates all relationships to the object of labour. I no longer use what I make, and I relate to the things I do use only via the intermediary of the money form. I have poured myself out, but I have returned only in a very partial, fractured, reduced, and abbreviated way. The consequence is alienation qua *Entfremdung*. Marx's observations on the functioning of money – and later, of its abstract form, value – will be important themes in all of his later work.

The second moment of alienated labour is the alienation from the activity of production itself. Here the *Entäusserung* vocabulary returns profoundly. It does so because Marx's description of this moment follows the *kenosis* structure, and explicitly: in the alienation of activity, the worker no longer belongs to his or her own essence [*nicht zu seinem Wesen gehört*] (2000: 514). For Marx, human essence is activity, praxis: the active shaping of the world in which we find our places. We have alienation when this activity becomes, first, boring, and so an insult to the spirit; second, physically damaging, and so an insult to the body; and, third, when the activity belongs not to myself but to someone else (1978a: 74). Marx then charts a consequence of this: I feel free only when I am not working, and so only in practice that Marx identifies with the lower-order functioning of animal being. In *Capital*, Marx will develop the notion of alienation from activity via the idea of work with machinery and the divisions of labour that such work both exemplifies and advances. The machines capitalism selectively develops hasten labour's deskilling and increase the physical damages of injury (1990: 344–73). Marx will develop the idea of the ownership of labour in his discussion of surplus-value: an excess of what is withdrawn over what is paid for (1990: 153–323). In the *Grundrisse*, Marx's historically unprecedented discussions of free time develop the idea of freedom as freedom from work (1973: 708). Here he envisions free time along with the capacity to use it well, especially in aesthetic and scientific practice.

Marx presents the third moment of alienation as an abstract consequence of the first two moments. In alienation, humans are prevented from participating in the universal construction of what it is to be a human being. This is not only the active shaping of the world in which we find our places, but the active, conscious, and free shaping of the concept of the human itself. When this participation is reduced to merely staying alive (1978a: 76), then humans produce only under the pressures of immediate physical need (1978a: 76). The claim that humans must

be forced to work is a result, a result that can be compared usefully with some of the dogmas of political economy. This result obscures a different concept of the human, one which defines the human as producing freely. Marx writes, ‘man produces only when he is free from physical need and only truly produces in freedom therefrom ... man also forms things in accordance with the laws of beauty’ (1978a: 76). In this case, humans are able ‘to contemplate themselves in a world that [they] have created’ (1978a: 76) – and not one that they have created under compulsion but freely, and with attention and design.

Alienated humans are thus separated from creating and re-creating the essence of the human being, what Aristotle called our second nature. Marx terms this aspect of alienation the alienation from human species-being. As Simon Skempton points out, the term ‘species’, present in both German and English, is rather unfortunate (2010: 101). Because the term has the overtones of biological determinism, it is easy to confuse what Marx is trying to capture here with its opposite. Marx is not arguing that there are set features of the human species that capitalist life erodes. He is claiming instead that the very idea of such set features is itself a product of alienation: capitalist life encloses the human species in a set of limiting definitions, especially those determinative of *homo economicus*.

In Marx’s later work, the third moment of alienation is taken over by two concepts: false consciousness and real subsumption. Marx explains the aetiology of false consciousness very succinctly in the *German Ideology*: ‘as individuals express their life, so they are’ (1978b: 150). If humans express their life only in the forms of alienated labour, then they are alienated. Marx develops the real subsumption idea in his manuscript work between the *Grundrisse* and *Capital*. Marx’s *Results of the Direct Production Process*, originally written in 1864, dates from this period (1994). It is one of the very few later texts in which Marx explicitly invokes the concept of alienation, and he does so multiple times in connection with the idea of real subsumption.

The real subsumption of labour by capital is a consequence of an earlier stage of capitalist development that Marx calls ‘formal subsumption’. In formal subsumption, capitalism imposes its forms on existing economic arrangements without yet altering the concepts by which those living in them operate: imposing especially money, including the wage form that conditions wage labour; machinery; the compulsion to overwork; and abstract domination. In such a configuration, Marx writes, ‘capital exists in particular subordinate functions, but not yet in its ruling functions’ (1994: 471). Over time, this produces pressures that advance and coordinate capitalism’s ideological functioning, and so its abilities to rule. In ‘real subsumption’, capital rules as an idea, and colonizes all of the relevant concepts, and especially the labour concept, with the norms it imposes. *Homo economicus* is taken as a natural given, and the market concept substitutes for the nature concept. The fantasy of labour becomes degraded and subordinate to the fantasy of instant, limitless monetary wealth.

Marx presents the fourth moment of alienation, the alienation of humans from other humans, as a consequence of alienation’s third moment. Alienated humans

do not live well in community with one another. Marx states the cause for this succinctly when he writes that ‘within the relationship of estranged labour, each man views the other in accordance with the standard and the position in which he finds himself as worker’ (1978a: 77). Working is, at once, the most degrading act in capitalism’s reality and the most elevated one in capitalism’s theory. These dual aspects of work are split and then projected across the fault lines of social class. This explains, on the one hand, ideas of hostility and degradation that are projected onto working persons. But, on the other hand, it also explains the esteem and elevation in which capitalists are held. In fact, workers loudly defend capitalists as if they had worked for their wealth: after all, why shouldn’t the gods be winged, just as they are (Feuerbach, 1957: 9)?

The division of humans into workers and non-workers is thus one aspect of how humans are alienated from other humans. The worker him or herself ‘begets the dominion of the one who does not produce over production and over the product. Just as [the worker] estranges himself from his own activity, so he confers to the stranger activity which is not his own’ (1978a: 78–9). Marx is already calling this figure the capitalist, using this new name for the master of labour, or *Arbeitsherr* (2000: 520). Marx’s discussions about political conflicts between workers and owners in *The Communist Manifesto*, *Wage Labour and Capital*, and *The Class Struggles in France* develop ideas begun here. They are also the basis for Marx’s discussion of the characteristics of the bourgeoisie. Before it breaks off, the section on alienated labour from the *1844 Manuscripts* makes a promise that it does not fulfil (2000: 518, 522; 1978a: 79, 81; Sayers, 2011: 28). Marx writes that non-working persons are also alienated. All social classes are subject to alienation, albeit in different ways. The path of self-actualization that *Entäußerung* could describe is also blocked for non-workers; they too receive the world of real subsumption as though it were a static fact; they too suffer from capitalist social forms.

Interesting work on the contemporary medical diagnosis of addiction, a privileged diagnosis of the twentieth and twenty-first centuries, shows that addiction plagues persons of all social classes (Svolos, 2017: 113–44). In his reading of Marx, Jacques Lacan ties addiction to what he calls ‘the discourse of the capitalist’ (1978): a repetitive search for satisfactions based on the commodity form. Addiction, literally, is to be spoken for in one’s essential being by something outside of oneself, and so to be alienated. It is experienced as a profound unfreedom, and by workers and non-workers alike.

TWENTIETH-CENTURY DEBATES ABOUT ALIENATION, LABOUR, AND FREEDOM

As we have seen, we get one kind of interpretation, not wrong but probably incomplete, when we think of Marx’s thought as originating in France, in the long shadow of the French Revolution. We get another interpretation entirely, not

wrong either, but also incomplete, when we think of it as taking its origins in Germany. This nineteenth-century pattern is repeated in the twentieth century, in two iterations. The first iteration crystallizes around the work of Henri Lefebvre, the second in that of Louis Althusser.

In the wake of the 1917 Russian Revolution, there was again enormous optimism around the idea of revolution. But, as William Lewis points out, the concept of alienation played a complex role in this optimism (2005). Insofar as alienation becomes a watchword carrying with it an association of German idealism, sub-scientific mysticism, intellectualism, and unwillingness to engage in concrete political action or invest a revolutionary vanguard, it would need to be banned from the official vocabulary of the Comintern. However, the opportunities created in the wake of the 1929 global stock-market crash and in the wake of the threat from Nazi Germany allowed the German idealists back into the Marxist fold, and with them the concept of alienation. Henri Lefebvre's long and complex history with the French Communist Party and at least two waves of German idealism in France – first Schelling and then Hegel, each subsequently suppressed – illustrates the point (Lewis, 2005: 83–115).

As William Lewis also points out, these are the debates into which Louis Althusser intervenes. Althusser's best idea about Marx is that we ought to turn to Marx's texts for an interpretation of Marx, and however incompletely Althusser himself accomplished this goal, he is to be commended for setting it before us in his political moment. Althusser's best ideas about interpreting Marx are likely those of overdetermination and hysteresis. However, the idea for which Althusser is famous is the postulation of a break between Marx's early humanist texts and late scientific texts. The idea of a break has slender textual basis, and was rejected immediately in the rich accounts of Marx's theory of alienation given in the 1970s by István Mészáros (1970), Bertell Ollman (1971: xiii), and E. P. Thompson (1978). Even Althusser himself came to reject his influential idea (Lewis, 2005: 189). However, as Lewis also points out, the thesis of the break attempts to solve the problem of the politicization of interpretation. This politicization had, on the one hand, produced some philosophically thin and dogmatic party interpretations. On the other – and in response, argued Althusser – it had produced a humanist Marxism identified with the concepts of alienation and freedom, one that tended to avoid engagement with Marx's later work, especially *Capital* (Lewis, 2005: 155–87).

It is easy enough to attack dogmatic interpretations of a rich figure like Marx. It is perhaps harder to understand, in light of the account given here, what the problems might be with a humanist Marx. However, there is a peril to the theological resonance of the alienation concept. The theological concept, always an anthropology of the human, risks portraying alienation as a kind of ontological, metaphysical, or psychological state that typifies human beings, and without regard to the mode of production in which they are immersed. The worst offenders, at least in France, were the existentialists – and this in spite of their avowed

atheism. Another merit of Althusser's contested thesis is that it attempts to claim the power of scientific status for Marx's later work. Marx himself claimed this for *Capital* in the nineteenth century. But what Marx does not mean by science is thin, empirical, or positivistic science, as he is also careful to explain – though this latter point is really best understood by turning to his texts as a whole, and probably also to Hegel's.

Today, the endless adjudication of the Marx–Hegel relationship has reached the limits of both its theoretical and its political usefulness. But the alienation concept has not. The view of alienation that you take depends on the concept of labour that you start with. Much of Marx's later work can be seen as a development, modification, and specification of the labour concept in light of the critiques of alienated labour begun in the *1844 Manuscripts*. There is labour and wage labour; division of labour and labour theories of value; living and dead labour; concrete and abstract labour; and, finally, labour power. Already in the *1844 Manuscripts*, Marx prefers terms other than 'labour' to describe non-alienated being: most prominently, 'activity' and 'creation'. As the labour concept comes under increasing pressure from real subsumption, it can no longer be used in the way Hegel uses it, as a kind of *Entäußerung* that consciously founds a world, a self, and a community that is subsequently enjoyed. Instead, the concept of labour functions in Marx's work exactly as Moishe Postone tells us it does: 'as a critique of labor in capitalism' and not 'as a critique of capitalism from the standpoint of labor' (1993: 5).

Once labour has been transformed, in real subsumption, once every *Entäußerung* is, necessarily, *Entfremdung*, alienation will only appear as a negative descriptor: it loses its positive sense. In fact, alienation is one of a set of English concepts that cannot be thought in the same way after Marx as it was thought before Marx. Initially positive or neutral, and meaning something like use, the idea of exploitation undergoes a similar transformation of meaning in Marx's hands. In addition, Marx has influenced the concepts of technology, social class, and domination as we have received them. Finally, Marx is the first to offer a comprehensive theory and name for the economic mode of production that, no matter our political orientation, we all call capital.

Already in the *1844 Manuscripts*, Marx highlights the ways the alienation he describes is an offence to human freedom: the word 'freedom' and its variants appear more than ten times just in the short text on alienated labour (1978a: 70–81) – and then always as the thing that alienation, in its various forms, cancels. William Roberts' recent work on Marx's republicanism focuses on *Capital* and highlights Marx's enduring interest in human freedom (2016). George Comninel's *Alienation and Emancipation in the Work of Karl Marx* ties the freedom and alienation concepts together, in light of a new interpretation of the significance of the French Revolution (2019).

A puzzle remains. The freedom that Marx advances is hardly the freedom of political economy, and yet it would be so very easy to confuse it with exactly

that freedom. In fact, we have inherited the freedoms celebrated in current public discourse unchanged from eighteenth-century political economy, especially the freedom to sell one's labour and to buy what one wants. While Marx's concept of alienation has shown us that these are no true freedoms at all, he has also done a masterful job of showing just how comprehensive capitalist conceptual norms have become. Marx thereby poses the political challenge of how we might emerge from the alienation and unfreedoms of capitalist life in order for *Entäußerung* to reveal its foreclosed promises of return, self-actualization, self-creation, freedom, individuality, and human community.

Praxis

Miguel Candiotti

The term *praxis* has a sufficiently complex history within Marxism itself to make it worth studying with care, especially with regard to its beginnings. This chapter will not look back to the distant genesis of the contrast between *theôria* and *praxis*, and neither will it consider the distinction between *praxis* and *poiêsis* signalled by Aristotle (2014: 101 [1140a]) but in fact ultimately unrelated to the views of Marx and his followers (Petrović, 2001; Balibar, 2007 [1993]). I will take as my starting point the Marxian concept of *praxis* which reached maturity in the so-called *Theses on Feuerbach* (*TF*). *Praxis* is a Greek word (πρᾶξις) that the German language incorporated into its ordinary vocabulary. This means that while for the speakers of other languages the use of the original Greek term constitutes a cultism or a technical philosophical term, in modern German, by contrast, *Praxis* is used as naturally as *practice* in English. It is therefore meaningless to attempt to establish a rigorous distinction between *praxis* and *practice* based on the German word and both terms should be accepted as equivalent. There undoubtedly exists a specifically Marxian use of this word, but it must be emphasized that for many years there was a misreading of *TF*, where certain Marxists seemed to have found a definition of *praxis* as something different from *practice*. In this way, the various uses of this concept by the Marxist tradition have depended fundamentally on the varied ways of interpreting the equivocal *TF*.

THE PROBLEMATIC EDITORIAL HISTORY OF THE *THESES ON FEUERBACH*

In 1888, Engels published his *Ludwig Feuerbach* adding 11 short unpublished notes by Marx as an appendix that later became famous as *TF*. In fact, although Engels did not say so, he had revised these notes himself. The original version had been written by Marx in Brussels in the spring of 1845, shortly before jointly writing with Engels himself the draft of what later would be called *The German Ideology (GI)*. However, the publication of the latter, a much more detailed and extensive manuscript, was not possible at that time and was later discarded by its authors (Marx, 1987a [1859]: 264). Another 40 years would have to pass before both the original version of *TF* and the part of *GI* that deals with Feuerbach, which was also written by Marx, would be published.¹ This means that for 80 years it was impossible to properly consider two twin texts, in which Marx sought to ‘settle accounts’ (Marx, 1987a [1859]: 264) with Feuerbach’s philosophy. And it also meant that for almost four decades the only version of *TF* available for study was that published by Engels,² which resulted in some confusion. Marx’s friend was not mistaken when he asserted that the theses are ‘the first document in which is deposited the brilliant germ of the new world outlook’, but also when he warned that ‘these are notes hurriedly scribbled down for later elaboration, absolutely not intended for publication’ (Engels, 1990 [1888]: 520). Precisely for this reason it is regrettable that he could not foresee the misunderstandings such notes would generate as long as they could not be compared with the *GI* section on Feuerbach, written at the same time.³

The most serious of these misunderstandings was produced around the definition of ‘practice’ (*praxis*) as ‘human sensuous activity’ (*menschliche sinnliche Tätigkeit*), in Engels’ version of the first thesis⁴ and as ‘human-sensuous activity’ (*menschlich-sinnliche Tätigkeit*) in both versions of the fifth. Marx later adds that this sensuous activity is, as such, the ‘real’ activity (*die wirkliche, sinnliche Tätigkeit*) of human beings, an ‘objective activity’ (*gegenständliche Tätigkeit*) that, at the same time, must be captured as ‘subjective’ (*subjektiv*) (Marx, 1975c [1888], 1975d [1845], cf. 1978a [1888], 1978b [1845]). What does all this mean? In what sense should practice be understood as a ‘sensuous human activity’? As an activity which can be perceived by the senses or as activity of the senses? To which other human activity can it be opposed as the ‘real’ activity? Is practice an ‘objective’ activity in gnoseological or ontological terms? And finally, how can it be claimed at the same time that it is ‘subjective’?

