The second 'insight' relates to the importance of what Sohn-Rethel calls 'functional socialisation'. For the character of the social praxis that is determined as the material basis for the forms of thought is identified with the 'history of the human relations of exploitation' (1936/1971: 12). The idealist thought forms must then be conceived as 'forms of alienation' (*Entfremdungsformen*) which in fact serve, and have historically always served, to mystify the practical–social relation between humans called exploitation. 'Functional socialisation' hence describes a society which unconsciously derives its own legitimacy from the obfuscation of the exploitation of humans by humans in the social praxis of labour. An adequate genesis of exploitation would then have to take the historical formations of Old

Egypt, the Ancient world, and 'recent European commodity production' into perspective (1936/1971: 20).⁵ Here, the paradox of a legitimisation strategy that is simultaneously unconscious and 'tacit' to its agents is something Sohn-Rethel is particularly eager to explore. In this context, we can find one of the first conceptualisations of what is later to be termed 'real abstraction':

What therefore gives identity to the commodities or forms of appropriation, is the role which they play as a member of the social nexus, *between* the exploiter and the exploited. Although an object has a completely different meaning to each of them, it *is* between them, in action, in which it changes hands from one to the other, the *very same* thing, it has an existence valid, and yet independent of both of them, it has an objective being; and it does not fall apart in this action, but remains as a unit and is one thing. Only long after these form characters have begun to play their indispensable and tacit role for functional socialisation, intellectual reflection picks them up and declares them as concepts. (1936/1971: 17)

With this development, the real origins of the forms of thought and the forms of practice become inverted, for in the course of human history, the properties of the object now appear as properties of the intellect or cognition. This early definition of real abstraction, without explicitly making use of the later concept, not only already implies the structurally unconscious motive of the emergence of thought from praxis, but over and above relates the praxis of commodity exchange to the already obfuscated nexus of *exploitation* in which the form of commodity as an *identical thing* facilitates the consolidation of the semblance of equivalent exchange.

The 1937 essay *On the Critical Liquidation of Apriorism: A Materialist Study* is probably even more ambitious in finding a thoroughgoing materialist deduction to Kantian transcendental idealism and its cognitive apparatus. Again, without explicitly making use of the term 'real abstraction', Sohn-Rethel here presents a study in the constitutive role of commodity exchange (the 'act' of exchange) for the emergence of thought-determinations. The main proposition of the essay is that the key to the mystification of the origins of human discursive thought lies in explaining the transcendental synthesis, i.e. *subjectivity*, through *money*, or in comprehending *money as social synthesis*. The deduction of this subjectivity, or the 'transcendental synthesis', from money is the foremost task in the unfolding of the deductive nexus. In order to accomplish this task, Sohn-Rethel goes on to explore what he thinks is the most basic *praxis* of a commodity society, one that also accounts for the constitutive concept of 'identity' (1937/1971: 66). For him, it is the *exchange* of commodities. Only in commodity exchange, Sohn-Rethel argues, are 'things' identical insofar as they are the 'objects of activity and the centre of attention' (1937/1971: 44). 'The identical, thing-like (*dingliche*) existence of commodities in equivalence is the active positing of the act of exchange' (1937/1971: 44). However, exchange does not so much *mediate* the acts of production and consumption as 'institutionalise' the *separation* between production and consumption, so that the production of a social surplus by the producers (slaves, labourers) and its appropriation by the consumers (the dominant class, i.e. the pharaonic rulers, capitalists) becomes mystified in the activity

of equivalent exchange: 'the exchange of commodities itself already is, precisely by virtue of the equivalence that designates it, the form of obfuscation of its real historical content' (1937/1971: 45). In other words, commodity exchange must be understood from the historical process of the emergence of an exploited and an exploiting class (1937/1971: 47). Sohn-Rethel's theoretical interest in establishing the concept of commodity exchange and the categories deriving from it (money, identity, being, etc.) as the mode in which exploitation becomes obfuscated, here still clearly informs his early epistemology.

His thesis of money as the social origin of transcendental synthesis is that, in actuality, 'the theoretical subject is the money owner'. This idea is developed from the 'steps of reflection of the original relation of exploitation' (1937/1971: 73) and is historically bound to the first forms of commodity exchange between the 'old Pharaohs' and other 'regions of exploitation' (1937/1971: 73). From these 'steps of reflection', Sohn-Rethel draws the following conclusion:

Money is the form of reflection of appropriation, and for this reason, it requires the identification of its owner with it ... in the ancient world, money is the functional instrument of exploitation, the means of appropriation of slaves. Our contention is that the identification of the money owner with the function of money ... becomes the original act of theoretical subjectivity. (1937/1971: 76)

For Sohn-Rethel, the identification of the money owner with the function of money as a means of appropriation is not only constitutive of the very categories of 'subjectivity', but more broadly gives rise to the system of what we call 'logic' (1937/1971: 80).

Since Sohn-Rethel's theoretical interest primarily lies in exposing the social origins of conceptual thought through the history of human *praxis*, we have to note that in his early works we find an *equivocation* at work in the determination of praxis in the emergence of 'thought': first, the *praxis of exploitation* and, second, the *praxis of commodity exchange*. As we can see, with the 1936 and 1937 works, Sohn-Rethel has not yet developed a *general term* for the *praxis at the origin of thought*, as he will later with the concept of real abstraction. Accordingly, to overcome this overdetermination, one of Sohn-Rethel's conceptualisations of social praxis is discarded: namely the *praxis of exploitation*, and with it, the social nexus of *production*. This is the decisive theoretical departure from his early conceptualisation of a materialist epistemology. Starting from the 1961 essay *Commodity Form and Form of Thought*, the heuristic framework thus becomes limited to the praxis of *commodity exchange*.

In *Commodity Form and Form of Thought: An Essay on the Social Origin of the 'Pure Intellect'* (1961), with the concept of 'exchange abstraction' as vantage point, Sohn-Rethel attempts to conceptualise a general term for the praxis that has historically generated what is commonly assumed to be the transhistorical validity of conceptual or logical thought. Here, the focus of the early works on the historical content obfuscated in the categories of thought has been completely substituted

for a focus on two new, more radically elaborated aspects: the separation of intellectual and manual labour and the centrality of Marx's analysis of the commodity form. It is in these two new respects that Sohn-Rethel attempts to rethink the material basis of intellectual thought, or the form of thought (*Denkform*). His focus is completely relocated to the act of exchange as the social nexus in which a commodity economy mediates its own totality. Also, the concept of 'abstraction', insignificant in his previous works, now gains significance with respect to 'tracing back' the categories of pure intellect to their social constituents. Accordingly, Sohn-Rethel establishes a taxonomy of the terms 'abstraction'/'abstractness' (*Abstraktheit*) in Marx's 'commodity analysis' (1961/1971: 107). However, the commodity form itself cannot by virtue of its *ontological* constituent of abstractness alone induce conceptual thinking. Sohn-Rethel's focus on social *praxis* demands that human action must come into play: 'there is no other way to prove our assumption, but to autonomously account for the roots of the pure categories of thought in commodity exchange' (1961/1971: 109).

As to *how* exactly the abstractness of the commodity form imposes itself on to the exchange process which then somehow 'activates' conceptual thought, albeit unconsciously, we are still left in the dark. Sohn-Rethel himself hinted at this problem (1961/1971: 114). By way of a solution, it is crucial for him to understand the specificity of exchange abstraction as distinct from an abstraction *in thought*. Thus, Sohn-Rethel has to resort to emphasising, with regard to the specific kind of abstraction we find here, that 'the abstraction taking place in exchange emerges from the exchange relation itself' (1961/1971: 114). Hence, for Sohn-Rethel, the emergence of abstract time and abstract space results from the process of *exchange*, not from the *production* process – an argument that will become eminent in *Intellectual and Manual Labour*.

Sohn-Rethel's second theoretical novelty, the emphasis on the separation between intellectual and manual labour as the origin of conceptual thought, also has to be located in the (historical) emergence of commodity exchange. As soon as a given society begins to produce a surplus for exchange, intellectual labour becomes a mode of reproducing society's own self presentation, as is most obvious in the natural sciences.⁶ Sohn-Rethel here argues that the 'scientific' view of nature is itself mediated through the forms of 'market relations' (*Marktverkehr*) (1961/1971: 110). Especially in capitalist relations, the cognition of nature (*Naturerkenntnis*) itself becomes, by 'social necessity', subsumed under the directive of 'production itself' (1961/1971: 131).

However, rather than demonstrating 'by way of which causality' (1961/1971: 114) commodity abstraction affects human thought, Sohn-Rethel resorts to a methodological observation to demarcate his own method from that of traditional metaphysics. Because of the impasse of having to already make use of the concepts of 'pure intellect' in order to explain the 'causality' [*sic*] between conceptual thought and social *praxis*, in *Commodity Form and Thought-Form* Sohn-Rethel has to make do with a methodological reassurance demarcating his own approach

from that of traditional epistemology and science. This impasse will be countered in *Intellectual and Manual Labour* by a clearer ‘phenomenological’ analysis of the *exchange* or *real abstraction*.

Intellectual and Manual Labour: Real Abstraction as the Praxis at the Origin of Thought

In *Intellectual and Manual Labour* (1970), Sohn-Rethel endeavours to finally prove what had merely been a postulate in his works since the 1930s, namely that ‘the forms of abstraction which constitute the socially synthetic function of money can be separately accounted for, and that they ... will prove to be the ultimate organisational principles of the cognitive functions of thought in commodity producing societies, i.e. societies mediated by money’ (1970: 17). He locates these ‘forms of abstraction’ in the praxis of commodity exchange, a praxis that induces a kind of abstraction not originating in thought, but in human activity itself, and is likewise obscured from the conscious and intentional activity of the participants of the exchange process, namely *real abstraction*. More perspicuously than in previous works, however, Sohn-Rethel draws attention to what is at stake in the question of a materialist epistemology. For this, he stresses the interdependency between real abstraction, the separation of intellectual and manual labour, and the necessity of the constitution of socialism:

The creation of socialism demands that society is successful in making the modern developments of science and technology subservient to its needs. If, on the other hand, the scientific forms of thought and the technological aspect of the forces of production elude essentially historical-materialist understanding, this subservience becomes impossible. Mankind might go, not the way of socialism, but that of technocracy; society would not rule over technology, but technology over society. If Marxism fails to invalidate the plausibility of the timeless claims to truth in the dominating scientific doctrines, the abdication of Marxism as an intellectual standpoint only becomes a question of time. (1970: 14)⁷

The overcoming of the separation of intellectual and manual labour hence becomes the *sine qua non* for the creation of a socialist (classless) society in which the ‘timeless’ objects of traditional epistemology are ‘formally deducible from the same level to which manual labour also belongs, the level of social existence’ (1970: 38). On a theoretical level, however, this gap can only be closed if one can account for the social praxis that actively obfuscates – or, rather, justifies – it, namely commodity exchange giving rise to the exchange abstraction.

For Sohn-Rethel, who rejects the localisation of abstraction in the labour process,⁸ the abstraction taking place in the act of commodity exchange is initiated by the unconscious and yet actively performed abstraction from the commodities’ *use* value: ‘The exchange of commodities is abstract, because it is not only different from their use, but also temporally separated from it’ (1970: 39). Taking up the earlier argument, Sohn-Rethel contends that the value abstraction is thus primarily an abstraction from both the temporal and the spatial aspects of the

commodity related to its use, and merely effects a *social* change with regard to the change of its owner. The exchange abstraction hence can be said to be an ‘abstracting’ act par excellence: it is not the consciousness of the agents of exchange that is abstract, but their *act*. This also explains the unawareness of the agents involved in the process. Merely the actual ‘non-event, the absence of acts of use ... at the given place and time’ (1970: 42) is what lends abstractness to the act of exchange. Guided by the form of the Kantian inquiry – ‘How is social synthesis possible through the exchange of commodities?’ (1970: 42) – Sohn-Rethel conducts the ‘phenomenological analysis’ of exchange along the lines of explanatory criteria for the abstractive character of exchange itself, as an abstraction ‘from’ its other (i.e. qualities related to use value). These are predominantly the ‘practical solipsism’ that each commodity-owner exchange effects as an abstraction from ‘the other person’ (1970: 51); the ‘abstract quantity’ exchange effects as an abstraction from the commodity’s quality (1970: 56); the ‘abstract movement’ exchange effects as an abstraction from concrete temporal and spatial change (1970: 62); and ‘strict causality’, an organising principle of changes not dominated by nature, but by the authority of the market (1970: 65). These properties of the exchange abstraction are held together by the principle of *formalism*. This formalism, according to Sohn-Rethel, is ‘a formalism of a “pure” character of abstraction, but nevertheless of spatio-temporal reality’ (1970: 54). Because of its pure formalism, abstracting from all objective content, the exchange abstraction unconsciously imposes itself on to the ‘private’ minds of the agents in the process. This becomes eminent in the phenomenological manifestation of abstraction-as-such – *money*. Money, by virtue of its abstractive power as the universal equivalent, the negation of use value *per se*, becomes the direct manifestation of a society that cannot but express itself through *abstraction* as the predominant mode of social intercourse. Hence it represents the social synthesis of commodity-producing societies. Yet if the synthesis of commodity-producing societies is generated by money, the phenomenally manifest form of value emerging from the (historical) *praxis* of exchange, then Kant’s ‘transcendental synthesis’, understood as the epistemological subject, is no longer bound up with its atemporally valid character: then the historically materialist ‘truth’ of the ‘transcendental subject’ is nothing other than money itself (1970: 56). Drastically, we might add, the condition of possibility of ‘synthetic judgments a priori’ – or rather, *thinking itself*, has its material basis in *money*.

By relating the emergence of thought abstraction to real abstraction – ‘an abstraction existing nowhere but in the human mind, but not emerging from it’ (1970: 35) – and ‘proving’ its historical origin in the origin of money, dating back to the seventh century BCE in ancient Ionia with the minting of the first coins,⁹ Sohn-Rethel has accomplished the task he set himself: both tracing back the atemporal ‘truth character’ of the intellectual categories to their material constituents in social praxis and accounting for the process by which this nexus is obscured from the consciousness of the social agents. However, in light of Marx’s

value theory, which Sohn-Rethel himself contrasts with his own, we can ask: are Sohn-Rethel's theoretical premises with regard to the pivotal role of exchange as the 'locus' of real abstraction convincing? For, even after he has determined exchange as the locus of abstraction, Sohn-Rethel still grapples with the problem of *what it is that makes products of labour relate to one another as commodities at all* – in Sohn-Rethel's words: 'how, then, is exchange itself possible?' (1970: 50). But has he not already proven the possibility of exchange – by exchange itself? It is not far-fetched to locate the tautological character of Sohn-Rethel's argument in his ignorance of Marx's specific intervention against classical political economy, namely tracing back the naturalisations of categories such as money, capital, and profit to the social nexus of *abstract labour* of which the exchange process is always already the fetishistic expression, the level of the 'surface'.¹⁰ Sohn-Rethel's incentive to 'locate' the origin of conceptual thought at the surface of the 'change of form' (*Formwechsel*) of commodity and money lacks insight into the totality of production which already evades the problem horizon of capitalist self-perception. For Marx, exchange, giving itself the semblance of equality, while being based on the fundamental contradiction, i.e. *unequal* exchange between capital and labour, poses a *problem* which can only be solved by looking at the specificity of 'the hidden abode of production' (Marx, 1976: 279) under the dictate of capital. It is here, in production, that the social synthesis is constituted: exchange is only production's inverted and mystified appearance as the 'very Eden of the innate rights of man' (Marx, 1976: 280). Sohn-Rethel therefore fails to explain how exchange, rather than the totality of the conditions of production, empowers a 'social synthesis' that gives rise to real abstraction. Is the fact that labour time becomes the common denominator for all different use values not already a 'real abstraction' in the most accurate sense? The problem of Sohn-Rethel's conscious disavowal of the role of production and abstract labour,¹¹ the 'deeply real mode of organisation of labour in the framework of the capitalist mode of production',¹² has to give the incentive to a predominant strand in the reception of Sohn-Rethel's theory that we shall briefly turn to now.

CRITICAL ENGAGEMENTS

Against the Exchange Fetish

According to Frank Engster, Sohn-Rethel did not simply pursue *conscious* objections to Marx's value theory through a deliberate (but methodologically impermissible) separation of form (exchange) and substance (labour), but was also inhibited by an *unconscious* motive: his misrecognition of the *theoretical status of value-form analysis*. The decisive deviation from Marx's method, then, consists in Sohn-Rethel's reading of Marx's '*systematic-categorical analysis* of the value-form of the commodity as an *empirical-historical event (Geschehen)*' (Engster, 2009: 19).¹³ Engster's conclusions are unequivocal:

By misconceiving the significance of the non-empirical status of value-form analysis, Sohn-Rethel is unaware that Marx ... in no way develops a logic of commodity exchange ... [nor] an exchange between 'commodity owners', but the *necessity of money* from the purely logical-categorical analysis of the value form of the commodity. (Engster, 2009: 20)¹⁴

Because Sohn-Rethel misses the point that *not real abstraction, but money* puts labour and exchange, substance and form itself, into an 'identical social relation' (Engster, 2009: 20), he is blind to the fact that '[t]he value constitution from exchange and circulation is a necessary semblance [*notwendiger Schein*]' (Engster, 2009: 20). He overlooks the critical crux of Marx's *critique*, namely that the 'exchange relation between commodities and their owners' is the mere *appearance* of the 'valorisation of labour and capital, living and dead labour', mediated by money (Engster, 2009: 20). For Engster, Sohn-Rethel's misrecognition of the status and *task* of value-form analysis thus yields an *inversion* of Marx's critique. Against Marx, who shows that exchange appears as the locus of synthesis precisely because in money's function as 'means of circulation', its relation to abstract labour is eclipsed (Engster, 2014: 544), Sohn-Rethel hypostatizes real abstraction as 'constitutive for the *semblance [Schein] of abstract labour* as the substance of value, against which the events of exchange and circulation are postulated as autonomous spheres of logical priority and historical power [*geschichtsmächtige Kraft*]' (Engster, 2014: 544). Exchange, like 'labour' in Marxism–Leninism, thus becomes in Sohn-Rethel a 'quasi-anthropological constant' (Engster, 2014: 546).

Tobias Reichardt more strongly argues that Sohn-Rethel's theoretical intervention is situated around a whole cluster of logical aporias (Reichardt, 2008: 244–5, 257), two of which are specifically devastating to Sohn-Rethel's conceptualisation of real abstraction originating from commodity exchange: one is that value abstraction is 'essentially an abstraction in thought', while at the same time it must be located in social reality, which 'requires its *separation from thought*' (Reichardt, 2008: 247).¹⁵ The other is Sohn-Rethel's endeavour to 'deduce the forms of cognition sociologically, namely by depriving them of any autonomy with regard to their social conditions, *without impairing the validity and truth of cognition itself*' (Reichardt, 2008: 256), which requires precisely the autonomy of logical thought that Sohn-Rethel otherwise disavows. Let us first look at the aporia of the status of thought and social reality in Sohn-Rethel.

According to Sohn-Rethel, real abstraction predominantly results from the abstraction *from* use value/actions of use in commodity exchange. Reichardt critically argues that this abstraction, even if we admit its plausibility, does not automatically generate a 'value abstraction', but, if anything, an 'abstract use value' (Reichardt, 2008: 248). This assumption, however, forms the template for Sohn-Rethel's claim to the 'equality' and 'identity' of commodities in exchange – a mere social 'postulate' (Reichardt, 2008: 249).¹⁶ Against this, Reichardt argues with Marx that commodities are not 'made equal' through exchange: they are *posited as equals* (Reichardt, 2008: 250). The positing of equality in exchange

presupposes a specific character of labour that makes its products relate to one another as commodities, and therefore as *values*, in the first place – and that is abstract labour. Hence,

[Just] as little as the scientist *creates* the atoms and molecules he discovers as elements of the objects with the help of his instruments, the abstracting social theorist *creates* value or its forms [in thought] ... Value is a social relation existing independently of whether people think it or not. Moreover, value does *not* exist in the consciousness of the subjects of exchange. It is the result of a social process 'that goes on behind the backs of the producers', based on the 'lack of awareness of the people who undergo it'. (Reichardt, 2008: 251–2)¹⁷

According to Reichardt, Sohn-Rethel's conceptualisation of real abstraction as 'an abstraction existing nowhere but in the human mind, but not emerging from it' represents a 'big confusion' (Reichardt, 2008: 253) regarding the status of value as a social objectivity.¹⁸ More to the point, there is an aporia in the contention that the status of the validity and truth character of the logical (i.e. Kantian) scientific concepts remains *unaffected* by their deduction from social praxis. Because 'logical thinking adheres to commodity exchange or a particular society, one should think of it as historically contingent. It should disappear with its social foundations' (Reichardt, 2008: 256). Instead, in Sohn-Rethel's dictum, the content of the concepts of logic are *valid* transhistorical entities, which the ravages of (historical) time do not affect. Because of this aporia of the dependence and simultaneous autonomy of the categories of cognition, Sohn-Rethel oscillates between a conceptual essentialism and a deductive materialism he is unable to solve with the means of his own approach. However, the problem of validity has become pertinent for the further trajectory of real abstraction in the context of the problem of value. We now turn to Helmut Reichelt to investigate its explanatory power.

The Trajectory of Real Abstraction: Helmut Reichelt

Reichelt's contribution presents less a direct engagement with Sohn-Rethel than a 'reconstruction attempt' (*Rekonstruktionsversuch*) of Marx's theory in the context of the *Neue Marx-Lektüre* since the late 1960s and its broader interest in the epistemological dimension of value and real abstraction. Because of its relative impact on the German, but also international reception of Marx, we will also consider, by way of conclusion, the incisive critique of this framework by Ingo Elbe.¹⁹

A former student of Adorno, Reichelt seeks to 'bring to an end' what his teacher's research programme merely postulated, namely how the 'logical unconscious' (Reichelt, 2007: 16) operating in the exchange or real abstraction can be accounted for in the category of value itself. In his 2001 essay 'Marx's Critique of Economic Categories: Reflections on the Problem of Validity in the Dialectical Method of Presentation in *Capital*', he problematises the concept of value as what Marx calls an 'objective form of thought' (Marx, 1976: 169),²⁰ a '*contradictio in adiecto*', generating a tension between being a mere 'abstraction in thought' and a simultaneously really existing entity. Reichelt identifies Marx's conceptualisation of value

in the passage from the first edition of *Capital* that ‘equivalent only means similarity of magnitude, after both objects have first been *reduced tacitly in our head to the abstraction of value*’ (Marx, 1978: 138).²¹ Because value, on the other hand, is defined as ‘objectively measurable’ in socially necessary labour time, Reichelt concludes that ‘the connection between value-abstraction and labour as the substance of value is virtually incomprehensible’ (Reichelt, 2007: 9). According to Reichelt, Marx, unable to close the gap between the two, was therefore unable to provide a methodologically satisfactory development of the money-form. The heuristic tool for closing the gap, according to Reichelt, is to be found in the concept of *validity*. Reichelt sees it already at work in *Capital*, predominantly the first but also the later editions, albeit evading Marx’s own explicit attention. Taking Marx’s remarks on the character of ‘external reflection’ as a starting point,²² Reichelt draws a parallel with regard to the constitution of value in exchange:

The form of equal validity ... is, therefore, the object as value-objectivity, but this is not in our intentional consciousness ... As an *external reflection*, consciousness takes over categories of the object ... and treats them as categories of objectivity. (Reichelt, 2007: 24)

However, ‘the so-called real abstraction’ is not ‘inter-subjective’ validity, but a validity constituted through the mode of (external) reflection which then gains an ‘objective being’, namely as the ‘unity of validity and being’ (Reichelt, 2007: 26).²³ Because Marx resorts to an understanding of value as ‘materialised [objectified] universal labour time’ rather than ‘validity’ as the product of unconsciously performed thought abstractions, Reichelt argues that the derivation of money becomes ‘more opaque, since the linking of this concept of value with the *constitutive abstraction carried out by agents engaged in exchange* can no longer be mediated’ (Reichelt, 2007: 46).²⁴ Capitalist society as a ‘real unity’, according to Reichelt, must rather be understood on the basis of the dynamics of an ‘objective conceptuality’ (Reichelt, 2007: 49). This should also account for the originally Adornian problematic of the ‘objectivity of the conceptual moment’ that implements itself through the minds of the agents of exchange as real abstraction, ‘irrespective of whether people reflect on this or not’ (Backhaus, 1997: 503).

Elbe has diagnosed Reichelt’s conceptualisation of validity as a ‘neoidealistic reinterpretation of the theorem of real abstraction as an objective concept’ (Elbe, 2006: 1), leading to damaging consequences. According to Elbe, Reichelt has ‘confounded the Marxian levels of abstraction in value-form analysis and in the exchange process’, and outright misrepresented Marx’s claim to value abstraction taking place ‘in our head’: ‘The context of the proposition in the development of the presentation of *Capital* shows that Marx here speaks of the *analytic determination* of value in scientific consciousness’ (Elbe, 2006: 2), and is thus completely unrelated to the *minds of the agents of exchange*. Reichelt therefore misjudges the level of investigation Marx undertakes in value-form analysis, which is the *scientific presentation* of the process, not a ‘really existing’ process in everyday life. The latter only begins with the second chapter, illuminatingly

titled ‘The Exchange Process’. Hence, propositions about the ‘merely theoretical *presentability* of value ... in no way contains a thesis about the alleged *production* of it in people’s minds’ (Elbe, 2006: 2). Moreover, Reichelt distorts the meaning of ‘form’ in Marx’s theory, which is inevitably linked to the *fetishised* real forms that value takes, and thus remains a *problematic and critical* concept, which had to remain unreflected in classical political economy. Instead, Reichelt misrepresents ‘value’ to mean ‘a constitutive abstraction’ carried out by the agents of exchange which denotes an idealist distortion nowhere to be found – and, indeed, quite contrary to – Marx’s critical presentation.

The idealist hyperbole of Sohn-Rethel’s concept of real abstraction presented in Reichelt, resulting in a nominalist reduction of value to a ‘social fiction’ (see, e.g. Jappe, 2013: 12) without social objectivity, has gained significance in theories of value and the value-form in recent years.²⁵ However, as Elbe argues, ‘[the] real abstraction of value, as well as the form of representation, money, are objective relations of validity’, understood as having a ‘historically specific social function’ (Elbe, 2008: 206). Belittling the reality of real abstraction to the status of a mere ‘conceptuality’ not only shows the theoretical limits of recent interventions in value theory, but is symptomatic of an attitude of complacency that harbours the danger of capitulating to the ‘law of autonomisation’ (Adorno) it once tried to demystify. Works that have recently stressed the *reality* of ‘real abstraction’ as an ‘open secret’ specific to capitalism,²⁶ on the other hand, are probably less inclined to succumb to the temptation of the conceptual realism, and, by engaging the concept in problems relating to new forms of the labour-commodity in ‘cognitive capitalism’, remain closer to Marx’s critical understanding.

Notes

- 1 The neo-Kantian Georg Simmel’s use of ‘reale Abstraktion’ in *The Philosophy of Money* (Simmel, 1900) found its way into the work of Helmut Reichelt (Reichelt, 2007, 2013), whose contribution will be discussed at the end.
- 2 Although Sohn-Rethel has previously been discussed in Smith (1984) and Postone (1993), only more recently has his theory gained momentum in the anglophone world. See Osborne (2004), Toscano (2008, 2014), Toscano and Bhandar (2015), Loftus (2015), and Rekret and Choat (2016).
- 3 For reasons of space, the use of real abstraction in sociology (Laclau, 2000) or theories of space (Smith, 1984; Lefebvre, 1991; Charnock, 2014; Wilson, 2014; Loftus, 2015), or other reflections not directly engaging Sohn-Rethel (e.g. Finelli, 2007; Bonefeld, 2014; Lotz, 2014) must be disregarded. For the same reason, we must leave the international debate, e.g. in France and Italy, unconsidered. As for Italy, prefaces to *Intellectual and Manual Labour* written by Pier Aldo Rovatti and Antonio Negri appeared in March and June 1977 respectively, in the far-left journal *Lotta Continua*. They are, however, absent from the Italian edition, published by Feltrinelli in the same year. The texts do not substantively address the theory of real abstraction.
- 4 Another, more elaborate work, also written in 1936, ‘Sociological Theory of Cognition’, also known as the ‘Lucerne exposé’, was only published in 1985 (Sohn-Rethel, 1985). Its main arguments are represented in the letter to Adorno.
- 5 As we can already see here, Sohn-Rethel ignores the form determination of different historical relations of production and confounds them into an ahistorical notion of ‘labour as such’.
- 6 See also Sohn-Rethel (1970: 43).

- 7 See also Sohn-Rethel (1978: 3). The existing English edition of Sohn-Rethel's *Intellectual and Manual Labour* is less a translation than a summary, allowing for much inexactness and argumentative gaps, often falsifying the original intent. The Sohn-Rethel translation fund wants to change this dismal state of affairs with a new translation of his main works: www.toledotranslationfund.org/alfred_sohn_rethel (last consulted 10 June 2021).
- 8 See Sohn-Rethel (1990: 7): 'the concept of abstract social labour ... is a fetish concept bequeathed by the Hegelian heritage ... [it] occupies exactly the place which should be occupied by real abstraction generated by the act of exchange'. See also Sohn-Rethel (1970: 57, 59, 69, 189).
- 9 In *Intellectual and Manual Labour*, Sohn-Rethel does not further elaborate on the specificities of this process. See *Money: The Cash Coin of the A Priori*, in Sohn-Rethel (1990).
- 10 As Marx writes, 'the whole system of bourgeois production is presupposed so that exchange value can appear as the simple point of departure on the surface' (Marx, 1953: 907). See also Marx and Engels (1987 (MECW 29): 455).
- 11 See footnote 9.
- 12 Kocyba (n.d.).
- 13 See also Engster (2014: 546).
- 14 As Engster, Reichardt, Jappe, and others point out, Sohn-Rethel also misconceives Marx's determination of the capitalist commodity form at the beginning of *Capital* as a 'pre-capitalist' one of 'simple commodity production' in the Engelsian vein (Engster, 2014: 557; Reichardt, 2008: 261; Jappe, 2013: 11).
- 15 Emphasis added.
- 16 "'Value" is not the basis for equality, but to the contrary, the postulate inherent in the exchange relation ... is prior to the concept of value' (Sohn-Rethel, 1970: 57).
- 17 The quotes are from Marx (1976: 135), and Marx and Engels (1975 (MECW 3): 433), quoted in Marx (1976: 168).
- 18 This also becomes apparent in the fact that Sohn-Rethel's 'postulate-theorem' is 'completely unable to explain the magnitude of value' (Reichardt, 2008: 254). Indeed, value would depend on purely subjective evaluation as in marginalist theories of price. See also Jappe (2013: 10).
- 19 It should be mentioned that Dieter Wolf's critique has formed the template for Elbe's and also Reichardt's responses to the *Neue Marx-Lektüre* (Wolf, 2004). Our presentation will limit itself to Elbe.
- 20 The English translation of 'objektive Gedankenform' being 'forms of thought which are socially valid, and therefore, objective'.
- 21 Emphasis added.
- 22 Marx writes that 'one man is king only because other men stand in the relation of subjects to him. They, on the other hand, imagine that they are subjects because he is king' (Marx, 1976: 14).
- 23 This nuance had been lost, according to Reichelt, in Simmel's neo-Kantian understanding of real abstraction in which 'validity' and 'being' are separated (Reichelt, 2007: 48).
- 24 Emphasis added.
- 25 See Elbe (2008). In the German context, this trajectory can be observed, among others, in Robert Kurz and Anselm Jappe (*Wertkritik, Krisis*) and the ISF (Initiative Sozialistisches Forum, Joachim Bischoff and Uli Krug). In the international context, it is even more widespread and can be located in Althusserian interpretations, e.g. in Jacques Rancière's early work. For Elbe's critique of Rancière, see Elbe (2008: 198).