No one who has read Marx’s other writings from the same period – especially the part of *GI* dedicated to Feuerbach – should doubt that by describing practice as human ‘sensuous activity’, that is as such ‘real’ and simultaneously ‘objective’ and ‘subjective’, he was not referring to any cognitive or interior activity, which is what, as will later be seen, many have thought, but rather to social practice that tangibly transforms the ‘sensuous external world’ (*sinnliche Außenwelt*) to

which it belongs (1975b: 273, cf. 1968: 512). Far from attempting to emphasize a particular form of the activity of consciousness (that is, cognitive, intellectual, theoretical, spiritual, etc.), what Marx does in *TF* is place the tangible human activity that makes consciousness possible, conditioning it from the outset before any act of knowing. The following passage from *GI* should settle all doubts in this regard:

Feuerbach speaks in particular of the perception of natural science ... but where would natural science be without industry and commerce? Even this 'pure' natural science is provided with an aim, as with its material, only through trade and industry, through the sensuous activity [*sinnliche Tätigkeit*] of men. So much is this activity, this unceasing sensuous [*sinnliche*] labour and creation, this production, the foundation of the whole sensuous world [*sinnlichen Welt*] as it now exists that, were it interrupted only for a year, Feuerbach would not only find an enormous change in the natural world, but would very soon find that the whole world of men and his own perceptive faculty, nay his own existence, were missing. (Marx and Engels, 1975c [1845–46]: 40, cf. 1978 [1845–46]: 44; see also Marx, 1996 [1867]: 375–6)⁵

The profound theoretical renewal initiated by Marx consists precisely in the recognition that, contrary to what had previously been thought, human intellectual activity is always preceded, exceeded and conditioned by practical activity, that is, what the social human being has done and does in material reality, no matter what knowledge has accompanied and sought to guide that preceding material activity. Indeed, for Marx consciousness is always bounded by material, objective, practical, real doing, which does not mean that knowledge cannot, in turn, partially direct that action that takes place outside its cognitive interiority. It would be foolish to deny the existence of this moment of influence of intellectual activity on the material, but the lesson of Marx is that it is not at all the initial or fundamental moment, as had been believed until him. Traditional thought had considered practice as subordinate to theory, as a mere application or realization of it. This theoreticism prevented sensuous-material action from being recognized as different from and prior to knowledge. However, Marx in no way proposes that there is a *de facto* separation between the spiritual-theoretical life and the material-practical life, between internal and external doing, since these constitute the two sides of total human activity, and are closely linked to each other. What he demonstrates is rather the importance of distinguishing them analytically by recognizing their specificity. Neither does the Marxian approach in any way suppose a dualism between 'body' and 'soul', or between 'matter' and 'spirit', but rather the affirmation of a single natural and historical reality within which human beings carry out one activity that has two moments in permanent interaction: a practical one, which takes place outside the mind, and a cognitive one (theoretical, intellectual, spiritual, etc.) that only happens within it. The totality of human activity is therefore not reduced to practice (external to consciousness, although not necessarily unconscious) or to knowledge (interior to mind): it is the dialectical unity of both moments, which accompany each other and interact without losing their difference, but always under the primacy

of practice, that is, of the sensuous, real, material, external, objective and, at the same time, subjective human activity.

SENSUOUS ACTIVITY? IDEALISM OR MATERIALISM?

The German word *sinnlich* has been translated into English as ‘sensuous’, which does not resolve its ambiguity. It appears seven times in the short *TF* (eight in Engels’ version) and adopts various forms. It can be understood in two different ways. The first is as ‘sense-perceptible’, that is, that *which can be captured by the senses*. The other is ‘sensory’, that is, that *which is of the senses themselves and their cognitive activity*. In the same way the noun form *Sinnlichkeit* (‘sensuousness’) can mean *the capacity to perceive and those things perceptible in themselves* (Althusser, 1960: 6, 8). And although this second meaning may appear unusual, Feuerbach and Marx use *Sinnlichkeit* above all to allude to the ‘sensuous world’ (*sinnliche Welt*) as opposed to an imagined ‘suprasensuous’ reality (*übersinnlich*) of theology or idealism in general.

The distinction between the two meanings – more precisely between the activity of the senses themselves and the activity they capture – can only be negligible from a subjectivist and idealist perspective. Instead, what characterizes the materialist point of view is the recognition that the reality known through the senses is not a mere cognitive production of the latter, but rather exceeds them:

I completely and unconditionally reject absolute, immaterial, self-complacent speculation – that speculation which generates its material out of itself. I am worlds apart from those philosophers who pluck out their eyes to be able to see better; I, for my part, need the senses, above all the eyes, to think; I base my thoughts on materials that are given to us only through the activity of the senses [*Sinnentätigkeit*]; I do not produce the object [*Gegenstand*] out of the thought but, rather, the thought out of the object, for that alone is an object that exists apart from the brain. (Feuerbach, 1972 [1841–43]: 252–3, cf. 1956 [1841]: 14–15)

Even if it highlights the activity of the senses – something that Marx *does not* do in the *TF* – all materialism denies by definition that knowledge and reality are the same thing, as idealism claims. There are two different sides involved in sensuous knowledge: an inner side and an outer one. The relationship between them is certainly a unitary and indivisible experience, but it cannot be reduced to a mere identity between what perceives and what is perceived, as Marx himself has emphasized.⁶ It is not, therefore, about it being possible to distinguish fully between what our senses provide to our experience and that which external reality provides for them, but simply of keeping in mind that the content of that complex sensuous experience is always a *real relation* between the inner world and outer world. To ignore this relationship would be to absolutize one side by denying the other, thus falling into objectivism or subjectivism. In *TF* Marx does not criticize materialism for establishing a rigid separation between subject and object on the plane of knowledge, something that Feuerbach certainly does not

do (1881 [1841]: 4–6, 12–13). Marx criticizes previous materialism – that of Feuerbach included – for keeping on considering that the fundamental activity of human being is knowledge, theory, contemplation, just like Hegel and the whole preceding philosophical tradition. In contrast, the new materialism recognizes the primordial character of praxis, that ‘sensuous activity’ which is not an ‘activity of the senses’, a cognitive act, but precisely the human activity that ‘exists apart from the brain’, the ‘*objective* activity’ (first thesis), the ‘material life-process, which is empirically verifiable and bound to material premises’ (Marx and Engels, 1975c [1845–46]: 36). Indeed, for Marx, practice is the social human activity (subjective–objective) – not *of* the senses (sensory) but rather patent *to* them – a movement with immense transforming power that Feuerbach certainly did not capture in his perception of the material objectivity (first thesis):

He does not see that the sensuous world [*sinnliche Welt*] around him is not a thing given direct from all eternity, remaining ever the same, but the product of industry and of the state of society; and, indeed [a product] in the sense that it is an historical product, the result of the activity of a whole succession of generations, each standing on the shoulders of the preceding one, developing its industry and its intercourse, and modifying its social system according to the changed needs. (Marx and Engels, 1975c [1845–46]: 39, cf. 1978 [1845–46]: 43)

This new materialist conception of practice as the objective human doing that traverses and configures reality, thus conditioning all forms of knowledge, represents perhaps the greatest contribution of Marx to critical thinking. And it entails denouncing the state of *practical* (or *material*) alienation in which society is torn apart by private ownership of the means of production, dominated by money and controlled by the modern state apparatus.

PRACTICAL ALIENATION (SOCIAL SELF-ESTRANGEMENT)

The materialist Feuerbach, therefore, fails to understand practice in a materialist way, unless we give this adjective its most banal significance: the moral one. According to *The Essence of Christianity*, practice is equivalent to individual action driven by selfish interests, and in that sense it is ‘subjective’, as distinct from authentic theory, which for Feuerbach is always ‘disinterested’ and, therefore, ‘objective’ (1881 [1841]: 112–120, 185–197). Moses Hess, for his part, extended Feuerbach’s thought to the social plane and introduced the notion of a ‘practical alienation’ (*praktische Entäußerung*) conditioned by a ‘theoretical alienation’ (*theoretische Entäußerung*) arising from the Judeo-Christian religion (Hess, 1961: 334–9). And Marx himself, who at that time was also performing his own social translation of the Feuerbachian critiques,⁷ adopted this practical version of the concept of alienation coined by Hess, but gave it a distinct, decidedly materialistic meaning. Thus, for Marx, it is rather the forms of ‘theoretical alienation’ which are conditioned by ‘practical alienation’, and not the other way round:

The basis of irreligious criticism is: *Man makes religion*, religion does not make man. Religion is the self-consciousness and self-esteem of man who has either not yet found himself or has already lost himself again. But *man* is no abstract being encamped outside the world. Man is *the world of man*, the state, society. This state, this society, produce religion, an *inverted world-consciousness*, because they are an *inverted world* ... The immediate *task of philosophy*, which is at the service of history, once the *holy form* of human self-estrangement has been unmasked, is to unmask self-estrangement in its *unholy forms*. Thus the criticism of heaven turns into the criticism of the earth, the *criticism of religion* into the *criticism of law* and the *criticism of theology* into the *criticism of politics* [and of *political economy*]. (Marx, 1975a [1843–44]: 175–176)

Clearly, these ‘unholy forms’ do not constitute the self-estrangement of any type of *spiritual* objectification – as in Hegel and Feuerbach – but rather of the practice itself understood as *material* practice, real objectification, which precedes and exceeds the field of mere conscience. This social and historical material activity – one which Hegel notes only in a mystified (spiritualized) way and Feuerbach flatly ignores (cf. Marx, 1975b: 341, 1975d [1845]: 3) – is therefore a type of objectification that overcomes the mere knowledge sphere. Through praxis, beyond their consciousness (which is not to say unconsciously), human beings shape the actual objectivity that they inhabit and which constitutes them. Both traditional idealism and materialism still remain trapped in a cognitive alienation from practice, that is, in a theoreticism or mysticism of pure theory: ‘All social life is essentially *practical*. All mysteries which lead theory to mysticism find their rational solution in human practice and in the comprehension of this practice’ (Marx, 1975d [1845]: 5). Indeed, practice is the genuine *essence* of ‘human society, or social humanity’ precisely because ‘in its reality it is the ensemble of the social relations’ (Marx, 1975d [1845]: 4, 5), of the real (material) interactions of individuals with each other and with nature. It is, therefore, an unusual essence which is material and historical, permanently changing, and as such remains elusive of all essentialist fixity.

It is in the framework of this new materialist conception of practice – or practical materialism⁸ – that the Marxian notion of alienation attains its profound meaning. All forms of the alienation of consciousness are based on society’s ways of material-practical alienation: the State, money and, above all, private ownership of the means of production. Thus, shortly after referring to these phenomena as ‘the *unholy form* of human self-estrangement’, and having already specifically approached a critique of the State as an alienation of society (cf. Marx and Engels, 1975b: 3–129, 146–174), Marx starts his critique of political economy and writes passages like the following:

Religious estrangement as such occurs only in the realm of *consciousness*, of man’s inner life, but economic estrangement is that of *real life*; its transcendence therefore embraces both aspects.

The estrangement of self-consciousness is not regarded [by Hegel, but neither by Feuerbach] as an *expression* – reflected in the realm of knowledge and thought – of the *real* estrangement of the human being.

In order to abolish the *idea* of private property, the *idea* of communism is quite sufficient. It takes *actual* communist action to abolish actual private property. (Marx, 1975b: 297, 334, 313)

And a few weeks after that, he makes explicit reference in *The Holy Family* to the practical and material character of the social self-alienation he denounces:

The enemies of progress *outside* the mass are precisely those *products* of *self-debasement*, *self-rejection* and *self-alienation* of the *mass* which have been endowed with independent being and a life of their *own* ... But as those *practical* self-alienations of the mass exist in the real world in an outward way, the mass must fight them in an *outward* way. It must by no means hold these products of its self-alienation for mere *ideal* fantasies, mere *alienations of self-consciousness*, and must not wish to abolish *material* estrangement by purely *inward spiritual* action. (Marx and Engels, 1975d [1845]: 82, cf. 1962 [1845]: 86–7; see also Marx, 1987b: 209–10)

Marx is obviously referring here to that which happens outside or inside *in relation to consciousness, not practice*, precisely because the latter is part of this same materiality – or sensuous, external, objective reality – which expands beyond cognitive interiority. The idea is to emphasize that the practical alienation – and hence, dis-alienation – of society and its products is not a phenomenon merely interior to knowledge but rather the other way around: knowledge is immersed in the practical alienation of society, which certainly precedes and exceeds it. This is the core of Marx's *practical materialism*; it pervades all his work, even before his *explicit* split with Feuerbach:

Feuerbach starts out from the fact of religious self-estrangement, of the duplication of the world into a religious world and a secular one. His work consists in resolving the religious world into its secular basis. But that the secular basis lifts off from itself and establishes itself as an independent realm in the clouds can only be explained by the inner strife and intrinsic contradictoriness of this secular basis. The latter must, therefore, itself be both understood in its contradiction and revolutionised in practice. Thus, for instance, once the earthly family is discovered to be the secret of the holy family, the former must then itself be destroyed in theory and in practice. (Marx, 1975d [1845]: 4, cf. 1978b [1845]: 6)

The theoretical-critical revealing of a problem which is not only theoretical is insufficient as are scientific discoveries regarding the objective alienation of society:⁹ 'in reality and for the *practical* materialist, i.e., the *communist*, it is a question of revolutionising the existing world, of practically coming to grips with and changing the things found in existence' (Marx and Engels, 1975c [1845–46]: 38; see also Candiotti, 2017a).¹⁰

PRACTICE AND REVOLUTIONARY PRACTICE

What are these 'things found in existence', that 'existing world' that must be changed through revolutionary practice? We already know the answer: they are precisely the alienated forms of practice itself, that is, of the material interactions of individuals with each other and with nature, and in particular of 'industry and

commerce', of 'this unceasing sensuous labour and creation, this production, the foundation of the whole sensuous world as it now exists' (Marx and Engels, 1975c [1845–46]: 40). It is precisely this practical-material basis of the existing world that contains oppressive elements that must be transformed, in turn, through a special form of practice: *revolutionary practice*, "'practical-critical" activity' (Marx, 1975d [1845]: 3).

This idea of the fundamental materiality of social practice as the ultimate nucleus of alienation, which can only be changed through revolutionary practice, had become manifest long before Marx's open rupture with Feuerbach in TF [1845]. In the *Introduction* of 1843–44 several passages highlight the impotence of mere criticism when the problems it faces are material, that is to say, when they go beyond the theoretical or intellectual level. In these cases, it is essential that criticism be oriented 'not towards itself, but towards *problems* which can only be solved by one means – *practice*' (Marx, 1975a [1843–44]: 181, cf. 1975b: 302, 1975d [1845]: 3 [second thesis]). Obviously, the practice to which Marx refers here – although he does not use the adjective – is *revolutionary practice*: that which consciously and radically attacks the existing social world; not practice understood as the normal material production and exchange that daily moves reality. What is required, therefore, is a specific form of practice which consists not in the mere alteration of the natural environment, but in a wilful transformation – in an emancipatory sense – of the existing social order. A conscious overcoming of situations of material-practical alienation that pure critical theory can only warn about and reject, but not resolve. For 'material force must be overthrown by material force', a task which falls to practice and not only to theory. However, Marx immediately adds: 'but theory also becomes a material force as soon as it has gripped the masses' (Marx, 1975a [1843–44]: 182), that is, when it manages to become assimilated by the masses and guides their powerful joint material activity, when it stops being just the critical knowledge of the few and translates itself into real revolutionary practice. This reasoning appears again with clarity in *The Holy Family* (1975d [1845]): '*Ideas* can never lead beyond an old world order but only beyond the ideas of the old world order. Ideas *cannot carry out anything* at all. In order to carry out ideas men are needed who can exert practical force' (Marx and Engels, 1975d [1845]: 119).

Practical materialism is therefore a theory of material-practical alienation and, consequently and at the same time, the guide for a revolutionary practice aimed at overcoming this alienation, and on this basis also alienation in its ideological forms. Real dis-alienation, collective emancipation, communal appropriation of all social-human power, can therefore only be achieved through a 'criticism' that becomes *practical-material* that is, revolutionary, 'practical-critical' activity:

Communism as the positive transcendence of private property as human self-estrangement, and therefore as the real appropriation of the human [social] essence by and for man; communism therefore as the complete return of man to himself as a social (i.e., human) being – a return accomplished consciously and embracing the entire wealth of previous development.

This communism ... is the *genuine* resolution of the conflict between man and nature and between man and man ... between the individual and the species ... *Material*, immediately perceptible [*sinnliche*] private property is the material perceptible expression of *estranged* [social] human life ... Religion, family, state, law, morality, science, art, etc., are only particular modes of production, and fall under its general law. The positive transcendence of private property, as the appropriation of [social] human life, is therefore the positive transcendence of all estrangement – that is to say, the return of man from religion, family, state, etc., to his human, i.e., social, existence. (Marx, 1975b: 296–7, cf. 1996 [1867]: 90, 1968: 536–7)

PRACTICE, PRODUCTION AND LABOUR

Balibar correctly points out that while the *TF* develop the concept of praxis, *GI* ‘is entirely organized around the notion of production, taken here in a general sense to refer to any human activity of formation and transformation of nature’ (2007 [1993]: 35). However, it should be noted that this is not production in general, but *material production*, that is, the same ‘*objective activity*’ or ‘*sensuous human activity*’ that in the *TF* was called ‘practice’ (*praxis*). But then, are praxis and labour also the same? Not necessarily. At least in the case of Marx, both concepts, although partly overlapping, also overflow each other as they presuppose different approaches to human activity.

For Marx, as we have seen, practice is the activity of the human-social subjectivity from an *objective* standpoint, material and tangible, exterior to the mind, and it is equivalent to material production in a broad sense, that is to say, ‘sensuous human activity’, a ‘material life-process, which is empirically verifiable’:

In direct contrast to German philosophy which descends from heaven to earth, here it is a matter of ascending from earth to heaven. That is to say, not of setting out from what men say, imagine, conceive, nor from men as narrated, thought of, imagined, conceived, in order to arrive at men in the flesh; but setting out from real, active men, and on the basis of their real life-process demonstrating the development of the ideological reflexes and echoes of this life-process. (Marx and Engels, 1975c [1845–46]: 36)

The Marxian category of ‘practice’, therefore, does not refer to consciousness and its cognitive or volitional processes, but to the material activity of human beings, which profoundly conditions their intellectual activity. The concept of ‘labour’, by contrast, encompasses all human activity that involves a *conscious effort* to produce a desired result. In fact, unlike the idea of ‘practice’, which emphasizes the material nature of subjective activity – and makes an abstraction of the consumption of human energy that it requires and of the rational will to guide it – the Marxian notion of ‘labour’ always presupposes the consideration of a certain intellectual activity and a certain expenditure of human force. That is why labour can be solely *theoretical* (intellectual, cognitive), without ceasing to be labour. Therefore, in addition to effort in general, conscious activity is always inherent to the consideration of human labour as such (cf. Marx, 1996 [1867]: 188), whether the predominant activity is intellectual (interior, non-material), or

practical (exterior, material), always coordinated with the former. In contrast, the Marxian categories of 'praxis' and 'material production' simply make abstraction from the conscious level and approach human activity only from its outer, objective, material, empirical side.

The terms 'labour' and 'practice' thus express distinct categories, different aspects of human activity. The practical-material-exterior is analytically distinguished – even if it cannot be really separated – from the theoretical-intellectual-interior. Labour, on the other hand, is defined only in opposition to leisure – that is, the time of no labour or 'free' time – and, like labour itself, may include a purely spiritual or also a practical activity. When the work is predominantly or exclusively a mental activity it is called 'intellectual', 'cognitive' or 'theoretical' labour. On the other hand, if what stands out is the material activity it is usually spoken of as 'manual', 'physical' or 'practical' labour, although no labour is *pure practice*. There is no doubt that Marx's main interest in the social-material transformation of the world leads him to prioritize practical labour over theoretical labour, to the point of omitting the adjective. This certainly helps to approximate the categories of 'practice' and 'labour', but does not make them synonymous.

That said, it should be noted that the concept of 'revolutionary practice', as well as that of 'labour', always involves the consideration of a *consciously directed effort*. Indeed, unlike the generic idea of practice, in the specific case of the revolutionary practice it is impossible to ignore the intellectual commitment that accompanies it, whose peculiarity is that of being a critical will directed against the given social order. Therefore, we can say that *revolutionary practice*, precisely because of that theoretical-critical impulse that is inherent to it, also constitutes an exceptional *revolutionary labour* which strives to produce a new society by transforming the existing one.

PHILOSOPHIES OF PRAXIS

Up to this point, we have observed that praxis and knowledge are for Marx the two great modalities of human activity, its two sides: external and internal, in relation to the mind. It is not possible to really separate them, but it is convenient to distinguish their peculiarities analytically. For ignorance of human activity as a dialectical unit of different elements leads to reductionist positions: from practice to knowledge, or vice versa. Now, there is a considerable variety of interpretations of the Marxian concept of *Praxis*, based above all on different ways of reading the *TF*, which is the text where that category acquires its greatest centrality in Marx. Antonio Labriola was the first to give the name 'philosophy of practice' (*filosofia della praxis*) to what he considered to be 'the pith of historical materialism' (1912 [1897]: 60, cf. 1973: 702). But what does Labriola understand by *praxis*? At first sight, the same as Marx did: *real human action*, social activity transforming the objective reality of which it is part, that is, the world

which subsists beyond our consciousness and different ways of knowing and interpreting it. But a closer look at the explicit mentions of ‘praxis’ by Labriola reveals that actually this author considers the concepts of *praxis* and *labour* as synonyms: ‘In the process of *praxis* there is the nature, which is to say the historical evolution of man. And in speaking of *praxis* under this aspect of totality, one aims to eliminate the vulgar opposition between practice and theory; because, in other words, history is the history of labour’ (1973: 689, cf. 1912 [1897]: 43). There is an interesting change of emphasis here. While Marx, reacting against the whole tradition, stressed the primacy of practice (material activity) over theory (cognitive activity), Labriola now emphasizes, under the name of ‘praxis’ or ‘labour’, the unity of theory and practice: ‘in labour thus integrally understood is included the respectively proportioned and proportional development of mental and physical aptitudes’ (1973: 689, cf. 1912 [1897]: 43). This unity and proportionality pointed out by Labriola thus restores a certain balance in the consideration of total human activity (theoretical and practical). But the danger of this unitary approach is the return to the old idealist conception that makes practice a mere moment or prolongation of cognitive activity (as evident in Vico, Fichte, Hegel, Cieszkowski, Hess, etc.). To illustrate what this reduction of practice to knowledge consists of, we will take the paradigmatic case of the first Italian translation of the *TF*, produced by the neo-idealist philosopher Giovanni Gentile in his 1899 essay *La filosofia della prassi* (cf. 1974 [1899]: 59–165). This author interprets *menschliche sinnliche Tätigkeit* as ‘human sensory activity’, which amounts to taking *praxis* – or *prassi*, as he prefers to call it – to be an activity of the senses, that is, a synonym of sensory knowledge. He also translates *Gegenstand* as ‘the term of thought’, and *wirkliche, sinnliche Tätigkeit* as ‘real, sensory activity’. Then he properly renders *gegenständliche Tätigkeit* into ‘objective activity’, but he adds a footnote which explains that by this phrase must be understood an ‘activity that makes, puts, creates the sensuous object’ (1974 [1899]: 68–9). This peculiar praxis of the senses would be the one that creates the entire so-called ‘material’ world, including ‘economic facts, which are products of human sensory activity’ (1974 [1899]: 156). Everything is thus ultimately reduced to the active sensation of human needs and interests. In short, according to Gentile, what Marx holds in the *TF* is ‘the productive nature of the sensory activity, forming the whole reality’ (1974 [1899]: 81), an activity which he also called ‘praxis’. This leads Gentile to conclude that Marx is an unconscious idealist and an incoherent materialist (1974 [1899]: 164–165), thus turning Marxian philosophy into a *sensist subjectivism*, that is, into a subjective idealism that asserts the primacy of the senses over the concepts: ‘Reality, therefore, according to [Marx], is a subjective production of man; but a production of sensory activity (*sinnliche Tätigkeit*) and not thought, as Hegel and other idealists believed’ (1974 [1899]: 78; cf. Candiotti, 2015).

This interpretation of praxis had several followers. It appears again, with different nuances, in Italian authors such as Arturo Labriola (1908), Rodolfo

Mondolfo (1968 [1909]), and Antonio Gramsci (1975 [1929–35]). It is not possible here to fully set out their peculiar subjectivist versions of the philosophy of praxis, which they also called ‘real humanism’ or ‘historicist humanism’, sometimes attributing it to Feuerbach himself, but always rejecting – in line with Gentile (1974 [1899]) and Croce (1973 [1900]), in the midst of the crisis of positivism and economicist Marxism – all ‘materialism’ as synonymous with metaphysics, objectivism, determinism, mechanicism, fatalism, passivity, etc. Given the current ecological crisis, this anti-materialistic Marxism appears today more evidently problematic than 80 years ago. Nevertheless, it was able to develop some of the deepest objections to economicist and dogmatic Marxism. Indeed, the permanent focus on the primacy of human praxis enabled it to reject any easy attempt to subordinate praxis to the contemplation of rigid ‘objective laws’, and led it to develop, especially in Gramsci, a highly complex political conception of praxis. To put it in a schematic way, for Gramsci, praxis is the historical process of social relations understood as an interaction between dominant and subaltern groups, whose axis is the struggle to conquer the ‘hegemony’ or ‘intellectual and moral direction’ of the whole of society in order to impose a certain ‘collective will’ or ‘ideology’. Praxis always constitutes, therefore, a unitary ‘historical bloc’ comprising history, politics and philosophy, where ‘intellectuals’ play a key role (cf. Gramsci, 1975 [1929–35]; Thomas, 2009; Frosini, 2010; Fernández Buey, 2014 [2001]; Candiotti, 2014b, 2017b). The subjectivist understanding of praxis also developed in other countries. In fact, it is a phenomenon so widespread that it would be impossible to undertake a complete enumeration of those who at some point subscribed to that interpretation, even without being predominantly *idealist* (in an ontological-gnoseological sense). We will merely provide a few names: Shlomo Avineri (1968), György Lukács (1971 [1923]), Michel Henry (1976), Adolfo Sánchez Vázquez (1980), Ernst Bloch (1986 [1954–59]), Georges Labica (1987) and Michael Löwy (2005 [1970]).

Let us now briefly consider the reduction of knowledge to practice, especially in a 1963 Althusser writing entitled ‘On the Materialist Dialectic’ (1969 [1963]), in which he introduces the category of ‘theoretical practice’. If, for Antonio Labriola, ‘praxis’ and ‘labour’ were equivalent and referred to the unity of theory and practice, for Althusser the synonymy is between ‘practice’ (not ‘praxis’, at least not explicitly) and ‘labour’. In fact, he indiscriminately uses the terms ‘theoretical labour’ (or ‘theoretical work’) and ‘theoretical practice’. And in his definition of ‘practice’ he offers an imitation of the way in which Marx (1996 [1867]: 187–196) describes the ‘labour process’ (cf. Althusser, 1969 [1963]: 166–167). Moreover, Althusser introduces a new element: the plural form ‘practices’:

This general definition of practice covers the possibility of particularity: there are different practices which are really distinct, even though they belong organically to the same complex totality. Thus, ‘social practice’, the complex unity of the practices existing in a determinate society, contains a large number of distinct practices. (1969 [1963]: 167; cf. Althusser and Balibar, 1979 [1965]: 136)

The main difference that Althusser points out is that which exists between ‘theoretical practice’ (1969 [1963]: 167) and ‘non-theoretical practices’ (Althusser and Balibar, 1979 [1965]: 59). We can then wonder if it is not much simpler to speak directly, like Marx, of different manifestations of theory (or intellectual activity) and practice (or material activity).

It is impossible to survey all Marxist readings of praxis here. I have had to limit myself to considering those that are most relevant by reason of their differences. But I believe that pointing out these specific contrasts is like drawing a relatively exhaustive map covering the main variants of interpretations of this category, since all Marxists subscribe to one of these versions, with greater or fewer nuances. In authors as diverse as Engels, Lenin, Mao Zedong, Trotsky or Karl Korsch, for example, we find interpretations of ‘praxis’ or ‘practice’ very close to that of Marx himself.

It is hoped that in the future a more precise and less eclectic use of the concept of praxis will be developed. An interesting way to do so would be to recover Marx’s ‘practical materialism’ and its articulation with the Gramscian version of the ‘philosophy of praxis’. The former would allow us to recognize the extramental conditioning of knowledge and human productive forces – in deep compatibility with ecological consciousness – and at the same time to push criticism towards the practical-material overcome of any limit that becomes arbitrary or socially unnecessary. Gramscian ‘philosophy of praxis’, for its part, stresses the fundamental importance of the intellectual and practical political battle in the field of culture, mass communication and organization of social normativity, since revolutionary praxis does not spring from the mere quantitative development of productive forces, but rather from the active – and at the same time patient – construction of an emancipatory hegemony.

Notes

- 1 Both texts appeared for the first time in 1924, edited by the Marx-Engels Institute in Moscow. A first version of all writings grouped under the title of *GI* was published in *Marx-Engels-Gesamtausgabe* [MEGA¹], I/5, Moscow, Marx-Engels-Lenin Institute, 1932 (cf. Candiotti, 2014a; Carver, 2010; Carver and Blank, 2014a, 2014b).
- 2 For a detailed comparison of the differences between Marx’s and Engels’ versions of the theses I mainly rely on the works of Bortolotti (1976), Labica (1987) and Macherey (2008).
- 3 It must be recalled that there is also another key Marxian work, written only a few months earlier, but which also came to light only later: the so-called *Economic and Philosophical Manuscripts of 1844*, which appeared in two simultaneous editions during the same year as *GI* (Marx, 1932a [1844], 1932b).
- 4 The original version reads ‘sensuous human activity’ (*sinnlich menschliche Tätigkeit*) (Marx, 1975d [1845]: 3, cf. 1978b [1845]: 5).
- 5 The texts added in brackets which appear in the quotes, in this case certain terms from the original text in German, are by the author – MC.
- 6 The importance of a passage in *Capital* which refers precisely to sensuous knowledge as a real relation that does not immediately appear as such, but rather as pure objectivity, and that can neither be reduced to pure subjectivity, is often overlooked: ‘the light from an object is perceived by us not as the subjective excitation of our optic nerve, but as the objective form of something outside the eye itself. But, in the act

- of seeing, there is at all events, an actual passage of light from one thing to another, from the external object to the eye. There is a physical relation between physical things' (Marx, 1996 [1867]: 83).
- 7 Towards the end of 1842, Marx wrote to Arnold Ruge: 'I requested further that religion should be criticised in the framework of criticism of political conditions rather than that political conditions should be criticised in the framework of religion ... for religion in itself is without content, it owes its being not to heaven but to the earth, and with the abolition of distorted reality, of which it is the *theory*, it will collapse of itself' (Marx and Engels, 1975a: 394–5).
 - 8 Balibar wrote: 'If these remarks are accurate, it means that Marx's materialism has nothing to do with a reference to *matter* – and this will remain the case for a very long time, until Engels undertakes to reunite Marxism with the natural sciences of the second half of the nineteenth century. For the moment, however, we are dealing with a strange "materialism without matter". Why, then, is this term used?' (2007 [1993]: 23). We should remember that for both Feuerbach and Marx 'materialism' is not the postulation of 'matter' as a metaphysical principle, but the assertion that the sensible reality has a material subsistence insofar as it is not a mere product of human knowledge, as idealism pretends. For this reason, we cannot agree with the characterization of the Marxian 'materialism of practice' as 'the most accomplished form of the idealist tradition, the form which enables us to understand more than any other the lasting vitality of idealism right up to the present' (Balibar, 2007 [1993]: 27).
 - 9 This is the same idea that would appear, 20 years later, in the whole first chapter of *Capital* and not only in its famous final section on commodity fetishism (Marx, 1996 [1867]: 45–93).
 - 10 The last of the *TF* affirms almost the same thing but in language more brilliant than it is clear, a characteristic of these notes: 'The philosophers have only interpreted the world in various ways; the point is to change it' (Marx, 1975d [1845]: 5). Engels' famous version adds the connector *aber* ('but', 'however', etc.), giving rise to anti-intellectual, pragmatic or practicist readings (Marx, 1975c [1888]: 8, cf. 1978a [1888]: 535).

Fetishism

Anselm Jappe

INTRODUCTION

‘Commodity fetishism’ was considered for a long time to be quite an ‘esoteric’ concept. Today, however, it is often considered to be one of Marx’s contributions that can still help us to understand the contemporary world. This is particularly the case where capitalism is thought of not only in terms of class domination, but also as an automatic and irrational system that is pushing the world towards an epoch-defining economic and ecological crisis.

‘Commodity fetishism’ is one of the most difficult of Marx’s concepts to understand. Marx himself called it a ‘mystery’, and, quantitatively speaking, it only makes up a very small part of his critique of political economy. The first generation of Marxists attributed almost no importance to it. From the 1920s, however, György Lukács and Isaak Rubin began an exploration; in Lukács’ case, via the concept of ‘reification’. In the post-war period, the concept of ‘alienation’ became central to Marxist debate. Certain authors claimed that there was a great deal of continuity between the use of fetishism in the work of the young Marx and in his later works. Fetishism was nearly always understood as a kind of ‘mystification’, as a ‘veil’, that hid the reality of capitalist exploitation. From the 1970s onwards, a new interpretation began to develop that linked fetishism to the concepts of value and abstract labour. It considered fetishism to be a *real inversion* of social life, not simply a matter of consciousness, and argued that the

concept is central to how we can use Marx today. Nevertheless, there are many different ways of employing the term ‘fetishism’ currently in circulation, even outside of the field of Marxism, that generally refer, often in a rather loose manner, to the world of imagination associated with objects of consumption: fetishism as the excessive adoration of commodities. Another approach is to analyse the potential continuity between commodity fetishism and older – religious – forms of fetishism, though such approaches run the risk of losing the historical specificity of modern fetishism from view.