Subsumption

Andrés Saenz de Sicilia

INTRODUCTION

Subsumption counts amongst those concepts of philosophical provenance that are taken up by Marx and recoded as critical social concepts. Originating as a logical category, subsumption nonetheless describes for Marx something fundamental about both the basic structure and the developmental tendencies of capitalist societies. Subsumption is, in a sense, the crucial logical figure of capitalist relations, insofar as these relations are founded on the systematically perpetuated subordination of labour to capital. Without this subsumption there can be no exploitation of surplus-value, and so no accumulation and expanded reproduction of capital. The concept of subsumption, however, has a somewhat ambiguous status within Marx's thought. The term appears repeatedly from Marx's early to late writings, yet nowhere is it subject by Marx to a rigorous treatment, and so no explicit 'theory' of subsumption is presented in his writings. What the reader of Marx appears to be confronted with is little more than scattered fragments and indications, allusions to a more substantial position that never appears, or that, in *Capital*, is structurally repressed by the systematising impulse that governs the movement of Marx's discourse. The ambiguities and apparent ambivalence expressed in Marx's use of the term has been the cause of wide-ranging debates over the uses and misuses of the concept and its relevance for a critical engagement with contemporary reality, spanning assertions of its irrelevance (or even

theoretical counterproductivity) to readings that elevate it as the primary concept characterising the configuration of contemporary (or 'late') capitalism.

In this chapter, I consider three aspects of subsumption as a Marxist concept: its philosophical pre-history, especially in the work of Kant and Hegel (an appreciation of which, I argue, is crucial to grasping the depth of its significance within Marxist theory); Marx's conceptualisation of subsumption (both at a 'general' level, in relation to his materialist methodology, and as capitalist subsumption, in his critique of political economy); and, finally, key interpretations and debates pertaining to subsumption within the Marxist tradition.

CONCEPTUAL BACKGROUND

Whether named as such or not, subsumption has been a figure of thought employed since antiquity, describing both a relation and an act. In its classical conception, subsumption denotes a hierarchical *relation* of classification in which one element is designated as a particular, subordinate of a more general category that encompasses it (e.g. 'the human' subsumed under the genus of 'animal'). Equally, subsumption refers to the *act* of judgement that produces (or at least describes) this relation, that of *subsuming* a particular under a universal or, in a legal/medical context, the case under a rule. In this way, subsumption is basic to the construction of any systematically ordered body of knowledge or scientific discourse. Yet in modern philosophy, subsumption begins to take on a new significance, referring not simply to the hierarchical arrangement of ideas, or even things, but to the process by which objective entities come to be constituted as such. It is this shift from subsumption as logical organisation to subsumption as form-determination (or from recognition to production) that prepares the way for Marx's use of the term.

Kant

It was Immanuel Kant who first broke with the received understanding of subsumption as a purely logical or formal relation, by according it a central role in his critical philosophy. For Kant, our experience of the external world is not a direct sensible apprehension of things 'in themselves' (as naïve empiricism would have it), neither is it the effect of a purely mental activity of construction (as dogmatic rationalism asserts), but rather results from a cognitive 'synthesis' of sensible and conceptual elements. For experience of objects to be possible, Kant argues, the 'matter' of sensation must be given a conceptually ordered 'form' by being subsumed under the 'pure concepts of the understanding' (Kant, 1998). The pure concepts supply rules for the organisation of experience, such that what is grasped spontaneously and arbitrarily by the senses can be re-organised in a systematically ordered, stable and communicable form, enabling

this 'matter' to be known (rather than simply 'felt'); that is, appropriated cognitively by a rational consciousness.

Unlike the classical notion of subsumption, where specific concepts are categorised under more general concepts (a relation of concept to concept), this cognitive synthesis involves the articulation of heterogeneous elements: discursive concepts and sensible intuitions. The radicality of Kant's proposition was that concepts (of a certain fundamental or 'pure' type) did not simply map relations between empirical objects, but actively intervened in the process of their formation. The Kantian project of developing a 'transcendental logic' along with the 'transcendental synthesis' that is its core, thus involved recoding cognitive relations and procedures that were previously understood to have validity only in relation to *thought* objects, rendering them essential aspects of the process by which the form of *empirical* objects (the objects of concrete experience) is determined.

Subsumption, from the time of Kant's philosophy onwards, thus takes on the character of an *object-forming*, rather than simply taxonomising act. It does not only imply the ordering or relating of given objects but is a basic precondition of their constitution *as* objects, a moment of their 'production'. Importantly, the productivity of subsumption within Kantian philosophy is not limited to the *objects* of experience alone but also reciprocally enables the actualisation of subjectivity, as the medium, or *compositional totality* within which the representation of each and every object is unified (a conscious continuum consisting in a multiplicity of distinguished and related objects). In binding together the various moments of sensation in a conceptually coherent manner, transcendental subjectivity also binds each moment to itself, as the totality within which all objects are composed. This effects a reciprocal movement whereby the form-determination of objects by consciousness also turns out to be the precise activity by which consciousness actualises itself as self-consciousness, in the 'transcendental unity of apperception'. This reciprocity is crucial, because it signifies that the existence of a totalising structure is not independent of or indifferent to those entities that it determines and totalises, but rather both the total structure and individual objects equally depend on the active processes of determination by which they are related to one another (this will be important for Marx, insofar as the production of a certain type of objectivity, e.g. commodities, reciprocally actualises and sustains the existence of the compositional totality that necessitates this production: capitalism).

Hegel

Subsumption does not play a central role in Hegel's philosophy and appears only infrequently in his writings. Nevertheless, there is an important thread of continuity relating the core aspects of the Kantian discourse of subsumption with Hegel's thought, as well as the development of novel features of subsumption

crucial for Marx's adoption of the concept. The importance of Hegel's treatment of subsumption is twofold. Hegel recognised the centrality of subsumptive form-determination to the constitution of objectivity whilst at the same time decoupling such acts of determination from their source in the ahistorical structure of the individual ego on which Kant's 'transcendental logic' was based. This enabled Hegel to formulate a dynamic and developmental account of the reciprocity between discrete forms and the compositional totality that encompassed them. Rather than reflexively reinforcing one another in a closed loop that would always return to the same point of departure (the Kantian unity of apperception), for Hegel the movement of determination and comprehension, or externalisation and appropriation, traced what Marx described as 'a spiral, an expanding curve, not a simple circle' (Marx, 1993: 266). On this account, acts of subsumption form objects, which in turn transform the system or structure of determination itself, compelling it in turn to generate new forms for new objects, thereby unleashing a restless developmental dynamic.

The reflexive closure operative in Kantian philosophy is thus transformed by Hegel into a processual account of development that passes through successive, interlinked stages, where each stage emerges as a result of the previous stage. This implies a new conception of how acts of relational determination (such as subsumption) interact with the structures of unity, or compositional totalities, in which their basic elements are situated. The subsumption of the particular under the universal is no longer an infinitely self-same act realised within an unchanging totality, but rather takes on a fundamentally different character depending on the stage of development of the totality, whilst at the same time driving that development onwards. Therefore, whilst retaining its Kantian characterisation as an object constituting process, Hegel relativises and multiplies the nature of subsumptive form-determination, specifying its nature and effects according to the stage or moment of development in which it is operative. This opens the path to conceptualising subsumption as both a social and historical process.

In the *Phenomenology of Spirit*, this processual concept of development leads to the 'sublation' (*Aufhebung*) of the finite standpoint of an isolated consciousness and the development of a social concept of subjectivity that emerges with the transition from subject-object relations through subject-subject, and then subject-substance relations in the various forms of ethical life (Hegel, 1977). In the first place, Hegel's exposition attempts to demonstrate that interpersonal relations are an implicit condition for the existence of the individual self-consciousness that characterises the standpoint of Kant's philosophy. The subsumption of intuitions under concepts thus comes to be associated with a partial form of knowledge belonging to a limited stage in the developmental series, opening the path to further, diverse processes of subsumption of an intersubjective nature (the subsumption of one subject by another and the emergence of hierarchical relations, as in the section on

‘lordship and bondage’). Subsequently, Hegel traces the development of social relations into enduring *objective* structures, rather than contingent and unstable relations between isolated individuals. Here, with the emergence of what he terms ‘spirit’, subsumptive relations obtain between particular individuals and the universality of the *social form* they exist within and are constituted by (as opposed to simply the domination of one self-consciousness by another). This is a vital precursor to Marx’s use of subsumption, as it lays the foundation for an analysis of processes through which individuals are subsumed under objective structures of sociality. Hegel’s intervention into the discourse of subsumptive form-determination thus clearly takes him far beyond the analysis of *synthetic judgement acts* proper to an individual consciousness and onto the theorisation of *relational forms* that determine the identity and practical action of individuals in a collective context.

Hegel’s analysis of the development through successive configurations of an all-encompassing social totality also establishes the basis for conceptualising subsumption in historical terms, although how exactly to characterise the historical dimension of Hegel’s philosophy has been contested since its earliest reception. More important than any putative correspondence between the successive ‘shapes’ of spirit described by Hegel and real historical epochs or events is Hegel’s commitment to the idea that different social and ethical orders give rise to different kinds of individuals, practices and institutions (as well as, by implication, different forms of unfreedom and domination). Yet the controversial aspect of this insight was the philosophy of history underpinning Hegel’s account, which equated the development through successive social stages as the necessary progression towards ever more rational and ethically perfected orders, culminating in an ‘absolute’ moment that both completed the developmental movement and unified all the preceding stages (thus totalising the multiple configurations of totality). On a certain reading of this view, history is driven by a rational necessity towards the realisation of universal freedom and unity between individuals, nature and the divine that would effectively complete the historical process, given that no ‘higher’ order could subsequently be realised. This gave rise not only to the problem of how to identify and validate the historical moment at which such a state of completion had or will have been attained but also of whether history could indeed end in this way.

Despite its apparent abstractness, Hegel’s most sustained explicit engagement with the concept of subsumption, in his *Science of Logic* (1999), bears directly on these problems. Here, Hegel criticises the logical form of subsumption *as such* (that is, independently of any concrete moment of subsumption) as a limited and contradictory relation that cannot produce genuine unity between the elements it relates. Hegel’s critique centres on the assertion that subsumptive form-determination always involves a kind of imposition or violence, as a particular ‘content’ is determined by a ‘form’ that remains in some sense abstract or indifferent to its specific qualities and so violates its singular

identity. Insofar as it is constrained by the abstractness of the form, the content cannot fully actualise or 'be' itself in its particularity and thus remains unfree. It is the guiding motive of the Hegelian dialectic to overcome all such abstractness and indifference in the relation between form and content, or universal and particular, in order to attain true freedom. The absolute and final unity that is the horizon of Hegel's system and the point of completion for the schema of historical development it entails therefore demands an overcoming of the limitations of subsumptive relations.

In spite of all the shortcomings that Marx identified in Hegel's thought, the motif of overcoming the imposition of alien and dominating forms indifferent to the qualitative singularity of the living content they shape figures as a powerful influence on his critique of capitalist societies. The logical and abstract character of subsumption, as highlighted by Hegel, is a perfectly apt figure for the oppressive character of capital, as an alienating and one-sided form of social relatedness.

On the basis of a reading of the structural function played by subsumption within the philosophy of Kant and Hegel, it becomes clear that the transformations it undergoes in their respective systems are crucial for the development of Marx's deployment of subsumption as a critical social concept. Far from simply indicating a hierarchical relation, as in its classical sense, subsumption in this tradition becomes inexorably bound to the problems of form-determination and systemic development. With Kant, we see that all objectivity must be produced (rather than simply apprehended) and that synthetic acts of form-determining subsumption are central to this production. With Hegel, we see that the production of objectivity takes place according not to a fixed but rather a developing 'historical' totality whose transformations alter the nature and effects of that production (and so too the nature and effects of the subsumptive relations operative within it). At the same time, Hegel recognises in subsumption an inherently alienating or oppressive character, insisting that, by definition, subsumption implies the unfreedom or constraint of whatever is subsumed. These interventions are significant for the development of Marx's thought and the critical tradition it birthed in three principal senses: first, the 'productivity' of subsumption informs the Marxist notion of labour and the labour process, as the ontological locus of object-formation with corresponding subject-forming effects; second, the abstract character of subsumptive relations informs the discourse of alienation, reification, ideology and 'real abstraction' (Wendling, Chapter 28, Rehmann, Chapter 31, and Lange, Chapter 32, this *Handbook*); third, the situation of subsumption within a developing compositional totality that enables its comprehension as a historical process (both in the sense of being determined by historical conditions and determining of historical change). In establishing these new problematics and giving rise to new conceptual resources, this philosophical history of subsumption is an essential precondition for the invention of a Marxist theory of subsumption.

SUBSUMPTION IN MARX'S WRITINGS

Materialism and the Critique of Philosophy: Marx's Reaction to the Philosophical Discourse of Subsumption

In his early writings, Marx identifies the limitations of previous accounts of subsumption, and of philosophy more generally, in the way they conceive of the relation between thought and reality. For Marx, idealist philosophy subscribes to an upside-down account of actuality in which the causal relation between thinking and being is inverted, such that ideas and the logical relations between ideas have primacy over real individuals and material relations. Nowhere, for Marx, is this inversion more evident than in Hegel's philosophy and theory of modern society, where 'he simply holds fast to the one category and contents himself with searching for something corresponding to it in actual existence' (Marx, 1975: 109). Marx charges Hegel with providing 'his logic with a political body; he does not provide us with the logic of the body politic' (1975: 109). Despite its claim to begin from the most immediate and presuppositionless point of departure, Hegel's thought, simply by virtue of being philosophy, already presupposes the priority of conceptuality over material being.

Recognising this congenital dogmatism of the ideal, Marx turns philosophy's own methods – in particular Hegel's dialectic – against itself, disarticulating the practice of critique from the context and problematics in which it originates in order to redeploy it in the service of a new project of materialist social criticism. For Marx, *critique* of given social reality – with its constitutive relations, practices, forms and institutions – is synonymous with the construction of an adequate systematic *exposition* of that reality: providing the 'logic of the body politic'. Such a 'logic' can only be the eventual (and continuously revised) result, rather than the dogmatic starting point, of critical social research that aims to retrace real existence in thought with a view to the transformation of that existence.

Grasping and criticising the logics of social and historical existence in this way becomes the central objective of Marx's project, driving him to invent a constellation of new categories and a singular theoretical methodology that defies traditional (yet still enduring) disciplinary boundaries. This movement of invention engendered a radical reconsideration of the status of conceptual relations, both within theoretical discourse as well as in the social reality it describes and seeks to undo. If the concept of subsumption is taken over from philosophy by Marx, it is not in order to subject it to critique in abstraction from any concrete social context in which subsumptive relations obtain. It is, rather, because it adequately expresses a 'determinate function' within a historically specific configuration of human relations and practices (modern, bourgeois society). From this materialist perspective, subsumption serves as the theoretical expression, or logical figure, of some real (i.e. material, practical) subordination of individuals or objects to a dominant social form or function. The 'categories' under which individuals and objects are subsumed in

Marx's discourse are not therefore reducible to thought-determinations (although they may still retain a conceptual dimension) but are more broadly conceived as categories of historical being or social forms of existence that determine and are constituted through the collective practice of social individuals.

Subsumption in Marx's evolving critical vocabulary thus comes to imply subsumption under historical forms of existence, or more specifically, as Marx says in the *Grundrisse*, 'subsumption of ... individuals under specific relations of production' (1993: 96). Such specific relations of production, unified in various configurations as 'modes of production' (Haldon, Chapter 2, this *Handbook*), come to act as the determining forms of action and identity under which individuals are subsumed and thereby constituted in their historical peculiarity (the 'universal' under which various 'particulars' are subsumed, in logical terms). If Hegel had already identified the inherently constraining and abstractive dimension of subsumption, where the unfreedom of the individual is presupposed in its subsumption *as such*, Marx appropriates and qualifies this contention by filling it with historical colour and content. Rejecting all but the most basic transhistorical determinations of production and reproduction as a metabolic process (Marx, 1976: 290), Marx demands an attentiveness to the specific ensembles of social relations and forms in which concrete subsumptive relations obtain. It follows that if indeed subsumptive relations are concomitant with unfreedom, such unfreedom has to be grasped in its historical particularity, in distinction from forms of unfreedom proper to other epochs (for example, feudalism or ancient slave-owning societies).

Capitalist Subsumption

Having developed a general theorisation of social form-determination as subsumption under relations of production, Marx's account of capitalist subsumption can be grasped as a historically specific configuration of this process of form-determination. In the context of the critique of political economy – Marx's *exposé* of the system of bourgeois categories (itself the idealised expression of bourgeois reality) – subsumption is used to describe the relation that obtains between capital and labour, such that labour can be said to be subsumed under capital insofar as it is form-determined as a *particular instance of capital*. This 'subsumption of labour under capital' has a dual significance, referring both to the above-mentioned notion of determination, where labour is constituted as a moment of capital both economically and materially, as well as simultaneously designating the unfreedom which this form-determination implies, as the repression of alternative modes of representation and action for labour.

This use of subsumption in Marx's writings is guided by the critical conception of subsumption set out by Kant, indicating a problem concerning not simply the hierarchical arrangement of preformed elements (as in the 'classical' concept of subsumption) but the deeper problem of how particulars are formed or constituted in accordance with the universal that subsumes them. For Marx, there is no natural or

eternal relation of belonging between labour and capital; their articulation is instead the effect of a particular conjunction of historical conditions and forces that determine productive activity as wage labour through the formation of a 'working' class (that is, a class of individuals with no other means of survival other than the sale of their labour capacity). This particularity is precisely what is at stake in Marx's discussion of capitalist subsumption: the historically specific mechanisms by which labour is form-determined (as an exploitable commodity) and dominated by capital. Marx analyses several different forms of subsumption under capital (formal, real, hybrid) each corresponding to a specific modality of command and coercion employed to extract surplus-value from the production process. Not only are these forms diverse, involving both social and material aspects, they also express capital's tendency progressively to deepen its control of production in order to remove all barriers to exploitation and accumulation. Subsumption is thus key, not only in specifying the historical particularity of capitalist social relations but also in conceptualising the internal dynamism and developmental tendencies those relations exhibit.

For Marx, the subsumptive relation between capital and labour is mediated through the unity of two processes: *the valorisation process* and *the labour process*. In this unity, 'the labour process is as it were incorporated in [the valorisation process], subsumed under it' (Marx and Engels, 1988: 67). At a general level, the essence of the subsumption of labour lies in the ways in which capital takes hold of the labour process and makes it also function as a valorisation process, an engine for the production of surplus-value. This happens, in its most basic form, through the conjunction of two different acts.

First, capital and labour take the form of commodities in the process of circulation: money wages and labour-power. The owner of labour-power and the owner of wages meet on the market and exchange their goods, which are commensurated as sums of value, that is, expressions of abstract human labour. In doing so, the owner of wages, the capitalist, *buys* the right to command a certain amount of labour time. The generalised commodification of labour-power, underpinned by the processes of 'so-called original accumulation' which gives rise to a proletarian class, is the first moment of labour's 'particularisation' under capital. From the perspective of circulation, Marx calls this a simple sale and purchase 'like any other', in the sense that both parties are formally free, and enter willingly into the exchange (even though this situation is conditioned for the proletarian by another sense of freedom: that of *the freedom from owning any property*). Nonetheless, at the same time, this quantitatively 'equal' exchange is 'coloured' by its peculiar content:

With his money, the money owner has ... bought disposition over labour capacity so that he can use up, consume, this labour capacity as such, i.e. have it operate as actual labour, in short, so that he can have the worker really work. (Marx and Engels, 1988: 64)

This actual using up of the labour-power commodity, Marx goes on to say, 'is a process qualitatively distinct from the exchange. It is an essentially different category' (1988: 54).

Second, in the analysis of production, Marx demonstrates that with this command over the labour process, the capitalist is able to compel the worker to perform surplus labour, to produce an excess of value over and above what they receive in the form of wages in order to reproduce themselves. In this way:

[a] relation of domination and subordination enters the relation of production itself; this derives from capital's ownership of the labour it has incorporated and from the nature of the labour process itself. (Marx and Engels, 1994: 102)

These two moments – exchange *and* production, the *formal* and *material* aspects of capitalist economic life – together determine the labour process as a valorisation process, and so establish the basis for capitalist subsumption; *neither is sufficient without the other*. The exchange relationship is necessary for labour to take the form of value, to fall under the ownership and command of the capitalist and thus *become variable capital* (that is, a formal instantiation of the universality of capital). Equally, the process of production is necessary for the value-creating capacity of labour to be exploited, so that the original capital generates a surplus and has expanded. It is only in this way that labour has acted *as* a moment of capital, subsumed under it.

Crucially, however, there is no inherent connection between these two processes; Marx says that ‘the labour process as such has nothing to do with the act of purchasing the labour capacity on the part of the capitalist’ (Marx and Engels, 1988: 65–6) whilst ‘on the other hand, the concept of the commodity in and for itself excludes labour as process’ (Marx and Engels, 1994: 71). Yet the two movements presuppose one another and come to appear as linked ‘naturally’ in their capitalist articulation. Their relationship must be constantly renewed in order to sustain the reciprocal movement between circulation and production that is the basis for the accumulation of capital. It is therefore the unity of these two acts – exchange and production – that constitutes the distinctive synthesis of the capitalist social form or ‘mode of production’: the mode by which labour is form-determined practically as ‘for capital’. In expressing the logic of this basic conjunction (as the articulation of a particular concrete content with an abstract social form of universality) it is ‘subsumption’ above all other concepts in Marx’s work that describes most directly what the specificity of *capitalist* domination consists in. In other words, it points to what is most essential in the capitalist power relation so as to distinguish it, both in its end and means, from hitherto existing forms of social domination.

Forms of Subsumption

Marx distinguishes between several forms of subsumption under capital, elaborating different modalities in which capital exercises its command over the labour process. Yet Marx insists that these form-determinations and processes of command function as *transformations* of existing configurations of production

and cannot be comprehended in abstraction from the concrete historical conditions in which they emerge and develop. What is indicated by the distinction between formal, real and hybrid subsumption are different mechanisms of transforming production on a capitalist basis, which in turn have transformative repercussions throughout the whole of society.

Formal Subsumption

With the ‘formal subsumption’ of labour under capital, Marx explains that capitalists take over existing production processes without altering the ‘specific technological character’ of the labour process in any way (Marx and Engels, 1988: 92). The means and methods of labour, as much as the final product, remain identical to the form they took when production was carried out in its pre-capitalist configuration. What does change is that now the worker works for a wage, under the command and supervision of a capitalist, using materials provided by the capitalist, and leaves the production process without ownership of any of the products they have toiled to realise. The worker’s labour has thus been subsumed under capital, appropriated and exploited to generate surplus-value, but only ‘formally’, that is, at the level of the economic relationship of exchange between the worker and capitalist. The worker’s actual activity is carried out exactly as it was before the capitalist commanded it and so is ‘materially’ untouched by the introduction of this new manner of exploitation. Insofar as formal subsumption functions as a mechanism of domination, it is thus purely at the level of the interpersonal power relationship by which the worker, dependant on their wage to survive, is compelled to cede command over their productive capacities to the capitalist who can profit from them. Given the purely formal character of this domination, when capitalists seek to increase their exploitation of formally subsumed labour (as they by definition must) the only means at their disposal involve the imposition of a longer working day or an intensified rhythm of labour, both of which run up against natural limits and social barriers.

Real Subsumption

Marx goes on to describe a deeper form of subsumption which builds upon the economic mode of control operative with formal subsumption. The ‘real subsumption’ of labour under capital involves not only the formal command over the worker enjoyed by the wage-owning capitalist, but also a further, *material* form of command resulting from the fact that the capitalist also owns and configures the means of production involved in the labour process. Dependant on these means to realise the labour activity they sold to the capitalist, workers must adapt to the means along with the methods of labour they technologically presuppose. If the capitalist alters the technical configuration of the labour process, so too will the worker’s labour be altered. The capitalist thus discovers another method

through which to increase the exploitation of labour, because if the production process can be made more efficient (that is, generate more use-values with an equal or diminished amount of labour-power, producing 'relative' surplus-value), or enable a greater power of coercion over the worker's activity, then the capitalist stands to gain, even without having 'formally' forced the labourer to work longer or harder. This is the 'real subsumption' of labour, which Marx's considers corresponds with the 'properly capitalist mode of production' (1975: 1019 ff.).

Marx subdivides real subsumption into three distinct moments: (1) co-operation, (2) division of labour and manufacture, and (3) machinery and large-scale industry:

- 1 Co-operation is the simple re-organisation of production by capitalists to enable the 'direct collective labour' of multiple workers. In effect, this merely means gathering workers in one location without changing the nature of their working process, so the difference it introduces with respect to formal subsumption (where workers may be employed by the same capitalist but carry out their work in different locations) is 'purely quantitative'. The capitalist gains here by a concentration that enables the sharing of resources and co-ordination of individual powers, as well as a heightened capacity for surveillance and supervision.
- 2 Division of labour and manufacture involves much greater interference by capitalists into the labour process, which is broken down into discrete moments that then become the specialised task of individual workers. The collective labour is 'divided' between these tasks; rather than one worker assembling an entire commodity from start to finish, each worker repeatedly performs a single moment of the overall process. Labour thus becomes increasingly specialised and perfected with respect to these 'partial operations', with each individual worker's input representing just a fragment of the final product. In terms of the experience of work, Marx argues that this gives rise to monotony of labour, with the incessant repetition of minute tasks, and a dissociation from the final product, which the worker may never see, understand or enjoy. Significant here for the theorisation of subsumption as the mechanism of capitalist domination is that the labour process is now designed and unified by the capitalist, not the worker, who, as a result, finds their activity inserted into a process alien to them.
- 3 The tendency towards inverting the worker's control over the labour process and placing it on the side of the capitalist is consummated with large-scale industry based on the use of machinery. Here, it is not just the division and specialisation of tasks that guarantees the efficiency of exploitation, but the development of machinery as the objective apparatus through which the labour process is realised:

The increase of the productive force of labour and the greatest possible negation of necessary labour is the necessary tendency of capital, as we have seen. The transformation of the means of labour into machinery is the realization of this tendency. (Marx, 1993: 693)

Unlike tools, machinery is not constrained by the limits of the individual human body (or even multiple bodies acting in concert) and so enables a huge increase in the productivity of the labour process. Large-scale industry turns the workshop into a factory, an 'articulated system' of processes and machines whose 'regulating principle' is an ever-perfected continuity of production, aiming to minimise all interruptions to the labour process (Marx, 1993: 693). Rather than cultivating specialist technical skill in the worker as manufacture does, industry inculcates the labourer into a 'specialisation in passivity', reducing their activity

to the simple operation of technically complex machinery overseeing its operation as ‘watchman and regulator’ rather than ‘chief actor’ (1993: 693). The activity of the workforce thus becomes ‘determined and regulated on all sides by the movement of the machinery, and not the opposite’ (1993: 693). In this way, capitalist command comes to be *objectively* posited in the material composition of the labour process, so that the worker confronts the necessity of their exploitation not just in the personal authority of the capitalist employer or in the bureaucratic organisation of tasks, but as a ‘technological fact’ built into the concrete reality of the means of production.

Hybrid Subsumption

Alongside the discussions of formal and real subsumption Marx also mentions the existence of various ‘hybrid forms’ (*Zwitterformen*) through which surplus-value is ‘extorted’ by capitalists without the labour process being formally subsumed (Marx, 1976: 645; cf. also Banaji, 2011: 63; Das, 2012; Murray, 2004: 265; Skillman, 2012). Like formal and real subsumption, an economic relationship underpins such exploitation, but without the mediation of a direct wage and without the ownership and control of the labour process by the capitalist (Marx, 1976: 645). Instead, either by monopolising the market for the purchase of the producer’s goods, or through advances of money, materials or land needed for production, the capitalist is effectively able to extract a surplus from the producer without purchasing and commanding their labour-power. Jairus Banaji has thus described the economic relationship implied by hybrid subsumption as effectively constituting a ‘concealed wage’ (Banaji, 2011: 98). The capitalist here functions formally as ‘middleman, as merchant’ (Marx and Engels, 1988: 270), or alternatively, as a usurer, feeding ‘on [the producer] like a parasite’ (Marx, 1976: 645), though ultimately the result is the same as with other modes of subsumption: exploitation and accumulation (Marx and Engels, 1994: 118–119).

Hybrid subsumption presupposes that formally independent producers are willing to enter into exploitative relationships, even in the absence of ‘political restraints’ obliging them to do so, in order to gain access to the money or means of production needed to secure their means of subsistence. The existence of such ‘hybrid forms’ must therefore be associated with, on the one hand, processes of ‘accumulation by dispossession’ (Harvey, 2003) and the concentration of wealth and means of production by a capitalist class alongside, and on the other, the propagation of money-mediated market relations.

Marx refers to hybrid subsumption in two primary senses (although a vast diversity of concrete scenarios, both historical and contemporary, is covered by the concept). Hybrid forms can be ‘transitional’ (*Übergangsformen*), serving as the basis for the historical emergence of formal subsumption at the dawn of capitalist production. But they also endure or emerge anew as ‘accompanying forms’ (*Nebenformen*) alongside properly capitalist production relations based on formal

or real subsumption. In this sense, hybrid forms are not restricted to residual or anachronistic forms of exploitation, but rather constitute a permanently present strategy of exclusion and outsourcing which capitalists can employ as a strategic response to both competitive pressures and the resistance of workers (Das, 2012).

HISTORICAL RECEPTION AND DEBATES

Periodisation and 'Total' Subsumption

Within the Marxist canon, the concept of subsumption remains a relatively undertheorised term, having received far less scholarly and political engagement than concepts such as alienation, exploitation, reification or abstraction. This neglect derives at least in part from its limited textual presence in Marx's writings and an apparent ambivalence on Marx's behalf with regard to its theoretical status (Murray, 2009: 173; Saenz de Sicilia, forthcoming; Skillman, 2013). The most sustained accounts of capitalist subsumption are developed by Marx in early drafts of his critique of political economy – *The Results of the Immediate Production Process* and the *1861–63 Manuscripts* – yet the term 'subsumption' was almost entirely omitted from the published volumes of *Capital*, with the earlier drafts in question becoming available relatively late on in the formation of both the 'orthodox' and 'critical' Marxist traditions. Nonetheless, amongst the various attempts to revitalise and reinvent the critique of capitalist society in the wake of the failures of historical communisms of various stripes, a number of significant contributions invoke subsumption as a central critical category. In particular, the writings of Theodor W. Adorno, Jacques Camatte and Antonio Negri all draw on subsumption as a category with which to theorise the developmental dynamics of capitalist power. Despite their emergence against the backdrop of diverse political and cultural contexts, common to these approaches is an understanding of subsumption as a category concerned primarily with the historical transformation of capitalist relations, either through the periodisation of distinct phases of capitalism mapped to the formal/real subsumption distinction and corresponding to differing modes of exploitation and resistance (as with Negri), or in the progressive extension and expansion of capitalist relations such that they begin to encompass all hitherto non-commodified realms of life such as culture and leisure (what Adorno and Horkheimer identified as 'the development toward total integration' (2002: xii)).

The work of Adorno established the first serious attempt, after Marx, to deploy the concept of subsumption in the tradition of Marxian social criticism. However, rather than building upon Marx's analysis of different forms of subsumption, Adorno's use of the category is more directly grounded in its prior philosophical conceptualisations and critique, particularly Kantian epistemology and its Hegelian metacritique.

In the first place, this philosophical legacy provided Adorno with a model for the fate of social individuals in modern societies, based on the formative schematising processes specified by German idealism in which the particular is adequated to the universal in a manner that abstracts away any excessive individuality (Adorno and Horkheimer, 2002: 65). This template of ‘identifying judgement’ is manifested concretely for Adorno in the reduction of ‘the overwhelming mass of the population ... to mere objects of administration’ (2002: 30) which forms them as passive and powerless (‘nullified’) individuals via, in the most extreme case, the ‘complete abstraction of subsumed human beings under arbitrary concepts’ to which they are made to fit (Adorno, 1973: 236). As Adorno’s correspondent Alfred Sohn-Rethel emphasised, the connection with subsumption here is not mere analogy given the practical (rather than merely theoretical) character of the abstraction involved in commodity exchange (Sohn-Rethel, 1978). In relating commodities quantitatively on the basis of their exchange-value whilst bracketing the qualitative heterogeneity of their specific properties, individuals do not just think abstractly but ‘actualize a real conceptual operation socially’ (Adorno, 2018: 155), concretising subsumption under the forms of capitalist value as a ‘real abstraction’ (Lange, Chapter 32, this *Handbook*) – with real effects at the level of the social form-determination of both objects and subjects.

In the second place, for Adorno, this procedure of social schematisation demonstrates a developmental tendency towards extensive and intensive absolutisation. Advancing along the twin vectors of ‘industrialisation’ in production and ‘mass culture’ in consumption, the dynamic of subsumption under exchange-value displays a movement towards the ‘total administration’ of social subjects. Individuals in capitalism find themselves dominated both in work and leisure, subject to a form of control that not only regulates their outward action and relation to others but comes to ‘perform’ their innermost identity, desires and personality in a manner that dissolves any real autonomy (Adorno and Horkheimer, 2002: 30). However, Adorno is conspicuously vague about the precise mechanisms by which this tendential colonisation of the inner and outer lifeworld is driven, and it is here that the limits of his account are evident. By giving primacy to commodity relations and the exchange abstraction in his account of the functioning of capitalist power, Adorno elides the key mechanism identified in Marx’s critique of political economy through which capital progressively transforms the world in its own image whilst deepening its domination of human societies: the real subsumption of the labour process, enacted by virtue of capitalist control over production. Constrained by his ‘circulationist’ standpoint (grounding the exchange abstraction in the metanarrative of ‘enlightenment’ and instrumental reason rather than a theory of accumulation), Adorno can only allude to the processes of material domination that flow with apparent automaticity from the commodification of labour and capitalist ownership of the production process. Adorno’s critique of capitalist society thus remains ‘formal’, unable to extend its analytic framework in a manner that would also encompass the concrete

dynamics of control, coercion and technical transformation that are crucial to the 'expanded reproduction' of capitalist social relations. The effect of this formalism is that, ironically, for all Adorno's Kantianism, he fails to incorporate the key innovation introduced by Kant into the thought of subsumption: the problem of the specific mechanisms of form-determination that must be operative if universal and particular are to attain, and maintain, identity. The residual idealism of this epistemologically inflected approach leads Adorno to a reductive and one-sided theory of capitalist subsumption that can offer no substantial account of how and why capitalist power advances as it does.

By contrast, the writings of Antonio Negri developed from the 1980s onwards draw directly on Marx's concept of subsumption in order to map and differentiate distinct material configurations of capital's command over labour, extending and intensifying the implications of the transition from formal to real subsumption in the context of a historical periodisation of capitalism. Whilst Negri's approach (along with the tradition of *operaismo* from which it stems) departs from a Marxian analysis of production, exploitation and resistance, much like Adorno he identifies a progressive historical deepening of this relation of command that comes to exceed the boundaries of the traditional sites of production, eventually encompassing and internalising every sphere of human activity within the matrix of capitalist power. Transposing Marx's analysis of subsumption from the individual labour process to the social whole, Negri refers to this historical completion as the 'real and total subsumption of labour' and 'world society' under capital (Negri, 1991: 121, 1988: 95). For Negri this totalisation of subsumption marks the point at which capitalist socialisation ceases to be mediated by commodification and value-relations and there is no longer any 'outside' to capitalist authority because 'the mechanism of the production and reproduction of labour power is wholly internal to capital' (Negri, 1988: 126). Instead of capitalist power being regulated by the law of value as it is for Marx, once there is no external domain left from which to extract the differential determination of measure (and with it the possibility of a 'surplus-value') that power metamorphoses into a generalised logic of pure command akin to the military-style discipline of the factory regime. To whatever extent capitalist social relations may continue to take the appearance of economic relations, the dynamic of subsumption transforms their essence towards a purely political logic of antagonism: 'society is configured in a disciplinary way through the development of the capitalist system' (Negri, 2003: 105).

In Negri's theorisation, total capitalist subsumption is 'the situation in which we have found ourselves since the middle of the twentieth century' (2003: 105), rendering Marx's account of commodification (and its corresponding value-theoretical analysis of exploitation and fetishism) an anachronistic framework that no longer has traction on social life and its conflicts. In place, Negri constructs an ontological framework in which the creative plenitude of labour is directly subsumed under a capitalist command which absorbs and appropriates its capacities without the mediation of competitive measure. Yet Negri's theoretical

dissolution of value as the regulating principle of capitalist power gives rise to a series of theoretical contradictions and aporias (Noys, 2010; Toscano, 2009). Most importantly, Negri's absolutisation of subsumption effectively suspends the conflictual character of the subsumptive relation itself, for once subsumption has been achieved there is no longer any tension between the universal and particular – that is, between capital and labour – as they are bound together by an analytically perfect identity. If conflict is thus to appear within Negri's account of subsumption, it can only be in the transmuted form of the immanent ontological opposition of 'full' and 'empty' time, represented respectively by the creativity of labour and the abstract totalisation of capital. Here, however, a robust account of the concrete mechanisms of subsumption and the social forms taken by the antagonism between capital and labour is lacking, leading Negri, like Adorno, to a one-sided development of Marx's initial theorisation of the concept.

The coherence of a Marxist theory of subsumption depends on the integration of the formal dimension of exchange and commodification with the material configuration of production and the tendential transformations of the labour process. Without *both* of these aspects, capitalist domination cannot be comprehended in the historical specificity of its operation and developmental dynamics. Whereas Adorno tends to treat subsumption as if it were an automatic effect of exchange relations (an *epistemological* conception concerned primarily with formal determination), Negri inverts this and understands subsumption only through the material logic of capitalist control over generalised productive activity (an *ontologised* conception of subsumption grounded in the idea of an original vital and creative plenitude possessed by labour which capital 'confiscates'). Neither approach, however, thinks the two sides of capitalist domination as equally essential to its functioning: the distinctive synthesis underpinning capitalist power.

Subsumption and the Critique of Political Economy

If the exaggerations and distortions of these 'periodising' approaches run into theoretical and empirical problems that ultimately render them untenable, they nonetheless open up important questions regarding the basic structure and development of capitalist societies: is the dynamic of subsumption driven by the 'economic' logic of accumulation or by the 'political' logic of class antagonism? Or some combination of the two (in which case, how is their combination to be conceptualised)? Is the transition from formal to real subsumption an automatic, or even necessary, implication of capitalist control of production or just one of its possible modalities? How do processes of subsumption in different areas of the economy and regions of the planet interact and affect one another? Is it coherent or plausible to speak of a 'total' subsumption of society and the individuals composing it?

Some aspects of these questions were addressed directly by the so-called 'labour process' debates of the 1970–80s (Braverman, 1974; Burawoy, 1978;

Gorz, 1976; Thompson, 2010). The common thread linking this variegated literature was the combination of a general theorisation of capitalist production and its immanent laws together with an attempt to grasp the shifting composition of capitalist production through a focus on strategies of capitalist control within the labour process. Importantly, significant early contributions to these debates, such as from the Brighton Labour Process Group, rejected any simple correspondence or transposition of the dynamics of subsumption between the level of the individual labour process and the configuration of the social whole, insisting that ‘the relation between capital and labour, at a general social level, cannot be derived from, or reduced to, the capital–labour relation within production’, whilst ‘the actual structure of the [labour] process is not historically determined by the abstract logic of capital accumulation, since capitalist production relations can only be reproduced as a totality of social relations’ (Brighton Labour Process Group, 1977: 23–4). This signalled the urgency of developing a research programme that would interrogate the evolving articulation of production and reproduction (understood as the totality of the social process and therefore the wider material context within which the specific struggles over subsumption in production play out). Posing the problem of the economic and political dimensions of capitalist power in other terms, these authors also examined whether the driving force of transformations in the labour process were grounded primarily in the competitive pressure to increase the efficiency of production or in the drive to consolidate control over labour (cf. Gorz, 1976). Recent contributions such as from Das (2012; see also Skillman, 2012) have continued this orientation through empirically informed analysis of patterns of transformation in contemporary capitalism’s labour processes.

Sharing some of these concerns, albeit at a higher level of theoretical abstraction, strands of Marxological scholarship referred to variously as ‘capital-logic’, ‘value-form theory’ and ‘systematic dialectics’ have sought to make important clarifications regarding the relationship between Marx’s account of subsumption and the framework of his critique of political economy. Building on Hegelian-inspired reconstructions of *Capital* which seek to consolidate the systematic coherence of its central categories, the work of Chris Arthur and Patrick Murray links the dynamic of subsumption to a dialectical exposition of the value-forms, the critique of fetishistic appearances and the distinction between absolute and relative surplus-value production. Emphasising the inner logical necessity (of accumulation) driving capitalist production and reproduction, Arthur’s account depicts capital as a ‘self-moving system of abstract forms’ that ‘must’ shape the material content it subsumes in accordance with this goal (Arthur, 2009: 155). Yet the focus on the systematic completeness of capital here tends towards an objectivism that reduces the antagonistic characteristic of capitalist class relations to a theoretical afterthought (in contrast to Negri, for whom struggle is primary at the expense of structural mediations, see Saenz de Sicilia, forthcoming). Subsumption is thus treated as a category located internally to the

quasi-autonomous ‘systematic dialectic’ of capital rather than a category articulating capital with its external foundations: nature and labour. Instead of subsumption naming the relation in which social conflicts over the exploitation of labour are concentrated, in these capital-centric accounts it becomes one further moment in the consolidation of capital’s systematic dominance. Whichever way the political stakes of capitalist subsumption are balanced within the ambit of these approaches, an exclusive focus on developing a ‘pure’ logic of capitalist accumulation elides the question of capitalism as real history and the central role played by subsumption (and its concomitant conflicts) in determining the trajectory of that history.

Finally, a significant and innovative set of engagements with Marx’s account of subsumption emerged within Latin American Marxism from the 1970s onwards. Developing a critical rereading of Marx in parallel with (and to some degree influenced by) their European contemporaries, authors such as Bolívar Echeverría, Armando Bartra and Enrique Dussel highlighted important neglected concepts and ‘esoteric’ structural aspects of Marx’s discourse in order to address the shortcomings of both orthodox Marxism and mainstream bourgeois social theory (in its incipient ‘postmodern’ inflection as much as in its traditional empiricist variants). Of these, Echeverría’s contributions are without doubt the most profound, in many respects surpassing any other attempt to situate a theory of subsumption coherently and systematically within the context of Marx’s critique of capitalist society (Saenz de Sicilia, 2018; Saenz de Sicilia and Brito Rojas, 2018). Working closely with Marx’s newly available drafts and notebooks whilst responding inventively to the lacunae in Marx’s project (for example, around the concept of use-value, cf. Echeverría, 2014), Echeverría made the case that subsumption, along with the analysis of value, fetishism and social reproduction, should be situated at the centre of Marx’s thought:

The concept of subsumption has a special importance with respect to the core of Marx’s critical discourse – that is to say, the theory of the contradiction between the socio-natural process of production/consumption and the socio-capitalist process of the valorization of value. It is the most advanced attempt made by Marx to show in general theoretical terms the way in which those two contradictory processes are articulated. (Echeverría, 1983: 2)

For Echeverría, the contradictory character of capitalist society – expressed from the most basic levels of value/use-value and abstract/concrete labour right through to the complexity of expanded capitalist reproduction/social reproduction – was in each instance articulated as a relation of subsumption, of use-value under value, concrete under abstract labour, and so on. Subsumption did not therefore figure as a discrete moment in Marx’s conceptual construction, but rather traversed the entirety of his exposition in *Capital* with increasing concreteness. Echeverría’s insights went on to be consolidated and extended systematically by Jorge Veraza (2008) in relation to the implications of real subsumption for transformations in the sphere of consumption, where the capitalist development of science

and technology leads to an inversion of means of production into means of destruction; that is, from means of securing the reproduction of human life to the means of its negation.

Enrique Dussel also places subsumption at the centre of his reinterpretation of Marx's critique of political economy (1985, 1990, 2001). Drawing on the background of subsumption in German idealism (though focused on Schelling rather than Kant and Hegel) along with Marxist liberation theology, Dussel's argument takes Marx's critique to rest on a dialectic of exteriority and totality in which living labour originally stands outside of the closed totality of capital but is then incorporated within it through its subsumption under value. Capital thus makes labour a moment of its own development, neutralising its independence and 'negating its exteriority'. For Dussel this transition, effected by the exchange of labour for a wage, is the key moment in which the *being* of capital, its social reality, is grounded. In this way he develops a broadly ontological framework for conceptualising subsumption (with some affinities to Negri) which draws on Marx's description in the *Grundrisse* of labour as a pure denuded subjectivity, as absolute poverty, or 'non-being' in contrast to the being of capital (Marx, 1993: 454). Dussel emphasises this negativity, or nothingness, of living labour, which is reduced to a pure potential until it is subsumed and actualised in production, serving as capital's mediation with itself. The subsumptive moment is therefore central to Dussel's entire conception of how capital forms a closed ontological totality (somewhat akin to Arthur's 'systematic dialectic') as well as to his insistence on the excessive character and resistant capacity of labour, which despite figuring (from the standpoint of that totality) as a non-being, can never fully or finally be internalised (given that it is the true, but denied, ontological foundation of capital). Much like Negri, the politics of this argument is mapped onto a Manichean ontological schema with the result that, rather than being able to give an account of capital's other, that which is subsumed, in concrete terms – say, in an account of the current composition of a global working class and the labour processes that function as the site of exploitation – Dussel constructs his critical discourse from the intangible standpoint of a theological negativity, a source that by definition cannot appear positively within his discourse, rather than a force grasped as already present, actively resistant and practically embedded in the material totality of social life.

CONCLUSION

Following its 'critical' reframing in German idealist philosophy, the category of subsumption acquires a distinctive theoretical status. It simultaneously designates the specificity of a relation (of analytic identity between particular and universal) whilst demanding an account of how that relation is produced and evolves (through processes of form-determination), transforming its own conditions of possibility as a result. This reframing establishes both the productivity

and difficulty of subsumption for Marxist theory. Subsumption both captures the uniquely conceptual and ‘actually abstract’ quality of capitalist domination whilst also (in its multiple modalities) designating the diverse social and material processes through which the control and exploitation of labour as well as the reshaping of production occurs. Yet Marx’s general schema of formal, real and hybrid subsumption only enumerates the most basic contours of the concrete processes of capitalist form-determination. The true effectivity of a theory of subsumption lies in its capacity to provide a framework for further research, both of a more focused and empirically informed nature (grasping the particularities of how the subsumption of labour and nature is configured in diverse scenarios) as well as of a synthetic, generalising nature (tracing the global articulations between production and reproduction). Pursuing these two trajectories of analysis enables Marxist theory to continually reactivate itself in response to the present, binding a basic account of accumulation (with its concomitant notions of class, value, fetishism, ideology, etc.) to the novel social forms expressive of capitalism’s capacity to adapt and evolve. Yet across all these levels of enquiry subsumption remains the crucial category of mediation and antagonism, marking the point of articulation and conflict between the abstract system of capitalist forms and the material foundations which it forms and appropriates. The tendency towards absolutisation, ontologisation or historicisation of subsumption weakens this effectivity by idealistically sundering the basic schema of subordination under capital from the real conditions and struggles in which it has its actuality (and potential overcoming). Subsumption cannot provide an answer or resolution to the problems of Marxist theory, only a framework for addressing those problems in a responsive and non-dogmatic manner.

PART V

Land and Existence

Primitive Accumulation, Globalization and Social Reproduction

Silvia Federici

INTRODUCTION: RETHINKING PRIMITIVE ACCUMULATION

Starting with the 1990 issue of *Midnight Notes* on the ‘New Enclosures’ (Midnight Notes Collective, 1990), followed by David Harvey’s theory of ‘accumulation by dispossession’ (Harvey, 2003) and by the many essays on primitive accumulation that have been published in *The Commoner* (2001) over the last decade, an extensive body of literature has explored the political meaning of this concept and tested its explanatory power with regard to the contemporary forms of capitalist development and ‘globalization’. Artists have contributed to this process. An outstanding example is the 2010 Potosí Principle exhibit organized by German, Bolivian and Spanish artists and curators (Creischer et al., 2010) who have worked to demonstrate the continuity between the imagery found in several sixteenth-century colonial paintings, produced in the Andean region at the peak of primitive accumulation in the ‘New World’, and the imagery coming from the ‘new enclosures’¹ that has been central to the globalization program. Primitive accumulation has also been at the center of post-colonial theory debates, with social theorists like Partha Chatterjee (2008) and Kalyan Sanyal (2014) arguing that, in India at least, the separation of the producers from the means of production and the extensive process of land grabbing, by which millions have been displaced, is leading to the creation of a ‘surplus population’, never to be absorbed by capitalist production; that is, they are leading to the

creation of a sphere of life 'outside' capitalism, rather than to the development of a totalizing capitalist system and wage relations. Feminists too have been rethinking the conditions of the existence of capital accumulation. Particularly important have been the works of Maria Mies (1986), Mariarosa Dalla Costa (1995), and Claudia von Werlhof (2000), who, anticipating themes that I have developed in my own work, have recognized that modern political economy has been and continues to be built upon slavery, colonization and 'women's permanent worldwide expropriation and deprivation of power' (Werlhof, 2000).

Thanks to these studies and artistic contributions, we now acknowledge that primitive accumulation is not a one-time historical event confined to the origins of capitalism, as the point of departure of 'accumulation proper'. It is a phenomenon constitutive of capitalist relations at all times, eternally recurrent, 'part of the continuous process of capitalist accumulation' (von Werlhof, 2000: 733) and 'always contemporaneous with its expansion' as an 'ever-renewed actuality' (Lazzarato, 2012: 44). This does not mean that primitive accumulation can be 'normalized' or that we should underplay the importance of those moments in history – the times of clearances, wars, imperial drives, 'when great masses of men are suddenly and forcibly torn from their means of subsistence, and hurled onto the labor market as free, unprotected and right-less proletarians' (Marx, 1976: volume 1, 876). It means, however, that we should conceive the 'separation of the producer from the means of production' – for Marx, the essence of primitive accumulation – as something that has to be continuously re-enacted, especially in times of capitalist crisis, when class relations are challenged and require new foundations.

Contrary to Marx's assertion that with the development of capitalism a working class comes into existence who 'by education, tradition and habit looks upon the requirements of [the capitalist mode of production] as self-evident natural laws', so that 'direct extra-economic force' is only used 'in exceptional cases' (Marx: volume 1, 899; De Angelis, 2007: 134), violence remains necessary to maintain the proper rate of profit and exploitation. Not surprisingly, in response to the culmination of an unprecedented cycle of struggles – anti-colonial, blue-collar, feminist – in the 1960s and 1970s, primitive accumulation has become a global and seemingly permanent process, with economic crises, wars and massive expropriations now appearing in every part of the planet as the preconditions for the organization of production and accumulation on a world scale. It is a merit of the studies and political debates that I have mentioned that we can now better understand the 'nature of the enclosing force that we are facing', the logic by which it is driven and its consequences for us. To think of the world political economy through the prism of primitive accumulation is to realize that the immiseration presently suffered by the majority of the population is a structural element of capitalist development and immediately place ourselves in a battlefield.

However, to fully comprehend the political implications of this development we must expand the concept of primitive accumulation beyond Marx's description

in more than one way. We must first acknowledge that the history of primitive accumulation cannot be understood from the viewpoint of an abstract universal subject, for an essential aspect of the capitalist project, throughout its history, has been the disarticulation of the social body, through the imposition of different disciplinary regimes, producing an accumulation of ‘differences’ and hierarchies that have profoundly affected how capitalist relations are experienced. In other words, we have different histories of primitive accumulation, each providing a particular perspective on capitalist relations necessary to reconstruct their totality and unmask the mechanisms by which capitalism has maintained its power. This means that the history of primitive accumulation, past and present, cannot be fully comprehended until it is written not only from the viewpoint of the future or former waged workers, but from the viewpoint of the enslaved, the colonized, the indigenous people whose lands continue to be the main targets of the enclosures, and the viewpoint of the many social subjects whose place in the history of capitalist accumulation cannot be assimilated into the history of the waged worker.

According to this methodology, I have analysed, in *Caliban and the Witch* (Federici, 2004), primitive accumulation from the viewpoint of its effects on women, the body, and the production of labor-power, arguing that this approach gives us a much broader understanding of the historical processes that have shaped the rise of capitalism than we gain from Marx’s work, where the discussion of primitive accumulation centers on the preconditions for the formation of the waged industrial proletariat. Two processes in particular, both ignored by Marx, have in my account been essential for the creation of the conditions for capitalist development. First is the separation of production and reproduction and the constitution of reproductive work – that is, the work of reproducing individuals and labor-power – as ‘women’s labor’ and as a separate social sphere, seemingly located outside the circuit of capitalist economic relations, a development coeval with the separation of the peasantry from the land and the formation of a commodity market. By this reorganization of social reproduction, the capitalist class has devalued the largest sphere of work on the planet, thereby saving an immense monetary wealth at the expense of women. Added to the devaluation of reproductive labor is the institutionalization of the state’s control and regulation of women’s sexuality and reproductive capacity, through the criminalization of abortion and the introduction of a system of surveillance and punishment that literally has expropriated women from their bodies (Federici, 2004: chapters 2 and 4).

Both these developments, which have accompanied the extension of capitalist relations in every historical period, have had crucial social consequences. The exclusion of reproductive work from the institutionally recognized sphere of economic relations and its deceptive relegation to the sphere of the ‘private’, the ‘personal’, the ‘outside’ of capital accumulation has made it invisible as work and naturalized its exploitation. It has also been the basis for the institution of a new sexual division of work and family organization, subordinating women to men and further differentiating them socially and psychologically. The state’s

appropriation of women's bodies and their reproductive capacity, which was realized in its cruelest form with the construction of a 'breeding industry' in the American slave plantations, has also inaugurated a new bio-political regime, directly tying procreation to the accumulation of capital insofar as this is essentially the multiplication of the proletariat (Marx, 1976: volume 1, 764).

As I have shown (Federici, 2004), the witch-hunts that took place in many countries of Europe and the Andean regions in the sixteenth and seventeenth centuries, leading to the execution of hundreds of thousands of women, were fundamental to this process. None of the historic changes in the organization of reproductive work that I have outlined would have been possible without a major attack on the social power of women, in the same way that capitalist development would not have succeeded without the slave trade or the conquest of the Americas – that is, without a relentless imperial drive, continuing to this day, and the construction of a web of racial hierarchies that have effectively divided the world proletariat.

PRIMITIVE ACCUMULATION AND THE RESTRUCTURING OF SOCIAL REPRODUCTION IN THE GLOBAL ECONOMY

It is with these assumptions and this theoretical framework in mind that in this chapter I analyze 'globalization' as a process of primitive accumulation, this time imposed on a global scale. This view is at odds with the neoliberal theory that celebrates the expansion of capitalist relations as evidence of a 'democratization' of social life. But it is also in contrast to the Marxist autonomists' view of the restructuring of the global economy, which, focusing on the computer and information revolution and the rise of 'cognitive capitalism', describes this phase of capitalist development as a step towards the autonomy of labor.² I propose, in fact, that the pillar of this restructuring has been a concerted attack on our most basic means of reproduction, the land, the house and the wage, aiming to expand the global workforce and drastically reduce the cost of labor. Structural adjustment, the dismantling of the welfare state, the financialization of reproduction and, not least, war have been the main strategies deployed to activate the new accumulation drive. In each case the consequence has been the destruction of our 'common wealth', and it has made no difference that, over time, its architects have multiplied, with the arrival of China and other emerging capitalist powers joining the World Bank, the International Monetary Fund and the governments that support these institutions as competitors at the feast. Behind the nationalist appearances and particularities there is one logic, one objective driving the new forms of primitive accumulation: to form a labor-force reduced to pure labor-power, with no guarantees, no protections, ready to be moved from place to place and job to job, employed mostly on short-term contracts and at the lowest possible wage.

What is the political meaning of this development? Even if we accept that primitive accumulation is an endemic part of life and work in capitalism (as Massimo De Angelis (2007: 136–41), among others, has insisted upon), how can we account for the fact that, after five hundred years of relentless exploitation of workers across the planet, the capitalist class, in its different embodiments, still needs to pauperize multitudes of people worldwide?

There is no obvious answer to this question, which has reopened old debates concerning capital's 'falling rate of profit' and the counter-measures needed to reverse this tendency. However, if we consider how 'globalization' is changing the organization of social reproduction, we can reach some preliminary conclusions. We can see that capitalism can only provide pockets of prosperity to limited populations of workers and for limited amounts of time, ready to destroy them (as it has done during the last thirty years through the globalization process) as soon as our desires exceed the limits which the quest for profitability imposes. We can see in particular that the limited prosperity that waged workers in industrial countries were able to achieve in the post-World War II period was never to be generalized, clearly being the product of a specific set of circumstances and productivity deals³ that the struggles of the 1960s and the collapse of communism brought to an end. As proletarian revolts spread in the 1960s from the colonial plantations of Africa and Asia to the black ghettos, the factories, the schools, the kitchens and even the war front, undermining both the Fordist exchange between higher wages and higher productivity and the use of the colonies (external and internal) as reservoirs of cheap and unpaid labor, the capitalist class resorted to the strategy that it has always used to confront its crises: violence, expropriation and the expansion of the world labor market.

A Marx would be needed to describe the destructive social forces that have been mobilized for this task. Never have so many people been attacked and on so many fronts at once. And we must return to the slave trade and the heyday of imperialism to find forms of exploitation and impoverishment as brutal as those that globalization has generated in many parts of the world. Not only is slavery reappearing in many forms, but famines have returned, and new cannibalistic forms of exploitation have emerged, like the sale of blood and organs and the traffic in body parts, unimaginable in the 1960s and 1970s. In some countries, even the sale of hair, reminiscent of nineteenth-century novels, has been revived.⁴ More commonly, in the more than 80 countries affected, globalization has been a story of untreated illnesses, malnourished children, lost lives and desperation. Impoverishment in much of the world has reached a magnitude never seen before, affecting up to 70% of the population. In sub-Saharan Africa alone the number of those living in poverty had reached 239 million by 2010, while across the continent immense amounts of money were obscenely siphoned off to the banks of London, Paris and New York.

As in the first phase of capitalist development, those most directly affected by these policies have been women, especially low-income women and women of

color, who, in many communities, today lack the means to reproduce themselves and their families or can do so only by submitting to the most intense forms of exploitation, working in *maquila* factories or reproducing families and children other than their own. Many give their children up for adoption, work as surrogate mothers or, in a more recent development, sell their eggs to medical labs for stem-cell research. They also have fewer children, as the need to secure some income has a sterilizing effect. Everywhere their capacity to control their own reproduction is under attack. In the USA, just being pregnant places poor women in constant danger of arrest, so much so that one can now speak of the ‘criminalization of pregnancy’.⁵

Women are also targeted because of their subsistence activities, especially subsistence farming, which stands in the way of the World Bank’s attempt to create land markets and place all natural resources in the hands of commercial enterprises. As I have written elsewhere (Federici, 2008), the World Bank had adopted the creed that only money is productive, while land is sterile and a cause of poverty if used only for subsistence. Not only has the World Bank campaigned against subsistence farming, through land law reforms, individual titling and the abolition of customary land tenure, it has also spared no effort to bring women under the control of monetary relations through the promotion of micro-finance, a policy that has turned millions into indentured servants to the banks and the NGOs that manage the loans (Federici, 2014; Karim, 2011). Thus, after years promoting population-control programs through massive sales of contraceptives, often imposed on governments as a condition for loans, the World Bank now obtains the same results by preventing women from eking out a living by means of subsistence farming, which, contrary to the World Bank’s claims, is for millions the difference between life and death. It is important to add that institutional violence against women and the devaluation of the activities around which their lives have been constructed have, as their counterpart, a documented increase in violence against them by the men of their communities. For in the face of diminishing wages and access to land, many look at women’s labor and bodies as the bridge to the world commodity market, as is the case with trafficking and dowry murders.

Examples could be multiplied of the ways in which the globalization process recapitulates older forms of primitive accumulation. My immediate concern, however, is not to describe the specific forms which this return of primitive accumulation has taken, but to understand what it reveals about the nature of the capitalist system and what it projects for the future.

Certainly, capitalist accumulation continues to be the accumulation of labor and, as such, it continues to require the production of misery and scarcity on a global scale. It continues to require the degradation of human life and the construction of social hierarchies on the basis of gender, race and age. Most important, by persisting after 500 years of capitalist development, these ‘original sins’ prove to be structural aspects of the capitalist system precluding any possibility of reform. Indeed, the economic and social programs that international capital

has put into place to defeat the liberation movements of the 1960s and 1970s by themselves guarantee that dispossession of land and acquired rights, precarity of access to monetary income and employment, lives lived in uncertainty and insecurity and the deepening of racial and sexual divisions will be the conditions of production for many generations to come, unless strong social movements can subvert these trends. It is evident, for instance, that by undermining the self-sufficiency of every region and creating a total interdependence, even between distant countries, globalization generates not only recurrent food crises but the need for an unlimited exploitation of labor and the natural environment.

As in the past, the foundation of this process is the enclosure of land. This presently is so extensive that even areas of agricultural life that in the past had remained untouched, enabling peasant communities to reproduce themselves, have now been privatized, taken over by governments and companies for mineral extraction and other commercial schemes. As 'extractivism' triumphs in many regions, compounded by land grabbing for biofuel, communal land ownership is legally terminated and dispossession is so widespread that we are fast approaching the stage described by Marx where:

One section of society ... demands a tribute from the other for the very right to live on the earth, just as landed property in general involves the right of the proprietors to exploit the earth's surface, the bowels of the earth, the air and thereby the maintenance and development of life. (Marx, 1976: volume 3, 888–9, 901–2)

In Africa in particular it is calculated that if the present trends continue, by the middle of the century 50% of the population will live outside the continent. This, however, may not be an exceptional situation. Everywhere, because of the impoverishment and displacement globalization has produced, the figure of the worker has become that of the immigrant, the itinerant, the refugee. The speed at which capital can travel, destroying in its wake local economies and struggles, and the relentless drive to squeeze out every drop of oil and every mineral that the earth holds in its bowels accelerate this process.

In 'developed countries' as well, the withdrawal of state's investment in the reproduction of the work-force and the consequent 'financialization of everyday life'⁶ are signaling the end of an era and the return of older forms of enslavement. Already in Marx's time, 'one of the most powerful levers of primitive accumulation' (Marx, 1976: volume 1, 919) was the public debt, now compounded by a financialization system that, as Saskia Sassen has shown, has found ways of turning even goods not yet produced and small household mortgages and loans into a source of speculation and huge profit (Sassen, 2012).

As millions have to resort to credit cards, student loans or risky mortgage deals to satisfy their most basic needs, from food to schooling to healthcare, lifelong debt and indenture to the banks become general features of proletarian life, while every moment of reproduction becomes a moment of capital accumulation. It is not surprising, then, that even in 'affluent countries' like Germany and the USA

life expectancy for the working class is declining, with the 'poor' expected to live several years less than their parents for the first time since World War II.⁷ Meanwhile, in some 'Third World regions' we are approximating a situation similar to that which prevailed between the sixteenth and the eighteenth centuries, that of a working class hardly capable of reproducing itself, living from hand to mouth, barely reaching middle age. Indeed, Marx's argument in the *Communist Manifesto* that capitalist development produces the absolute impoverishment of the working class is now empirically verified. Witness the incessant migration from the 'South' to the 'North', since the late 1980s, mostly motivated by economic need and the many wars that the corporate lust for mineral resources is generating. We are told, moreover, that there is no remedy for this immiseration. Plausibly assured by virtue of its military arsenals that, like it or not, the '99%' have no alternatives other than life in capitalism, and confident that its global reach will provide large markets and ample supplies of labor, the capitalist class now makes no pretense of progress, declaring crises and catastrophes inevitable aspects of economic life, while rushing to remove all the guarantees that more than a century of workers' struggles had obtained.