Given the great variety of possible interpretations of fetishism in Marx’s work, it is necessary to first let Marx speak for himself. It is not a matter of ‘explaining’ this concept, as one could explain the concept of surplus value, because no explanation would be agreed upon by all of those who have attempted to interpret his work. The history of the concept of fetishism had led to more divergent interpretations than nearly any other of Marx’s concepts. The second part will briefly examine debates about fetishism in Marxism before moving on to deal in greater length with the ‘critique of value’ (Moishe Postone, Robert Kurz, *Krisis*), which has placed more importance on the concept than any other Marx-based approach. The analysis will conclude with a survey of the, often confused, way in which the term is currently used.

MARX ON FETISHISM

It is quite remarkable that Marx used the concept of fetishism even in his earliest writings. In his 1842 article ‘Debates on the Law on Thefts of Wood’, Marx condemns the attempts of the Prussian legislature to ban the poor from collecting wood and hunting hares in the forests. He ends with the words:

The savages of Cuba regarded gold as a fetish of the Spaniards. They celebrated a feast in its honour, sang in a circle around it and then threw it into the sea. If the Cuban savages had been present at the sitting of the Rhine Province Assembly, would they not have regarded wood as the Rhinelanders’ fetish? But a subsequent sitting would have taught them that the worship of animals is connected with this fetishism, and they would have thrown the hares into the sea in order to save the human beings. (Marx, 1842: 262–3)

This ironic statement demonstrates that the ethnological concept of fetishism, and its application to the critique of modern society, was already present from the very start of Marx’s critical project.

The word ‘fetishism’, deriving originally from the Portuguese and which carried the connotation of something that is ‘artificial’ or ‘fabricated’, first appeared in the seventeenth century. European colonisers used the term to describe, what seemed to them to be, the worship of wooden idols by African ‘savages’. It was the French writer Charles de Brosses, in his work *Du Culte des dieux fétiches* [*The Cult of God Fetishes*] (1760), who introduced the term ‘fetishism’ to describe a supposedly primitive stage in the historical development of religion.

There is a profound link between commodity fetishism and religious fetishism: not only does Marx refer to it from his very first articles onwards, but his mature theory of commodity fetishism is a continuation of his earlier concept of 'alienation' and, therefore, of his view of religion as an exile of human powers into heaven. Marx compared commodity fetishism explicitly to religious fetishism, in which men worship fetishes that they themselves have created and in which they attribute supernatural powers to material objects. Thus, Marx speaks in *Capital* of

a mode of production in which the worker exists to satisfy the need of the existing values for valorization, as opposed to the inverse situation, in which objective wealth is there to satisfy the worker's own need for development. Just as man is governed, in religion, by the products of his own brain, so, in capitalist production, he is governed by the products of his own hand. (Marx, 1867: 772)

Twenty-five years after the article on the theft of wood, Marx once again used the term fetishism, in a much more consequential manner, at the end of the first chapter of *Capital* (1867). After a somewhat austere architectural structure and meticulous logical deductions in which he develops the value form in a highly abstract manner (and without ever referring to social classes or other human actors), Marx concludes with a subsection, 'The Fetishism of the Commodity and its Secret', that is no more than 15 pages long. Its style is very different from the preceding pages: ironical and witty, full of metaphors and historical references that intermingle with literary allusions. It could pass for a simple literary digression that the reader could leave out without losing anything important. Moreover, as the very title of the chapter states, it is a 'secret', and the contents of that secret seem at first glance hardly intelligible. In its first four pages, Marx uses the expressions 'metaphysical subtleties', 'theological niceties', 'mysterious', 'mystical', 'enigmatic', 'misty realm', 'hieroglyphic'. No wonder then that this digression has for so long attracted little attention from readers of *Capital*, even more so given that the concept of 'fetishism' does not reappear again until the end of the first book.

Marx terms commodities 'sensuous things which are at the same time suprasensible or social', in which relationships between men appear as things, and things as creatures endowed with their own will (Marx, 1867: 165):

The mysterious character of the commodity-form consists therefore simply in the fact that the commodity reflects the social characteristics of men's [*sic*] own labour as the objective characteristics of the products of labour themselves, as the socio-natural properties of these things. Hence it also reflects the social relation of the producers to the sum total of labour as a social relation between objects, a relation which exists apart from and outside the producers. Through this substitution, the products of labour become commodities, sensuous things which are at the same time suprasensible or social. [...] It is nothing but the definite social relation between men themselves which assumes here, for them, the fantastic form of a relation between things. In order, therefore, to find an analogy we must take flight into the misty realm of religion. There the products of the human brain appear as autonomous figures endowed with a life of their own, which enter into relations both with each other

and with the human race. So it is in the world of commodities with the products of men's hands. I call this the fetishism which attaches itself to the products of labour as soon as they are produced as commodities, and is therefore inseparable from the production of commodities. [...] To the producers, therefore, the social relations between their private labours appear as what they are, i.e. they do not appear as direct social relations between persons in their work, but rather as material [*dinglich*] relations between persons and social relations between things. (Marx, 1867: 164–6)

As a result, in commodity production, 'the process of production has the mastery over man, instead of the opposite' (Marx, 1867: 175), and for the producers, 'their own movement within society has for them the form of a movement made by things, and these things, far from being under their control, in fact control them' (Marx, 1867: 167–8). The fetishism is already present in the very fact that social activity takes the form of the commodity, value and money, the 'semblance of objectivity possessed by the social characteristics of labour' (Marx, 1867: 167). People are, however, not conscious of this appearance. They produce it without knowing it through acts of exchange in which, like a natural law, socially necessary labour time imposes itself as a regulatory element. It is the money form that makes the real relationship between commodities disappear behind a thing-like appearance: the visible fact that a shirt is 'worth' 10 euros is only a 'thing-like' expression of the relationship between quantities of abstract time. Thus, productive activity is reduced to a simple 'productive expenditure of human brains, nerves, muscles' (Marx, 1867: 134). People do not bring their private labours into relation directly, but only in a (pseudo-)objective form, with the appearance of a thing, namely, equal human labour expressed in a use value. Nevertheless, they do not do so in a conscious manner. They attribute the movement of their own products to the natural qualities of these products.

However, 'the whole mystery of commodities, all the magic and necromancy that surrounds the products of labour on the basis of commodity production' applies to commodity society alone (Marx, 1867: 169). Marx shows that in autarkic, or self-sufficient, production (he uses the example of Robinson Crusoe), such as one finds in medieval society or, on the contrary, in a 'free association of producers', there is no fetishism and social relationships are not 'disguised as social relations between things, between the products of labour' (Marx, 1867: 170). On the contrary, 'for a society of commodity producers [...] general social relation[s] of production [consist] in the fact they treat their products as commodities, hence as values, and in this material [*sachlich*] form bring their individual, private labours, into relation with each other as homogenous human labour' (Marx, 1867: 172). Marx continues to evoke fetishism in the following chapter, 'The Process of Exchange', which concludes:

Men are henceforth related to each other in their social process of production in a purely atomistic way. Their own relations of production therefore assume a material shape which is independent of their control and their conscious individual action. This situation is manifested first by the fact that the products of men's labour universally take on the form of commodities. The riddle of the money fetish is therefore the riddle of the commodity fetish, now become visible and dazzling to our eyes. (Marx, 1867: 187)

However, it is the first lines of the second chapter of *Capital* that provide the best definition of the essence of fetishism, even if the word itself does not appear: ‘Commodities cannot themselves go to market and perform exchanges in their own right. We must, therefore, have recourse to their guardians, who are the possessors of commodities’ (Marx, 1867: 178). It is the commodities themselves which are the real actors – the ‘subject’ – in a commodity society. Human beings only enter onto the stage as the servants of these objects, as a necessary evil for the sake of production and circulation.

The concept of fetishism returns at the end of volume three of *Capital*, ‘The Revenues and their Sources’, in a chapter entitled, in yet another reference to religion, ‘The Trinity Formula’. When Friedrich Engels composed the third volume with the manuscripts left by Marx, he put together three fragments to form chapter 48, one of the last ones, but we cannot know with certainty where Marx himself had intended to place them.

In this chapter, Marx analyses the fact that the three principal factors of production – capital, land and labour – appear, in the eyes of economic actors, as factors that contribute to wealth creation, which would justify the pretensions of capitalists and property owners to receive a part of the surplus value realised as ‘just’ compensation for the production factor that they contributed. ‘Vulgar’ political economy sought to give a theoretical foundation to this sharing out that does indeed dominate in capitalist society. Thus, Marx writes:

Capital – profit (profit of enterprise plus interest), land – ground-rent, labour – wages, this is the trinity formula which comprises all the secrets of the social production process. [...] Capital, land, labour! But, capital is not a thing, it is a definite social relation of production pertaining to a particular historical social formation, which simply takes the form of a thing and gives this thing a specific social character. [...] It is not only the workers’ products which are transformed into independent powers, the products as masters and buyers of their producers, but the social powers and interconnecting form of this labour also confront them as properties of their product. Here we therefore have one factor of a historically produced social production process in a definite social form, and at first sight a very mysterious form. (Marx, 1894: 953–4)

At a material level, these three factors are obviously necessary for production. However, the false appearance that dominates the consciousness of subjects in capitalist society – and a little later Marx speaks indeed of a ‘religion of everyday life’ – identifies the material and technical factors of production with their social form and attributes to the different material factors of labour the capacity to produce the value of the commodity:

We have already shown in connection with the most simple categories of the capitalist mode of production and commodity production in general, in connection with commodities and money, the mystifying character that transforms the social relations for which the material elements of wealth serve as bearers in the course of production into properties of these things themselves (commodities), still more explicitly transforming the relation of production itself into a thing (money). All forms of society are subject to this distortion, in so far as they involve commodity production, however, where capital is the dominant category and forms the specific relation of production, this bewitched and distorted world develops much further. (Marx, 1894: 965–6)

Thus, fetishistic inversion exists in all commodity production, but reaches its apogee in developed capitalist society, and even more so in the form of monetary interest, where capital seems to be endowed with the ability to grow without having to go through the exploitation of labour.

Capital-profit (or better still capital-interest), land-ground-rent, labour-wages, this economic trinity as the connection between the components of value and wealth in general and its sources, completes the mystification of the capitalist mode of production, the reification of social relations, and the immediate coalescence of the material relations of production with their historical and social specificity: the bewitched, distorted, and upside-down world haunted by Monsieur le Capital and Madame la Terre, who are at the same time social characters and mere things. (Marx, 1894: 968–9)

In this argument, Marx does not use the word ‘fetishism’, but it is understood that this inversion between things and social relationships is the same as that of which he spoke at the start of *Capital*. This is equally true for the following remark:

What is also implied already in the commodity, and still more so in the commodity as the product of capital, is the reification of the social determinations of production and the subjectification [*Versubjektivierung*] of the material bases of production which characterize the entire capitalist mode of production. (Marx, 1894: 1020)

The core of Marx’s argument would therefore be the refutation of bourgeois economic theory when it affirms that the worker, when receiving their salary, receives everything to which they have a right, because the remuneration of other social classes corresponds to the multiplicity of factors of production. The denial that labour is the only source of value (and therefore of surplus value) is essential for the apologists of capitalism because they hope to show that there is no ‘injustice’ in the way that workers are paid. Bourgeois political economy, and the spontaneous representations of the ruling classes that it systematises, therefore operates a ‘mystification’ of consciousnesses by confusing things – the material agents of production – with social relationships.

FETISHISM IN MARXISM

During the first few decades of the dissemination of Marx’s theory, that is, the period of the Second International up to the start of the First World War, which was dominated by social democrats, the concept of fetishism, along with the concept of abstract labour, was practically never discussed. Even today, for many traditional Marxists – who primarily understand Marx as having provided a theory of social justice that was meant to aid the working classes – the concept of fetishism can be summarised in a single word: ‘mystification’. They see fetishism as an epiphenomenon, and above all as a con, as a veil that is, more or less consciously, thrown over the truth: that surplus value originates in the unpaid labour of the worker. From this perspective, fetishism is not a real phenomenon,

but concerns only the relationship between reality and its representation. The response to fetishism would therefore be to provide the correct information about the origins of value.

The first serious reprisal of the theme of fetishism, as well as that of value and abstract labour, appears in György Lukács' (1923) *History and Class Consciousness*. The term 'fetishism' appears there from time to time, but it is the concept of 'reification', the touchstone of the book, that encompasses the theme of fetishism: the transformation of social processes into things (*res*). Lukács recalls the fact that both *A Contribution to the Critique of Political Economy* and *Capital* begin 'with an analysis of commodities' and states: 'For at this stage in the history of mankind there is no problem that does not ultimately lead back to that question and there is no solution that could not be found in the solution to the riddle of commodity-structure'. Consequently, he wishes to analyse the 'problems growing out of the fetish character of commodities, both as an objective form and also as a subjective stance corresponding to it [...] Commodity fetishism is a specific problem of our age, the age of modern capitalism'. When he writes, 'only by understanding this can we obtain a clear insight into the ideological problems of capitalism and its downfall' (Lukács, 1923: 83–4), he ties fetishism to ideology, but he does not reduce it to an ideology. In contrast to nearly all other Marxists of his time, Lukács gives fetishism a central role:

It has often been claimed – and not without a certain justification – that the famous chapter in Hegel's *Logic* treating of Being, Non-Being and Becoming contains the whole of his philosophy. It might be claimed with perhaps equal justification that the chapter dealing with the fetish character of the commodity contains within itself the whole of historical materialism and the whole self-knowledge of the proletariat seen as the knowledge of capitalist society (and of the societies that preceded it). (Lukács, 1923: 170)

Lukács notes that, for Marx, every commodity is fetishistic. Capitalism cannot therefore be overcome simply by workers appropriating the world of commodities themselves. However, just as he conflates the Marxian concept of 'abstract labour' with the Weberian concept of the rationalisation and mechanisation of the division of labour, Lukács is still caught between a concept of fetishism as a *real inversion* and an *inverted vision of reality*.

Isaak Rubin's *Essays on Marx's Theory of Value* appeared in the Soviet Union at around the same time. This book, in contrast to Lukács', had almost no impact on contemporary debates (at least not in the West). The author was persecuted after 1930 as a 'Menshevik' and was executed in 1937. It was only with the publication of an English translation of his book in 1969 that its value was recognised.

The first chapter of his book is titled 'Marx's Theory of Commodity Fetishism' and begins with the phrase, 'Marx's theory of commodity fetishism has not occupied the place which is proper to it in the Marxist economic system' (Rubin, 1924: 5). He insists on the need to distinguish between the technical and socio-economic aspects of production, and also argues that the confusion of these two

is typical of the kind of fetishism that characterises bourgeois economics and everyday life:

The theory of commodity fetishism, which could more accurately be called a general theory of production relations of the commodity capitalist economy [is] per se, the basis of Marx's entire economic system, and in particular of his theory of value. [...] Marx did not only show that human relations were veiled by relations between things, but rather that, in the commodity economy, social production relations inevitably took the form of things and could not be expressed except through things. (Rubin, 1924: 5–6)

Rubin underlines that ‘the circulation of things – to the extent that they acquire the specific social properties of value and money – does not only express production among men, but it creates them’ (Rubin, 1924: 10–11). He was also aware of the originality of Marx's theory of fetishism and noted that, although Marx quotes antecedents to his theory of value, he practically never does so for his theory of fetishism. Rubin states his case clearly:

The absence of direct regulation of the social process of production necessarily leads to the indirect regulation of the production process through the market, through the products of labor, through things. Here the subject is the ‘materialization’ of production relations and not only ‘mystification’ or illusion. This is one of the characteristics of the economic structure of contemporary society [...] Fetishism is not only a phenomenon of social consciousness, but of social being. (Rubin, 1924: 59)

Rubin had a much clearer idea of the nature of value as a social relationship than nearly all of his contemporaries:

Thus what is revealed is an inseparable connection between Marx's theory of value and its general, methodological bases formulated in his theory of commodity fetishism. [...] One can only wonder why Marx's critics did not notice this inseparable connection between his labor theory of value and his theory of the reification or fetishization of the production relations among people. They understood Marx's theory of value in a mechanical-naturalistic, not in a sociological, sense. (Rubin, 1924: 72)

Karl Korsch was, alongside Lukács, the other great source of ‘Western Marxism’ with his *Marxism and Philosophy* (1923). However, commodity fetishism is only mentioned once in this book. In his *Karl Marx* (1938), he notes that the paragraph about fetishism is ‘important for the stand taken by Marx against all bourgeois economics’. He continues:

[B]y depending in their conscious actions upon such imaginary concepts, the members of modern ‘civilized’ society are really, like the savage by his fetish, controlled by the work of their hands. Commodities and, in a still more conspicuous form, the particular kind of commodity which serves as a general medium of exchange, namely, money, and all further forms of capitalistic commodity production derived from those basic forms, such as capital, wage-labour, etc., are examples of that fetish form assumed by the social production-relations of the present epoch. (Korsch, 1938: 131)

However, Korsch actually somehow limits the concept of fetishism by presenting it purely in opposition to bourgeois economical science, which is entirely taken

in by the fetishistic appearance of economic life. Korsch also stresses another important aspect: fetishism presents social conditions as ‘natural’ and ‘eternal’ when they are in fact historically specific to capitalist society: ‘the ‘fetishistic’ device of bourgeois economics had been shifted from the realm of human action to the so-called immutable, nature-ordained relations between things’ (Korsch, 1938: 137).