I would argue, however, that this confidence is misplaced. Without indulging in any optimism which would be irresponsible given the unspeakable devastation unfolding before our eyes, I would affirm that worldwide a consciousness is taking shape that capitalism is 'unsustainable', and creating a different social economic system is the most urgent task for most of the world population. Any system that is unable to reproduce its workforce, and that has nothing to offer it except repeated crises, is doomed. If after exploiting for centuries every part of the planet, capitalism cannot provide even the minimal conditions of reproduction to all, and must continually plunge millions into miserable living conditions, then the system is bankrupt and has to be replaced. No political system can sustain itself in the long term purely by force. Yet it is clear that force is all that the capitalist system has left at its disposal, and without its policemen, its armies, its jails and torture chambers now girdling the earth it would have long ago collapsed. It can prevail for the time being only because of the violence it mobilizes against its opponents.

Notes

- 1 The 'new enclosure' is the concept developed in the homonymous issue of *Midnight Notes*, published in 1990, to describe the new forms of privatization and expropriation activated by the globalization process.
- 2 I refer here to the argument, developed by Hardt and Negri (2000) in several works that in the present phase of capitalist development, presumably characterized by the tendential dominance of immaterial labor, capitalists withdraw from the organization of the labor process so that workers achieve a higher degree of autonomy and control over the conditions of their work. This theory follows Marx in accentuating the progressive character of capitalist development, seen as the (forced) actualization of the objective expressed by workers' struggles, which capitalism, against its own interest, must incorporate to re-activate the accumulation process. For a critique of this theory and the concept of cognitive capitalism, see Caffentzis and Federici (2009) and Federici (2011).

- 3 The Fordist deal required, for instance, parallel/equivalent increases between wages and productivity – a requirement that the industrial workers' struggles of the 1960s and early 1970s subverted.
- 4 The reference here is to the story of the prostitute Fantine in Victor Hugo's *Les Misérables* who sells her hair to support her child. Today many young women do the same in India, where there are also villages in which many young people have only one kidney, having sold the other to obtain some money.
- 5 This is how health advocates and social theorists describe the increasing harassment of low-income, mostly black women when they are pregnant. As state after state adopts legislation that gives personhood rights to the fetus, the rights of the mother vanish, and she can be arrested for a variety of forms of behavior possibly harmful to the fetus. Some women have been arrested for being in a car accident, others for refusing a caesarean birth, other because blood tests indicated the use of substances possibly harmful to the fetus, including legally approved painkillers.
- 6 This is the term Randy Martin has used to describe this process. See Martin (2002) and also Federici (2014).
- 7 As reported by Maurizio Lazzarato, in Germany life expectancy for low-income earners dropped from 77.5 years in 2001 to 75.6 in 2011, while in what was East Germany it has dropped from 77.9 to 74.1. Lazzarato comments that, at this pace, with 20 more years of cuts and 'efforts to "save" Social Security', the retirement age will finally coincide with the death age (Lazzarato, 2012: 177). In the USA, too, the 'poor' are living shorter lives. According to the August issue of the journal *Health Affairs*, from 1990 to 2008 there was an actual decline in life expectancy among blacks and among white women and men who did not complete high school. The study found that white men with more than 16 years of education live 14 years longer than black men with less than 12 years of education, and the disparities are widening. In 1990 the most educated men and women lived 13.4 years and 7.7 years longer respectively than the least educated. The most shocking finding of this study is the speed at which this gap has widened. For example, 'In 1990 the gap in life expectancy between the most and least educated white females was 1.9 years; now it's 10.4 years' (Griswold, 2012).

Commons

Massimo De Angelis

INTRODUCTION

Commons are social systems formed by three interconnected elements: (1) a commonwealth, that is a set of resources held in common and governed by (2) a community of commoners who also (3) engage in the praxis of commoning to reproduce their lives and their commonwealth, social labour and correspondent forms of social cooperation.

To evolve and adapt in their multi-systems' environments (which crucially also include capital and the state), commons systems seek to develop new organisational forms that balance individual subjects' freedom with integrative forces that keep subjectivities together. Commons systems seek to do this through the acting together of commoner subjectivities, or *commoning* – the generative immaterial and material activity through which commoners govern their commonwealth, define the value and meaning of their actions, the quality and porosity of the boundaries of the commons, their relations to non-human nature or the ecosystems of which they are part, and the relations with their own environment, namely the state, other commons and corporate capital, as well as the multitudes at large. The two structural elements that all commons are based on – namely resources pooled by any means and a plurality of subjects – are reconfigured through both iterated and evolving practices of commoning which in time reconstitute the pool of resources as commonwealth, and the plurality of subjects into

commoner communities and the rules that define their self-government. The iterative/evolving nature of commoning puts into motion the commons circuit. In other words, it continuously transforms the commonwealth and associated commoners necessary at the beginning of any process of commoning into new (transformed) commonwealth and new (re)produced subjectivities, while also enacting strategies of adaptation to the stimuli of the environment. On the other hand, strong enough changes in the operations, structure, subjectivities and density of commons within a territory influence the systems in the commons environment, which will have to adapt in their turn. Commoning is the force-field generated by the praxis of the 'we', which reproduces and modifies social systems, channels behaviour towards certain value practices, and thereby transforms individual subjectivities in particular contexts. Reverberations of this are felt outside the commons, generating new memes, inspiring new linkages and new formations, defining new cultures.

This systemic, relational and dynamic definition of the commons (De Angelis, 2017) is more comprehensive than the conventional Neo-Institutional one developed by Elinor Ostrom and her associates, which sees the commons simply as resources shared by a set of individuals, or common goods. As I will develop below, the derivation of this more comprehensive understanding of the commons is obtained once Marx's own understanding of capital as a mode of production and his less complete understanding of social revolution and of an alternative mode of production is taken into consideration. This definition can be linked to debates developed especially in France around the notion of the Common (singular) which can be articulated principally as a political principle (Dardot and Laval, 2019) or as a mode of production (Giuliani and Vercellone, 2019; Hardt and Negri, 2009). As we will see in the third section of the chapter, the issues raised in these debates are crucial to frame the problematic of post-capitalist social transformation, the deepening of democracy and the transformation of the law.

Etymologically the words *common*, *commons*, *commoner*, *community*, *commoning* and *communism* are all fundamentally related. They all have roots in the Latin expression *cum-*, together, and *munus*, obligation, duty, gift. This points to the expectations of reciprocal obligation of care and aid – *munus* (Esposito, 2009) – and a shared understanding that there are things that belong to all of us, *cum*. As Dardot and Laval put it:

What we find in the term's etymological meaning is thus the Janus-face of the debt and the gift, of obligation and recognition ... the articulation of *cum* and *munus* (*cum-munus*) ... not only designates that which is pooled or 'shared in common' (*mise en commun*) but also, and perhaps especially, designates those subjects who have 'duties in common'. (Dardot and Laval, 2019: 32–3)

Historian Peter Linebaugh (2008) sees the origin of the concept of commoning in the practice, bearing this name, of Mediaeval peasant efforts to collectivise the King's land. With the advance of capitalism and successive waves of enclosure,

the term became less frequently used, while political/theoretical language started to use other terminology to refer to alter-capitalist practice. Movements of the 1960s and 1970s forced communitarianism, solidarity and ‘sharing’ back onto the agenda. In the midst of this era, a modern critique of commons emerged with ecologist Garrett Hardin’s 1968 paper in *Science*, ‘The Tragedy of the Commons’. This seminal article claimed that sharing land or any resource among a group of farmers always results in resource depletion. To demonstrate this, Hardin relies on the first premise of methodological individualism, assuming that each farmer aims only to maximise their own individual utility. This is achieved by keeping their cows longer on the meadow or by bringing in more cows. Obviously, with increasing competition among farmers in a fixed resource pool, the latter will deplete; hence the tragedy of the commons. Hardin’s solution was twofold: either privatisation of the commons under different property rights or monitoring and enforcement of rules by the state.

Nobel prize laureate in economics (2009) and political scientist Elinor Ostrom (1990) produced an effective and simple critique of Hardin’s thesis. After studying numerous cases of existing commons around the world, some of which had lasted hundreds of years, Ostrom argued that Hardin was really talking about the tragedy of free access. Hardin’s blind spot is the fact that commons are governed by commoners, who together decide on the rules of access and continuously monitor them. Commoners are not only self-interested but make sure that their collective interaction with shared resources is sustainable, otherwise they would all lose the resources they depend on. Ostrom thus makes a clear connection between commonwealth (or wealth held in commons), and the community of commoners, with its governance system.

However, Ostrom’s original definition of the commons suffers from two important limitations. In the first place, commons are theorised as resource systems that can live beside both state and capital, thus disregarding enclosing and co-opting tendencies of capital and state, both historical and continuous, as well as the aspirations and practices pushing for the constitution of alternative socio-economic systems (De Angelis, 2004, 2007; Harvey, 2003) Second, in her approach commons appear as resources that are rival or subtractable, and access to which is difficult to hinder. This implies that only natural resource systems are commons – say a fishing ground, an irrigation channel, a groundwater basin or a grazing area – while not the resource units derived from those systems such as ‘the tons of fish harvested from a fishing ground, the acre-feet or cubic meters of water withdrawn from a groundwater basin or an irrigation canal, the tons of fodder consumed by animals from grazing area’ (Ostrom, 1990: 31).

This latter distinction, however, runs counter to both historical experience and the complexity of contemporary forms of commons, as these come to be reclaimed by plural social movements around the world (Caffentzis, 2004; Cox and Federici, 1976; Federici, 2012). Both historically and in current experience, there are indeed myriad examples in which communities pool excludable

resource units into a 'common pot'. They will then establish rules or customs for their individual appropriation: from toy libraries, communal kitchens, factories reclaimed by workers, social centres or indigenous communal practices. In the second place, in recent decades there has been growing interest in non-rival common goods such as knowledge, music or software codes. These latter resources are such that it is difficult to prevent people enjoying them. Also, the 'stock' of the resource is not reduced when one uses it. A boundary is constructed by these resources when capital and the state impose their privatisation, making them artificially scarce. Today, the open access movement is founded on the refusal to privatise non-rivalrous goods such as information and knowledge. In academia and cyberspace, this social movement is dedicated to principles of information sharing, open source, copyleft, creative commons and anti-privatised knowledge commons (Benkler, 2003).

In all these cases, commons names not just a type of resource shared but social systems comprising three elements (De Angelis, 2017): (1) a commonwealth, (2) a community of commoners and their social relations, and (3) a praxis of commoning, of doing in common, including the self-organising act of governing the relation to the commonwealth and nature, as well as the relationships between commoners. This means that it is not the intrinsic characteristics of the common goods that determine the possibility of the commons, but that it is 'the capacity of labour cooperation to organize itself in an alternative way compared to the private and public logics which determines in the last resort the propensity of a series of goods or resources to be managed according to the principles of Common' (Vercellone et al., 2015: 26). Recent decades have witnessed indigenous communities and new commons systems becoming more visible and innovative – from the streets of Cochabamba, to New York, Naples, Johannesburg, Athens and Mumbai. Commoners can be found subtracting resources from the capital system, and inserting them into processes of collective production and cultures based on value practices, which in context-specific ways are participatory and deeply democratic, and whose horizon is the welfare of the commoners, social utility and environmental sustainability.

This emergence of contemporary collective action around the commons has occurred in two interconnected ways. First, as a survival response to the enclosures and multiple crises of neoliberalism, as well as a refusal to submit to exploitative technologies and practices. Second, they also emerge as a striving for novel social organisations that favour empowerment of coproducers, non-alienated cooperation, social utility and ecological transformation. The commons function in both spheres of social reproduction and production. In the former, they involve new forms of social organisation in the production of food, housing, energy, health care, education, arts and culture, or even the 'global commons' of the biosphere, at least at the aspirational level. Commons have also developed within and led to the transformation of businesses, as shown in several cases in manufacturing and services discussed by Laloux (2014). The commons

movement involves participatory exploration of new technologies and forms of cyber cooperation – open source software production, peer-to-peer cooperations such as Wikipedia, and open-source machines. These multisided spaces of cooperation are potentially transformative, offering an alternative model of production to capitalism and authoritarian state systems. Although there is the danger that the latter systems co-opt the commons and shift costs of social reproduction onto them, the commons, and the related notion of the common, remain the kernel around which a broad project of radical emancipation, deep democratisation and ecological transformation can be constituted. Commons and social movements are therefore faced with the task of rebuilding the fabric of social reproduction, redressing the qualitative and quantitative aspects of social metabolism and setting a limit on capital's drive for endless accumulation.

In his major *oeuvre*, Marx appears to mention the word 'commons' only with reference to their enclosures, or original ('so-called primitive') accumulation, about which there is an important literature concerning its significance in contemporary capitalism (De Angelis, 2001, 2004; Harvey, 2003; Midnight Notes, 1992). On the other hand, we can turn to Marx's defence of customary rights and entitlements for the poor to collect wood in his early articles in the *Rheinische Zeitung* from 1842 (see Linebaugh, 1976). Moreover, in his *Ethnological Notebooks* and his famous letter to Vera Zasulich on the Russian commune, Marx seems open to reflect on the commons as a form that is relevant to post-capitalist social emancipation. In the limited space of this chapter, I will discuss some aspects of these emancipatory potentials of the commons through three different routes.

A first theme begins with a paraphrase of the very first section of *Das Kapital* in which Marx begins his analysis of capital starting from its elementary form of wealth, the commodity. The rationale of this paraphrase is to reproduce the logic of Marx's argument while at the same time substituting the commodity with the elementary form of post-capitalist wealth, common goods. Thus, I begin to read those early pages on the commodity as if they were written for the elementary form of post-capitalist wealth, and instead of the commodity we were talking about, common goods. As I turn Marx on his head from an analysis of capital to an analysis of its antipode, postcapitalism and the commons, I develop the narrative from a paraphrase of those early pages of *Capital* into the discovery of the Commons as social systems. Just as in the analysis of the commodity Marx uncovers a capitalist system and its alienating and exploitative features, so in the analysis of common goods, we uncover the commons systems and their emancipatory potentials.

A second theme is an exploration of the possible connection between the commons and the question of radical transformation of the current social formation which sees the dominance of state and capital. I turn here to Marx's conceptualisation of social revolution as different from political revolution (Davidson, Chapter 18, this *Handbook*), and to the key importance of the development of alternative modes of production (which I interpret in terms of the commons)

within the fabric of the old, without which any political revolution would be, in Marx's view, 'quixotic'.

A third theme, which builds from the second, interrogates the interrelation of the Anglo-Saxon usage of the *commons* (plural) and the continental European usage of the term *common* (*comune*, *commun*) (singular). Here I highlight the importance to maintain both usages in a virtuous systemic relation.

All these themes point to a Marxian-inspired framework for the commons understood as social systems (De Angelis, 2017). Let me start with a game, a paraphrase of Marx's beginning of capital on the commodity, read and translated in terms of common goods.

THE OUTSIDE OF THE COMMODITY

The wealth of *post-capitalist society*, as it peeps over the horizon of the many heterogeneous practices of communities, associations, peer-to-peer networks and social movements, appears in the first instance as a collection of common goods, a commonwealth. We need therefore to enquire after this elementary form of post-capitalist wealth.

Common goods have a twofold character, revealed in the first place by their own name which combines a noun (good) with an adjective (common). They are 'goods', in the sense of being social objects of value, use-values, objects (whether tangible or not) that satisfy given socially determined needs, desires and aspirations. They are common goods, in the sense that they are use-values to a plurality.

However, this is not sufficient to define common goods in the post-capitalist sense. An airport lounge is a use-value to a plurality, as is a public space, a city, a train, a park, a school or a street. Also, any mass-produced commodity is a use-value to a plurality, in the sense that it serves the necessary or acquired needs of a subset of a population, although this cup, this computer, this car is a use-value to me. What is common to all these cases is that the plurality is largely silent; it is only a passive user or consumer of these goods. To make it a common good, the plurality needs to come alive as a plurality of commoners, by claiming post-capitalist ownership of that good. To claim ownership is not simply a question of defining property rights in the legal sense. To 'own' here refers not to legal possession, but to the plurality having the power to govern that good, and with it to govern the relation within the plurality. A plurality that claims ownership to one or more use-values is one that, in different forms, situations and contexts, not only employs or accesses that use-value but also governs its production and reproduction, its sustainability and development, as well as the relationships between the co-producers themselves, the ecosystem and other social systems. In so doing, the plurality shapes a relationship to that good and to the environment within which it is (re)produced, while the subjects of that plurality govern

their relations with one another. This plurality therefore also creates other values besides the use-value of the common goods. It creates relational values by measuring, assessing and giving particular senses to the modes of social relations of (re)production through which the common goods are (re)produced and their use-value distributed among the commoners. Therefore, and to the extent the plurality sustains that claim of ownership, the common good is turned into an element of a common system or, briefly, a commons: this built space is an element of the self-organised social centre in Milan; these pipes are an element of the water associations in Cochabamba, Bolivia; this knowledge and know-how are elements of peer-to-peer networks in cyberspace.

The twofold character of a common good is therefore the following: on the one hand, it is a use-value for a plurality; on the other, it requires a plurality claiming and sustaining ownership of the common good – this can be done only through the creation of relational values, namely values that select the ‘goods and bads’ of social action while at the same time sustaining and (re)producing one another, social relations, social practice and the ecology in which social practice is embedded. Thus, our initial formulation can now be corrected. The wealth of post-capitalist society also includes this normative and relational wealth.

Since today the commons are produced in larger contexts of capitalist domination, this implies that they coincide with a force-field that will often be oriented by goals and practices that run opposite to capitalist production. Indeed, the twofold character of common goods is quite distinctive from the twofold character of the commodity in a social system dominated by capital, as discussed by Marx (1976) in the first chapter of *Capital*. The commodity is a use-value and an exchange-value. But the latter is not the result of a plurality taking ownership of the good produced in common (in a factory, an office, through a diffused network of producers held together through competitive markets, etc.), but the result of an individualised plurality divided into wage and wealth hierarchies and set to compete for livelihood against one another. For this plurality, their common condition of production is a matter of insignificance, an un-problematised given, a fact of life you do not even try to question or govern in some way, and therefore an alien force. In capitalist commodity production, value presents itself as exchange-value, neither good nor bad, a mere ratio: pounds per carton of milk; euros per smartphone; dollars per hamburger. Value here induces social forces only through a systemic integration with other capitalist producers, who take these ratios as a benchmark to meet or beat so as they can reach their own profit goals, namely through the incessant process of the formation of capitalist ‘socially necessary labour time’ (De Angelis, 2007). The values of conviviality, social justice, ecological balance, as well as the goals of livelihood, get squeezed out by this incessant competitive struggle which instead shows what such a systemic integration really values: accumulation for accumulation’s sake. This value, this induction into a social force-field occurs within capital-systemic loops that impose measures, assessments and sense productions that are heteronomous

to (outside) the producers themselves thus giving rise to exploitation, widening power hierarchies, environmental catastrophe and subjection. This is possible to the extent that social conflict over the 'measure of things' of (re)production (the how, the what, the why and the how much) has insufficient direction and force to constitute a feedback mechanism that would have enough counter-power not only to contrast capital's own measures but also to constitute social systems that are able to reorient, in a self-organised and therefore deep democratic way, a different sense of the 'measure of things' related to social (re)production. The twofold character of common goods is at the basis of our understanding of commons as specific social systems of production and reproduction, quite different from capital, and which, if developed into strong enough social forces, can contrast and replace capitalist production. The twofold character of the common good contains two basic elements – one objective (the 'common goods' themselves) and one subjective (an ownership-claiming plurality of subjects) – that give us an entry-point to understand commons as social systems. The potential dynamism and movement of these commons' social systems emerges from two interconnected processes.

One is internal to the commons itself, and defines the modes in which a plurality of subjects establishes their ownership to the common goods and the forms of the social relations they set in place, negotiate or even contest. For example, in Zapatista-held areas in Chiapas, indigenous communities hold territories and land as commons; but within that movement and those communities women have constituted social movements to question their subordinate position and emancipate from patriarchal practices. Here commons are also centred on social conflict, but a conflict reconciled with itself, in the sense that it is not concealed, marginalised and brushed aside as 'deviance', but acknowledged as the key expression of democratic vigour.

The other element that gives commons dynamism and movement is external to them, and stems from the way the commons in question are articulated or structurally coupled to other commons or to capitalist circuits, the degree to which they are exposed to destructive waves of enclosures, the limits of their 'deals' with capital and the state, and the extent to which they are open to co-optation. The nature and effective transformational force of these endogenous and exogenous processes is key to understanding and problematising the development of commons systems as transformative social forces. Hence it is not possible to understand the commons without understanding capital. Even when we deal with the commons in very general and abstract terms to highlight their properties, the commons we deal with are never romantic outsiders, but situated outsiders, social systems that must negotiate their way in an environment in which predator capitalist systems are ready to enclose or subordinate them. For this reason, a Marxist standpoint on the commons must always be attentive to the relation between commons and capital systems, a relation that has always been crucial, but particularly so in moments of crisis such as today. This is acknowledged in

the very definition of commons as social systems, which also include in their environment other systems such as capital systems, state systems, other commons and ecological processes.

POLITICAL RECOMPOSITION AND SOCIAL REVOLUTION

The numerous commons systems initiated and (re)produced by the relational, affective and goal-oriented praxis of commoning give rise to commons circuits in which the values produced are not subordinated to capital's bottom line of profit, but produce myriad other *social values*. However, from a perspective of social transformation, the development and diffusion of commons' systems is a necessary but insufficient condition for overcoming the capitalist/state hegemony both as a mode of production and in terms of dominant technologies of ordering, selecting and measuring social relations and social practice. They are necessary, in that the production of new systems of (re)production requires the development of social systems like commons which, by positing their different measures, values and senses of things in praxis, engage in the construction of another common sense and another material life, experimenting with and establishing new sustainable, socially just practices in a convivial and participatory atmosphere. This conception finds a home in Marx's idea that social rather than political revolutions are a primary condition for overcoming the capitalist mode of production and its state apparatus.

In the first place, a political recomposition could not generate and sustain, through any sort of political representation, a radical change in social relations and systems of social reproduction. My conviction is that political recompositions are certainly necessary to create momentum for change by initiating chain reactions of sociality and channelling social energies into particular objectives and directions with efficient thrust. In this sense, phases of political recomposition and the correspondent forms of political representation are important for opening up opportunities for the radical development of new social relations and systems, for shifting constraints imposed by higher layers of the social hierarchy. However, in themselves they do not radically change social systems like capital into something else: they can only perturb them. Capital reacts and adapts to these perturbations by developing new forms, absorbing, enclosing, channelling, re-dividing within the wage hierarchy, co-opting and repressing – and the mix of these strategies will depend on the cost–benefit calculus in a given situation. Keynesianism and the welfare state, as developed in the post-WWII period, are a case in point (De Angelis, 2000).

This implies a conception of radical change, of 'revolution' that is aligned with Marx's conception of social revolution (rather than of Lenin's political revolution). In the first place, a social revolution is not the 'seizure of power' engineered and led by a political elite (whether through reformist or political revolutionary

means) (Holloway, 2002), but the actual production of another form of power, which therefore corresponds to the ‘dissolution’ of the old society and of the old ‘condition of existence’ (Marx, 2012: 59), or a change in the ‘economic structure of society’ constituted by ‘the totality of the [social] relations of production’ (Marx, 1977). Secondly, precisely because it is constitutive of new social relations reproducing life (and dissolving old relations), social revolution cannot be reduced to a momentary event, a ‘victory’; rather, it is epochal and configured by a series of ‘victories’ and ‘defeats’. Marx thus speaks of the ‘beginning’ of the ‘epoch of social revolution’ (Marx, 1977), but how long this epoch is, none can say (although climate change and the massive crisis of social reproduction are putting some urgency on the horizon). This distinction between social and political revolution does not imply that social revolution is not itself ‘political’. Social revolution is political in the sense that it acts as a crucial perturbation of established dominant systems and poses the socio-economic basis for a new polity, for new forms of governing the networks of social cooperation.

This priority of social (rather than political) revolution also implies that in order to replace the current system (model), we do not need an already worked-out system to be ready to take its place before dreaming or wishing its demise. Alternative systems can certainly be imagined and problematised, but it is not through their ‘implementation’ that the development and history of modes of production occurs. Systems are not implemented; their dominance can only be an emergent property of the dynamic of social formations comprising struggles for hegemony among different modes of production. Their emergence occurs through the related processes of social and political revolution, with the former creating the source from which the latter draws its power to perturb capital while at the same time developing its autonomy. This is how, for example, the dominance of capital developed from the phase of commercial capital, to industrial capital and, today, financial capital hegemony, an evolution in form and structure that was unimaginable at the time of the mercantilists or of Adam Smith’s writings.

The process of social revolution today is ultimately a process of finding solutions to the problems capital systems cannot solve. This implies the establishment of multi-scalar systems of social action that reproduce life in modes, systemic processes, social relations and value practices that seek alternatives to the dominant model and that are able to reproduce at greater scale through networking, coordination and the creation of new institutions of the common. What has become increasingly clear from various movements in the last few decades is that commons, understood as systemic interactions of commoners, commonwealth and environment through deeply democratic and convivial commoning, are today the material basis of any process of social revolution.

The relationship between social and political revolution is thus the relationship between the social systems that underpin them, namely commons and movements. We should heed Marx’s warning about radical transformation beyond capitalism, when he says in the *Grundrisse* that ‘if we did not find concealed in

society as it is the material conditions of production and the corresponding relations prerequisite for a classless society, then all attempts to explode it would be quixotic' (Marx, 1973: 158).

Commons are these concealed modes of production in which a classless society can be given form vis-à-vis capital. In fact, commons are latent within society and channel all the support and resources through which we reproduce our lives and knowledge. We are generally born into one, even if it only consists of interactions with our parents or carers, and siblings or friends. As soon as the process of socialisation begins, we reproduce our subjectivities in bodies and spirit through engagement in networks of social cooperation that confront us with the need to develop values, practices and measures that are truly alternative to the subordination of life to profit, or that push us to learn to adapt to it while keeping a distinct identity. As soon as these networks of social cooperation develop into systematic patterns, we find all the elements of commons to varying degrees: pooling of resources, communities and commoning. Given the development of communication and information technologies and the cognitive labour that mobilises them, these commons-based forms of social cooperation have the potential to further expand and destabilise their boundaries, renew their social compositions and develop multi-cultures of horizontality based on a new mode of production, the Common.

However, this advancement of commons sooner or later implies a collision with other social systems governing, constraining, or coopting them, such as state and capital, and thus commoners must face the question of pushing back capitalist forms of measurement and give value to their social action, especially if capital's development depends on enclosures, seizing the human and natural resources mobilised by these alternatives. It is also clear that the force alternative systems can sustain in this collision course with dominant social systems (their resilience, so to speak) is proportional to the degree of the multiple social powers they are able to mobilise. By a social system's resilience I mean the ability of a social system to retain function and a sufficient degree of prosperity, reproducibility and social cohesion in the face of the perturbation caused by the shocks and crises of outside systems, like ecological, state and capital systems. Thus, for instance, since capital and commons are to a large extent structurally coupled social systems, these shocks and crises (such as the loss of income due to unemployment and economic crisis, or state victimisation criminalising particular struggles) put to the test the commons' resilience, forcing them to adapt and evolve. The path of this adaptation however is open, and it can lead to a greater domestication of the commons within capital's loops (such as, for example, the patriarchal nuclear family in the post-WWII period) or, on the contrary, the development of autonomy and resilience of the commons in spite of capital's circuits (like, for instance, the experience of occupied social centres in Italy or the universe of grassroots voluntary associations socialising different aspects of reproduction).

My underlying thesis is thus that a social force like the commons only emerges, expands and creates effective transformative powers vis-à-vis other social forces

such as capital and the state as a manifestation of its own powers, to the extent this is necessary for its preservation and reproduction (and the preservation and physical/cultural/emotional reproduction of the commoners comprising it). Therefore, in order to problematise social change we need to problematise social forces. Doing so implies understanding social systems, in particular commons and the social movements they are able to give rise to. It is in this sense that the old revolutionary philosophy can shed light on the present:

Communism is for us not a state of affairs which is to be established, an ideal to which reality [will] have to adjust itself. We call communism the real movement which abolishes the present state of things. The conditions of this movement result from the premises now in existence. (Marx and Engels, 2000: 11)

The premises now in existence are the actually existing commons and the forms of their cooperation that create the Common, the paths of social transformation they are able to generate vis-à-vis capital and the state.

THE COMMONS AND THE COMMON

Let us explore further the connection between these terms, Commons and the Common, by looking at the debate over the Common in the singular that has developed, especially in France. From this debate, the Common can be principally articulated as a mode of production or a political principle. Both approaches see the neo-institutionalists focus on natural common goods as limited, and both seek to interpret the debate over the common(s) in political terms. The terms of the debate on the Common as a mode of production were set with the publication of Hardt and Negri's *Empire*, *Multitude* and especially *Commonwealth* (Hardt and Negri, 2000, 2004, 2009), as well as their latest book, *Assembly* (Hardt and Negri, 2017). The notion of the *Common as Mode of Production* (CaMOP) along these terms was then also developed by others, especially Giuliani and Vercellone (2019) and Vercellone et al. (2015). The approach to the *Common as a Political Principle* (CaPP) was mainly put forwards by Dardot and Laval in their book on the *Common* originally published in French in 2014 (Dardot and Laval, 2019). In the space available here, I can only try to synthesise the kernel of each approach and outline some key critical points emerging from the debate. I will then draw some conclusions in light of my own work on commons as social systems.

With some degree of simplification, the CaMOP approach can be encapsulated as follows. The diffused wave of struggles of the 1960s and 1970s pushed upwards the social wage (including the monetary wage and the conditions of social reproduction tied to *welfare*) above and beyond the capacity for the regulation of Fordism – the regime of regulation of class relations that emerged after the crisis of the 1930s and that was based on the figure of the mass worker. With the emergence of post-Fordism there was a shift in the conditions of production and

class composition, with increased reliance on mass intellectuality, ‘immaterial labour’ and the precarisation of labour, to the point that a new type of capitalism can be said to have emerged, namely cognitive capitalism (see, for example, Moulier Boutang, 2011; Fumagalli, Chapter 84, this *Handbook*). Perhaps the central aspect of cognitive capitalism is that, on the basis of the accumulation of past struggles and the expansion of *Welfare*, and in spite of the neoliberal reaction, there took place a mutation in the class composition and organisation of social labour which increasingly rested on cognitive labour (understood as the *living labour* of production of, for instance in IT&C, education, health, down to the very basic ‘essence’ of social networking). In terms of its organisational capability and the actual content of work and organisation of labour process, this cognitive labour is largely autonomous from capital, in the sense that capital no longer organises how this labour constructs its social cooperation, and

[t]he content of what is produced – including ideas, images, and affects – is easily reproduced and thus tends toward being common, strongly resisting all legal and economic efforts to privatize it or bring it under public control. (Hardt and Negri, 2009: x)

What capital does instead is return to certain conditions of formal subsumption of labour under capital (Negri and Vercellone, 2008), in which one of the most important consequences is the ‘becoming rent of profit’. This marks, according to the CaMOP approach, a key aspect of cognitive capitalism, which also corresponds in this period to the hegemony of finance as a dominant mechanism of rent extraction.

There are of course some key contradictions in this phase. For example, the possibility for cognitive capitalism to rely on rent extraction from the Common depends on its capacity (*vis-à-vis* the counterforce from the common) to impose artificial scarcity on many products of the common, for instance, through patenting and intellectual property rights (Rekret and Szadkowski, Chapter 85, this *Handbook*). These forms of enclosure are thus forms of *theft* and calling them thus is not an abandonment of Marx in favour of Proudhon, but simply a recognition of the ‘re-composition of rent as tool of exploitation and new figure of profit’ (Negri, 2014).