The concept of fetishism appears sporadically in works of Critical Theory, of the Frankfurt School as it is commonly known, notably in the writing of Theodor W. Adorno. He always criticised the concept of alienation as ‘idealist’ and as an expression of an aversion to that which is ‘foreign’ (*alienus*). He would refer to the concept of ‘fetishism’ as a more ‘objective’ alternative, but always thought of it, essentially, as a form of false consciousness. This approach can be seen in his debates with Walter Benjamin in the 1930s (see below) and in his essay ‘On the Fetish-Character in Music and the Regression of Listening’ (1938), where he refers to the commodification of musical experience as a kind of ‘fetishism’, which, for Adorno, means venerating things for their exchange value (their price in monetary terms). This understanding of fetishism was partially influenced by Thorstein Veblen’s theories of ‘ostentatious consumption’ – indeed, the conceptions of fetishism and ‘exchange value’ that circulated in the 1960s and 1970s, particularly in terms of a ‘critique of consumption’, often bare traces of a more or less unconscious adaptation of Veblen.

Equally, the term ‘fetishism’ in Adorno can also have a positive meaning: by singling out an object, notably luxury goods or works of art, fetishisation potentially posits them beyond the sphere of ‘exchange’, which levels everything and violates each object’s individual identity. Fetishisation therefore defends quality against quantity and even preserves the idea of happiness (Adorno, 1951: § 77). Indeed, Adorno’s conception of capitalism turns upon ‘exchange’ and on the ‘abstraction’ that exchange produces. Despite his attempts to appropriate the categories of the Marxian critique of political economy, at least in his later works, Adorno essentially remained fixated upon the sphere of the *circulation* of value. He particularly insisted on the similarities between the philosophical categories of ‘identity’, which he criticised for its repression of ‘difference’, and ‘exchange’, in the sense of exchange value, which also effaced any individuality. It was therefore the epistemological dimension of fetishism that mostly interested Adorno.

Between the 1950s and the 1970s, the theme of ‘alienation’ became the object of lively debates that frequently referred to the ‘young Marx’. Fetishism was often understood as a reprisal of the same concept in the ‘mature Marx’, who was considered to be less concerned with consciousness and more interested in ‘economic’ factors. However, it was above all the turmoil of 1968 and the development of a non-orthodox Marxism that led to a return to the concept of fetishism. Albeit, not everywhere, of course. In the preface to an edition of *Capital* published in French in 1969, Louis Althusser recommended new readers skip the

first chapter, which he saw as a nefarious Hegelian metaphysical hangover, and declared that the theme of fetishism would lead only to confusion.

The reprisal of fetishism at this time owed a great deal to the pioneering work of a Galician exile in the USA, Roman Rosdolsky, whose important study on *The Making of Marx's Capital*, a detailed and profound commentary on the *Grundrisse*, was published posthumously in 1968. The rediscovery of fetishism in the 1960s went hand-in-hand with the rediscovery of the importance of the Hegelian roots of Marx's work, and not only his early works. Rosdolsky begins his book by saying: 'Of all the problems in Marx's economic theory the most neglected has been that of his method, both in general and, specifically, in its relation to Hegel', in particular to his *Logic* (Rosdolsky, 1968: xi–xii). Rosdolsky analyses the role of money as a fetishistic medium and notes that Marx's concept of 'commodity fetishism' was 'already in evidence in his earliest economic works', as in his notes on Mill from 1844 (Rosdolsky, 1968: 126).

At the same time, and also in the USA, Fredy Perlman translated and published the first Western edition of Rubin's *Essays* and added an important preface where he writes: 'Later, when Marx refined his ideas of 'reified' or 'congealed' labor, the theory of commodity fetishism provided a focus, a unifying framework for his analysis' (Perlman, 1972: xii). Perlman demonstrates the continuity between the concept of alienation found in the young Marx (which was not known in Rubin's time) and fetishism, via the concept of reification. Referring to the debates of his own time, Perlman writes:

Consequently, the reification of social relations and the fetishism of commodities are not 'chains of illusion' which can be 'broken' within the context of capitalist society, because they do not arise from 'stereotyped alternatives of thinking' (Erich Fromm). The capitalist form of social production 'necessarily leads' to the reification of social relations; reification is not only a 'consequence' of capitalism; it is an inseparable aspect of capitalism. (Perlman, 1972: xxiii)

The concepts of 'alienation', of 'estrangement', of 'reification' and of 'fetishism' tend to coincide. Some authors, such as Guy Debord (1967), in whose work the word 'fetishism' is almost absent are, in effect, talking about it when they evoke 'alienation'. Debord uses the term 'fetishism' explicitly only in thesis 36 of *The Society of the Spectacle*:

The fetishism of the commodity – the domination of society by 'intangible as well as tangible things' – attains its ultimate fulfilment in the spectacle, where the real world is replaced by a selection of images which are projected above it, yet which at the same time succeed in making themselves regarded as the epitome of reality. (Debord, 1967: 16)

When he writes in thesis 67, 'like the old religious fetishism, with its convulsionary raptures and miraculous cures, the fetishism of commodities generates its own moments of fervent exaltation' (Debord, 1967: 33), he is instead referring to fetishism as the projection of desires onto objects and their adulation.

In Germany, some students of Adorno deepened the concept further. For Hans-Jürgen Krahl, the critique of fetishism was a continuation of the Kantian critique of

pure reason: just as the latter sought to reinstate the autonomy of the transcendental subject by demonstrating that what the subject attributed to things actually belonged to itself, the critique of fetishism points to the fact that the autonomous relationships of production appear as the natural qualities of products (Krahl, 1971: 49).

In Italy, it was Lucio Colletti who, from the end of the 1960s, took up the concepts of value, abstract labour, fetishism and their interconnectedness. While condemning the Hegelian side of Marx, and rejecting Marx himself from 1974 onwards, Colletti was one of the first to see that for Marx fetishism was a *real inversion* – even if this was, for Colletti, another reason to condemn Marx in the name of logical empiricism and Kantianism. According to Colletti, the processes of hypostatisation and substantiation of the abstract, the inversion of subject and predicate are not, for Marx, only defective aspects of the logic of Hegel, but rather are effectively to be found in the actual structure of capitalist society. The scientific Marx, according to Colletti, analysed the ‘natural laws’ of the economy; Marx as the critic of political economy examined a fetishistic world turned upside down. The theory of fetishism and the theory of the dialectical contradiction as a real phenomenon are therefore only different ways of formulating the same observation. As Colletti (1974) argues in *Marxism and Dialectic* it is not only the representation of reality that is turned upside down, but reality itself. Indeed, he makes the point as early as 1969 in an article on ‘Bernstein and the Marxism of the Second International’: ‘Marx’s theory of value is identical to his *theory of fetishism* and that it is precisely by virtue of this element (in which the crucial importance of the relation with Hegel is intuitively evident) that Marx’s theory differs in principle from the whole of classical political economy’ (Colletti, 1969: 77).

When the ‘crisis of work’ became visible from the 1970s onwards, a reading of Marx that was centred on the concept of abstract labour and its ties to commodity fetishism emerged. It was above all Moishe Postone (1993) in his work *Time, Labour and Social Domination* and the German reviews *Krisis* and *Exit!*, with their main author Robert Kurz, who developed from the end of the 1980s a new approach under the name the ‘critique of value’. Putting aside the differences between these authors, we can summarise their approach as follows: fetishism means that things govern society in place of human beings because these things contain their social relationships within them. This is a real inversion, an inversion between abstract and concrete, where, in a socially unconscious manner, concrete labour and use value serve only as the ‘bearers’, or ‘supports’, of the underlying, invisible substance, which is the value produced by the abstract side of labour. In a fetishistic society, the true subjects are not the humans, but value and its tautological accumulation. Fetishism is therefore not an epiphenomenon but represents the very heart of Marx’s conception of capitalism as a society which is not only unjust, but also, in its basic categories, destructive and self-destructive. Fetishism cannot be overcome without overcoming abstract labour and value.

The three ‘characteristics’ that Marx describes in his analysis of the value form are *inversions* between concrete and abstract. Use value becomes the phenomenal

form of its opposite: exchange value. Concrete labour becomes the phenomenal form of its opposite: abstract labour. Private labour becomes its opposite form: immediately social labour. That which should come first, the concrete, becomes a derivative of that which should come second, the abstract. In philosophical terms, we might speak of an inversion between substance and accident. The description of alienation that Marx gives in the *Economic and Philosophical Manuscripts* (1844) does not therefore appear as a fundamentally different approach to his later conceptualisation of fetishism, but as a first approximation which already, implicitly, stated the essential: the dispossession of people through abstract labour has become the principal of social synthesis.

Fetishism is not only an inverted representation of reality, but an *inversion of reality itself*. In this sense, the theory of fetishism is central to the totality of criticisms that Marx aims at the foundations of capitalism. Well beyond the explicit use of the word ‘fetishism’, the concept of fetishism as inversion exists throughout Marx’s critique of political economy and was anticipated by the ‘philosophical’ works of his youth. The ‘fetishistic’ character of capitalist society is not only a secondary aspect but belongs to its ‘cell-form’ itself: the commodity. Far from being a ‘superstructure’ belonging to the mental or symbolic sphere of social life, fetishism resides in the very bases of capitalist society and permeates all of its aspects. Marx’s theory of value and his theory of fetishism are therefore essentially identical.

According to Postone, the young Marx understood alienation as the alienation of a presupposed subject that exists independently of capitalism and is constituted by labour – understood as a transhistorical category – and that has to take back control of its own objectifications, which have become independent of it. The mature Marx had instead arrived at the conclusion that in capitalism both the subject and the object developed from the very beginning as alienated forms. There is no original essence to reconquer or to raise to victory. Likewise, and above all, there is no essence that is constituted by some kind of transhistorical human labour. The real moment of ‘rupture’ in the evolution of Marx’s ideas was rather the moment when he recognised alienation was inherent to abstract labour itself, and not only to the exploitation of living labour.

Traditional Marxism, according to the critique of value, preferred empiricist ‘common sense’ to Marx’s dialectic when it affirmed that ‘behind’ value the ‘real’ essence of capitalism was hidden, that is to say, the exploitation of one class by another. At first sight, Marx’s passage on the ‘trinity formula’ does provide some justification for the ‘classical’ Marxist position. The fetishism that Marx analyses in the third volume of *Capital* is not, however, the fetishism analysed in the first. It is rather a matter of two different levels of analysis that do not necessarily contradict one another. The path followed in *Capital* moves from essence to appearance, from categorical critique to an analysis of the empirical surface, from pure categories to the concrete forms that these categories assumed in Marx’s time. The paradigmatic case is the movement that takes ‘value’ – a

non-empirical category – through a number of intermediary steps to its ‘market price’, which is the only level immediately perceptible to economic actors, and which constitutes the almost exclusive object of bourgeois economic science. Marx’s two major developments of fetishism correspond therefore, respectively, to its essence and its phenomenological form.

To conceive of fetishism as a category of reality implies that the agents of capitalist production are instead *acted upon* by the logic of value rather than *being themselves the actors*. The real subject of capitalist production is not the ruling class, nor the proletariat, but value itself, which reduces human actors to the executors of its orders. Marx expresses this fact in the paradoxical and surprising formula that value is an ‘automatic subject’ (the phrase appears in *Capital*, vol. 1, in chapter 4, ‘The General Formula for Capital’, but is not translated properly in most English translations). Earlier in the *Grundrisse*, Marx already said that ‘value enters as subject’ (Marx, 1939: 311).

Of course, it is not, as fetishistic appearances suggest, things that are really in charge. They reign only to the extent that social relationships have become objectified within them. In the value form, something which exists only in the mind, a *form*, as the expression of social relationships, regulates material life. Marx explains that

[t]hese *objective* dependency relations also appear, in antithesis to those of *personal* dependence (the objective dependency relation is nothing more than social relations which have become independent and now enter into opposition to the seemingly independent individuals; i.e. the reciprocal relations of production separated from and autonomous of individuals) in such a way that individuals are now ruled by *abstractions*, whereas earlier they depended on one another. The abstraction, or idea, however, is nothing more than the theoretical expression of those material relations which are their lord and master. (Marx, 1939: 164)

Fetishism is precisely a universality that is not the sum of particularities. It is the unwanted result of the particular conscious actions (that do indeed exist) of subjects. From this point of view, capitalism could be seen as the continuation of a series of preceding forms of unconscious society, based, in turn, on totemism, kinship, land or religion. History would therefore be a ‘history of fetishism’ rather than a history of class struggle, and the Marxian idea of an ‘end of prehistory’ was interpreted by the critique of value, at least in its early stages, as the construction of a society which would be, for the first time in history, truly conscious of what it does. This vision, no doubt, is very far from ‘historical materialism’ and its schema of an economic base and superstructure.

In a society where abstract labour – the abstract side of labour – and the value that it produces forms the social ties between people and designates their place in society, individuals meet only as separated producers that must reduce their products to a common measure – which removes their intrinsic qualities – in order to exchange and be able to form a society. Abstract human labour, ‘universally human’ labour (that is, non-specific, non-social, the pure expenditure of energy without regard for content or consequences) has the upper hand over use value

and concrete labour. This also means that the members of society lose all control over what will become of their products: it is not their beauty, not their usefulness, not the conditions of their production, nor their environmental impact that counts, but only their capacity to represent in their 'commodity-body', in their use value, a certain quantity of value and surplus value. This is why Marx calls commodities 'sensible-suprasensible': behind their sensible appearance a 'suprasensible' aspect is hidden, the fact that they are only the 'bearers' of an 'ungraspable' and incomprehensible essence, the value created by the abstract side of labour. There is no 'balance' between the abstract and concrete sides of the commodity: the abstract side necessarily wins out. People find themselves powerless in the face of this logic that they have themselves produced and attempt to appease the gods of their own creation: exactly like in religion. Commodity fetishism is even worse than traditional religion: heaven and earth are not separated, because each commodity contains within it a metaphysical quality as it obeys an invisible and abstract logic, one that does not refer to the needs of people and that no one has chosen. Commodity fetishism is 'mysterious' and seems 'metaphysical' because it exists beyond the traditional ontological distinction between being and thinking.

One of the defining traits of fetishistic capitalist society is that it has a 'conceptual' nature: abstraction, incarnated in money, does not derive from the concrete, but dominates it. The form makes itself independent of its content and attempts to disencumber itself of it completely. When, for example, food is thrown into the sea in order to raise its price, despite the fact that people are dying of hunger, the concrete side of this commodity, its use value, its 'reality', serves only to 'incarnate' the phantasmagorical value that it is supposed to possess as a simple expenditure of the human energy that in the past was necessary to produce this commodity. This is indeed a real inversion.

Value, like other historical forms of fetishism, is an 'a priori' in the Kantian sense; it is a schema of which its subjects are not conscious, because it presents itself as 'natural' and not as historically determined. Everything that the subjects of value can think, imagine, want or do is expressed already in the categories of the commodity, money, value and labour. Nevertheless, it could be objected that the Marxian critique of value also wants to unveil the self-movement of things as a *false* appearance. Indeed, human beings *are* the creators of their own products. People are, at the material level, 'behind' the objectivised fetishistic form of the commodity. However, it is not people as conscious subjects, nor people in control of their own sociality, but rather fetishistic individuals. The creator of fetishism is an individual who is only a subject in relation to nature, but not with regards to their own society.

SOME MORE PROBLEMATICAL ELABORATIONS OF 'FETISHISM'

Marx is not the only person to have introduced the term 'fetishism' into a larger theoretical framework. Two other authors notably took up the notion in the years

after the death of Marx, but without drawing upon him. Emile Durkheim argued, in *The Elementary Forms of the Religious Life* (1912), that fetishism and totemism are characteristic forms of relationship to the sacred that are found in all religions and that are based upon the projection of a 'collective consciousness'. Sigmund Freud, in one of his later works, the short essay on 'Fetishism' (1927), links sexual fetishism – the transference of desire onto a substitute object – to castration anxiety. Although these two uses of the fetishism concept have no direct relationship to the Marxian concept, it was inevitable that the enlargement of the semantic scope of the term would produce, in later decades, a confluence of its different meanings that has led to it being employed in a manner that is very broad and often purely associative: today, one can 'fetishise' anything.

A sort of precursor to this attitude can already be found in the work of Walter Benjamin in the 1930s. Benjamin's writing, however, would not circulate widely until the 1970s and it therefore contributed primarily to the genesis of 'post-modern' theory and its understanding of fetishism. Benjamin mostly took up the concept of commodity fetishism in describing (in part through a prolific correspondence with Adorno) the transformations that took place in nineteenth-century France but interpreted it for the most part in the sense of a visual 'phantasmagoria'. He therefore evokes projection, myth, dream, illusion, adulation, chimera and ideology, all of which linked back to the 'disenchantment of the world' evoked by Max Weber. The bourgeoisie constructed an imaginary and seductive world in order to hide the 'impoverishment of experience' that capitalism had brought about. Although it is very interesting in its own right, Benjamin's understanding of fetishism does not have a great deal of basis in the Marxian concept and, in the long run, contributed to promoting a certain conceptual and semantic confusion. For Marx, *every* commodity – as a bearer of a portion of value – is fetishistic, without regard for its contents or its relationship to the needs and desires of consumers. This implies that no commodity can be *more* or *less* fetishistic than another one. Moreover, it does not become fetishistic through its sale or circulation on the market because its fetishistic character derives already from its conditions of production: the production of a use value serves only the creation of value and surplus value.

From the 1970s onwards, the term 'commodity fetishism' appeared to many authors to be a perfect summary of, and handy phrase for, the core characteristics of post-modern capitalism, which is imagined to turn upon consumption, advertising and the manipulation of desire. The word has become popularly used as a term to describe the excessive love of commodities and an adhesion to the values that they represent (speed, beauty, success, etc.). Fetishism is therefore widely understood less from the perspective of producers and of abstract labour, and more from that of the consumer and the psychological motivations that drive him to purchase commodities, as well as the social consensus that consumption creates. It should be said, however, that this level of analysis has very little to do with Marx's approach. The fetishisation of objects and the commercialisation

of desires are obviously very really facts. However, they are the result of the capitalist search for profit under conditions of total competition – and, therefore, also a result, in the final analysis, of abstract labour and fetishism – but this is a *consequence* that occurs at the phenomenological level. This level, which can indeed be described by psychology and sociology, is not at all identical to the deep structure that Marx called fetishism. Some authors, such as Guy Debord and perhaps the earlier writing of Jean Baudrillard (*The System of Objects, The Consumer Society, For a Critique of the Political Economy of the Sign, The Mirror of Production, Symbolic Exchange and Death*, published between 1968 and 1976), attempted to bring together both levels in their use of the term.

The debate about the importance of fetishism has continued in recent years in anthropological studies of the sacred sphere that partially look back to the works of Marcel Mauss, Georges Bataille and Claude Lévi-Strauss. It could be asked (and Baudrillard goes in this direction): is commodity fetishism no more than a sub-category of fetishism in general, that is, as a universal phenomenon? On the one hand, such an approach contributes, in a positive way, to ‘demythifying’ modern culture and its claims to be radically different – and superior – to other cultures: capitalist society is, as such, ruled, like all of the ‘savages’ that it despises, by a sacred logic that totally contradicts its pretensions to be rational and secular. On the other hand, however, such a perspective ends up losing the historical specificity of modern fetishism, of commodity fetishism – which is based on the two-fold nature of labour in capitalism – in a sea of other historical fetishisms. It therefore becomes difficult to grasp that which radically *distinguishes* capitalism from preceding societies. Fetishism risks being considered only as a part of the eternal human condition and being confused with the category of ‘mediation’ or ‘symbolic structure’ as such. Yet mediation is not the same as fetishism; just as objectification is not the same as alienation. The critique of fetishism is not a critique of mediation or of symbolism in the name of some imaginary immediacy, but rather a critique of *fallacious* mediations. Modern fetishism is not just another form of an eternal human unconscious; it is the historical consequence of the domination of social life by abstract labour, which ‘embodies’ itself in concrete human activity.

Ideology-Critique and Ideology-Theory

Jan Rehmann

'Ideology-theory' emerged in the 1970s and 1980s, first in connection with Louis Althusser in his school in France, then Stuart Hall and the 'cultural studies' in the UK and the Berlin *Projekt Ideologietheorie (PIT)* founded by Wolfgang Fritz Haug in Germany. Claiming a re-foundation of Marxist research into ideology, it marked a double distinction: first, from a widespread 'economism', which reduced ideology to a mere epiphenomenon of class interests and thus missed the relative autonomy of the ideological; second, from a traditional ideology-critique, which understood the ideological merely as a 'false' and 'inverted' consciousness. The objections to the criticism of 'false consciousness' can be summed up as follows: it overlooked the 'materiality' of the ideological, i.e. its reality as an arrangement of 'ideological state apparatuses' (Althusser), intellectuals, rituals, and praxis-forms. By its fixation on consciousness, it also missed the unconscious functioning of ideologies, their capacity to engender subjectivities and 'subjects', their anchorage in bodily dispositions and attitudes of 'habitus' (Bourdieu). And it drew attention away from the main task, which is to grasp their efficacy in subjecting minds, bodies, and 'hearts'. According to Stuart Hall, the most important question regarding an 'organic' connective ideology is 'not what is *false* about it but what about it is *true*', i.e. not in terms of a universal truth, but rather of what 'makes good sense' (1988: 46).

Since the history of theories often moves through pendulum swings, the traditions of ideology-critique and of ideology-theory have developed separately and often against each other. Having participated myself in one of the

ideology-theoretical ‘schools’, the *PIT*, I would like to take a step back and reconsider this bifurcation. In my view, the ideology-theoretical claim to overcome the traditional fixation on a critique of ‘false’ consciousness was productive and is still valid. But the demarcations between the two are not as clear as it seems. At a closer look, most of the approaches usually described as ‘ideology-critical’ (from Lukács to Horkheimer, Adorno, and Marcuse) also try to explain the conditions of emergence and efficacy of ideologies, for example by taking up Marx’s analysis of ‘fetishism’ and ‘reification’ or by the concept of a ‘culture industry’. On the other hand, ideology-theories also contain a component of ideology-critique, which however shifts from a traditional true–false dichotomy to the distinction between domination and an emancipatory capacity to act (in the sense of Spinoza’s *potentia agendi*). In this vein, the *PIT* proposes to differentiate between an ideological ‘socialization from above’ and dimensions of ‘horizontal’ socialization, which takes place whenever the *common* is re-claimed and re-appropriated from below. It will be shown with the example of Althusser that an ideology-theory proclaiming to do without an ideology-critical perspective runs the risk of being transformed back into a functionalist theory of legitimacy.

Taking up two allegedly opposite examples, namely Marx and Engels’ critical concept of ideology and Gramsci’s theory of hegemony, I will deconstruct the widespread dichotomy between ideology-critique and ideology-theory. My assumption is that this dichotomy is counterproductive and needs to be overcome by the renewal of an ideology-critique, which operates with a theory of the ideological as ‘conceptual hinterland’ (Haug, 1993: 21).

MARX AND ENGELS: BEYOND A CRITIQUE OF ‘FALSE CONSCIOUSNESS’

There are indeed quite a few passages in which Marx and Engels (for example, in relation to religion) spoke of a ‘false’ or ‘inverted’ consciousness, an ‘independent kingdom in the clouds’, a ‘distorted conception’, a ‘standing on its head’, and so forth.¹ *The German Ideology* summarized the different descriptions of ‘distortion’ and ‘inversion’ in the image of a *camera obscura*: ‘If in all ideology men and their circumstances appear upside-down as in a *camera obscura*, this phenomenon arises just as much from their historical life-process as the inversion of objects on the retina does from their physical life-process’ (*Marx and Engels Collected Works* 5: 36). In order to disprove the idealistic inversions of ‘German philosophy’, which ‘descends from heaven to earth’, they claimed to set out ‘from real, active men, and on the basis of their real life-process’ and to demonstrate ‘the development of the ideological reflexes and echoes of this life-process. [...] It is not consciousness that determines life, but life that determines consciousness’ (*MECW* 5: 36ff.).

These formulations became the target of the ideology-theoretical turn. Althusser argued that *The German Ideology* understood ideology as mere ‘form

of consciousness' (forme-conscience), 'in a plainly positivist context [...] as a pure illusion, a pure dream, i.e. as nothingness [...], empty and vain' (Althusser, 1994: 496, 2001: 108). Stuart Hall criticized an 'empiricist relation of the subject to knowledge', according to which 'the real world indelibly imprints its meanings and interests directly into our consciousness' (Hall, 1988: 44). For Raymond Williams, it was an 'objectivist fantasy' to believe that 'real' life conditions could be known 'independently of language' and that there was '*first* material social life and *then*, at some temporal or spatial distance, consciousness and "its" products', which were, in reality, 'always [...] parts of the material social process itself' (Williams, 1977: 60–1). Terry Eagleton accused Marx and Engels of a 'naive sensuous empiricism which fails to grasp that there is no "real life-process" without interpretation'. In reality, humans move in a world of meanings, which are 'constitutive' of their activities, not secondary to them. The *camera obscura* metaphor was therefore unable to grasp the dynamic nature of human consciousness and instead reduced it to a device 'passively recording objects in the external world' (Eagleton, 1991: 73–6).

Here we should pause a moment and ask whether or to what extent these criticisms actually hit the mark of Marx and Engels' approach. Around the same time that *The German Ideology* was written (1845–6), Marx wrote his *Theses on Feuerbach* (1845, published 1888), whose first thesis criticized that 'all previous materialism' had conceived of reality and of sensuousness 'only in the form of the *object, or of contemplation*, but not as *sensuous human activity, practice*, not subjectively' (MECW 5: 3). The tenth thesis proclaimed to overcome an 'old materialism', which is tied to bourgeois society (bürgerliche Gesellschaft), by a 'new' one, whose standpoint is 'human society, or social humanity' (MECW 5: 5). This 'new materialism' became the starting point of what Antonio Labriola and Antonio Gramsci later called a 'philosophy of praxis' (cf. Rehmann, 2013: 62, 118ff.). Could it really be the case that Marx and Engels in *The German Ideology* assumed a 'passive' reflection of the exterior world by consciousness, thus falling back to the position Marx just denounced?

Let us take up a key passage, in which *The German Ideology* tried to counter the philosophy of conscience by developing five aspects of social activity. Opposite to the evolutionist interpretation put forward by Williams and Eagleton (*first* 'real life', *then* meaning), Marx and Engels emphasized that these aspects 'are not of course to be taken as [...] different stages, but just as [...] "moments", which have existed simultaneously since the dawn of history' (MECW 5: 43). Human beings must *first* produce the means to satisfy their basic needs, for example, eating, drinking, housing, clothing; they *second* create new needs; and *third*, while daily re-creating their own life, they also 'propagate their kind' and create relations between man and woman, parents and children (MECW 5: 41–3); these three 'moments' so far are then *fourth* summarized by a surprisingly comprehensive concept of 'production', namely, the 'production of life, both of one's own in labour and of fresh life in procreation', which are in turn connected to different

modes of co-operation (*MECW* 5: 43); *fifth*, people also have ‘consciousness’, which however does not manifest itself in the ‘pure’ form the idealistic philosophers imagined: it was

from the outset afflicted with the curse of being ‘burdened’ with matter, which here makes its appearance in the form of agitated layers of air, sounds, in short, of language. Language ... is practical, real consciousness that exists for other men as well ... and ... arises from the need, the necessity of intercourse with other men. ... Consciousness is, therefore, from the very beginning a social product, and remains so as long as men exist. (*MECW* 5: 43–4)

This analysis of five ‘moments’ has obviously nothing to do with what Williams described as an ‘objectivist fantasy’ of human life devoid of meaning and language. Nor is it a demonstration that language and consciousness have only a ‘secondary’ status. Instead of asserting that consciousness does not belong to the real practice of life, they argue that it could *only* be understood as an integral part of life practices, and therefore as a composite of social relations. Therefore, they criticize the philosophy of consciousness *not* from the perspective of an underlying dichotomy between (primary) ‘life’ and (secondary) consciousness, but rather because it severed consciousness from the practical contexts of life in order to demonstrate its nature as a primary force. Where the critics of *The German Ideology* bring out their heaviest guns, the result is ambiguous at best. Their criticism catches Marx and Engels red-handed as they fight a hand-to-hand scuffle with their opponents, and thereby move within their opponents’ discursive materials, taking up their idealistic discourses of a philosophy of consciousness and polemically turning it against them – for example, when they assume that ‘life determines consciousness’ (*MECW* 5: 37), or when they famously assert that it is ‘not the consciousness of men that determines their existence, but their social existence that determines their consciousness’ (*MECW* 29: 263). Descriptions of ideology as ‘false’ or ‘inverted consciousness’ suggest – similarly to the terms ‘echo’ and ‘reflex’ – a concept of ideology as a volatile epiphenomenon without any materiality and efficacy of its own.

But the criticism overlooks the anti-objectivist and praxis-philosophical thrust of the overall argument in both the *Theses on Feuerbach* and *The German Ideology*. It misses in particular that Marx and Engels were not primarily interested in debunking particular forms of consciousness but rather in explaining them from their societal foundation: the ‘inversion’ of ideology, its ‘standing on its head’ was for them an effect of the social division of material and mental labour, which they saw in turn intimately connected with the formation of private property, class and gender antagonisms and the state. It is only because of this underlying social division that ‘consciousness *can* really flatter itself that it is something other than consciousness of existing practice, that it *really* represents something without representing something real’. Only by means of this division is ‘consciousness [...] in a position to emancipate itself from the world and to proceed to the formation of “pure” theory, theology, philosophy, morality’, which

are practised by specific intellectual groups ‘as a profession, that is, as a *business*’ (MECW 5: 45, 379). What produces and maintains this reversal of consciousness is the real detachment of intellectual activities from social production, their growing independence and their predominant position in relation to production. This applies also to the emergence of religion, which is to be distinguished from the magic and natural mysticism of pre-state societies by the formation of a specialized priesthood, which is set free from manual labour. ‘The first form of ideologists, *priests*’, Marx wrote in a marginal note that in turn illustrated a passage written by Engels: ‘Division of labour only becomes truly such from the moment when a division of material and mental labour appears’ (MECW 5: 44–5).

The *camera obscura* is therefore to be understood not just as a metaphor for ‘false consciousness’, but rather for the ‘idealistic superstructure’ of class societies (MECW 5: 89). The combination of a philosophical term (‘idealistic’) and a category for a material and institutional reality (‘superstructure’) is symptomatic of the move from a traditional discourse of consciousness to a historical-materialist ideology-theory.² The metaphor *camera obscura* thus stands for the material arrangement and the socially unconscious that undergirds the forms of consciousness. As Wolfgang Fritz Haug argued, the detachment of consciousness ‘is framed and constituted by the material “dispositive” [in a Foucauldian sense] of social domination’ (Haug, 1984: 24). A similar view was held by Pierre Bourdieu, who took *The German Ideology*’s considerations on the divisions of manual and mental labour as a starting point from which to develop his concept of social ‘field’ in the domain of religion (Bourdieu, 1991: 6, 9). As soon as one takes the underlying social arrangement of the division of labour, of class formation, gender antagonism and the emergence of the state into consideration, one can see that Marx and Engels made a decisive shift towards an ideology-theory that conceived of the ideological as a material arrangement in society.

A similar method can be observed in the second application of ideology-critique. When Marx analyses in *Capital* the fetishism of the commodity, of money and of capital, he is not solely concerned with the mystifications in the brain, but rather with the *objective* inversions in capitalism, by which exchange value rules over use value, abstract labour over concrete labour, and private capitalist profit rules over people’s lives. It is these objective inversions that engender ‘socially valid, and therefore [...] objective thought forms’, by which people spontaneously perceive their conditions (MECW 35: 87, 542; cf. Marx, 1976: 169, 682). As an ‘objective thought form’, which (again) combines a term describing consciousness (thought form) and a term referring to ‘reality’ (objective), fetishism operates both as a fixed praxis-form in bourgeois society and a corresponding form of consciousness, which in turn is both a socially necessary miscognition and a pragmatically ‘correct’ account of phenomena ‘of the way things “are there”, without it being possible to change them at will’ (Balibar, 2017: 66). Marx’s critique thus targets the very normality of bourgeois reality and the normalization of its subjects.³ This capitalist ‘religion of everyday life’ is so deeply

anchored in socio-economic reality that it cannot be unhinged by a critique of 'false consciousness': even when scientifically disproved, its everyday validity and efficacy remain unbroken: 'the actual agents of production themselves feel completely at home in these estranged and irrational forms of capital-interest, land-rent, labor-wages, for these are precisely the configurations of appearance in which they move, and with which they are daily involved' (Marx, 1981: 969).