In this approach, the possibility of emancipation is inherent in the mode of production adopted by cognitive labour, and thus ‘the transition is already in process: contemporary capitalist production by addressing its own needs is opening up the possibility of and creating the bases for a social and economic order grounded in the common’ (Hardt and Negri, 2009: x). What emerges clearly from this perspective is the focus on the need for struggles to reverse the hierarchy between state/capital/common (Brancaccio and Vercellone, 2019), and attempt to create the Common as the hegemonic force. In order to do this, the CaMOP approach focuses on the need to turn welfare into *commonfare* (Vercellone et al., 2015). In particular, this would imply the key strategy of pursuing a social basic income to give more power to cognitive workers to refuse conditions of precarity and

low wages, while liberating time for the common and fighting the ‘anti-common’ policies of cognitive capitalism, especially in the knowledge common. This would also entail the creation of new institutions and the deep transformation of the welfare/workfare state into a commonfare state. Accordingly, the

[p]ossible supremacy of the logic of common would not mean that the institutions and guarantees of the welfare state would vanish, but the transformation of their way of management through the development of mechanisms of direct democracy and coproduction which would permit transition from a model of state-control to a model of the commonfare state. (Vercellone et al., 2015: 27)

Clearly, the vantage point of the CaMOP approach seems to be located within a particular class composition of the ‘developed’ centres of global capitalism, although the importance of cognitive labour can be seen as increasing around the world. Yet it is worth mentioning at this stage the fact that cognitive capitalism, like Fordism and post-Fordism before it, is only a very general characterisation of what may be new or specific to our particular era, not an understanding of the totality of what capitalism is or how it operates in this particular historical phase. Just as industrial capitalism during the industrial revolution presupposed slavery for its mass provision of the cotton raw material adapted to the new technologies of the nascent capitalist factories (Russell, 2011), or just as Fordism – the massification of work in assembly line – presupposed the reinforcement of patriarchal domination in the households and neo-colonial relations vis-à-vis the ‘third-world’, likewise for cognitive capitalism, which is also predicated on wage and labour hierarchies and thus remains an important but nevertheless limited subset of contemporary capitalism.

For example, the cognitive labour I am doing through my computer right now is *also* predicated on the rare earth materials extracted by some enslaved child’s hands somewhere in East Congo, a form of labour that is not comparable to what the CaMOP approach understands as cognitive labour. My cognitive labour is also predicated on the data servers that contain the files of my bibliography, which require massive energy expenditure and production of waste to carry out this service, among others. Cognitive labour itself also generates waste, and not only through what it consumes to reproducing its body. The great challenge, therefore, is that cognitive labour, however and wherever it is exercised, if it really wishes to cognise its embeddedness in this world *as a common*, ought to see itself as only a part of the world, a part related to other parts of the same world. Collective reflection on these relations, how they’re constructed through different value practices, and their often clashing ‘measure of things’, is one of the key contributions that cognitive labour – understood more generally as the cognising praxis of the human species across the wage hierarchy (including the unwaged) – can offer in the institution of the Common. But it can do so only if it develops a political principle of the Common to be alerted to and contrast the mechanisms of capital subjectification inherent in its systems. The CaPP approach of Dardot and Laval (2019) seeks to focus on this political principle of the Common, though to my mind they seem to be throwing away the baby with the bathwater.

The CaPP approach of Dardot and Laval (2019) does not accept the narrative on the Common as mode of production. For example, they see the spheres of cognitive capitalism discussed by CaMOP as dominated by the imposition of capital's measure, not the creation of the common. Much of this critique is, I think, well taken, but only if we acknowledge that capital's measure is not the only measure in town in the creation of the common, and there are forms of alternative or counter-measuring and ordering more vernacular to cognitive labour. Taken this way, I don't think the CaPP invalidates the gist of the CaMOP approach.

Also, as with the CaMOP approach, the CaPP perspective does not see the Common as a form of possession or a type of object. The CaPP approach instead regards the common as creating 'a space in which use prevails over ownership'. In this sense, the Common is 'not a resource in itself – even when it is related to one' (Dardot, 2018: 22). The Common is thus that collective activity 'of those who take charge of it, preserve it, maintain it and take care of it', and the 'active links' it establishes with 'an object, a place, a natural resource (for example, a waterfall or a forest), or something artificial (for example, a theatre or a square)' (Dardot, 2018). The ongoing cooperative activity that links a plurality of material and immaterial elements of social production, that governs the production and the sharing of things in common and regulate the social relations among co-producers and co-users, is what myself and others have called *commoning* (De Angelis, 2017; Linebaugh, 2008), and what Dardot and Laval call the common. In this sense of *commoning*, Dardot and Laval acknowledge the key driving elements of the commons understood as systems, just as the CaMOP approach sees *commoning* in the cognitive labour that produces the common.

In Dardot and Laval, the emergence of the common today is manifest in the activity inherent in the many waves of struggles that have been developing from the alter-globalisation movement onwards. As they write:

The emergence of the 'common' as a political rallying cry initially grew out of dispersed social and cultural struggles against the capitalist order and the entrepreneurial state. As the central term used to denote an alternative to neoliberalism, the common became the effective principle for struggles and movements that, over the past two decades, have resisted the dynamics of capital and given rise to original forms of activism and discourse. In other words, the common is far from a purely conceptual invention: the common is rather the concrete product of social movements and various schools of thought dedicated to opposing the dominant tendency of our era, namely the extension of private appropriation into every sphere of our societies, our cultures, and our very lives. In this sense, the term 'common' does not so much refer to the *resurgence* of the eternal Communist Ideal, but rather designates the *emergence* of a new way of challenging capitalism and imagining its transcendence. In other words, it is a term that helps us turn our back on the strategy of state communism once and for all. By appropriating and operating the means of production in its entirety, the communist state methodically destroyed the prospects for real socialism, which 'has always been conceived of as a deepening – not a rejection – of political democracy'. For those dissatisfied with the neoliberal version of 'freedom', the common is thus a means of opening up a new path. It is precisely this context that explains the thematic emergence of the common in the 1990s. It was a shared political demand that could be found in the most local and concrete struggles, as well as within the largest national and international political mobilizations. (Dardot and Laval, 2019: 4–5)

Through such plural and articulated activity, Dardot and Laval see a re-elaboration for today of the political principle of the Common, a political principle that they uncover through an extensive archaeology ranging from Aristotle through Proudhon, from Marx to Mauss, Hannah Arendt, Cornelius Castoriadis and Félix Guattari. As they discuss in an earlier work (Dardot and Laval, 2017), for them the Common is a form of rationality that contrasts the neoliberal rationality that constructs its ordering of interconnected states and markets around the principle of competition with the consequent shaping of subjectivities. The comprehensive rationality of neoliberalism finds its counterforce in the political principle of the Common. This rationality is not only a critique of neoliberalism but also an alternative. The CaPP approach sees the derivation of this principle in the recognition that a

[‘c]ommons’ is first and foremost an institutional affair and, more specifically, an institutional space defined by collectively developed practical rules. What is most important is the dimension of instituting the activity, and not the technical characteristics of things and goods. Here lies the essential difference between common goods and the common(s). (Dardot, 2018: 22)

Any commons, therefore, in so far

[i]t is instituted as such, is a good in an ethical and political sense. By contrast, any good that is capable of being purchased and sold, is not in itself a commons. This means that a commons is a good only under the condition that it is not a possession or an acquisition. In other words, once it is instituted, a commons is inalienable and inappropriable. (Dardot, 2018: 22)

Democracy is also clearly part of this principle, since:

[a] common, regardless of its specific designation, requires self-government or democratic government. The very act of establishing a common is in and of itself a democratic act. The act of governing a common is nothing more than the continuation of the democratic act; it is thus a sort of continuation of the institution. It consists of reviving this institution by critically assessing its collective rules, whenever the situation demands it. As such, the governance of the common can only proceed from the principle of democracy – the non-democratic governance of a common would threaten, in the short-term, the very existence of this common. I call this the principle of the common, this time in the singular form. (Dardot, 2018: 22)

What do we make of these two perspectives? I think they both contribute to the question of social transformation in current conditions. The CaPP critique of the idea of cognitive labour as a space in which the common develops autonomously from capital, makes sense, in that capitalist discipline/subjectification, appropriation and exclusion also seek incessantly to enter the spheres of production of knowledge (De Angelis and Harvie, 2009). On the other hand, the CaPP critique of CaMOP overshoots the mark in that it seems to posit absolute domination by capital in these areas, while in fact cognitive capital is traversed, like any other sphere, by struggles. It is for this reason that within the CaMOP approach there is an appeal to identify the common produced by cognitive labour as a *tendency*. A tendency is nothing other than the pattern resulting from a clash of forces, when one of these forces (or group thereof) is pervasive and dominant. Hence in

the CaMOP approach we may well understand the Common as traversed by class struggle while remaining dominant. As we saw, this is just the opposite of the basis for the CaPP critique of CaMOP. Now, whether capital or the common is the dominant force governing the tendency will differ relative to the many situated contexts and scales of the social. For this reason, rather than focusing on the dominance of capital versus the common as the signature of the ‘tendency’, we should move our gaze to the struggle between the two, to what I have called the frontline of value practices (De Angelis, 2007), which gives rise to particular clashes among modes of production *and* opposing political principles. At that situated junction, then, the common as a political principle becomes key, not just in negating but in establishing and promoting the common as a mode of production with lesser entanglement to capital – or actually subordinating the state and capital to the common, including through modes of self-government and self-organisation, deep democracy and non-exclusion.

The two approaches, therefore, notwithstanding their obvious differences, could be articulated in a virtuous dialogue. The Common as a mode of production becomes the basic social condition out of which the common as political principle can spring up. On the other hand, at the frontline of value struggles vis-à-vis capital, the common as political principle can help to elicit, promote, expand, orient and support the common as mode of production. Virtuously linked in this sense, the CaPP loses any hints of idealism, which have been pointed out by the CaMOP approach (Negri, 2014; Vercellone et al., 2015), as the emergence of the political principle comes to be located in the challenges of sustaining, expanding and adapting the Common as mode of production (which also includes the political struggles of social movements to challenge the capital/state constraints preventing the development of the Common). On the other hand, the CaMOP approach would become less open to those critiques, advanced by the CaPP approach, that see it disregarding the capitalist/state strategies to measure (and therefore subjectify) cognitive labour. This would allow the CaMOP to problematise the value struggle inside cognitive labour, not only in terms of the struggles against rent (and profit) extraction (Dughera and Vercellone, Chapter 4, this *Handbook*) but *also* in terms of asking what type of cognitive labour, for which production, for what ends, and under what working rhythms.

CONCLUSION

By way of conclusion, we can put forward three observations. First, we can understand commons as systems by subverting the logic embedded in the commodity. These commons are elements of the Common understood as a mode of production, as a common system of commons, a *common of commons*. The role of cognitive labour distributed and in cooperation across the wage hierarchy is to cognise the ‘measure of things’ embedded in practices that (re)produce the

common, problematise its political relation to capital and the state as well as its strategies and forms of struggles. Second, the development of the common through the praxis of commoning (whether in (re)production or struggle) is at the basis of a process that Marx calls social revolution, which is necessary to establish ‘the material conditions of production and the corresponding relations prerequisite for a classless society’ inside a social formation. Third, the development of the Common also brings with it the continuous need to forge an adequate political principle of the common that is able to mobilise and orient struggles, envisage common-based solutions to social and ecological problems, and expand the common as a mode of (re)production. Cognitive labour, distributed and cooperating across the wage hierarchy in both production and reproduction spheres, gives rise to this political principle, while the latter in turn informs new practices and struggles, with the result of contributing to the development of the Common vis-à-vis capital. These iterative but creative processes are ongoing, scaled and situated, their content circulating across networks to contaminate different contexts.

Extractivism

Verónica Gago

Recently, the concept of extractivism has enjoyed wide diffusion in Latin America in order to renew a critique of developmentalism and, at the same time, come to grips with the region's insertion into the global commodities market. Many authors (e.g. Escobar, 2012, preface; Gudynas, 2016; Lander, 2016; Svampa, 2015) use the concept to denounce forms of dependence, which update logics of plunder and looting, linking this debate to dynamics of 'accumulation by dispossession' (Harvey, 2003).

The entry will start by reviewing the literature associated with those debates. Then, the concept will be broadened along three lines of investigation: (1) the neoextractivist form of contemporary economies in Latin America and its organic relationship to consumption and finance; (2) the need to expand the concept of extractivism beyond its sectorial limitation to the extraction of raw materials; and (3) the relation between this expansion and the expansion of the margins of valorization, to understand the crucial roles played by popular economies and territories in the urban peripheries in this new moment of accumulation.

Additionally, I will explore the relationships between extraction and sovereignty. The dominant form of extraction of value is neoextractive insofar as it configures the relationship between territory and the global market. The internal circulation of goods and products depends on the success of that insertion. The capacity of state mediation (I will focus on rent extraction to fund social programs and subsidize production) is therefore inserted into a broader set of institutional assemblages. In this sense, I will describe 'financial extractivism', as exercised

through debt, especially targeted at feminized popular economies (Cavallero and Gago, 2020). Financial extractivism extracts value from the plane of social reproduction, of non-waged labor, where different feminist thinkers have located the specific forms of exploitation of women and feminized bodies in capitalist society (Federici, 2004, 2012). The Marxist notions of value and exploitation will be discussed in this context.

ARCHIVE AND PRESENT USE OF THE TERM

The question of extractivism has become increasingly important in critical debate recently, largely driven by conflicts that gave the issue political urgency (see Acosta and Brand, 2017; Junka-Aikio and Cortes-Severino, 2017). Around the world, the consolidation and intensification of extractive activities has led to the emergence of new conflicts and conceptualizations. In Latin America, it has been an interpretative key to the recent web of struggles that has been decisive in the debate over how to characterize the associated regional cycle: the emergence of the so-called ‘progressive governments’ that profited from high commodity prices (Escobar, 2012, preface; Gago and Mezzadra, 2017; Gudynas, 2016; Lander, 2016; Ospina Peralta, 2016; Svampa, 2015). More recently, conflicts persist and are rekindled: the struggle against the highway crossing the Tipnis territory in Bolivia, protests against the progression of petroleum extraction in the Yasuní national park in Ecuador, the launching of the Orinoco Mining Arc in Venezuela, and the indigenous mobilizations against the Dakota Access Pipeline are all emblematic examples.

While these dynamics spread and gain momentum through technologies that have a greater impact (especially fracking, as well as package technology that enables the constant expansion of the agricultural frontier), the struggles that resist and confront them *sabotage* and *precede* that violence and velocity. The attack on communal land ownership, forced displacement of populations, looting of resources that support diverse types of economic autonomy, and the multiple forms of violence that function as a productive force inseparable from processes of capital accumulation have been understood by the notion of ‘accumulation by dispossession’ (Harvey, 2003).

In many cases, extractive dynamics are deployed in indigenous territories, reproducing and renewing a colonial dimension that combines the interests of transnational corporations and states through the discourse of (neo)developmentalism. In many of these conflicts, women’s defense of the ‘body-territory’, as it has been conceptualized recently, is fundamental, allowing for understanding territory as the extensive body of the community as well as the body of women as territory. The concept also enables analysis of how both body and territory are currently subjected to a logic of conquest by webs of violence that are combined in a moment of the revival of capital accumulation (Federici, 2004; Gago, 2020; Segato, 2016).

This colonial dimension reminds us that what we call (neo)extractivism cannot be considered completely new, given that, particularly in the conquest of Latin America, extractive initiatives have been fundamental since the beginning. The extractive question on this continent goes back to the process of capitalist colonization and continues in the later structure of the creole elites due to its rentier character. Therefore, it is inherent in the colonial attribute that is transferred onto the new republican states. This rentier character has been associated with a modernization project that constantly obscures the predatory and archaic character of those elites associated with the metropolitan elites of global capital. Thus, there is a global archive of the sequence of the extraction of raw materials going back five centuries in Latin America connecting the form of accumulation, extraction, and political regime and, for that reason, today it must be understood as a *novelty*.

The best-known image of this situation was popularized by the title of Eduardo Galeano's 1971 book: *The Open Veins of Latin America*. A striking medical metaphor for the drawing of blood which became a favorite with dependency theorists, the text synthesizes that historical invariant for the mass public. When the former Venezuelan president Hugo Chávez gave Barack Obama a copy during the Summit of the Americas in 2009, the book's sales peaked again to show the accuracy of the diagnosis. However, this obscures the differences that characterize the current extractive moment, and, in turn, it becomes a powerful image of the 'independentist' discourse that the region's progressive governments used to represent themselves at the height of neoextractivism.

Extractivism simultaneously functions as a logic of valorization, not only an economic but rather a political mechanism for the constitution of capitalist relations in constant mutation. Thus, the extractive logic serves as a lens for the analysis of how variable scales, intensities, and temporalities are connected to the modes of valorization of the present, in their material, subjective, geographic, and virtual implications. This necessarily *broadens* the notion of extractivism. The hypothesis is that the *extractive* logic has turned into a privileged mode of value production in the current phase of accumulation, in which finance plays an exemplary role (as a *prototype* and as a *code*), and that it is this logic that allows for updating the very notion of exploitation.

The work of two researchers on the mining question in Latin America has led to the timely opening up of a little-known anti-colonial archive: the Argentine historian Enrique Tandeter (1993) and the Bolivian sociologist René Zavaleta Mercado (1986). Tandeter in *Coercion and Market: Silver Mining in Colonial Potosí 1692–1826*¹ analyzed the mining business of Potosí as a foundation of first the Viceroyalty of Peru and later the Viceroyalty of Río de la Plata, by linking its cycles and productivity to forced labor. As Achille Mbembe argues, this connection is so insightful that it allows for understanding the slave trade in extractive terms. Mbembe writes of a process by which 'African peoples are transformed into living minerals from which metal is extracted', giving rise to a transition from

'*homme-minerai* to *homme-métal* and from *homme-métal* to *homme-monnaie*' (2013: 67–8). On the other hand, Zavaleta Mercado investigated small-scale mining production and worker organization in order to think about the 'strata' that shape the mottling of a society such as the Bolivian, where the waged labor model was not hegemonic. This is seen in a more synthetic way in his posthumous work *The National-Popular in Bolivia* (1986). Both perspectives intimately connect mining extraction with the question of labor, providing a fundamental reading that is often lost in more recent interpretations of the extractive phenomenon. Thus, indigenous labor coercion is inseparable, as a mechanism of labor-power, from the mining business in Tandeter's case, while, in Zavaleta Mercado's case, the relation to the depths of extraction functions as a metaphorical basin for Latin American political constitution. As Silvia Rivera Cusicanqui (2010a) reminds us, the image of the motley proposed by Zavaleta Mercado for thinking about the coexistence of diverse societal organizing principles and temporalities, which cannot fit into the modern state synthesis, originates from Oruro's technical description of the mine's veins.² Today these lines of thought can be interwoven with the most interesting and acute criticisms of the extractive dimension in order to update the anti-colonial critique. Silvia Rivera Cusicanqui develops this perspective in her work *Principio Potosí Reverso* (2010b) and continues in other texts about the recent conjuncture such as 'Myth and development in Bolivia: The colonial turn of the MAS government' (2015), as does Luis Tapia (2011) in his analyses about the transformation 'of agrarian population into extractivist population' through land reforms driven by Evo Morales' government.

LITERAL EXTRACTIVISM

In the last 15 years, an inflection point has been reached in the debate about neoextractivism. This was particularly important and influential in Latin America because it provided a critical perspective on the 'progressive' governments that arose in several countries following neoliberalism's crisis of political legitimacy at the beginning of the new century, in connection with multiple struggles and conflicts.

A group of investigators has conducted detailed research on the intensive mode of extraction of large volumes of 'natural' resources following demand for raw materials for export. These resources require little to no processing, disproving the idea that they serve to create intermediate industries in their origin countries. In general, they involve megaprojects, with investments by transnational corporations following an agreement with the state on tax benefits. Since this modality is applied to the mining, agrarian, petroleum, forestry, and fishing sectors, Eduardo Gudynas (2016) calls for speaking of 'extractivisms'.

One new element of this period is the main destination for the exports. China's emergence as a 'central country' in terms of demand has led to an intense political

debate, displacing, for some authors, the imperialist map associated with extractivism in other historical moments of intensive primitive accumulation. This is closely linked to the argument used to legitimize the region's progressive governments by arguing that their taking advantage of the historic increase in commodity prices (the 'commodity boom') was geopolitically inscribed in a shift of US hegemony.

A second key argument in terms of constructing legitimacy and newness is that the extraordinary rent maintained as income for more than a decade is what allowed state 'intervention' to play a specific role. First, because it has been the 'material' base that sustains the funding of social benefits programs that were a key part of interventionist policies, relaunching the discourse of recovered national sovereignty, even if clearly leaving out public infrastructure. Second, because this mode of 'intervention' (thus financed and focused) is what has supported the governments' rhetoric that they are the opposite of the hegemony of finance, which characterized the region from the military dictatorships through the processes of democratic transition and eventually led to the crises at the beginning of the century.

There are three dimensions that are crucial for characterizing the state today: the combination between a mode of dependent and subordinate insertion into the global market and forms of intervention on the terrain of social reproduction which, in turn, express a capacity for landing in urban and suburban de-waged territories through the social policies won by social movements, and a relaunching of the forms of valorization through finance that include so-called 'excluded' sectors. In this register, the 'progressive' governments opened up the discussion about possible models of 'nationalization' and social organizations themselves tested, with differing luck, their capacities to control and manage resources. The social repercussion of terms such as *Buen Vivir* or *Vivir Bien*, which were quickly associated with the constitutionalization of forms of the social, solidarity, and popular economy, embodied in the constitutions of Ecuador, Bolivia, and Venezuela, should also be understood in this complex intersection.

EXPANDED EXTRACTIVISM

Today, extractive activities have been expanded beyond the extraction of minerals, gases, and hydrocarbons, to particularly characterize new frontiers of *agri-business* (soy being the most notable example; others, such as palm oil, are also important).

However, the extractive frontier expands to other social, political, and economic dynamics that do not only have the land as their privileged space. These include the extractive dimension of contexts ranging from urban real estate (including informal speculation) to the virtual territories of data mining and algorithms, and, in a more fundamental way, popular economies whose vitality is extracted through apparatuses of debt. We refer to this displacement of the frontiers of 'extractive' zones as *expanded extractivism*.

This notion accounts for a two-part movement. On the one hand, there is a multiplication of references to extractive language for defining technologies and procedures that convert elements into ‘raw materials’ which become strategic for the privileged operation of capital. On the other hand, it demonstrates the need to conceptualize extractivism beyond the connotation of ‘specific technical procedure’ linked to raw materials in order to understand it as a *logic of valorization*.

At the same time, by highlighting the role of finance, this formulation opens up a novel perspective on finance and production. The hegemony of finance is no longer considered a symptom of the end of production, as when it is compared to the industrial regime, but rather this argument emphasizes the specifically productive dimension of finance (Hardt and Negri, 2017). The spatiality of extraction is not limited to the multiplication of ‘enclaves’ (Ferguson, 2006), but marked by connectivity among heterogeneous spaces. In this sense, when we speak of *expansion* we are referring to an *expansion of the frontiers of valorization* that find their common operator in finance.

We can summarize the features of this expansion as follows (cf. Gago and Mezzadra, 2017):

- a) Firstly, extraction cannot be reduced to operations linked to raw materials that become commodities on the global scale. First, because digital and financial elements play a fundamental role in extracting raw materials, organizing the logistics of their circulation, and determining price shifts in international stock markets. This complicates the position of Latin America in the so-called ‘international division of labor’. Secondly, because extraction cannot be confined to inert materials. It is also connected to the extraction of labor power, expanding and complementing the concept of exploitation itself. This raises the question of how capital itself is related to what, in traditional terms, could be called labor, though it increasingly takes the form of a complex and highly heterogeneous social cooperation.
- b) From this point of view, the concept of extraction supposes a certain exteriority of capital to living labor and social cooperation. The extractive relation thus differs from the relation of exploitation in a factory based on the stipulation of a contract for waged labor. While the contract introduces the worker to a space that is directly organized by capital, in cases as different as popular finance (via consumer credit) and Facebook (through a company that extracts value from data interactions), we face capitalist actors who do not directly organize the social cooperation that they exploit. Thus, we can speak of a certain exteriority. However, the idea of exteriority must be complicated in at least two ways. On the one hand, even if these capitalist actors do not directly organize subjects’ cooperation, this cooperation is far from free: in the case of Facebook, it is permeated by operations of the algorithm; in the case of popular finance, it is developed under the sign of debt. On the other hand, other capitalist actors operate in this cooperation, including even the most traditional industrial businesspeople. It is this complex coordination between outside and inside that opens up a battlefield of disputes over appropriations, codifications, and possibilities for liberation.
- c) Thirdly, extractivism cannot be solely associated with the rural or non-urban landscape. Since it does not only involve raw materials, and because we are not faced with a complete exteriority, it is necessary to highlight the circuits in which extractive operations take their shape and speed, undoing the city–countryside binary. However, this link is often noted to criticize populism as a political moment that is attached to an extractive-type economy. This division depoliticizes other extractive forms in which value is extracted from a popular vitality that is increasingly indebted but never completely submissive. This city, formatted by the urban

dynamism of the peripheries, is also different from the gentrified city to which extractive rent is linked when speaking of 'urban extractivism'. In this sense, extractive logics bring together the government of poverty, producing violence and becoming imbricated with the same logics and rhetorics of inclusion proposed by the discourse of citizenship. This perspective enables a reading of new social conflicts that allows for mapping the web of agribusiness, finance, illegal economies, and state subsidies according to both complementary and competing logics. At the same time, it is these logics that allow for avoiding the victimizing image that the narrative of dispossession tends to underscore.

Those three points compose a theoretical perspective whose general features are shared by several authors, who emphasize, each in a different way, the extractive character of finance as well as other contemporary operations of capital that utilize and exploit social cooperation (Gago, 2015, 2017; Gago and Mezzadra, 2017; Hardt and Negri, 2017; Mezzadra and Neilson, 2015; Sassen, 2014).

The concept of *expansion* differs from explanations that argue that extractivism is an economic mode exclusively comprised of dispossession, which, in the case of 'progressive governments' in Latin America, has the political effect of *co-opting* popular movements through the provision of subsidies, making those governments 'populist' (Svampa, 2015). But also it is a critique from those perspectives which analyzes an 'extractivist theology' in terms of a 'blind belief' (Gudynas, 2016) in the promise of development. We must be careful not to divide a financial extractivism in the 'First World' from an extractivism of raw materials in the 'Third World' or so-called Global South. To the contrary, the concept of expanded extractivism challenges the binary that reproduces a *naturalism* of certain regions and a sophisticated *abstraction* of others. This articulation, based on the financial dynamic, is more complex because it is capable of connecting social inclusion, consumption, and debt in sectors that are usually characterized as marginal, excluded, or surplus populations.

EXTRACTIVISM AND FINANCE

The nexus between extractivism and finance is key for three reasons: (1) it shows that the extraction of raw materials must be analyzed in relation to financial valorization; (2) it allows for expanding financial valorization and capture beyond raw materials; and (3) it enables thinking about the multiplication of 'extractive' forms that are made viable by the expansion of the financial norm. The extractive character has to do with: (1) exploiting a social cooperation that finance neither produces nor organizes, but which it commands externally as an apparatus of capture and valorization; and (2) forcing us to reexamine what constitute the multiple 'outsides' of capital today (that from one point of view implies debating the notion of formal subsumption).

Finance thus functions as: (1) the *prototype* of the extractive operation; (2) the *common code* that reunites and abstracts heterogeneous modalities of labor; (3) the *internal driver* of accumulation by the type of connection between money and

the obligation to future exploitation; and (4) *the political form* itself of extraction for how it defies the confines of territories' sovereignty.

The Latin American sequence shows how finance operates from below, and, therefore, unravels its properly extractive operations. In the regional sequence it is necessary to disentangle the articulation between neodevelopmentalism and neoliberalism and to analyze their relationship with the popular protests that marked the beginning of the century in the region. This unmask the political demand underlying the subsidies to popular sectors beyond the frameworks of assistencialism and co-optation used to characterize them as passive. The popular revolts on the continent rendered visible and challenged the privatization of public resources as part of the neoliberal logic outlined in the Washington Consensus (the water and gas wars in Bolivia are two of the most important examples). Later, the so-called progressive governments take up certain challenges to the neoliberal schema emerging from the plebeian revolts and codify them under categories of political economy. As they proclaimed the end of the Washington Consensus, those governments promoted forms of financialization of everyday life, allowing for finance to become the privileged translator of a popular desire for social inclusion.

Finance can be understood as an opportunistic system of reading those productive exchanges from below. What finance reads and attempts to capture is the dynamic of subjects linked to the structuring of new forms of labor, entrepreneurship, and self-management that arise in the popular sectors in parallel to their condemnation as excess or surplus populations. Finance descends. If the proliferation of neoliberalism from below is strengthened with a monetary flow that organizes an entire system of popular finances, we must also recognize certain distinctions within these flows. On the one hand, finance that circulates from below and feeds a money system capable of settling certain initiatives, and, on the other, financialization driven from above through certain state, banking, and non-banking financial institutions. It is precisely in the conflictive logic of assemblage where the question of the production of subjectivity emerges, as a terrain of disputes, where capital attempts to impose itself as a social relation. Thus, the articulation between progressive governments, plebeian revolts, and the financialization of popular life shapes a new landscape where the production of rights and social inclusion is carried out via financial mediation. The favored apparatus of that mediation is mass indebtedness, which is driven by the same social subsidies that the government hands out to so-called 'vulnerable sectors' (Gago, 2015).

Thus finance 'lands' in the popular economies (Gago, 2018; Giraldo, 2017; Roig, 2014; Tassi et al., 2015; on its urban dimension: Simone, 2004), those economies that arose in moments of crisis, feeding off of the modes of self-management and work without a boss, and exploiting the forms through which subaltern fabrics reproduce life in a way that cannot be simply reduced to 'survival'. The *political* dimension of popular economies has to do with the politicization

of reproduction and rejection of the miserabilist management of its activities. It is this politicization that *finance reads and translates as power [potencia] to be exploited*. Thus, a multiplicity of efforts, savings, and economies ‘are put to work’ for finance. This means that finance becomes a code that manages to homogenize that plurality of activities, income sources, expectations, and temporalities.

Finance has been skillful and swift at detecting this popular vitality and establishing an extraction of value that operates directly on labor power as living labor. It is ‘extractive’ because it organizes a mode of financial exploitation in which the wage does not mediate the exploitation of labor power (Gago and Mezzadra, 2017; Gago and Roig, 2016). What finance exploits in this mode of value extraction is an availability to future labor that no longer takes the dynamic of the waged measure. As Marx (1973: 367) indicated in the *Grundrisse*: ‘but now, it is money which in itself is already capital; and, as such, it is a claim on future (new) labor’ (cf. Negri, 1991).

If, in this text, Marx was referring to capital’s command over ‘future labor’ as the substance of ‘exchange’ between capital and labor, in the third volume of *Capital* he emphasizes the same temporality – in an expanded, multiplied, and accelerated way – in his analysis of ‘interest bearing capital’, in other words, financial capital. Highlighting its accumulation of ‘claims or titles’ to ‘future production’ (Marx, 1981: 599, 641), Marx allows us to discover, behind the financial dynamics, the expanded reproduction of command over future labor (what is meant by the labor necessary to produce ‘future wealth’).

Today this demand for future labor is translated into the compulsion to all types of labor, even without the form of a stable or guaranteed job. This compulsion without the context of the wage redefines the obligation to the future in debt. Therefore, this modifies how debt has been understood up until now: debt within the horizon of the wage reinforces the obligation and the commitment to work and the conditions of successive precarization that it could impose; becoming indebted without having work is something else because it structures another relationship between money and the future. The suppression of wage mediation in debt highlights the apparatus of financial capture rooted in a vital force that, as pure living labor, is pure power [*potencia*]. Étienne Balibar (2013) argues that what sociologically is called precarization actually drives a debt economy, generating a new historical wave of proletarianization.

This drives the compulsion to all sorts of labor, which invigorates the versatility and opportunism that popular economies utilize in combination with illegal economies, in an analogy with finance’s versatility in reading and capturing that plebeian energy beyond the wage. This form of compulsion is, in turn, also codified by the consumption encouraged by debt.

Therefore, the concept of expanded extractivism is fundamental. First, because it forces us *not* to decouple the extractive question from the reconfiguration of the labor issue in its contemporary mutations and metamorphosis (this methodological clue also comes from the anti-colonial archive). Extraction in popular

economies is carried out over the labor force whose horizon is not strictly that of waged inclusion. In this sense two terms that frequently remain separated are connected: extraction and exploitation (the terms are divided when ‘accumulation by dispossession’ is understood as the opposite of ‘accumulation by exploitation’). Highlighting the articulation of finance with popular economies, debt and consumption, and state subsidies funded by extraordinary commodity rents, draws a map that connects exploitation of a working class that is no longer exclusively waged with an extractive modality that does not only apply to so-called natural resources and that redefines the very notions of ‘territory’ and ‘frontier’ of value extraction.