In a third main usage, the later Engels anchored the concept of ideology in a critical theory of the state. He defined the state as 'the first ideological power over man', followed by the law and the 'higher' ideological powers like religion and philosophy (*MECW* 26: 392–3). As a 'power, having arisen out of society but placing itself above it, and alienating itself more and more from it', the state reveals 'the admission that this society has become entangled in an insoluble contradiction with itself, that it has split into irreconcilable opposites which it is powerless to dispel' (*MECW* 26: 269). According to the *PIT*, Marx and Engels' reflections on ideology can be 'summarized' by the late Engels concept of ideological powers: 'Marx and Engels' analyses are focused on the connections between state and ideology, their ideology-critique is oriented towards [...] the withering away of the state' (*PIT*, 1979: 19).

What is common to the different usages of ideology by Marx and Engels are therefore two characteristics: one, they were actually dealing with structurally anchored societal arrangements, even though this focus was at times hidden beneath the predominant discourse of consciousness of the time;⁴ two, they used ideology as a *critical* concept, which means that not every world-view, mode of perception, thinking or feeling is by definition ideological. The concept of ideology referred to specific powers and forms, which are part of the reproduction of class societies. It was therefore a problematic development that both the 'official Marxism' of the Second International and the 'Marxism–Leninism' of the Third International carried out a 'neutralization' of the concept of ideology, namely as an ideational form of expression of class interests in general, which all but eliminated Marx and Engels' ideology-critique in its different varieties. At the founding conference of the Second International in 1889, the young Russian delegate Georgi Plekhanov invoked 'our revolutionary ideologues' (quoted in Jena, 1989: 67). Kautsky too employed a 'neutral' concept when he used 'intellectual' (*geistig*) and 'ideological' interchangeably (1906: 128f.). It was however mainly Lenin who influenced the development of a concept of ideology as a medium for antagonistic class interests (cf. Rehmann, 2013: 61ff.).

There were only a few theorists after Marx's death who took up aspects of Marx and Engels' critical concept of ideology. Georgy Lukács considered the commodity fetishism analysed by Marx to be the cornerstone of an encompassing 'reification'. Whereas Marx had used the concept to describe specific economic thought forms, Lukács generalized (and arguably totalized) its meaning so that it meant a 'universal category of society as a whole', seamlessly penetrating all levels of social consciousness (Lukács, 1971: 86, 93). This ideology-critical paradigm was

taken up and modified by Theodor W. Adorno and by Max Horkheimer.⁵ Another exception is represented by Antonio Labriola who, in 1896, described what he called ‘critical communism’ as being critical of any ‘ideology’, including a communist one. According to him, Marxist theory is opposed to the ‘ideologies of every sort’; it is ‘the clear and definite negation of all ideology’ (Labriola, 1966: 73–4, 98, 123). It is in particular Labriola who leads us to an ideology-critical dimension in Gramsci’s approach, which has been overlooked for quite some time.

GRAMSCI’S COMBINATION OF IDEOLOGY-CRITIQUE AND THEORY OF HEGEMONY

It has become commonplace in scholarly interpretation that Gramsci had left behind Marx and Engels’ ideology-critique and replaced it with a ‘neutral’ concept of ideology. Stuart Hall summarized Gramsci’s concept of ideology as ‘the mental frameworks – the languages, the concepts, categories, imagery of thought, and the systems of representation – which different classes and social groups deploy’ (Hall, 1996: 26). Similarly, Peter Thomas came to the conclusion that in Gramsci’s ‘most significant formulation of this concept ... , ideology is conceived in a neutral sense, as the form in which humans know a world wracked by the “real” contradictions of class struggle’ (Thomas, 2009: 281). But thought forms ‘wracked’ by class contradictions are not a good example of a ‘neutral’ concept of ideology, since Marx and Engels saw class antagonisms (and their ideological representations) as a transitory necessity, which is to be overcome in a classless society.⁶

The relationship between Gramsci’s theory of hegemony and Marx and Engels’ ideology-critique therefore needs to be disentangled more carefully. This is no easy task. Whereas Gramsci’s opposition to the treatment of ideology as a mere appearance of the economy was pervasive, his use of the term itself oscillated between different and partly opposite meanings. It is clear for Gramsci that Marx’s term ‘ideological forms’ (*MECW* 29: 263) is not to be understood as mere forms of consciousness, but rather as an ideological ‘terrain’ (Gramsci, 1975: 2359), in which the contradictions of class societies are being fought out. Ideologies are therefore ‘anything but illusions and appearance’, but rather an ‘objective and effective reality’, the terrain of the ‘superstructures’.⁷ Far from being a ‘marché de dupes’ (fool’s bargain), a game of illusions and tricks, ideology is to be understood as the ‘entire ensemble of superstructures’ (1975: 164). Gramsci thus focuses on what Althusser and other ideology-theorists later described as the ‘materiality’ of the ideological, on its ‘trenches’ in civil society, ‘hegemonic apparatuses’, ‘organic’ or ‘traditional’ intellectuals, complex and multiple power relations etc.

On some occasions Gramsci used the concept of ideology *positively*, predominantly in cases when a philosophy went beyond the limited bounds of the

intellectuals and was diffused into the great masses, where it created new forms of mass intellectuality. In this positive usage ideology signified the 'mass element of any philosophical conception', its conforming 'moral will' and 'norm of conduct'.⁸ The terminology became somewhat blurred by the fact that Gramsci described the same connection between world-view and conforming 'norm of conduct' with Croce's wide notion of 'religion', as well as with terms like 'faith', 'politics', 'culture', 'ethics' or 'intellectual and moral reform'. When philosophies become 'ideologies', they assume the 'fanatical granite compactness' of the 'beliefs of the people', which take on the same energy as 'material forces' (Gramsci, 1971: 404) – a formulation that refers of course to the famous quote by the young Marx that theory becomes a 'material power as soon as it has gripped the masses' (*MECW* 3: 182–3). Gramsci explicitly addressed a polysemy of the concept of ideology, which could be applied to both 'arbitrary elucubrations of particular individuals' and the 'necessary superstructure of a particular structure'. Consequently, one must distinguish between 'historically organic ideologies, which ... are necessary to a given structure, and ideologies that are arbitrary, rationalistic, or "willed"'. Whereas the latter only created individual 'movements' and polemics, the former "organise" human masses and create the terrain on which men move, acquire consciousness of their position, struggle' (1971: 376–7).

But Gramsci's terminology in regard to ideology is heterogeneous and contains both positive and critical usages. The latter were mostly due to the influence of Antonio Labriola, from whom Gramsci also adopted the term 'philosophy of praxis'. It is therefore no coincidence that his critical concept of ideology was particularly clear when he used it in the context of his concept of the philosophy of praxis, which 'freed itself (or is trying to free itself) from every one-sided and fanatical ideological element' (Gramsci, 1975: 1487). Like Labriola, who anticipated the danger that the philosophy of praxis would again become a 'new inverted ideology', in particular when people 'unfamiliar with the difficulties of historic research' transform it into 'a new philosophy of systematic history', i.e. 'history conceived as schemes or tendencies or designs' (Labriola, 1966: 126–7), Gramsci pointed out that Marxism was not exempt from slipping back into an 'ideology in the worst sense of the word, that is to say a dogmatic system of eternal and absolute truths' (Gramsci, 1971: 406–7). Such a relapse into ideology did not only occur in an elaborate philosophical form, but also on the level of popular common sense: it was the 'subaltern' character of certain social strata which necessarily created a 'direct ideological "aroma" emanating from the philosophy of praxis', namely in the form of 'mechanical determinism': 'I have been defeated for the moment, but the tide of history is working for me in the long term'. Such a determinism had the historical merit of becoming 'a tremendous force of moral resistance, of cohesion and of patient and obstinate perseverance', but at the same time it functioned as a 'substitute for the Predestination or Providence of confessional religions', which meant that the 'activity of the will' was present 'only implicitly, and in a veiled and, as it were, shamefaced manner', lacking 'critical unity'.

Such fatalism was the ‘clothing worn by real and active will when in a weak position’. Determinism had intrinsic strength as a ‘naive philosophy of the mass’ and ‘religion of the subaltern’, but as soon as it was elevated by intellectuals to a thought-out philosophy, it became a cause of passivity and ‘idiotic self-sufficiency’ (Gramsci, 1971: 336–7).

Against the backdrop of this relapse into ideological attitudes, Gramsci emphasized the ideology-critical perspective of the philosophy of praxis: whereas other ideologies aim at ‘reconciling opposing and contradictory interests’, the philosophy of praxis is the ‘very theory of these contradictions’. Instead of functioning as an ‘instrument of government of the dominant groups in order to gain the consent of and exercise hegemony, it is the expression of these subaltern classes who want to educate themselves in the art of government and who have an interest in knowing all truths, even the unpleasant ones’. For this they needed to dismantle not only the deceptions of the upper class, but also ‘and – even more – their own’ (Gramsci, 1995: 395–6). Not only does the philosophy of praxis ‘claim to explain ... the entire past, but also to explain ... itself historically’. Gramsci called this a ‘*maximum* “historicism”, the total liberation from any abstract “ideologism”, the beginning of a new civilization’ (Gramsci, 1975: 1864).

The widespread assessment of Gramsci’s ‘neutral’ understanding of ideology flattens out his contradictory usage of the concept. It represses his employment of a critical concept of ideology and overlooks that his dealings with ‘common sense’, ‘passive revolution’, ‘religion’, ‘Fordism’ etc. are examples of a vigorous and differentiated ideology-critique. Let us take as a case in point his distinction between ‘common sense’ and ‘good sense’ and their different relationships to ideology and philosophy: ‘Philosophy is criticism and the superseding of religion and “common sense” [senso comune]. In this sense it coincides with “good sense” [buon senso], which is opposed to “common sense”’ (Gramsci, 1971: 326; cf. Gramsci, 1975: 1378).

Whereas Althusser’s theory of ‘ideology in general’ presents a homogeneous top-down model of eternal submission, Gramsci thematizes a heterogeneous ensemble of four dimensions: (1) a *senso comune*, incoherent and disjointed, ‘strangely composite’ of different historical layers and opposite social perspectives; (2) the weight of *ideologies* (here religion) upon and within common sense; (3) on the other hand the dimension of a *buon senso*, which he defines as a ‘healthy nucleus’ of common sense, characterized by a sense of ‘experimentalism’ and open to new experiences;⁹ and finally (4) a *philosophy of praxis* that has the task of ‘coinciding’ with *buon senso*, taking it as a stronghold from which it works to render common sense more coherent.¹⁰

Gramsci’s critique of common sense is thus an ideology-critique that tries to push back the overwhelming impact of ideologies on common sense and to strengthen the inherent potentials of realistic experiences and capacities to act. Contrary to Horkheimer and Adorno, who treat common sense as if it were merely a passive effect of a manipulative ‘culture industry’, Gramsci’s critique is

not a frontal attack, but rather manifests itself as a ‘criticism of “common sense”, basing itself ..., however, on common sense in order to demonstrate that “everyone” is a philosopher and that it is ... a question of ... renovating and making “critical” an already existing activity’ (Gramsci, 1971: 330–1). The apparently paradoxical notion of a critique *of* common sense *based on* common sense and its inherent, ‘already existing’ intellectual activity marks a significant paradigm shift from a totalizing ideology-critique to a dialectical and differentiated one. Gramsci defines ideology-critique in a way that breaks with the paradigm of a mere critique of ‘consciousness’: in the framework of a philosophy of praxis, the critique of ideologies ‘involves the ensemble of the superstructures’ in order to induce a ‘process of distinction and change in the relative weight’ of the ideologies so that the ‘old collective will disaggregates into its contradictory elements’ (Gramsci, 1971: 195). This approach coincides with Ernst Bloch’s argument in *Heritage of Our Times* (1932) that the left needs to counteract German fascism by developing a ‘multi-layered dialectic’ in order to ‘release’ the elements of non-contemporaneous contradictions which are ‘hostile to capitalism, homeless in it’ and to ‘remount them for functioning in a different connection’ (Bloch, 1990: 113). These approaches were later elaborated in terms of discourse theory as ‘disarticulation’ and ‘re-articulation’ of ideological formations, by means of which ideology-critique needs to operate as an ‘interruptive discourse’ that intervenes in the ideological block of the opponent in order to decompose it, to reshape it and build effective elements into a new order (cf. Hall, 1988: 56; *PIT*, 2007: 57–8).

What is remarkable is therefore that Gramsci did not follow the general trend of contemporary Marxism–Leninism and altogether abandon the critical concept of ideology of Marx and Engels, but combined elements of it – via Labriola – with his new concept of hegemony. ‘Ideological’ for him are those mechanisms that keep the popular classes in submission to ‘foreign hegemonies’ (Gramsci, 1975: 713), a submission which impedes the passage from ‘subalternity’ to an ethico-political level. If one resists the temptation to rashly homogenize Gramsci’s contradictory usages of ideology and instead maintains the dialectical tension between them, one can see that they constitute a particular theoretical strength. Gramsci tries to do both – on the one hand understand, long before Althusser, the materiality of the ideological, its existence in apparatuses and practices, its efficacy, and on the other hand maintain that a philosophy of praxis has to operate as a permanent ideology-critique, not least in relation to one’s own tendencies to relapse into ideology. Marxist analysis and politics has to deal with the contradiction that (1) it must intervene into the ideological forms of the existing class society and is thereby necessarily co-determined by them, forced to develop (and in part ‘become’) a popular ‘ideology’ of its own, and therefore (2) needs a strong ideology-critical *philosophy of praxis* that helps to think through what it is doing and to historicize its own ideological involvements. To obscure or to neglect a theoretical understanding of this contradiction only leads to a *passive* dialectics that produces endless splits and defeats.

BEYOND ALTHUSSER: PERSPECTIVES OF A CRITICAL-STRUCTURAL THEORY OF IDEOLOGY

Instead of placing Marx/Engels' and Gramsci's concepts of ideology on opposite poles ('ideology-critique' vs 'hegemony theory'), both approaches can be characterized by their particular combination of a critical concept and a structural concept of ideology, which focuses on the underlying societal arrangements of thought forms. The separation of the two strands of critical theory is to a large part due to the influence of Althusser, who conceptualizes ideology-theory in a way that it has lost its connection with the tradition of ideology-critique.¹¹

Let us first try to identify where Althusser's ideology-theory intersects with and departs from Gramsci's hegemony theory. As Althusser himself indicated, his distinction between repressive and ideological state apparatuses (ISAs) is formed following the model of Gramsci's differentiation of 'political society' and 'civil society', coercion and hegemony (Althusser, 2001: 95 fn. 7). The treatment of the ideological apparatuses as *state* apparatuses would not be comprehensible without Gramsci's broadening of a traditional narrow concept of the state to the wider concept of the 'integral state'. Both Gramsci's 'integral state' and Althusser's ISAs include those institutions and associations that are usually considered to be 'private'. But whereas Gramsci was primarily interested in the possibilities of how subaltern classes develop the hegemonic capacities to occupy the different levels of the superstructures, Althusser's main attention was directed to the ways the ideological subjection under the bourgeois state is accomplished by the ISAs. The two perspectives are of course not mutually exclusive, but could complement each other in a productive way. New in comparison to Gramsci are above all the concepts of the 'subject' and of the voluntary subjection (*assujettissement*) that Althusser developed on the basis of the psychoanalysis of Jacques Lacan. This enabled him to understand the ideological as an unconscious, 'lived' relationship and to illustrate the dynamic and active character of ideological subjugation. At the same time, the integration of Lacanian psychoanalysis exposed Althusserian ideology-theory to the tension between the historically specific ISA concept and an unhistorically conceived 'ideology in general' – a contradiction, which led to divided receptions and finally contributed to the disintegration of the Althusser School.

I will not dive into the many productive insights of Althusser's ideology-theory,¹² but focus on what I think is a fundamental loss: due to his understanding of Marxism as a 'theoretical antihumanism', Althusser rejected the notions of alienation and fetishism. He mistakenly identified Marx and Engels' critical concept of ideology with the paradigm of 'false consciousness', and thus abandoned their ideology-critical perspective altogether. 'Ideology in general' became for him an 'organic part of every social totality'; it was 'eternal, exactly like the *unconscious*', i.e. 'omnipresent, trans-historical and therefore immutable in form', so that the human being was conceived of as an 'ideological animal by nature'.¹³

In this sense, Althusser moved within the ‘neutral’ concept of ideology of Marxism–Leninism, even though it was now legitimated by a psychoanalytic point of view. Based on Lacan’s concept of the ‘imaginary’, the ‘misrecognitions’, which Marx had located in the alienated structures of class societies, were once again relocated into the individual. Instead of developing the ‘celestialised forms’ of the ideological out of the ‘actual relations of life’, which Marx called the ‘only materialist and therefore scientific method’ (cf. Marx, 1976: 494, fn. 4; transl. modified), Althusser handed over all human practice and thought forms to a timeless structure of alienation and misconception that is based on the premise of a primary ‘un-societal foundational structure’ of the individual.¹⁴ Concrete analysis of the respective conditions of action was thus replaced with a reductionist procedure: ‘in the night of the subject-effect all practices turn grey’ (*PIT*, 1979: 126).