Thus extraction becomes an operative mode of capital in which expanding the margins of valorization requires the colonization of new areas, sectors, and forms of production that exceed the productive forms *coordinated* by the command of capital. This portrays finance in its productive *in as much as in* its extractive character. In other words, it is not a *fictitious* speculation or a *non-real economy*, as it tends to be characterized by the industrialist discourse for accounting for a dynamic that does not include the labor force in waged terms. In this sense, extraction is produced directly over forms of social cooperation, where finance lands, takes root, and is inserted in order to unfold over a multiform vitality that it *exploits*. It does so in axiomatic terms: that is, making its command code immanent. Finance thus ‘weaves’ together the relations between ‘literal’ extractivism (defined by financialization’s constitutive relation with mining, hydroelectric, and petroleum projects and the manipulation of commodity prices) and extractivism in the expanded sense. Therefore, it directly exhibits the *extractive* logic as a dynamic that produces value that articulates the tendency of constant abstraction (the dimension that underscores the idea of the *fictitious* as capital’s utopia) with the violence of multiple types of dispossession (the dimension that emphasizes accumulation by dispossession and privatization in general) and the generation of value (the obligation to a future of exploitation) without the exclusive standard of the wage.

The sequence of exploitation and extraction must be analyzed simultaneously. In this respect, it is worth noting that for Marx exploitation also has a mineral origin. As Mezzadra and Neilson (2018) indicate: ‘In the opening sentence of his entry on Ausbeutung (“exploitation”) for the Historisch-Kritisches Wörterbuch des Marxismus Johannes Berger (1994: 736) notes that ‘originally the word was meant to designate the extraction of mineral resources in ore, coal mines etc.’ It is important to keep in mind this etymological link between the concept of exploitation and the world of extraction. One can find several traces of this link in Marx’s *Capital*, particularly where the ‘production of surplus value’ is equated with the ‘extraction of surplus labor’ (Marx, 1977: 411). It is not only a semantic coincidence, but also the violence that accompanies both processes.

Therefore, the second fundamental point in this notion of expanded extractivism is the specific violence of this neoextractive sequence. In the words of Silvia

Federici (2004): we are in the presence of a moment of accumulation where violence becomes a 'productive force' of the first order, precisely because of the expansion of the frontiers of valorization. An expansion that, in neocolonial terms, always involves looting, dispossession, and relaunching exploitation. Rita Segato (2016) speaks of a new era, no longer characterized by the 'coloniality of power', but rather by 'lordship' (the concentration in a small group of owners) of the land. These statements must be connected with the question of the expansion of consumption, as a dynamic that challenges the democratizing wager of these forms of constructing governability over the popular agenda.

IN THE LANDS OF DEBT AND CONSUMPTION

David Harvey's (2003) formula of 'accumulation by dispossession' has been frequently taken up in the debate over extractivism. One of Harvey's fundamental references is Rosa Luxemburg's reflection on imperialism and the expansive dynamic of capitalism. Emphasizing the necessity of multiple 'outsides' to enable that dynamic, Luxemburg is, of the classical Marxists, the theorist who can contribute the most to understanding the issue of extractivism. Once her notion of *outside* is detached from its exclusively geographic-territorial reference, it becomes productive for thinking about the current moment. Her theory of imperialism enables us to think about the dynamic of accumulation on a global scale, and, in particular, current 'extractive operations' of capital (Mezzadra and Neilson, 2017).

The imperialist question – as Kaushik Sunder Rajan (2017) argues – allows for a reterritorialization of the theory of value. From this point of view, the *joint* analysis of the constitution of labor markets (or forms of exploitation), the extraction of 'raw materials' (and the debate about their very content), and financialization (in terms of abstract and concrete abstractions) becomes essential. The latter (which Lenin also addresses in terms of imperialism) expresses an extension of the logic of capital accumulation where its inherent contradiction is found. To return to Luxemburg: the spatial and temporal gap between the production of surplus value and its conversion into capital in the first place.

The joint analysis of labor markets, raw materials, and finance provides an effective perspective for thinking about the different forms of extraction that are remapping its broader sense today. It is helpful here to look at the theme of consumption in Rosa Luxemburg's (2003) work, since it plays a fundamental, although rarely recognized, role in the debate. Consumption drives the social deepening of extractivism as a fundamental vector of its effective *expansion*. In other words, *finance extracts value from consumption*. Therefore, consumption becomes a strategic terrain of struggle because it is there that finance 'recuperates' monetary flows for the realization of commodities and because the obligation 'to the future' becomes 'present' there.

In *The Accumulation of Capital*, explaining Marx's ideal schema of the production and realization of surplus value among the figures of the 'capitalists' and the 'workers', Luxemburg proposes broadening the figures in a non-formal way, creating space for the pluralization that seems to be revealed as inherent in consumption: 'The decisive fact is that the surplus value cannot be realized by sale either to workers or to capitalists, but only if it is sold to such social organizations or strata whose own mode of production is not capitalistic' (2003: 332). She gives the example of the English cotton textile industry, which, during two-thirds of the nineteenth century, supplied India, America, and Africa, as well as providing for European peasants and petty bourgeoisie. She concludes: 'The enormous expansion of the English cotton industry was thus founded on consumption by non-capitalist strata and countries' (2003: 332).

The *elasticity of the accumulation process* involves the contradiction pointed to previously. The 'revolutionary' effect of capital operates in those displacements, capable of resolving the discontinuity of the social process of accumulation for brief moments. Luxemburg adds the necessity of the non-capitalist to capital's 'magic art': 'but only on the pre-capitalist soil of more primitive social conditions can it develop the ascendancy necessary to achieve such miracles' (2003: 339). The violence of that appropriation on the part of European capital requires a complementary political power that is only identified with non-European conditions: that is, in American, Asian, and African 'colonies'. Here Luxemburg cites the exploitation of indigenous populations by the Peruvian Amazon Co. Ltd that provided rubber from the Amazon to London to demonstrate how this managed to produce a situation 'bordering on slavery'. 'International trade' as a 'prime necessity for the historical existence of capitalism' then appears as 'an exchange between capitalistic and non-capitalist modes of production' (2003: 340). But what emerges when the process of accumulation is considered from the point of view of variable capital, that is, from living labor (and not only from surplus value and constant capital)?

The 'natural' and 'social' limits to the increase in exploitation of the labor force makes it so that accumulation, Rosa Luxemburg says, should expand the number of workers employed. The quotation from Marx about how capitalist production has concerned itself with 'converting the working class into a class dependent on wages' (*Capital*, vol. I: 594, cited in Luxemburg, 2003: 340) leads to the question of the 'natural propagation of the working class', which, however, does not follow the rhythms and movements of capital. But, Rosa Luxemburg argues, the 'formation of the industrial reserve army' cannot depend on it [simple reproduction] to resolve the problem of expanded accumulation. Labor for this army is recruited from social reservoirs outside the dominion of capital – it is drawn into the wage proletariat only if need arises. Only the existence of non-capitalist groups and countries can guarantee such a supply of additional labour power for capitalist production' (2003: 342).

Luxemburg adds the question of race to the sources of the composition of the industrial reserve army indicated by Marx (and an analysis like that of Paolo

Virno's (2003) enables us to think about it in its *expanded* current state as a virtual and transversal condition of all workers): thus, as capital needs to have access to all of the 'territories and climes', neither 'can it manage with white labor alone ... It must be able to mobilize world labor power without restriction in order to utilize all productive forces of the globe – up to the limits imposed by a system of producing surplus value' (Luxemburg, 2003: 343). The point is that these workers of the non-white races 'must first be "set free" in order to be enrolled in the active army of capital' (362). Recruitment, from this point of view, continues the *liberating* orientation that is attributed to the proletariat understood as the 'free' subject (Luxemburg cites as an example the South African diamond mines). The 'labor-problem' in the colonies thus combines worker situations that go from the wage to other less 'pure' modalities (in the sense that the wage is taken as the norm). Luxemburg highlights how capitalism depends on the 'side by side' coexistence of 'non-capitalist strata' as a crucial element for its expansion. This is the starting point for re-evaluating the problem of the internal and external market, which she emphasizes are not only concepts of political geography, but of social economy. The conversion of surplus value into capital, exposed in this map of global dependency, is revealed at the same time as 'ever more urgent and precarious' (2003: 347).

Capital can by force, Luxemburg says, appropriate the means of production and also force workers to become the object of capitalist exploitation. What it cannot do by violence is 'force them to buy its commodities': that is, it cannot force them 'to realize its surplus value' (2003: 366). In other words, it cannot force them to become consumers.

Here we can extend her line of reasoning in the current conditions, adding another element: the way of becoming consumers in vast sectors of the planet is materialized through massive indebtedness. Debt becomes a particular way of producing the necessary 'obligation' for commodities to be realized. This introduces a sheer *financial* violence into the realization of commodities. There is another novelty: contemporary indebtedness does not rely on waged workers to be successful. In the case of Argentina, for example, the way in which state benefits programs (which recognize informal economies as a reserve of self-managed employment) have connected with compulsory and individualizing bankarization has been the key condition for the *financial exploitation* of the assisted population (Gago and Roig, 2016).

Finance recognizes and exploits a non-waged productive fabric, within which the forms of contracting are varied and include informal wages and state benefits. The state is key in the construction of an architecture of institutional obligation: imposing compulsory bankarization, marketing it as 'financial inclusion', and, finally, functioning as a guarantee for massive indebtedness in the hands of banks and other financial organizations that they create to deal with the popular sectors. An entire sector of the population that is characterized by being migrant, informal, productive, and decapitalized becomes the target of debt that, in turn,

functions as the driver of the expansion of the capacity for consumption. The relation between inclusion, money, and peripheral neighborhoods promotes a rhetoric that is the opposite of austerity and that manages to unify inclusion and exploitation under financial apparatuses. What is clear is that these economies, which were previously visualized as insignificant and merely subsidiary, are converted into dynamic territories attractive to capital, expanding the frontiers of valorization and creating new consumers, beyond the wage.

This extractive modality, additionally, is built on a previous dispossession: the de-investment in infrastructure by the state, since the consumption of popular sectors based on access to credit implies the displacement of the state's obligation in regards to the provision of public services in favor of debt and, on the other hand, the classist difference that is renewed by their conversion into creditors who are always at a disadvantage in respect to other segments of the population. Indebtedness occurs for the consumption of non-durable goods (household appliances and clothing) and to fund services that were de-funded by the state (health care and transportation, for example) at especially high interest rates. The interest rate reintroduces the class differential onto the homogenizing apparatus of debt, a segmented differential in financial exploitation that especially falls on the popular sectors. In this way, the interest rate is not subsidiary to debt, but rather the way in which a differential in terms of the abstract form of exploitation is singularized (cf. Chena and Roig, 2017).

Therefore, in contrast to Luxemburg's analysis, we could say that one of the characteristics of contemporary extractivism is that there is much less of a chance for investment in infrastructure to be made in the 'triumphant march of commodity economy' (Luxemburg, 2003: 366), which speeds up the process of dispossession and exploitation. Luxemburg analyzes the crucial articulation between international credit, infrastructure, and placement of goods in detail in several passages: the struggle against all the 'formations of the natural economy' and particularly the plundering of lands to end the self-sufficiency of peasant economies, underscoring mortgage debts on US ranchers and the Dutch and British imperialist policy in South Africa against black and indigenous populations as concrete forms of political violence, tax pressure, and the introduction of cheap goods.

Debt puts the focus on the problem of the temporal and spatial gap between the realization and capitalization of surplus value. Luxemburg dedicates some emblematic paragraphs about this operation of debt to the relationship between England and the Republic of Argentina, where loans, English exports of manufactured goods, and the construction of railways rose to astronomical figures in only a decade and a half. South American states, South African colonies, and other 'exotic countries' (such as Turkey and Greece) equally attract flows of capital in cycles mediated by bankruptcy and later restarted: 'Realized surplus value, which cannot be capitalized and lies idle in England or Germany, is invested in railway construction, water works, etc. in the Argentine, Australia, the Cape Colony or Mesopotamia' (2003: 407).

The (temporal and spatial) dislocation in reference to where and when surplus value can be capitalized allows for the dilemma of accumulation to act as a machine of abstraction that, however, depends on the concrete circumstances that time and time again attempt to be homogenized: 'British capital which finds an outlet in Argentine railway construction in the past might well have been realized in China in the form of Indian opium' (2003: 408).

Abroad, however, a 'new demand' must be made to emerge or be 'violently created': what is transferred, Luxemburg says, is the 'enjoyment' of the products. But how are the conditions produced so that that *enjoyment* takes place? 'What matters to capital is the very fact that its products are "used" by *others*. The new consumers must indeed realize the products, pay for their use, and for this they need money' (2003: 407). Today, the massification of indebtedness crowns the fabrication of that enjoyment. That enjoyment is the translation of a desire that produces an outside. Obviously it is not an outside in the strictly literal or territorial sense.

If, in Luxemburg's argument, what announces the crisis is the catastrophic moment of the end of the non-capitalist world (with its appropriation by imperialist expansion), in the current permanent displacement of those limits (and the constant management of the crisis), we should also take note of the creation of non-capitalist worlds (space-times of desire), which capital jumps onto with increasing voracity, speed, and intensity. At the same time, we need to detect what type of extractive operations relaunch the *imperial* question, already beyond national limits.

This highlights not only the axiomatic dynamic of capital (Deleuze and Guattari, 1987), capable of always incorporating new segments and displaying an apparent multiform and infinite annexation, but also underscores a *previous* moment: the production of worlds where collective desire produces an outside over which surplus value is regenerated through consumption and debt, linking new modalities of exploitation and value extraction.

If Marx says that machinery expanded exploited human material, to the extent that child and feminine labor is the first catchphrase of machinism (Marx, 1887: 271), we can think about the expanded concept of extractivism as the expansion of the exploited human and non-human material based precisely on the dynamic of finance.

This underlines a double movement: how these operations are reordered from the point of view of labor, taking their migrant, popular, and feminized composition as a key element of analysis, beyond the waged canon. We can also project Marx's methodological premise that it was the limits imposed by labor that led to the rise of machines: this moment of the so-called hegemony of finance has also been reached because of the limits imposed by labor. Limit and expansion thus mark a dynamic that is not symmetrical, but rather a rhythm marked by conflict. The reading of an 'outside' becomes the manner of detecting how resistance (in its historical difference) is what produces that limit, over which capital later seeks to expand its frontier. This has to do with a non-pure 'outside' where the conflictivity that constitutes it takes on multiple and diffuse forms. Diverse financial

apparatuses today (from consumer credit to derivatives, from mortgages to future bonds) transversalize capture across different sectors and activities, seeking to directly conquer *future* value, instead of labor realized in the past. The difference between rent from extraction and the wage goes through that temporal difference and is a radical change in the measure of exploitation.

Consumption must be understood in register key as well. First, because there is a radicalization of its role in the current moment of capitalism. Second, because there is a cost to consumption that is already realized beyond the limits of the wage that recognizes a rejection of austerity and is not simply a passive financial mediation (Federici, 2012).

In this sense, popular economies operate as spaces of elaboration and dispute of those *outsides*, as instances where extractivism is expanded in a more conflictive way. Identifying popular economies with forms of proletarian micro-economy emphasizes that there is a dispute over social cooperation occurring there. Additionally, it challenges the commonly repeated idea in Latin America (and the Global South more generally) that evokes the ghost of the lumpenproletariat: that class that does manage to bring together the characteristics of the proletariat. However, that idea fits well with the ‘naturalization’ of wealth in the region, primordially identified as a continent of natural resources and raw materials. An analysis of what Nancy Fraser (2014) calls ‘struggles for the limits’ for which capital seeks to permanently extract value from what she calls ‘informal gray zones’ can be situated in those proletarian micro-economies. Fraser highlights the link between massive semi-proletarianization and neoliberalism as a strategy of accumulation that is organized based on the expulsion of millions of people from the formal economy toward those gray zones of informality. However, it is important to link what appears as separate in her argument: expropriation becomes a mechanism of ‘non-official’ accumulation, while exploitation seems to remain the ‘official’ mechanism. Instead, we must emphasize the simultaneity of exploitation and dispossession and their imbrication under the conditions of the extractive form as the way of valorization.

Saskia Sassen (2014) argues that the capitalism that is categorized as extractive embodies a new geography of world power, composed of ‘frontier zones’ with that lead to making decisions that operate as much on the transnational level as on the national and local level, revealing their interdependence. She argues that a new international division of labor is at stake in this unfolding of national sovereignty over globally defined rules. Sassen explains:

[I]t is becoming evident that state sovereignty articulates both its own and external conditions and norms. Sovereignty remains a systemic property but its institutional insertion and its capacity to legitimate and absorb all legitimating power, to be the source of the law, have become unstable. The politics of contemporary sovereignties are far more complex than notions of mutually exclusive territorialities can capture. (Sassen, 2006: 415)

Expanded extractivism thus refers to a modality that functions over distinct ‘territories’ (virtual, genetic, natural, social, urban, rural, of production, and of

consumption) and finance concentrates its operation in that heterogeneity, redefining the very notion of territory as a sovereign unit. It is in this sense that finance raises the question of its functioning as ‘command’: that is, its capacity for centralizing and homogenizing the distinct dynamics of valorization. Deleuze, commenting on Foucault, argues that the formation of sovereignty has two characteristics: realizing ‘operations of extraction’ and ‘deciding over death’. He later summarizes: ‘The economy of sovereignty is the economy of extractions’ (2014: 365).

The concern for the political form of extractivism in the sense developed here leaves open the question about command and its territorial landing, about the reformulation of the state’s role, and, even more so, about how to understand the relationship between extractivism and violence.

A feminist analysis follows in a twofold attempt to raise the issue of the simultaneity of those planes of social conflict today. Firstly, toward a better understanding of how extraction operates *over* (as capture and exploitation) and *against* (as hierarchization and privatization) the social composition or cooperation, with intense levels of violence. Secondly, in order to create a map of the contemporary heterogeneity of living labor for all of those who persist against dispossession and exploitation, a cartography that provides the foundations for thinking through cooperation beyond the hierarchized binaries: remunerated labor and non-remunerated labor, production and reproduction, production and consumption, home and labor market.

THE FEMINIST READING OF EXTRACTIVISM

Maria Mies, along with Veronika Bennholdt-Thomsen and Claudia von Werlhof (1988), reflected on women as ‘colonies’: that is, as territories to be looted, from which wealth is extracted with violent force. Based on an analogy between the female body and the colony, they connected what capital exploits as ‘free resources’ from domestic labor, peasant labor, and the labor of the inhabitants of cities’ slums, and explained that that exploitation is simultaneously colonial and heteropatriarchal. The hypothesis that emerges is that *domestication and colonization are inseparable*, since they constitute a specific relation both as a way of exploiting the labor force and of subordinating territories. Through the subjugation of women, feminized bodies, nature, and the colonies, under the guiding motto of ‘civilization’, capitalist accumulation is founded based on the sexual and colonial division of labor.

In this line, the importance of domestic labor’s functioning as compulsory and free has been systematized by Silvia Federici (2004) in her book *Caliban and the Witch*. In capitalism, the domestic is produced as a space of ‘enclosure’: women are *confined* to the home, they are limited to this sphere baptized as the ‘private’. What we learn from Federici, whose theorization returns to the political experience of the Wages for Housework campaign in the 1970s, is the specific mode

of exploitation that capitalism organizes for women, which requires first of all for them to be socially discredited and their reproductive work be seen as a *natural resource*. Only in this way is their enclosure and privatization justified. Later, they are forced to work for free and their tasks are rendered politically invisible.

One of the tasks of feminist economics is to discuss how social reproduction be organized in non-extractivist and non-exploitative terms, which implies fighting against its *naturalization*. This goes beyond opposing reproduction and production (as if they were antithetical terms), to instead think about reorganizing their relation. Several feminists have read Marx in this register to carry out a two-part movement with a two-part objective. On the one hand, taking Marx to the hidden places of his work, and, simultaneously, radicalizing Marx's method of investigation of looking to the 'hidden abode' of how capitalist reality is produced (see Brown, 2006; Federici, 2018; Fraser, 2014). In this sense, the feminist reading exhibits its own constituent character: it not only illuminates what is left invisible by Marx (replicating and expanding his method of looking to the hidden abode of what occurs), but also explains the historical, political, and economic function of that invisibilization.

In this sense, the form of *financial exploitation*, as a concrete apparatus of the extraction of value in feminized popular economies (and that is articulated with other extractive forms), reveals a mode of capturing social vitality beyond the limits of the wage, which is strongly rooted in the tasks of reproduction in a broad sense. Above all, it is a dispute over the temporality of exploitation: finance implicates obedience in the future and, therefore, functions as an 'invisible' and homogenizing 'boss' of the multiple tasks capable of producing value. Today we see how finance has constituted a capillary network capable of, on the one hand, providing private and very expensive financing to resolve problems of everyday life, resulting from austerity and inflation; and, on the other hand, structuring the temporality of an obedience to the future, blaming and individualizing responsibility for the dispossession that has emptied the territories of infrastructure (from health care to water, including food provision).

Saying that extractivism is not only an economic mode, but also a political regime, makes an articulation visible: sexual violence as political violence in a machinery of looting, dispossession, and conquest. But, by the same token, it enables us to think about other dynamics of looting, dispossession, and conquest connected to other territories such as debt and consumption where financial apparatuses expand their frontiers of valorization, which is a fundamental part of the *expanded* conceptualization of the extractive operation. By linking both dynamics – literal extractivism of raw materials and the extractivism of finance carried out over populations that are 'excluded' – we can connect the forms of *exploitation* that are renewed through a mapping of the heterogeneity of labor in a feminist register.

Indigenous and community feminisms, by proposing the notion of the body-territory, place a demand on all forms of feminism: decolonization as a practical

dimension that is inseparable from de-patriarchalization. An entire series of investigations deploying a feminist perspective critique of extractivism are nourishing these debates. To name only a few: Mina Navarro (2013) speaks of ‘multiple dispossessions’ in Mexico and the struggles for the common that confront them. In Chile, several analyses present women’s resistance to being treated, in terms of body-territory, as ‘sacrificial zones’, for example, in the regions of Puchuncaví and Quintero (Bolados and Sánchez, 2017). In Peru, extractivism as a ‘biopolitical project’ is presented from the coupling, in mining activity, between ‘patriarchies, sexism, and discrimination based on gender’ (Silva Santisteban, 2017). In Ecuador, perspectives such as that of Cristina Cielo and Cristina Vega (2015) have been developing how the devalorization and intensification of reproductive tasks are the ‘silent complement of Ecuador’s productive matrix based on exporting raw materials’. In Colombia, mapping the relationship between illegal networks and criminal groups associated with mining extractivism demonstrates that ‘processes of violence that specifically affect Indigenous, afro-descendant, and campesina women have increased’ (Ulloa, 2016). Lorena Cabnal (2013), based on the conceptualization of communitarian feminism in Guatemala, has long raised the issue of the relationship between mining and sexual violence. And, above all, there has been an enormous collective production of manifestos and declarations of encounters that systematize different situations in the region and update conflicts.

Agriculture

Kohei Saito

INTRODUCTION

With the deepening of the global ecological crisis, as manifested in climate change, desertification, extinction of species and ocean acidification, the desire for critical political ecology is rapidly growing. Although Marxism has been criticized for quite a long time due to its ‘Prometheanism’ (Giddens, 1981: 60), which supposedly aims at the absolute domination over nature without recognition of ‘natural limit’ (Benton, 1989) and is thus incompatible with environmentalism, there has been a recent ‘rediscovery’ of Marx’s ecology.¹

It is particularly in this context that Marx’s analysis of *agriculture* has gained more attention. His discussions of agriculture are a valuable source of inspiration not only for revealing contradictions of large agribusiness – the ‘coincidence of hungry mouths with overflowing grain silos’ (Magdoff et al., 2000: 9) – but also for understanding the current degradations of the material conditions of production (O’Connor, 1998; Foster, 2000). Agriculture is a key topic for Marx’s ecology not only because it brings the metabolic interaction between humans and nature much more into the foreground than does industry, but also because during Marx’s lifetime the problem of soil exhaustion was a major socio-ecological issue in Europe and the USA. It is therefore not a coincidence that there are new eco-Marxist currents emerging out of Marx’s critique of modern agriculture.

Marx developed his critique of modern agriculture while preparing his theory of ground rent. Ground rent is a topic through which other classical political

economists also dealt with the problem of ‘natural limit’ and the antagonistic relationship between the ‘town’ and the ‘country’. Thus, Marx’s critique of modern agriculture needs to be understood in the general context of his *critique* of political economy. Contrary to his precursors, who tended to ascribe the problem of diminishing natural forces and resources to an ahistorical and static ‘natural limit’, Marx eagerly studied natural sciences in order to comprehend the uniquely capitalist dynamics of the social and the natural, and to reveal the combined problem of environmental crisis as a main contradiction of capitalistically constituted social relations.

Correspondingly, the problem of a natural limit unique to biologically based industries has been analyzed in the eco-Marxist tradition in various ways (Foster et al., 2011; Klein, 2014; Holleman, 2018). In recent years, however, some ‘postmodern’ Marxists have tended to neglect the fruits of previous discussions, straying into another fetishized belief that natural limits are social constructions (Harvey, 1996; Vogel, 1996; Castree, 2013). It is more fruitful here to go back to Marx in defense of the concept of ‘metabolic rift’, which allows us to recognize the uniqueness of the biological systems affected by agriculture and extractive industries.

AGRICULTURE AND INDUSTRY

The relationship between industry and agriculture under capitalist production posed classical Marxism a great challenge in the guise of the ‘agrarian question’ (Kautsky, 1899; Lenin, 1961 [1901]). The problem was not just about the evaluation of the revolutionary (or reactionary) character of peasants, but also about the future possibilities of capitalist development in agriculture. Agriculture was not modernized and mechanized as fast as industry, and small peasants persisted for a long time without the concentration of capital in the hands of the few. Furthermore, there seemed to exist various natural obstacles to the improvement of agrarian productivity, which could not be overcome even with the aid of modern technologies and natural sciences. This apparently insurmountable difference between agriculture and industry was often formulated as the ‘antithesis’ between town and country.

There are, roughly, two approaches that Marx’s texts offer in terms of the transcendence of this antithesis of industry and agriculture. In *The German Ideology* and the *Communist Manifesto*, Marx and Engels maintained that capitalism would penetrate agriculture and over time bring to it the fruits of capitalist industry. In this view, there seems to be no essential difference between agriculture and industry, and the industrialization of agriculture based on capitalist development would prepare a material foundation for large-scale socialist agriculture. This is a productivist view (Saito, 2014).

However, Marx also offered another explanation, according to which agriculture is ‘the most fundamental’ of all production processes and cannot be simply

reduced to the same mechanism of industry (Marx, 1973: 640). Thus, Marx recognized a particular dimension of agriculture that needs to be taken into account to understand the agrarian question. It is this aspect, albeit by way of a critique of Marx, that Eduard David, a German reformist social democrat, highlighted in his second edition of *Socialism and Agriculture*. He claimed that ‘organic production’ in agriculture is essentially different from ‘mechanic production’ in industry. According to David (1922: 42), industrial terminology such as ‘means of production’ and ‘raw materials’ cannot adequately explain the functioning of soil, seeds and other natural forces in agriculture. In agriculture, argued David, ‘living nature’ plays the primary and human labor only the secondary role, and this is something that the industrial development cannot simply overcome (cf. Tamanoi, 1978).

Following Lenin’s (1961 [1901]) criticism of David’s view for its retreat to small-scale agriculture, the traditional Marxist interpretation argued for transcending the antithesis between town and countryside in a productivist manner. This culminated in Joseph Stalin’s *Economic Problems of Socialism in the U.S.S.R.* Stalin conceived the antithesis between town and country under capitalism as an ‘antagonism of [workers’ and peasant’s] interests’ (Stalin, 1972 [1952]: 24) – i.e. not as the material and natural differences in biologically based production – so that this antagonism would be overcome through ‘immense assistance rendered by the socialist town, by our working class, to our peasantry’ as well as ‘systematic supply of first-class tractors and other machines’ (Stalin, 1972 [1952]: 25). Apparently, this transformation was a merely *technical* and *productivist* one.

In this vein, Stalin (1972 [1952]: 25) even argued against Engels’s view, expressed in *Anti-Dühring*, that ‘the great towns will perish’ (Engels, 1987: 283): ‘This, of course, does not mean that the effect of the abolition of the antithesis between town and country will be that “the great towns will perish”. Not only will the great towns not perish, but new great towns will appear as centres of the maximum development of culture’. Stalin was obviously aware that his own productivist reading diverged from Marx and Engels. What did Stalin actually suppress in favor of his Soviet ‘Marxist’ doctrine?

MARX AND AGRICULTURE

Marx’s critique of political economy treated ‘agriculture’ in various ways: agriculture in pre-capitalist/non-Western society, in capitalism and in socialism. However, looking over an enormous mass of the Marxist literature, the main focus was for a long time on the historical question of pre-capitalist agriculture in the transition to capitalism (Dobb, 1946; Sweezy et al., 1976; Brenner, 1985; Wood, 1999).

Theoretically, the precondition for the emergence of capitalism is the dispossession of means of production and the dissolution of the petty mode of production, whether conducted by the state violence or by the expanding market force of competition accompanied by merchant capital and usury. Marx's analysis of capitalism's historical presupposition in the chapter on 'so-called primitive accumulation' in Volume I of *Capital* describes the cruel process of enclosure in England conducted by the state violence in opposition to Adam Smith's peaceful formation of capitalism by industrious individuals. On the other hand, in Volume III of *Capital* Marx also offers an explanation of how rent was gradually transformed from natural to monetary rent, so that the relationship between landlords and peasants founded on direct personal and political domination was transmuted into a pure monetary relationship between 'free' and 'equal' individuals.

However, while Marx's treatment of pre-capitalist agriculture gained attention in the transition debate, Marx's critique of the *capitalist* development of agriculture tended to be marginalized. This is unfortunate because Marx's critique of capitalist agriculture consequently remained unnoticed, and his labor theory of value was often blamed as a proof for the neglect of any 'natural limits'. Socialism is, according to many critics, envisaged as the full realization and emancipation of the productive forces in a Stalinist manner. In such an anthropocentric and Promethean view, there would be no space for a serious ecological discussion of the scarcity of natural resources and the destruction of nature by the development of productive forces.

Ted Benton (1989: 77), for example, tried to combine Marx's 'red' critique of political economy with 'green' environmental thought. He did so by admitting that Marx fled from recognizing the limit of nature because he was afraid that any recognition of natural limit would make him fall into Malthusianism. Thus, Benton maintained that Marxists need to correct their false belief in the possibility of the absolute mastery over nature and learn to integrate natural limits – especially in agriculture and other eco-regulatory labor-processes – into their theoretical analysis. Benton's critical evaluation of Marx's productivism became quite influential among so-called 'first-stage ecosocialists' (Foster, 2014), such as Alain Lipietz (1995) and André Gorz (1994).

However, their criticism turns out to be quite one-sided. Strangely enough, Benton, Lipietz and Gorz all do not pay any attention to Marx's theory of ground rent in *Capital*, Volume III. This is odd, considering that Marx directly dealt with the relationship between humans and nature under capitalism in those chapters. Moreover, this problematic approach was already generally rejected in the wake of the rediscovery of 'Marx's ecology', mainly owing to Paul Burkett (1999) and John Bellamy Foster (2000), who belong to the current of 'second-stage ecosocialists' (Foster, 2014). Through a careful analysis of Marx's and Engels's texts, Foster and Burkett convincingly showed that Marx developed a critique of the modern robbery system of unsustainable agriculture and envisioned the transcendence of the distorted relationship between town and countryside under

capitalism (see Foster and Burkett, 2016). To understand the originality of Marx's theoretical contribution to environmentalism, a detour through the history of economic thought is helpful.

AGRICULTURE AND THE PROBLEM OF NATURAL LIMITS IN POLITICAL ECONOMY

Hans Immler (1985), in his pioneering work of political ecology, following the general evaluation by the first-stage ecosocialists, criticized Marx's labor theory of value because it excluded nature's productive contribution by treating abstract human labor as the single source of value.² Nonetheless, Immler differed from other critics of Marx in that he paid careful attention to the issue of agriculture in the history of political economy.

Immler believed it necessary for any political ecology to recognize nature's essential contribution to production by regarding nature as productive of value. This view is incompatible with Smith, Ricardo and Marx, who all advocated a labor theory of value. Immler thus made recourse to the tradition of physiocracy, especially to the work of François Quesnay. According to Immler, physiocrats recognized the essential contribution of nature to production by ascribing the sole value-producing function to agriculture. Nature is something that humans cannot arbitrarily alter. On the contrary, humans are fundamentally dependent upon it because they cannot produce anything without nature. Not just in agriculture, but also in industry, natural power is vital. It is this point that physiocrats indicated when they calculated nature's work towards value production. However, Immler did not explain how Quesnay's view of the unproductive character of labor can be built into a consistent value-system under industrialized capitalism.

Moreover, it is questionable whether the only way to recognize the natural limits and nature's indispensable contribution in the production process inevitably requires treating nature as productive of value. This is especially so because classical political economists also analyzed the difference between industry and agriculture, paying attention to nature's productive contribution. For example, Smith highlighted this difference in the following manner: 'In agriculture, too, Nature labours along with man.... In [manufactures] nature does nothing; man does all' (Smith, 1982: 363). Furthermore, Smith distinguished 'value' and 'wealth' and highlighted the fundamental character of agriculture for the 'wealth' of a nation. Indeed, when he listed wealth in the order of 'food, clothing and lodging', he seemed to emphasize the primary importance of 'food'. In fact, he claimed that 'subsistence is, in the nature of things, prior to conveniency and luxury' (Smith, 1982: 377).³

In Ricardo's system of political economy, Smith's emphasis on the peculiarity of agriculture came to be criticized as reminiscent of physiocracy and as a confusion of 'value' with 'wealth'. Ricardo thus rejected Smith's distinction of agriculture and industry with regard to nature's (non-)work, but his book *On the*

Principles of Political Economy also argued for the uniqueness of agriculture in his treatment of the theory of ground rent, pointing to the diminishing returns of agricultural production as manifestation of a limit of nature. According to his model, at the beginning of civilization when labor is scarce and land abundant, capital and labor are invested in the most fertile lands. As the population increases, the demand for food increases correspondingly, so that more capital and labor must be invested in less fertile lands because the availability of rich soil is limited in a way that humans cannot alter in any arbitrary way. Since the producer on the better soil can continue to produce with the same productivity, he can still produce more cheaply than others while selling his products at the price of products produced under the 'most unfavourable' condition (Ricardo, 1951: 73). Ricardo argued that this price difference of agrarian products becomes the source of so-called 'differential rent'. Furthermore, the cultivation of less fertile soils increases the price of corn and wheat, so that the reproduction cost of laborers also goes up. This increase in turn reduces capitalist profit. This is why Ricardo argued for the abolition of the Corn Laws to import cheap corn and wheat from abroad.

Robert Malthus shared the same theoretical hypothesis with regard to diminishing agrarian productivity, though he reached a different conclusion than Ricardo. Malthus pointed to the difference between the 'geometrical' increase of the population and the 'arithmetical' increase of agricultural products. In other words, population increase accelerates at a much faster rate than agricultural productivity, which only increases at a declining rate. Due to this natural limit in agriculture, there exists an inevitable tendency to 'absolute surplus population', whose further increase must be checked by another sort of natural limit, such as poverty and a related increase in mortality rates. For Malthus, this is an inevitable consequence, imposed by the law of nature. Furthermore, he defended the Corn Laws in favor of the landlords because their unproductive consumption is essential for economic growth.

Despite the policy differences between Ricardo and Malthus, they both recognized the same kind of 'natural limit' unique to agriculture, which humans cannot arbitrarily modify, emphasizing the diminishing return of agricultural productivity. Hence the antagonistic relationship between town and country.⁴ Their abstract model was removed from concrete agricultural practice, as well as from diverse natural conditions for maintaining or even improving soil fertility. After all, Ricardo's 'economic' explanation of agriculture reduces the problem of the natural limit to the problem of capital's costs and returns, reflecting his basic approach as founded on the value-system of market and industry (Tamanoi, 1978: 87).

Benton (1989) argued that this law of diminishing returns in agriculture is exactly what Marx feared, because admitting natural limits would be equivalent to accepting the conservatism of the Malthusian argument. Benton believes that Marx thus dropped the distinction between agriculture and industry as though the modern application of technology would eradicate natural restrictions in agriculture. In contrast, Benton (1989: 67) himself emphasizes the uniqueness of agriculture as an 'eco-regulatory' process differing from industrial production.⁵

However, looking at the formation of Marx's theory of ground rent in the 1860s, one soon realizes that Marx dealt with the problem of natural limit in agriculture in various ways. Although neglected by critics, Marx's *Manuscripts of 1861–1863* developed a concept of 'absolute ground rent', a category that is missing in Ricardo. Absolute ground rent can be obtained by the landowners because in agriculture there is much less flexibility of capital mobilization, so that the 'production price' with the average rate of profit is not realized in agriculture, by contrast to industry. Since the organic composition of capital is lower in agriculture than in industry – i.e. agriculture is more labor intensive than industry –, the rate of profit remains higher in agriculture than the average rate of profit, but capital cannot move from industry to agriculture due to lack of available lands. This surplus of profit compared to the average can thus be appropriated by the landowner as absolute ground rent. It is noteworthy that Marx's theory of absolute ground rent is founded on a natural limit imposed upon the mobility of capital. The limited availability of land and the difficulty of mechanization hinder free competition of capital in agriculture as well as the higher organic composition of capital. Thus, Marx formulated his critique of Ricardo's theory of ground rent by explaining how the average rate of profit does not penetrate agriculture. Here Marx was already aware of the natural limit and consciously chose to integrate this aspect in his critique of political economy.

CRITIQUE OF METABOLIC RIFT IN *CAPITAL*

Of course, one can argue that this type of recognition of a natural limit is insufficient to serve as the foundation of an ecological critique of capitalism. However, there are further ecological discussions in *Capital*. Namely, Marx explicitly denounced the destructive character of modern agriculture driven by the 'productive force of capital':

[Capitalist production] disturbs the metabolic interaction between man and the earth, i.e. it prevents the return to the soil of its constituent elements consumed by man in the form of food and clothing; hence it hinders the operation of the eternal natural condition for the lasting fertility of the soil. Thus it destroys at the same time the physical health of the urban worker, and the intellectual life of the rural worker. (Marx, 1976: 637)

Justus von Liebig, a German chemist, played a central role in this critique of modern agriculture (Foster, 2000: 155). In the seventh edition of *Agricultural Chemistry*, Liebig (1862) added a new introduction, about 100 pages in length, where he harshly criticizes the robbery system of agriculture. According to Liebig, modern capitalist agriculture is characterized by the short-sighted interest of the farmers in extracting as many plant nutrients from the soil as possible to generate a maximum of crops without taking enough care of the soil afterwards. Farmers sell not only crops but also straws as commodities, even though they

could be used to maintain the soil fertility. Consequently, soil fertility is quickly exhausted because inorganic substances indispensable for plant growth diminish without a careful constant replenishment through manure, which, in Liebig's view would ultimately lead to the collapse of European civilization due to a general shortage of food.

In this vein, Marx pointed to the 'irreparable rift' of social and natural metabolism on a global scale in the manuscript for *Capital*, Volume III:

On the other hand, large landed property reduces the agricultural population to an ever decreasing minimum and confronts it with an ever growing industrial population crammed together in large towns; in this way it produces conditions that provoke an irreparable rift in the interdependent process between social metabolism and natural metabolism prescribed by the natural laws of the soil. The result of this is a squandering of the vitality of the soil, and trade carries this devastation far beyond the bounds of a single country. (Marx, 1992: 752–3)

These are key passages for the 'metabolic rift' approach (Foster et al., 2011). Its theoretical contribution is of considerable significance, especially considering its development by a number of second-stage ecosocialists (Clark and York, 2005; Clausen, 2007; Saito, 2017a) as well as third-stage ecosocialists in other spheres beyond agriculture such as global warming, fishery, stock farming and disruption of the nitrogen cycle, confirming the methodological merit of employing Marx's approach to analyze the ecological crisis in today's world (Mancus, 2007; Klein, 2014; Weston, 2014; Longo et al., 2015). In other words, the theoretical significance of Marx's critique of modern agriculture is not limited to the robbery of the soil's nutrients under capitalism. Its general framework shows how the reified power of capital distorts the human metabolic interrelation with nature, so that it can be applied to various environmental issues whenever the closing cycle of nature is disrupted by extractivism of natural gas, oil, and rare metals.

Speaking of 'metabolism [*Stoffwechsel*]', Marx defined labor as the mediation of metabolism between humans and nature (Marx, 1976: 283). There is a transhistorical necessity for human beings to labor and form a certain relationship with their environment in order to live on this planet. There are universal biophysical processes and cycles within nature with which humans must interact. Nonetheless, the way humans interact with nature largely differs depending on the social organization of labor. Marx emphasized that under commodity-production the metabolism between humans and nature is primarily mediated by value, i.e. the objectification of abstract human labor. This mediation inevitably remains quite one-sided, abstracting from the complex process of the universal metabolism of nature and the concrete aspects of useful labor. In this vein, Marx maintained that as capital becomes the automated subject of social production, the entire realm of society and nature is radically reorganized for a more effective valorization of capital. This constitutes the subordination of the material aspects of metabolism between humans and nature to the logic of capital. Consequently, both human labor power and natural power get expropriated and exhausted. In *Capital*, Volume I, Marx intensively studied various parliamentary reports to

investigate the degradation of working conditions, which caused the physical and mental exhaustion of workers. Similarly, Marx continued to study the exhaustion of natural forces, claiming that Liebig's demonstration of the 'negative, i.e. destructive side of modern agriculture' contains 'flashes of insight' (Marx, 1976: 638; Saito, 2017a).

In the same section Marx described the capitalist development of agriculture as follows:

In agriculture, as in manufacture, the capitalist transformation of the process of production also appears as a martyrology for the producer; the instrument of labour appears as a means of enslaving, exploiting and impoverishing the worker; the social combination of labour: processes appears as an organized suppression of his individual vitality, freedom and autonomy. The dispersal of the rural workers over large areas breaks their power of resistance, while concentration increases that of the urban workers. In modern agriculture, as in urban industry, the increase in the productivity and the mobility of labour is purchased at the cost of laying waste and debilitating labour-power itself. Moreover, all progress in capitalist agriculture is a progress in the art, not only of robbing the worker, but of robbing the soil; all progress in increasing the fertility of the soil for a given time is a progress towards ruining the more long lasting sources of that fertility. The more a country proceeds from large-scale industry as the background of its development, as in the case of the United States, the more rapid is this process of destruction; Capitalist production, therefore, only develops the techniques and the degree of combination of the social process of production by simultaneously undermining the original sources of all wealth: the soil and the worker. (Marx, 1976: 638)

Marx critically analyzed the destructive consequences of development of productive forces, instead of simply praising its positive effects brought about under capitalism, which only seeks to exploit the labor force through a more extensive and intensive working day, having squeezed out the free gift of natural power (Marx, 1981: 879). The logic of capital as the principle of social organization is fundamentally different from the logic of nature. Capital as the endless process of value cannot take the material conditions for the sustainable maintenance of natural power into account. The discrepancy between the logic of capital and the logic of nature increases with the development of capitalism, ultimately causing the disruption of metabolic interaction between humans and nature.

There are two important points in Marx's discussion. Firstly, Marx's reception of Liebig clearly shows that *he recognized natural limits*, denouncing the unsustainability of capitalist production especially in agriculture and extractive industries. This recognition of a natural limit does not mean a retreat to Ricardo's law of diminishing returns. Rather, Marx followed his own method of critique of political economy and investigated why political economists' supposition regarding declining agrarian productivity *appears* valid. Marx showed this by carefully investigating how social relations under capitalist production undermine the natural conditions for the sustainable cultivation of the soil. In this vein, he demonstrated that modern technology destroys the fundamental condition for the sustainable free development of humans in the long run.⁶

This leads us to our second point. Since capital is an abstract process of valorization, the price mechanism of ground rent is unable to reflect the necessary

material conditions for sustainable production. Rent as well as commodity prices in capitalist economies are very incomplete in terms of the ecological information required for any sustainable production. Capital's emphasis on maximum short-term profit and market valuation degrades nature to the status of 'condition of production' (Altvater, 1993). As long as the actual process of valorization requires its material bearers, capital cannot produce completely free from various natural restrictions. Nevertheless, it also cannot recognize any absolute limits (Mészáros, 1995). It constantly tries to overcome them only to deepen the metabolic rift on a global scale.

Here Marx saw both the necessity and possibility of a radical social change: 'But by destroying the circumstances surrounding that metabolism, which originated in a merely natural and spontaneous fashion, [capitalist production] compels its systematic restoration as a regulative law of social production, and in a form adequate to the full development of the human race' (Marx, 1976: 637–8). With the same spirit he argues in the manuscript for *Capital*, Volume III that in a communist society the metabolism between humans and nature must be consciously organized: 'Freedom, in this sphere, can consist only in this, that socialized man, the associated producers, govern the human metabolism with nature in a rational way, bringing it under their collective control instead of being dominated by it as a blind power' (Marx, 1981: 959).

As we have argued, capital cannot simply accept the hindrances imposed by nature. Capital constantly attempts to transform a 'limit' [*Grenze*] to a 'barrier' [*Schrank*].⁷ It invents new technologies, develops means of transportation and discovers new use-values and markets, while crystallizing itself as the 'system of general utility' (Marx, 1973: 409). In other words, a biological system of nature is not a mere obstacle or barriers for capital. It is noteworthy that nature can also be employed as a 'vehicle for accumulation' (Kloppenburger, 1988). In this context, Boyd et al. (2001) applied Marx's concept of 'formal' and 'real subsumption' to nature. While formal subsumption of nature is a simple exploitation of natural processes for the sake of commodity production and valorization in nature-based industries, real subsumption aims at manipulating biological productivity so that nature is '(re)made to work harder, faster, and better' (Boyd et al., 2001: 564) for capital accumulation. The latter includes growth hormones, synthetic fertilizers and pesticides, as well as new biotechnologies, genetically modified organisms (GMOs) and biomedical implants.⁸

Nevertheless, capital can never control nature without confronting any obstacles, uncertainties or risks. For example, Liebig's warning on the collapse of European civilization due to soil exhaustion did not come true thanks to the invention of the Haber–Bosch process enabling the mass industrial production of ammonia. However, this invention did not fully repair the metabolic rift. The dependence on chemical fertilizer remains as long as the disruption of the soil-nutrient cycle continues to exist, causing new environmental issues unique to big agrobusiness such as contamination of soil and water, soil erosion, loss of

biodiversity. This is what Clark and York (2008) call ‘metabolic shift’. Capital shifts metabolic rifts to somewhere else, which is foundational to the ‘imperial mode of living’ in the Global North (Brand and Wissen, 2017). Correspondingly, as Vandana Shiva (2015: 173) points out, the robbery character of agriculture has not changed since Liebig’s time: ‘Contemporary societies across the world stand on the verge of collapse as soils are eroded, degraded, poisoned, buried under concrete and deprived of life’. After all, metabolic rift cannot be fully repaired unless the universal metabolism of nature is mediated by freely associated producers in a more conscious and social way. This is the basic insight of Marx’s ecosocialism.

ECONOMIC CRISIS AND ECOLOGICAL CRISIS

The metamorphosis of capital in the process of its valorization requires its material bearers in nature. However, the logic of capital and the logic of nature are wholly different, even if nature is elastic to some extent. Nature cannot always catch up with revolutionary changes of production process and rapid increase of productivity under capitalist production (Lebowitz, 2005: 138). Unsustainable production leading to exhaustion could suddenly raise the price of raw materials or the shortage of raw materials could even stop certain production processes entirely. Thus, there are structural constraints and obstacles to the untrammelled appropriation of natural resources through the industrialization of agriculture and extractive industries.

In this regard, this natural constraint can lead to the instability of the capitalist mode of production. James O’Connor (1998) formulated this instability as the ‘second contradiction of capitalism’. He argued that increasing production costs due to the deterioration of the material conditions of production would slow down capital accumulation, lowering the profit rate. O’Connor’s theory of capitalist crisis focused on the ‘underproduction of nature’. This view has recently been revived in Jason W. Moore’s *Capitalism in the Web of Life* (2015), in which he argues that the ‘ecological surplus’ made possible by the abundance of cheap raw materials and labor was key for the development of capitalism. Thus, the ‘end of Cheap Nature’ – consisting of food, energy, raw materials, and labor power – would make the capital accumulation much more difficult. The *economic crisis* of capital, according to this type of interpretation, initiates an ‘epochal shift’.

On the other hand, the metabolic rift approach does not fully accept this view, shifting its focus instead to *ecological crisis* as the primary contradiction of capitalism (Foster and Burkett, 2016). It is true that economic crisis may *one day* in the future lead to rising production costs due to the exhaustion of natural resources. However, it is also probable that capital will repeatedly find new ways of expanding business under the pressure of the growing disasters of capitalism. For example, capital can continue to profit from climate change by inventing new business opportunities such as geo-engineering, new GMO commodities, carbon

trade, and insurance for drought and flood: 'To put it bluntly, capital can in principle continue to accumulate under any natural conditions, however degraded, so long as there is not a complete extinction of human life' (Burkett, 1999: 196). In other words, the 'real subsumption of nature' extends and intensifies with the deepening of ecological crisis, and people's lives become more dependent on commodities provided by capital. It is then unlikely that natural limits can lead to the collapse of capitalist system due to the 'End of Cheap Nature'. Capitalism can keep going even beyond those limits, but the current level of civilization cannot exist beyond a certain limit. Thus, it may be too late for humans and non-humans to wait for the second contradiction of capital to make the existence of capitalism impossible. In sum, the real crisis for the metabolic rift approach is not for capital accumulation, but for 'free human development' (Burkett, 2005). Foster and Burkett are 'anthropocentric'. O'Connor and Moore are, in contrast, '*capitalocentric*' (Malm, 2018: 195, emphasis in original).

NATURAL LIMIT AND PRODUCTION OF NATURE

In this context, Moore argues that the concept of metabolic rift presupposes the dualistic Cartesian division between Society *and* Nature or capitalism *and* 'the environment'. In such a Cartesian framework, Society works upon Nature, while Nature remains a passive medium. These two entities are not constitutive of each other and remain fully separated. As a result, there is, according to Moore's criticism of the metabolic rift theory (2015: 80), only 'static' and 'ahistorical' treatment of nature bounded by the fetishization of natural limits. Foster's conception of the metabolic rift only points to 'Society plus Nature equals Crisis' without being able to grasp the historical dynamics of the 'world-ecology'. Moore, in contrast, attempts to transcend this division by a post-Cartesian monistic understanding of '*oikeios*' (Moore, 2010: 392), in which society and nature are 'co-produced' through the web of life. Accordingly, he suggests replacing an 'and' with an 'in', namely 'society *and* nature' with 'society *in* nature'. Capitalism develops *through* nature.

Behind this terminological shift, there is a clear affinity with the idea of the 'production of nature' developed by Neil Smith (2008) and Noel Castree (2000), who also argued for a monist understanding of the nature/society relation. They believe that there is no longer a 'nature as such' as a result of the capitalist subsumption of nature in its entirety, so that society and nature are constantly mixed and 'hybridized': nature is always already socially delimited. Notably, Smith (2006: 27) also talks about 'real subsumption of nature', but here, unlike Boyd, Smith does not intend to highlight the unique obstacles and challenges posed by biologically based industry but rather to underscore the reduction of nature to 'second nature': 'With the production of nature at a world scale, nature is progressively produced from within and as part of the so-called second nature'

(Smith, 2008: 54). As the nature/society distinction is eroded and undermined, the materialist monism of Smith and Castree reduces nature to social construction, or even ‘fiction’ (Castree, 2013: 6).

The idea of the production of nature undermines the existence of ‘natural limits’, as everything has become ‘second nature’. This point becomes clear when David Harvey (1998: 19–20) criticizes Foster and argues that ‘the invocation of “limits” and “ecoscarcity” as a means to focus our attention upon environmental issues makes me as politically nervous as it makes me theoretically suspicious’. Harvey agrees with Smith, who criticized ‘left apocalypticism’ (Smith, 2008: 247) for its recognition of natural limits: ‘But the Malthusian scenario has never as yet really grabbed hold’ (Harvey, 2011: 94).⁹ He highlights capital’s ability to convert any ‘limits’ to mere ‘barriers’ (Harvey, 2011: 90). It is no surprise that Moore (2014: 13) also pointed to the ‘apocalypse’ of the metabolic rift approach.

However, it should be clear that the recognition of a natural limit in a Marxian sense has nothing to do with ‘the Malthusian scenario’. The monist critique of the metabolic rift approach is attacking a straw man, because no one really assumes the absolute separation of Society and Nature. In contrast, the concept of ‘metabolism’ signifies nothing but a unity and incessant interaction between humans and nature. This unity, however, does not eliminate the existence of natural limits. They exist independently of humans. There are, for example, ‘planetary boundaries’ with regard to land use, the nitrogen cycle and fresh water, beyond whose tipping point an irreversible and unexpected change may occur.

In reply to Castree and Moore, Foster (2016) claims that today it is all the more important to analytically distinguish society and nature. As Stefano B. Longo, Rebecca Clausen and Brett Clark (2015: x) point out in *The Tragedy of the Commodity*, this distinction is necessary because ‘ecological concerns are not problems derived internally, originating from ecosystems themselves, but are produced externally, by social drivers. For example, the oceans are not polluting themselves; humans are doing it’. Andreas Malm (2018: 85) also agrees with Foster that there are social causes of ecological crises based on *human* ‘agency’, which must be strictly distinguished from causal chains in nature. The ‘analytical distinction’ of the social and the natural is ‘the indispensable premise for any solution to such a combined problem’ (Malm, 2018: 61). In fact, Marx’s theory of metabolism first investigates pure social economic categories to reveal the general tendency of transformation and reorganization of the metabolic interaction between humans and nature under capitalism (Saito, 2017b). Only by carefully investigating the social aspects of the global ecological crisis is it possible to envision how to fix them in the future society. There is actually nothing ‘apocalyptic’ about recognizing planetary boundaries. They are not constructions of consciousness and epistemology. There are objective limits of nature, and it is possible to establish a sustainable and flourishing society only within these limits.

CONCLUSION

Long-standing discussions regarding the particularities of agricultural production in Marxism, which can be seen to create both obstacles and opportunities for capital accumulation, serve not only to deepen understanding of the uniqueness of biologically based production but also to illuminate the degradation of natural conditions of this production under capitalist production. However, the formal and real subsumption of nature under capital has become so extensive and intensive that even some Marxists tend to fall into a fetishized view that nature has become a pure social construction without any 'limits' (to capital). This appearance increases with the rapid development of biotechnology, which pushes further commodification of agricultural production and proletarianization of farmers (Magdoff et al., 2000: 106).

However, it is necessary strictly to distinguish limits to capital and limits to nature. The degradation of natural conditions will not pose ultimate limits to capital accumulation, but this does not mean the real subsumption of nature will not pose threats to the universal metabolism of nature. The opposite is actually the case. In this context, the capitalocentric position of a certain postmodern Marxism falls into a kind of quietism and functions as an ideology that hinders the urgent actions required to stop the ecological crisis. Only by investigating the *social* character of the current ecological crisis is it possible to determine what countermeasures are required for coexistence and coevolution of humanity and nature in post-capitalist society.

Notes

- 1 It is 'rediscovery' because there were actually various discussions on the issue of ecological crisis in the tradition of classical Marxism (e.g. Commoner, 1971; Marcuse, 1972; Mészáros, 1995). They were simply and unjustifiably marginalized by many Marxists (see Foster and Burkett, 2016: 2).
- 2 Immler is simply wrong. It is not Marx but capital that treats human labor as the single source of value and creates various ecological problems.
- 3 However, as Yoshiro Tamanoi (1978: 118) points out, Smith's view on the spatial separation of town and country is problematic despite this priority of food production in agriculture. Smith wrote: 'The town, in which there neither is nor can be any reproduction of substances, may very properly be said to gain its whole wealth and subsistence from the country'. Smith continued to argue that the 'gains of both are mutual and reciprocal' (Smith, 1982: 376). According to Tamanoi (1978: 122), Smith's assessment of the coexistence and mutual dependence of town and country arises due to his neglect of the process of 'primitive accumulation' in England. Although Smith consciously treated the sphere

- of non-market and non-value as the material foundation of a nation's wealth prior to the industrial production of value, he was not able to understand how the extension of the capitalist industrialization transforms the relationship between town and country into the antagonistic and hierarchical subordination of the latter by the former.
- 4 However, neither Ricardo nor Malthus was able to offer a way for the transcendence of this antagonism. Especially, Ricardo's solution of importing cheap corn and raw materials for the sake of England's higher rate of profit expanded the domination of the town over the country on a global scale as 'ecological imperialism' (Clark and Foster, 2009; Saito, 2017a: 206).
 - 5 This does not mean Benton supports Malthusianism. In the same article, Benton (1989: 77) tries to examine the possibility of the third way beyond naturalism and social constructivism.
 - 6 The development of modern technology is guided by the logic of valorization, so that the development of productive forces is organized as 'productive forces of *capital*'. The direction of technological development is also severely influenced by economic relations. This does not mean that it is necessary to reject all the technological developments under capitalism nor to give up further development of productive forces. Rather, it means: first it is necessary to distinguish the true development of productive forces and mere robbery; second, the true development of productive forces requires a thorough reflection upon the negative aspects of modern technologies.
 - 7 In *Grundrisse* Marx famously wrote that 'every limit [*Grenze*] appears a barrier [*Schranke*] to overcome' (Marx, 1973: 408).
 - 8 In a similar way, Malm (2016) also applies formal and real subsumption to elaborate on the difference between water power and steam power.
 - 9 Harvey (2011: 94) adds: 'Because capital has successfully done this in the past does not necessarily mean, of course, that it is destined to do so in perpetuity'. But taken together with his previous remark against Foster, it is questionable how much he really believes this.

Energy and Value

George Caffentzis

INTRODUCTION: FROM THERMODYNAMICS TO MARXISM

Marx and Engels were bricoleurs extraordinaire, ready to use any tool that was at hand to solve a problem. Marx famously coquetted with Hegel's dialectical categories, but he also flirted, less famously, with thermodynamics, *the* science of energy of his day. In this chapter, I will first deal with this flirtatious affair (joined in or even inspired by Engels) to show that it is as important as their coquettish trysts with the dialectic. Then I will sketch the vicissitudes of the concept of energy in Marxist research to this day.

'Energy transformations' were at the centre of the vision of mid-19th-century thermodynamics. The key words of the physics of the day were, besides 'energy' itself, 'transformation', 'conservation', and 'equivalence'. It was exciting to discover that electricity, mechanical motion, heat, and so many other forces can be transformed into each other equivalently to conserve an abstract but beguiling entity: energy. Engels defines it rather abstractly in the following way:

When motion is transmitted from one body to another, it may be regarded as active and as the cause of motion in so far as it transmits itself, in so far as it is transmitted. We call this active motion *energy*, and the passive, *the manifestation of energy*. (Engels, 1976: 74 [Engels' italics])

It is in this energetic framework that I locate Marx's vision of capitalism. Not only did the steam engine transform heat into power, but capitalism itself was a

gigantic engine transforming labour-power into surplus-value. There is a relation between value and energy, of course, but they are not identical, for labour and the power to labour in Marx and Engels' theory must be a *special sort of energy* qualified as *general human labour*. Moreover, this relation of value to energy is not just that of a special kind of energy, but one that has a structural similarity to energy as understood by thermodynamics.

Indeed, Marx's vision of capitalism is of a system of transformations that has as its basis a common pool of surplus-value from which each capitalist claims his/her own profit according to his/her (variable and/or constant) capital invested. One way of seeing the relation of energy to value is to glance at the tables of contents of *Capital's* three volumes. They are dominated by terms like 'metamorphosis', 'transition', 'transferring', 'conversion', 'circuit', 'reproduction', 'formation', and, most important for my argument, 'transformation'.

These value transformations happen 'behind the backs' of most capitalists and workers. Indeed, they appear at first to be falsified by empirical reality, the way the Copernican hypothesis appeared to 16th-century critics who pointed out that they could not feel the earth rotating around its axis at almost a thousand miles per hour and at 18.5 miles per second in orbit around the sun nor could they detect a stellar parallax, even with their most sophisticated instruments (Kuhn, 1962). The stellar parallax was first measured in 1838, roughly 300 years after the publication of Copernicus' *On the Revolutions of the Heavenly Spheres*.

The second part of this chapter describes the impact of the notion of energy on Marxism after Marx's death and after a hiatus of debate and discussion that lasted almost half a century. I will review the Marxist theory of energy from the recent introduction of ecological themes by James O'Connor, John Bellamy Foster, Andreas Malm, Jason W. Moore, Timothy Mitchell, and especially Saral Sarkar. Not all these writers could be classified as Marxists – for example, Sarkar is openly an ardent eco-socialist, but he is a vehement critic of Marx and Marxism (Sarkar, 1999: 57–92). These writers, however, have had a profound impact on contemporary Marxism as well as being profoundly influenced by Marxism, both old and new.

MARX AND ENGELS ON TRANSFORMATIONS OF ENERGY AND VALUE

What does Marx mean by 'transformation'? Is it a technical term or just an occasional, *ad hoc* usage? As we will see, for transformation to take place, there must be a 'definite process' that accomplishes every transformation of X into Y; the result of every transformation of X is never 'just' Y, it is always both ampliative and supplemental, as well as the source of illusion. Let us examine a number of examples.

In the case of the transformation of money into capital, the process is the circuit M-C-M' and the *supplement* is the confusion of money with capital (hence

the confusion of the capitalist with the greedy miser). *For the goal of capitalist accumulation is not just money per se, but capital, i.e. money that 'makes' money.*

In the case of the transformation of the value of labour-power into wages, the process is one that begins from the hidden substratum, 'the essential relation manifested ... in the value and price of labour-power', and appears in the phenomenal form as 'value and price of labour' (Marx, 1990: 682). The transformation, in this case, goes from a coherent truth – what actually is bought in the transaction between workers and capital is labour-power not labour – to a confused appearance: one's wages are payment for labour performed during a particular period of time.

This notion of transformation (as a process from hidden 'truth' to apparent 'illusion') becomes standard usage in *Capital*, Volume 3. Consider a more complex example, where Marx writes of the relation between two transformations:

It is the transformation of surplus-value into profit that is derived from the transformation of the rate of surplus-value into the profit rate, not the other way round. In actual fact, the rate of profit is the historical starting point. Surplus-value and the rate of surplus-value are, relative to this, the invisible essence to be investigated, whereas the rate of profit and hence the form of surplus-value as profit are visible surface phenomena. (Marx, 1981: 134)

Or again, on the relation between profit and surplus-value:

Thus even if the rate of profit is numerically different from the rate of surplus-value, while surplus-value and profit are in fact the same and even numerically identical, profit is still for all that a transformed form of surplus-value, a form in which its origin and secret of its existence are veiled and obliterated. ... It appears to consciousness as if capital creates this new value in the course of its movement through the production and circulation processes. But how this happens is now mystified, and appears to derive from hidden qualities that are inherent in capital itself. The further we trace out the valorization process of capital, the more is the capital relationship mystified and the less are the secrets of its internal organization laid bare. (Marx, 1981: 139)

In other words, the process of valorization is what brings about the transformation from surplus-value to profit, just as the process of competition is the transformation mechanism that brings about the transformation of profit into average profit. But here too the process of transformation creates illusions and reversals of explanatory power:

In competition, therefore, everything appears upside down. The finished configuration of economic relations, as these are visible on the surface, in their actual existence, and therefore also in the notions with which the bearers and agents of these relations seek to gain an understanding of them, is very different from the configuration of their inner core, which is essential but concealed, and the concept corresponding to it. It is in fact the very reverse and antithesis of this. (Marx, 1981: 311 [Marx's italics])

Thus, there is a hidden reality that is *transformed* into a visible appearance which, once established, becomes *self-explanatory*. For example, once capitalists have a sense of what the average rate of profit is for their moment, it becomes

regulatory and the basis of compensation (without, of course, explaining *why* it is *what* it is).