Like his predecessors of the Second and Third International, Althusser thus eliminated again the ideology-critical perspective of Marx and Engels. By doing so, he contributed to what Juha Koivisto and Veikko Pietilä described as the main ‘dilemma’ of the research on ideology, namely a polarization between ideology-critical approaches fixated on the critique of consciousness, and ideology-theories that break with the critique of consciousness but instead re-introduce a ‘neutral’ concept of ideology (Koivisto and Pietilä, 1993: 238). The former focused on the critique of inverted and reified forms of social consciousness (Lukács) or of ‘instrumental reason’ and ‘identitarian thought’ (Horkheimer/Adorno), but had major difficulties taking into account the discursive struggles in the hegemonic apparatuses of civil society; the latter distanced themselves from the totalizing tendencies of the Lukács-paradigm, but – by their re-introduction of a ‘neutral’ concept of ideology – lost the ideology-critical dimension of Marx and Engels and thereby the analytical sharpness of the concept altogether. What was missing in this arrangement was a ‘critical-structural conception of ideology’ that accounted for both the material *and* alienated existence of ideology and was able to connect the two strands in an organic way (Koivisto and Pietilä, 1993: 243).

Such a critical-structural conception of ideology was however developed by the Berlin *Projekt Ideologietheorie* (*PIT*). Following Engels’ concept of ‘ideological powers’, the *PIT* distinguishes between particular ideologies and the ‘ideological’ as an institutional framework determining human practices, thought forms and attitudes. The ideological is connected with a specific organizational form of class societies reproduced by the state and thus designates the functioning and efficacy of an ‘alienated socialisation from above’ (cf. Haug, 1987: 60–2, 68; Rehmann, 2013: 241–8). But the structural ideology-theory is also ideology-critical, because it deals with the functioning of ideological powers, practices and discourses from the heuristic perspective of their ‘withering away’ in a society without class, state and patriarchal domination. Compared to Althusser’s ‘ideology in general’, this concept of the ideological is more specific and allows it to be distinguished it from other dimensions of socialization, for example ‘horizontal’ forms, by which people try to organize their lives; utopian impulses, which

exceed the ideological form; or dimensions of the *cultural*, in which individuals and groups arrange their activities in an enjoyable way and 'practise what appears to them to be worth living'. It is important to bear in mind that these are *analytical* distinctions, which in empirical reality intersect and permeate each other. As Boltanski and Chiapello have shown with the example of France, many of the counter-cultural articulations of the '68 movement were successfully co-opted by a neoliberal management-ideology and marketed as a new lifestyle (2005: 197f., 326, 461, 498). And conversely, certain community-oriented functions which are represented and preserved in ideologies can be re-claimed by oppositional social movements and redirected towards their own capacity to act.

Althusser's model of interpellation conceptualized the construction of ideological subjects and subjectivities too monolithically from the top down: the small subjects interpellated by the big Subject just 'turn around', recognize themselves (and each other) in the call and affirm it with their 'yes' (Althusser, 2001: 121). Judith Butler criticized this model for disregarding different forms of disobedience. The law might not only be refused, but it might also 'be ruptured, forced into a rearticulation', so that there is always a 'slippage' between the discursive command and the effects, a 'constitutive failure of the performative', which might open possibilities for resignifying the terms (Butler, 1993: 122, 124). Stuart Hall contrasted Althusser's model with a more flexible and dialectical one, which differentiates between the coding of an ideological message and its active decoding by the interpellated subject. With this he can distinguish between three different types of responses: a 'dominant-hegemonic' model, according to which the decoding takes place within the dominant code; a 'negotiated code', in which the dominant position is accepted only on a general level and redefined independently with regard to the local conditions; and finally an 'oppositional code', by which the addressees interpret the message in a '*globally* contrary way' (Hall, 1993: 517). Althusser's model of interpellation only covers Hall's first variety, and even in this case, we have to presume that the interpellated subjects would only subjugate themselves 'voluntarily' if they recognized something 'of their own' in the interpellation.

This 'of their own' is, according to the interpretation of the *PIT*, a dimension of the 'common' (*Gemeinwesen*) that is represented in ideologies, however displaced and alienated.¹⁵ The ideological itself is not a homogenous block but rather contains a dialectic, according to which each ideology that appeals to the broader masses must also contain 'recognizable' elements of the common; for example, plebeian and counter-cultural motifs. This is by no means a peculiarity of 'progressive' tendencies, but also applies, for instance, to right-wing populist and fascist ideologies, whose success, as Ernst Bloch had already shown in the 1930s, can be explained, among other things, by their 'thefts from the commune' (Bloch, 1990: 64).

The *PIT* has conceptualized this inner contradictoriness with the concept of an 'antagonistic reclamation of the common (*Gemeinwesen*)', by which the

same ideological instances and values are interpreted and claimed in an opposite perspective (cf. Rehmann, 2013: 254–61). Different classes, genders and generations interpret very differently what *God's Will* is, what *justice* means, what *morality* proclaims and what *aesthetics* and *taste* define to be 'beautiful' or 'ugly'. Correspondingly, there are antagonistic interpellations, including 'horizontal' and emancipatory ones, and respective collective and individual subjectivities. Against this backdrop, the notion of ideology-critique changes its meaning: it has to pick up the 'horizontal' functions of the common represented in the ideological, to claim them and to fetch them back for the development of a capacity to act in solidarity. This means, for example, that a critique of religion informed by ideology-theory should not try to prove again and again that religion as such is an 'inverted consciousness' or 'opiate of the people'. Its analytical task is rather to decipher the social antagonisms and struggles in the field of religion and to set free its emancipatory impulses (cf. Rehmann, 2011: 151–2).

A critical-ideology theory has of course to be continuously fine-tuned to the concrete transformations and conjunctures of neoliberal high-tech capitalism. Obviously, the honeymoon of neoliberal ideology is long over. Its earlier capacity, based on the new computer technologies, to capture the imagination of large parts of the young generation who fancied getting creative jobs in the dot.com economy, has been replaced with disenchantment and bleak pessimism. Ideological interpellations need a sufficient economic substratum to be effective in the long run. As this substratum is shrinking in the growing debt crises, the capacity to engender mass consent is eroding and the authoritarian, disciplinary and panoptic tendencies grow in significance.¹⁶ To the extent that there is still a consensus, it is for the most part a passive consensus, a consensus by default, which reflects primarily the perceived absence of an appealing vision that 'another world is possible'. We cannot determine beforehand for how long the elites, their neoliberal ideologues and their right-wing populist counterparts will succeed in shifting the blame to competing nation-states, to trade unions, immigrants, feminists and other enemy-images, or at what point the fundamental contradiction between capitalism and democracy becomes visible and opens the way to new anti-capitalist movements and alliances. One of the most urgent questions is if and how the left is able to respond to neoliberalism's hegemonic crisis by developing an appealing democratic-socialist alternative to high-tech capitalism.

Notes

- 1 For example, *Marx and Engels Collected Works (MECW)* 3: 175; *MECW* 5: 27 et sqq., 420; *MECW* 35: 19; *MECW* 50: 164.
- 2 Marx would later, in *Theories of Surplus Value*, employ the category of 'superstructure of ideological strata' (Marx, 1969–71 [1]: 287).
- 3 According to Balibar, Marx's theory of fetishism, by rethinking the constitution of social objectivity, also 'virtually revolutionized the concept of "subject"' (Balibar, 2017: 65): 'the *givenness* of the

- objects of experience is immediately combined with the *norm* of behavior they call forth' (2017: 66), the fetishistic objectivity 'constitute[s] subjects which are part of objectivity itself or which are [...] given in experience [...] alongside commodities, and *in a relation to them*' (2017: 67).
- 4 As Fredric Jameson observed, Marx's theory of ideology is not 'one of false consciousness, but rather one of structural limitation and ideological closure' (1981: 52).
 - 5 This does, however, not yet apply to the early Horkheimer until the end of the 1930s (cf. Abromeit, 2011 and Rehmann, 2016).
 - 6 Cf. my debate with Thomas' interpretation in Rehmann (2014).
 - 7 Gramsci (1975: Q 4, §15, 436–7; Q 10.II, §41.XII, 1319; Q 11, §64, 1492; Q 13, §18, 1595–6).
 - 8 Gramsci (1975: Q 10.II, §41.i, 1292; Q 10.II, §2, 1242; Q 10.II, §31, 1269).
 - 9 Cf. Gramsci (1971: 328, 348; Gramsci, 1975: Q 10.II, §48; Q 11, §56; Q 16, §21; Q 12, §12, 1378).
 - 10 Cf. Gramsci (1975: Q 15, §22, 1780).
 - 11 It is interesting to observe the trajectory of other Althusserian scholars. Whereas, for example, the early Balibar juxtaposed 'two completely different strands in the Marxist tradition' (epitomized by Lenin vs Lukács), whereby the ideology-critical theory of fetishism is 'not materialistic', but still humanistic and ideological (1974: 206, 220f.), he later proceeded to a complementary reading of the theory of ideology as a theory of the State and the theory of fetishism as a theory of the market and its 'subjects' (2017: 77f.). Michel Pêcheux developed a concept of transformation of the subject-form by 'disidentification' that tried to break out of the 'eternity' of the Althusserian 'ideology in general' without explicitly challenging it (cf. Rehmann, 2013: 180–5).
 - 12 Cf. Rehmann (2013: 147–78, 285–6).
 - 13 Althusser (1979: 232; 2001: 109, 116).
 - 14 According to the *PIT*, Althusser's concept of 'ideology in general' is caught in a problematic psychoanalytic opposition between a 'needy individual' and a necessarily 'repressive society' – a dichotomy, in which the formation of self-determined capacities to act cannot be conceptualized (*PIT*, 1979: 121 et sqq.; cf. Rehmann, 2013: 165–73).
 - 15 See *PIT* (2007: 108). According to Engels, '*Gemeinwesen*' (literally: 'common-being') 'is a good old German word that can very well do service for the French "Commune"' (Letter to Bebel, 18 and 28 March, 1875, in *MECW* 45: 64). As Hardt and Negri point out, the common is not only the common wealth of nature, for example, air, water, fruits of the soil, but also the results of social production (Hardt and Negri, 2009: viii).
 - 16 For an analysis of 'disciplinary neoliberalism', cf. Bakker and Gill (2003: 60, 65, 116 et sqq.).

Real Abstraction

Elena Louisa Lange

INTRODUCTION

The German Marxist economist and philosopher Alfred Sohn-Rethel (1899–1990) presented the term ‘real abstraction’ as the heuristic framework towards the solution to the problem of the systematic cleft between the historical-materialist (Marxian) and the natural-scientific methods of cognition. Sohn-Rethel attempted to overcome this divide by tracing back the transhistorical *validity* of the concepts of the intellect to their material *genesis* in the social praxis of the exchange of commodities. For him, the latter constitutes the social nexus of *value* which, in the form of money, presents the synthesis of capitalist social relations. Commodity exchange, or the ‘exchange abstraction’ (and with it, value and money), therefore originates not from an abstraction in *thought*, but from abstraction in *practice*, and hence, from a *real abstraction*. Conceptual abstraction and the abstractions of the natural sciences are therefore to be derived from the social praxis of value constitution in exchange. Thus, through the process of commodity exchange, real abstraction enables a process in which people at the same time actively *generate* and *obfuscate* the material and social origins of their intellectual faculties, and yet remain unaware of it. The concepts of ‘cognition’ (*Erkenntnis*) therefore can be historically and materialistically deduced from the process of real abstraction as the constitution of social praxis. With this rationale, theory and practice, whose

unsolved relation hitherto presented a major fetter to both the justification and the implementation of Marxist thought, no longer present an opposition, but can be both grounded in the history of social praxis itself.

Although Marx, in *A Contribution to the Critique of Political Economy* (1859), had already used the term 'real abstraction' (*reelle Abstraktion*) to point to the 'conversion' of all commodities to labour time (Marx and Engels, 1987: 272), the general point of reference in the context of Marxist philosophy today originates from Alfred Sohn-Rethel's conceptualisation in his main work, *Geistige und körperliche Arbeit* (Sohn-Rethel, 1970) (*Intellectual and Manual Labour* (Sohn-Rethel, change to: 1978)), of which earlier drafts and versions have existed since the 1930s.¹ At the time of its introduction into theoretical Marxist debates in 1960s Germany, the intellectual environment was dominated, on the one hand, by debates on the heuristic and methodological importance of value-form analysis in volume one of *Capital* (Euchner and Schmidt, 1968) and, on the other, by the theoretical authority of the teachings of the Frankfurt School, especially Theodor W. Adorno and his interest in the possibilities of a material basis for a dialectical unity of epistemological and social critique. Only recently, however, has Sohn-Rethel's work begun to gain significance beyond the interests of a small number of German Marxist academics.²

The main part of this article focuses on Sohn-Rethel's theoretical formation of the concept of 'real abstraction' throughout his writings from 1936 to 1970, the year in which *Geistige und körperliche Arbeit* was first published in German. A second part reviews critical interventions that problematise the foundation of 'real abstraction' in Sohn-Rethel's reading of Marx's theory of value.³

Because Alfred Sohn-Rethel takes the conceptualisation of real abstraction from a particular reading of Marx's theory of value in *Capital*, the second part focuses on a selection of contributions that have attempted directly to develop this theory for an epistemological approach to the problem of value. In part because translations from Sohn-Rethel have been slow, incomplete or still wanting, the more pertinent debates have taken place in the German context, where we can witness not only what we consider the most far-reaching elaboration with regard to the epistemology of value, namely in the work of Helmut Reichelt and his notion of 'validity', but also the most sustained critique of Sohn-Rethel's concept, as well as Reichelt's theoretical elaboration, in the works of, e.g. Frank Engster, Tobias Reichardt, and Ingo Elbe. By drawing attention to recent research that thematises problems of real abstraction (e.g. its logical inconsistencies, or its implicit methodological individualism and neo-idealism), we hope to show not only where Sohn-Rethel's concept of real abstraction and Marx's concept of value diverge, but also to problematise a 'reading' of value which we consider to be detrimental to understanding capitalist socialisation and its ultimate abolition, goals that arguably also informed Sohn-Rethel's particular intervention.

THE THEORETICAL FORMATION OF 'REAL ABSTRACTION' (1936–1970)

The Materialist Impetus: Sohn-Rethel's Early Conceptualisation

To understand the context in which the term 'real abstraction' is first conceptualised, though not used verbatim, it is useful to look at the implications of Sohn-Rethel's early materialist epistemology in the works of 1936 and 1937.

In the earlier *In Place of an Introduction: An Exposé on the Theory of 'Functional Socialisation'*. A Letter to Theodor W. Adorno, 'two basic insights' (Sohn-Rethel, 1936/1971: 7) structure Sohn-Rethel's early conceptualisation of such an epistemology.⁴ The first is articulated in Sohn-Rethel's understanding of Marxist ideology critique: its task would be to trace back the problems of theory and cognition (*Erkenntnis*) to problems of human *social praxis*. This would entail scrutinising the indebtedness of the 'validity character' (*Geltungscharakter*) of *theory* to the *praxis* of the human being. For Sohn-Rethel, only as the *critique* of 'truth', proclaimed by theory as its unquestionable basis, does Marxist thought secure its own ground as a science *distinct* from bourgeois philosophy and ideology. The task of critique therefore requires a genealogical determination of the *obfuscated* origins of cognition's 'truth character' in human social praxis. In that sense, the methodological claim of tracing back the categories of cognition to human social practice genealogically, namely with regard to the history of their development, should be the decisive criterion for the *coherence of Marxist critique itself*, since, with the accomplishment of that task, the concepts ascribed to the realm of theory would lose their ahistorical, asocial character. This method would allow one to embed the categories of cognition in the 'complete deductive nexus' (*lückenloser Ableitungszusammenhang*) (1936/1971: 9) of a materialistically grounded history of human praxis, 'so that ... the concepts of subjectivity, identity, being (*Dasein*), objecthood (*Dinglichkeit*), objectivity and the logic of the forms of judgment can be unequivocally and without interruption traced back to moments of the commodity form of commodities, along with their genesis and dialectic' (1936/1971: 12).