Indeed, Marx's vision of capitalism is of a system of transformations that has as its basis a common pool of surplus-value from which each capitalist claims his/her own profit according to his/her capital invested. To illustrate this case Marx devises a 'thought experiment', that of the 'zero-worker' capitalist:

[A] capitalist who employed no variable capital at all in his sphere of production, hence not a single worker (in fact an exaggerated assumption), would have just as much an interest in the exploitation of the working class by capital and would just as much derive his profit from unpaid surplus labour as would a capitalist who employed only variable capital and therefore laid out his entire capital on wages. (Marx, 1981: 299)

This allegiance to the common pool of surplus-value is the objective bond of the capitalist class. Indeed, it makes capitalists into a class (with members on the inside and non-members on the outside) whose members self-reflexively place themselves inside the magic circle, i.e. membership is not merely a fact about them, it *is* them. The competition that is taken by many as the definition of capitalism (or, as in our era of euphemism puts it, 'the market') is simply a mechanism that sorts out what is always already created in the production process (surplus-value). Hence, what divides capitalists is always subordinate to their unity: the common lust for surplus-value and the common fear of this lust's revelation. In contemporary jargon, Marx's analysis is similar to a system theory approach to the vicissitudes of value after the moment of its creation.

It should be clear that the illusions created by these transformations are not merely ideological projections, i.e. they are not detachable from the productive base, the way legal and cultural constructions are detachable. These constructions can be changed without putting the survival of capitalism in question. For example, the law was used to justify the use of 'slave catchers' by using the commercial maxim that one's property rights over a possession are still in force in 'free states'. Later, this ruling was rejected under readings of the US Constitution that put human beings outside of the class of possible objects of slavery ('except as a punishment for crime whereof the party shall have been duly convicted', to quote the 13th Amendment). This change of ideology did not end capitalism (as the slaveocrats often threatened it would). But if the transformations involving the value and price of production, the value and the price of labour-power or similar ones are blocked, capitalism would be threatened with collapse since these transformations are functional to the very operation and reproduction of the system. For if there were no difference between the value and price of production of a commodity, there would be no investment in high 'organic-composition' industries (since they would tend to have only a small number of workers to exploit) and if there were no difference between the value of labour and the value of labour-power, the theft of the value creativity

of workers would become so obvious that the wage contract would tend to be rejected by one of its parties: the worker.

Moreover, Marx argued that the major revenues of the capitalist ruling class (profit, interest, and rent) are transformations out of this pool of surplus-value created by the system of exploitation of labour as a whole. The endless busyness of the horizontal surface of capitalist society (with its long and intertwined organic-chemistry-like molecular circuits built from blocks of M-C-M') is matched by an equally active vertical dimension connecting the surface with the hidden 'essence' or 'core'. There are more than enough secrets, deceptions, and illusions in this world of business to satisfy any deconstructionist philosopher or postmodern literary critic. An exquisite problem arises from this world of mirrors. The distortions are infinitely multiplied, the confusions are stirred into greater confusion, and the illusions become even further sources of illusion. Thus, the origin of an individual capitalist's profit in a common pool of surplus-value is hidden to him/her, but the very lack of explanation of its source creates the plausible impression that it is *sui generis*. Hence there arises the 'magic' of compound interest and all the other fairy tales capital tells itself in its moments of boosterism.

Marx's vision of the structure of capitalism was similar to the view of nature in the last half of the 19th century proposed by 'energeticists', i.e. those physicists who intended to replace matter in motion as the primary focus of physics with the flow of energy. This connection is not arbitrary. First, etymologically, 'energy' is a compound word: *εν* (in) + *εργον* (work), and as the 11th edition of the *Encyclopaedia Britannica* points out, '[it is] a term which may be defined as accumulated mechanical work, which, however, may be only partially available for use'. Therefore, energy is rooted in the ontology of work as is Marx's notion of value (of course, the notion of work is different – though related – in each case). Energy is simultaneously the most abstract of concepts and the most crucial from the point of view of a society built on work.

Most important was the place of conservation laws for both thermodynamics and for Marx's theory of capitalism. The conservation of energy 'law' is an essential ingredient of the explanatory heuristic in the energetic framework. But the surface of phenomena continually seems to violate the law of the conservation of energy. It is hard to trace in an obvious way the movement of energy from one phenomenal form to another. A pendulum in a closed energy system is pushed, it swings, and soon slows to a stop. Why doesn't the pendulum swing forever? Because it swings in an invisible medium that resists its movement, and this resistance creates turbulence and heat with every swing. The pivot of the pendulum is also the source of friction. The energy 'lost' due to friction and drag on the first swing is E_1 and that lost on the n^{th} swing is E_n while the initial energy arising from the fall of the pendulum's weight is E . At the end of the first swing the total energy is $E - E_1$, and at the end of the second swing the energy is $(E - E_1) - E_2$. Eventually on the m^{th} swing, the loss of energy will be equal to the original

energy E , i.e. $E - (E_1 + E_2 + \dots + E_m) = 0$. It is only based on the conviction that a conservation law is operative that one would be inclined to launch a research programme to determine the dimensions of E_i of the kind we see with James Joule's obsessive efforts to eliminate the non-frictional factors caused by the fall of the weights on the water in his device's calorimeter.

Marx was similarly concerned about this division of value (especially surplus-value) throughout the capitalist system. To trace out the 'loss' (or actually diversion) of value in the system, to correct the misattribution of value to fictional categories (e.g. the identification of wages with the value of labour creates, or the equation of rent on a piece of land with that land's 'productivity') and similar efforts are crucial to understanding capitalism and form the basis of the Marxist analysis of capitalism. These efforts become more detailed as one moves from the first to the third volume of *Capital*. In the first volume, the capitalist system is viewed literally extra-terrestrially, similar to the view of the earth as a thermodynamic system. For it is very easy to determine the amount of energy input E during, say, one year, since this energy is almost exclusively the sun's light and heat energy impacting on the earth's surface. It is a bit more difficult to determine the energy 'loss' of the earth, E_L , due to the reflection of solar light and the radiation of heat into space, shifting cloud cover, changing chemical composition of the atmosphere, absorption of energy by the oceans, the leaking of heat energy from the molten core of the earth through volcanoes (both on land and below the seas), etc. But what is truly difficult to determine is the fate of $E_N = E - E_L$, the net energy. How much goes into photosynthesis? How much is transformed into stored energy? The debates around both global warming, climate change and the 'Gaia Hypothesis' illustrate the claim that, though the outlines of both macro-hypotheses are easy to establish, the fine points of both are hard to empirically establish.

Marx certainly required his own conservation principles to carry on his more micro-analytic inquiries. It was easy enough to treat the system as a whole and divide its functioning into a number of macro-variables, T , V , C , and S , but it is not easy to see how, for example, T , the total value created by the totality of labour in a year (which plays the role of the sun in this system), is distributed across industrial branches. The guide to this assessment must be based on some conservation principles, for example, the totality of profits, interest payments, rents, and taxes should equal S , the total of wages should equal V , and the total investment in productive capital should equal C . Such a value-accounting of the capitalist system is achievable, just as the energy account of the earth is, but there is no Marxian 'model' which has actually accomplished such a feat. It is not clear that there is any such project to investigate the social universe on the agenda at the moment, although an energy account of the earth is the Holy Grail of many ecologists and climate scientists. But in either project, the conservation laws are crucial, since they provide a heuristic for hunting down the sources of existing explanatory lacuna.

A HALF-CENTURY HIATUS: STALIN'S ECOLOGY VERSUS STANCHINSKII'S

The question concerning the relation between matter and energy was central to the philosophy of science at the end of the 19th and the early 20th century in Europe. Physicists like Ernest Mach and Albert Einstein were engaged in testing the critique of mechanistic materialism and its proposed substitute, the energetics paradigm, which claimed that all change in the physical world can be explained as the product of energy transformations. The supporters of energetics took the position that the 'billiard-ball'-like atomistic model of physical systems that became hegemonic in the sciences in the 18th century was facing a superior, more flexible explanatory model.

The wide-ranging debate between energetics and materialists expressed itself in the social sciences and the arts as well, but most importantly for *Handbook* readers, in Marxism. Central figures in Marxist theory and practice like V. I. Lenin and Alexander Bogdanov participated in a debate whose literature included Lenin's *Materialism and Empirio-criticism* and Bogdanov's science fiction novel, *Red Star* (Lenin, 1909 [1962]; Bogdanov, 1908 [1984]; Wark, 2015: 3–60). Lenin saw in the energetics movement a 'science-based' reactionary philosophy that was de-materializing and idealizing physics, while Bogdanov's protagonist in his novel is transported to Mars where a form of socialism is in power, but instead of a utopia, he encounters a dystopia reminiscent of the ones depicted in apocalyptic ecological films like *Soylent Green* produced during this last half century. With remarkable foresight, Bogdanov describes a world where:

[i]ndustries have become so dangerously polluting that many have to be relocated underground. The population is growing so rapidly that food shortages and even famines are predicted within several decades. Natural resources, including radioactive matter that is the main source of energy, are being exhausted. Forests are being destroyed. (Gare, 1996: 116–17)

Along with the conceptual clashes with dogmatic materialists, however, ecologists like Vladimir Vladimirovich Stanchinskii used energetics to lay the foundations of a new method of analysis of biological systems:

Biological communities had previously been defined by their floristic composition, by certain structural features, or by certain visual homogeneity. Stanchinskii investigated food webs to identify the boundaries of communities within nature, tracing the transformation of solar energy by vegetation and other autotrophes through myriad biotic pathways until all the accumulated energy potential had been exhausted. (Gare, 1996: 122)

This approach had a profound effect on those who were attempting to apply the first law of thermodynamics (or the energy conservation principle) into the biological realm, and not only in the Soviet Union (Weiner, 1984: 684–96).

The beautiful thermodynamic *qua* ecological studies of limnology in the 1940s perfectly illustrated the influence of an energeticist approach to ecology in the USA (Lindeman, 1942: 399–417).

Though it gained increased scientific attention and respectability in the late 1920s, the energetics approach to ecology also had to face the growing hostility to its conservation tendencies in the highest power circles in the Soviet Union – including Stalin himself, who was anxious to go ahead with an industrialization programme, insisting that the survival of the Revolution depended on it. This was Stalin’s ecology. He would brook no resistance to this drive from any quarter, including ecological energeticists like Stanchinskii, who ‘opposed the damming of rivers without due care for the ecological effects; the collectivization and uniform mechanization of agriculture; the efforts to acclimatize exotic fauna; and interference in the life-styles of traditional societies occupying ecologically fragile environments’ (Gare, 1996: 124).

Stanchinskii and other like-minded intellectuals directly faced Stalin’s wrath for openly questioning the industrialization project. Stanchinskii, in particular, was fired from his job, his research station was closed, and he was arrested in 1934, after the typesetting of one of his books, which was about to be published, was destroyed. This campaign led to a hiatus in the conceptual development of ecological energetics in Communist Russia for decades, during which a similar hiatus prevailed in the post-WWII USA, where a growth-oriented ideology prevailed until the 1970s.

THE RE-BIRTH OF ENERGETICS IN MARXISM AND MARXISM IN ENERGETICS: THE RELATION OF ENERGY TO VALUE

The period 1988–9 can be taken as the end of the hiatus in the development of ecological energetics discourse in the Marxist orbit. There were many reasons and causes for this change. Surely the lifting of the harsh repression of ecological energetics mentioned above was important in freeing the collective tongues of the Russian scientific intelligentsia. After all, the dismantling of the Communist Party’s hegemony in the Soviet Union and Eastern Europe made it possible to liberate Marxism from its role as a rigid state ideology. Indeed, the tearing down of the Berlin Wall saw the creation of many new forms of Marxism that offered a variety of ways to understand the relation between energy and value, even to the limit-point of denying the centrality of value for understanding capitalism (Sarkar, 1999; Caffentzis, 2018).

The clearest harbinger of this change in Marxism was James O’Connor’s essay ‘The Second Contradiction of Capitalism’ (O’Connor, 1988), and its application to energy commodities (i.e. oil, natural gas, coal, radioactive ores). O’Connor somewhat abstractly defines the ‘first contradiction’ in the following way: ‘[it] is the contradiction between capitalist productive forces and production relations’

(O'Connor, 1996: 200). This is the class struggle as traditionally defined: workers against capital. He then defined 'the point of departure of an "ecological Marxist" theory of economic crisis and transition to socialism is the contradiction between capitalist production relations (and productive forces) and the conditions of capitalist production, or "capitalist relations and forces of social reproduction"' (O'Connor, 1996: 200).

O'Connor emphasized the tendency of capitalism to destroy its own conditions of production, for example, the family, labour-power, and natural resources. They are sources of crisis for capitalism 'because conditions of production are not produced as commodities' (1996: 206–7). Indeed, he finds the answer to the question 'Why does capital impair its own conditions of existence?' by pointing out that the conditions of production like labour-power are 'site-specific' (including the individual body as a unique 'site') (1996: 207).

Energy commodities, especially those that are fossil-fuel-based, have led to many examples of this 'second contradiction'. After all, fossil-fuel commodities are 'site-specific' (i.e. you cannot drill for oil just anywhere) as well as not having been produced as commodities. The vegetation millions of years dead that constituted an oil field did not dream that it would be burned to power internal combustion engines in the 21st century. Hence, their owners, according to the rule of capital, are legitimate recipients of rents as well as profits.

As Foster (2008) notes, the oil industry displays a concrete historical example of two second contradictions clashing to create an antinomy. For, on the one side, 'peak oil' theory predicts a catastrophic scarcity and ever-increasing prices for the most vital energetic fluid of our period; on the other, there is climate change due to the generations of greenhouse gases generated by the combustion of these energy commodities. Separately, peak oil and climate change create a permanent crisis for capitalism but together they result in a higher contradiction: energy imperialism. Foster concludes his article by connecting peak oil, climate change, and imperialism:

The supreme irony of the peak oil crisis of course is that the world is rapidly proceeding down the path of climate change from the burning of fossil fuels, threatening within a matter of decades human civilization and life on the planet. (Foster, 2008: 28)

Similar points could be made about atomic energy, the failed energy regime alternative of 20th-century capitalism.

Increasingly there are more Marxist or Marxist-influenced studies of the transition of energy regimes, the impact of energy on the class struggle, and vice versa. Two prime examples are Timothy Mitchell's *Carbon Democracy* (2011) and Andreas Malm's *Fossil Capital* (2015). The first gives a powerful account of the transition from coal to petroleum while the second analyses the transition from non-carbon sources of energy to coal. But both Mitchell and Malm provide perspectives that move explanations of energy regime transitions from the realms of technocratic reasons to the terrain of class struggle.

Mitchell rejects accounts that emphasized the so-called efficiency brought about by the liquefied character of the fuel. He points out that the superior explanation for the transition was the ever-increasing organizational capacity of workers in the coal industry world-wide not only to demand (and win) increased wages and improved working conditions for themselves, but also to support a programme of ‘democratic’ material rights that would be available to the whole working class. This was possible because of the strategic place of the coal industry in the entire functioning of the capitalist mode of production. When the coal miners went on strike, they precipitated the equivalent of a general strike, since coal had increasingly become essential for all branches of industry, especially in the USA and the UK. This situation threatened the foundation of the coal-based mode of capitalist production. As the power of the miners and other workers in the coal industry increased, so did the power of the working class as a whole.

Something had to change for the capitalist class: there needed to be a *material de-leveraging* of the position of the working class (and especially the coal miners) if capitalism was to survive. Neither an ideological nor a policy account would be enough to describe the collective power of the miners. Capital’s strategy to escape workers’ power was the shift to petroleum, which required fewer workers, which made it easier to bribe and/or terrorize them.

Malm’s *Fossil Capital* follows a line of explanation for energy regime transition similar to Mitchell’s. In Malm’s case the energy regime transition in question is from ‘non-carbon’ energy sources (especially natural falls of water), which were the dominant forms of energy up until the 19th century when they were replaced by coal fuelling the steam engine (aka, ‘the industrial revolution’). The problem with the ‘non-carbon’-based energy sources was twofold. First, non-carbon-based energy imposed a definite tactical disadvantage to capitalists, since the factories and workplaces could not easily be moved in response to workers’ struggle. You cannot simply move waterfalls at will. Second, the rise of steam power made it possible for capitalists to escape the ‘tyranny’ of the skilled and so ‘unruly’ cottage weavers via technological means. The coal-fuelled steam engine, unlike a waterfall, was site-specific. It could operate separately from its fuel source in the newly created industrial towns in middle England and southern Scotland. So the production of energy commodities could be de-localized and separated from the production of commodities.

Most recently there is a return to grand theoretical syntheses influenced by Marxism (for instance, in Jason Moore’s *Capitalism in the Web of Life* (2015) and Brent Ryan Bellamy and Jeff Diamanti’s edited volume *Materialism and the Critique of Energy* (2018)) as well as the proliferation of detailed studies of energy’s role in the class struggle. The future holds frightening prospects, but the revival of Marxist energy studies which are developing new concepts like the capitalocene, fossil capital, and work/energy is a portent of a new class politics that will allow us to articulate what really ails us.

Climate Change

Matt Huber

INTRODUCTION

The year 2016 was the hottest on record. It beat the previous record of 2015, which beat the previous record of 2014. The largest sources of marine biodiversity – the coral reef systems – are witnessing a massive die-off. The Arctic looks to be ice free during summer by 2040. Projections suggest parts of the Middle East will become uninhabitable due to excessive heat by 2100. These are only a handful of headlines I've seen recently. This is a planetary crisis that requires a massive political response. Yet, to understand how to respond to such a crisis, it is also necessary to offer clear explanations of its causes. Many environmentalist accounts tend to locate climate change as a crisis of 'humanity' in the era of the Anthropocene. Their solution is to reject an industrialised humanity, decarbonise, and 'transition' to local agricultural livelihoods more attuned with nature. Others see it as a problem of technology – a bug in the fossil fuel–machinery–electricity nexus that can be tweaked through engineering solutions. Still others view it as a 'market failure' – carbon emissions are unmonetised externalities that if properly priced through fees, taxes, or emission trading schemes, can be corrected by the market.

In this chapter, I consider different Marxist explanations of and solutions to the climate crisis. First, climate change is ultimately a historical product of the relationship between capitalist social relations, on the one hand, and industrial

machinery and fossil fuels, on the other. Drawing from Marx's work on machinery, we can understand the shift to fossil fuels as constitutive of the shift from the formal to the real subsumption of labour under capital. As fossil fuel powered machinery extended beyond the 'hidden abodes' of production (e.g. steam powered factories), a Marxist approach must also explain the increasing centrality of fossil fuels to the reproduction of labour power (e.g. oil, electricity, and suburbanisation). This perspective reveals climate change as a crisis rooted in 'contradictions' between the relations and forces of production. Second, various approaches examine the contemporary manifestations of what many call 'climate capitalism' in an age of neoliberalism, or the various ways in which climate solutions have been channelled into markets and profit. Third, Marxist global political economy examines power relations between states in shaping international climate negotiations. Social movements for climate justice call attention to how the global South bears the disproportionate share of negative consequences from climate change, while the global North shares the historic responsibility for emissions. Fourth, I argue Marxists need to move from a framework that blames a fetishised 'thing' called 'capitalism' and towards a classical focus on class as defined as control and ownership of the 'means of production'.

THE RISE OF FOSSIL CAPITALISM

Climate change is mainly caused by one thing: the burning of fossil fuels. Thus, if Marxism is a historical-materialist framework, it is critical to understand the historical transition to fossil fuel energy in social terms. First, I will briefly lay out the epochal material transformations made possible by the shift to fossil fuels. Then I will explain the social dynamics of these material relations.

There are two critical material elements of the historical shift to fossil fuels. First, it transformed the relationship with human labour. The shift to fossil fuels is at its core a transformation of the *productive forces* of society from muscle power to automatic machinery. In material terms, this not only expanded the capacities of production but also created fuel needs for those machines. Although waterwheels played a pivotal role in early industrial capitalism, coal powered steam engines provided geographical versatility allowing production to be concentrated in urban industrial districts (not scattered throughout the countryside along rivers; Malm (2016)). Prior to the industrial revolution, Cipolla (1978: 45) estimates that 80–85% of all mechanical energy came from animal and human muscle power; the balance coming from wind and water. Johnson (2014: xxi) suggests the average American today harnesses the energy equivalent of 'eighty-nine human bodies working for us day and night'. Nikiforuk (2014) labels fossil fuels 'energy slaves' in the sense that societies that once relied on the muscle power of actual slaves now harness the power of what I call 'dead ecologies' or buried legacies of plant-life (Huber, 2013: 12).

Second, it transformed the relationship to land. Coal was not only central to mechanical energy like the steam engine but also necessary for heat energy. On the surface, society's heat needs are simply for the household – heat and warmth – but there is also the massive industrial metabolism of the 'heat-process industries' like iron-smelting, glass, beer, bricks, etc. Prior to the use of subterranean coal, these heat needs could only be fulfilled through land-intensive reliance upon forests (often transformed into charcoal). Coal allowed Britain to relieve land constraints by tapping into what Sieferle (2001 [1982]) calls 'the subterranean forest'. As Sieferle says, 'Fossil energy liberated humans from their ties to area size ... the territorial solar energy principle was broken' (Sieferle, 2001 [1982]: 121). Wrigley (1988: 80) estimates that '10,000 tons of iron involved the felling of 100,000 acres of woodland'. Thus, it is impossible to imagine the modern built environment of concrete, steel, and a host of other materials, without an energy source requiring vast acreage of forests. Sieferle (2001 [1982]: 104) estimates that by the 1820s, British coal use would have required the entire territory of the United Kingdom to produce the equivalent amount of wood energy.

Marx was aware of this shift and its political implications. In *Capital's* discussion of relative surplus value – or increases in labour productivity – Marx isolates a key transition between productivity increases based on more complex divisions of labour (what is referred to as the era of 'manufacture') and increases based on machinery (the era of 'large-scale industry'). In the former, even if the capital relation exists – capitalists hiring wage workers – the labour process is ultimately driven by the 'hands' (and muscles) of the workers themselves. In the latter, since the labour process is driven by capitalist-owned machines, capital can wrestle total autocratic control over the labour process. With machinery capital is 'not only [an] automaton, but an autocrat' (Marx, 1976 [1867]: 545). This constitutes what Marx calls the 'real subsumption of labour' wherein 'machinery is the real master of living labour' (Marx 1976 [1867]: 953). Automatic machinery not only allows capital to set the pace of work but also replace workers when they struggle for better conditions. Marx (1976 [1867]: 563) explains:

According to Gaskell, the steam-engine was from the very first an antagonist of 'human power', an antagonist that enabled the capitalists to tread underfoot the growing demands of the workers, which threatened to drive the infant factory system into crisis. It would be possible to write a whole history of the inventions made since 1830 for the sole purpose of providing capital with weapons against working-class revolt.

As Malm (2016) has recently shown, it is not incidental that fossilised coal was a necessary part of this process. Machinery could be driven by water (which is provided by nature for free). Yet coal as a mobile commodity allowed capital independence and control over their fuel sources, and, more importantly, allowed location in the towns where a surplus of exploitable labourers existed (water power is necessarily scattered throughout the countryside in river systems).

This shift consolidated the power of capital over living labour, but it also reshaped power relations in a larger sense. In what Wrigley calls the ‘organic economy’ powered by sunshine and muscles, social power was achieved through control over two factors – land and bodies/muscles. In particular, landed property was at the centre of economic systems of power. Sieferle (2001 [1982]: 95) explains:

Energy was collected on the surface of land, land was the source of the landlords’ revenues, its ownership conferred political power and wealth and wealth was always wealth in land. The surest way to increase wealth consisted in increasing the area under possession.

In the industrial system, power was increasingly consolidated into the hands of capitalists that controlled machines and other technologies. As Marx understood, landlords increasingly played a parasitical role in capital accumulation, renting out productive land to capitalists and extracting rents from surplus value.

It is important from a Marxist perspective to centre this process in production and the extraction of surplus value. As Hampton (2015) has shown, since the industrial revolution, the extraction of relative surplus value is completely tied to fossil fuels and ever increasing automation. Nevertheless, fossil fuels became increasingly important outside the realm of production. Massive productivity gains required global markets. Thus, fossilised production also required fossilising the means of circulation initially in the form of steamships and railways. More importantly, the steam engine itself was highly inefficient and inflexible. In the late nineteenth century, the ‘second industrial revolution’ included the electrification of production and the shift towards petroleum in the transportation sector (Mokyr, 1998).

Overall, as Malm (2016) shows, the fossilisation of production also entailed the spatial centralisation of production in the industrial cities. As Marx predicted, this also provoked large-scale labour organisation and struggle against the despotic power of capital. As capitalism went into crisis in the late 1920s, workers rose in revolt to demand more rights for trade unions and a wider commitment by states to social welfare and security (Huber, 2013: 27–60). This is obviously a drawn out and complicated process, but it is worth emphasising here that as a result of these struggles fossil fuel became central to the reproduction of labour power for *some* segments of the working class – the most obvious example being the suburban factory worker with an electrified house and private oil-fired automobile. This clearly increased emissions dramatically – leading to what some have called the ‘Great Acceleration’ of anthropogenic effects on the planet after 1945 (McNeill and Engelke, 2016) – but, as I have argued elsewhere, there are more important political implications (Huber, 2013). This process *energised* the realm of social reproduction in ways that extended the power of automatic machinery to (some) workers. This process in the realm of production represents the real subsumption of labour under capital; in the realm of social reproduction, I call it the real subsumption of *life* under capital¹; where life itself

appears as capital (risk, investments, work ethic, entrepreneurial tenacity, etc.). Energising the working classes through privatised housing and suburbanisation led to immense atomisation and fragmentation of class solidarity and culture. As Naomi Klein (2014) points out, this profound privatisation (made possible by fossil fuel) led to a profoundly anti-collective/public political culture precisely at the moment when climate change demanded collective action.

Of course, giving workers power (and energy) was not tolerable to capital. Fossil fuel also makes capital more mobile and able to relocate when worker demands become too strong. In the USA, for example, capital almost immediately fled to the South and Southwest where unions were weaker and taxes were lower. Eventually capital found needed surpluses of super-exploitable labour in the global South and other developing areas. Malm (2016: 327–366) examines how China has become the ‘chimney of the world’ because of fossil capital’s need to seek out cheap labour to attach to heavy fixed capital investments in machinery.

In the wake of this comingled history of fossil fuels and capitalism, by the late 1980s scientists and society as a whole began to discover something was terribly wrong. From a Marxist perspective, it is clear there are significant contradictions between the relations and forces of production, on the one hand, and the stability of the global climate system, on the other. Clark and York’s (2005) ‘biospheric rift’ explains how capital accumulation necessarily produces emissions the atmosphere cannot absorb. James O’Connor’s (1998) ‘second contradiction of capitalism’ explains how private capital tends to undermine/destroy the ‘conditions of production’. Certainly, the climate system represents one of the most important conditions for all life on earth. It is important, however, to be precise on the social relations of fossil fuel and capital-labour relations. For capital, fossil fuel and machinery represent the key to relative surplus value (i.e. the primary goal of production). For labour, fossil fuels have become central to daily life and social reproduction for some sectors of the working class. Thus, fossil fuels have become central to the social reproduction of capitalists and (some) wage workers. This obdurate centrality represents a major contradiction with the climate system as a whole. Put simply, this contradiction is between life and death; it means that the substance of fossil fuels is at once viewed as essential to ‘life’ while it *ensures* increasing levels of *death* for human and nonhuman life all over the planet.

NEOLIBERALISM AND CLIMATE CAPITALISM

Any contemporary Marxist analysis must proceed from the context of a nearly five-decade assault by capital on the working class. This assault has been remarkably successful – profits were revived by the 1980s and working-class power has been significantly weakened through deunionisation, globalisation and ever increasing (fossilised) automation (McNally, 2011). It is in this context

that we can understand the fledgling and mostly ineffective attempts at solving the climate crisis. We label this era 'neoliberalism', but Harvey (2005: 31) more descriptively calls it an era marked by 'the restoration of class power'.

Several scholars have attempted to understand the relationship between market-based climate policies and capitalism as a whole (e.g. Newell and Paterson, 2010). First, neoliberal (capitalist class) ideology constructed government intervention and regulation as bureaucratic 'top down' or 'command and control' burdens on freedom, including much of the legacy of environmental regulation that emerged in the early 1970s (Faber, 2008; Layzer, 2012). Thus, it became 'common sense' among even the most liberal policy technocrats (academics, policy think tanks, environmental non-profits) that the right policies would channel the price mechanism, private choices, and the profit motive to 'solve' pollution-related problems like climate change (for a paradigmatic example, see Hawken, 1993). Again, as Naomi Klein (2014) points out, it is a serious case of 'bad timing' when climate solutions require full-scale regulation and control of fossil fuel capital and public investment, yet the political climate only imagines austerity and according the utmost freedom and flexibility to private enterprise.

A particularly pernicious stance rooted in the 'social cost' theory of Arthur Pigou (1920) claimed that pollution-like carbon emissions were costs 'externalised' onto society by private actors (individuals and corporations). Thus, policymakers could design tools to 'internalise' these costs or 'externalities' into the price mechanism so that private actors could adjust accordingly. From this perspective, climate change was simply one big 'market failure' that could be corrected by getting the prices right. Al Gore (1993: 348) explained this logic at perhaps the peak of neoliberal hegemony (the mid-90s):

[We should find] ways to put a price on the environmental consequences of our choices, a price that would be reflected in the marketplace. For example, if we were to tax the pollution dumped by factories into the air and water, we would get less of it. And we might well notice a sudden increase in the amount of interest companies show in improving the efficiency of their processes in order to reduce the pollution they cause.

The obvious solution is to tax carbon, but neoliberals found an even more convoluted (but eminently 'flexible') system of emissions trading or 'cap and trade'. From a working-class perspective, these proposals are perplexing. At a time of increasing inequality and economic insecurity, they ultimately focus on raising the cost of energy (in the hopes such price increases will change behaviour). Of course, most of the advocates of these kinds of policies come from a professional class of academics, policy wonks, and others whose politics and outlook focuses on their own concerns with middle-class 'overconsumption' and 'excess'. It is no surprise that the right wing is able to construct such policies as an attack against the interests of poor and working-class people. The CEO of Chevron put it bluntly, 'I've never had a customer come to me and ask to pay a higher price for oil, gas, or other products' (Reed, 2015). Even the fossil fuel magnate

Charles Koch offers a critique of climate policy supposedly on behalf of the poor: 'I'm very concerned because the poorest Americans use three times the energy as the percentage of their income as the average American does. This is going to disproportionately hurt the poor' (quoted in Gold, 2015). Unfortunately, the right can frame these climate solutions as a government conspiracy to 'tax' hard working and already economically insecure populations. As I will explain below, a Marxist approach to climate politics and class would offer radically different solutions to the crisis.

The neoliberal policy consensus that climate change could be solved via market mechanisms led to the creation of actual markets for carbon. This not only led to financial speculation on the price of carbon (e.g. the European Union Emissions Trading Scheme (EU ETS) and the UN Clean Development Mechanism) (Frunza, 2013) but also a complicated politics around 'offsets' where money can be made from projects that claimed to reduce carbon in the atmosphere. These offset programmes include everything from forest plantations, wind farms, and even heavy industrial manufacturing – notoriously manufacturers of harmful fluorochemical cooling gases produced *more* of the destructive coolant gas in order to claim more 'waste' gas emissions were 'destroyed' (Rosenthal and Lehren, 2012). Unsurprisingly the buyers of these carbon offsets often come from the rich global North (including heavy industrial emitters themselves) and the 'producers' often exist in the global South. Reproducing what some call 'carbon colonialism' (Bumpus and Liverman, 2011), there are numerous terrible examples of violent dispossession of local peasant or indigenous communities to make way for offset projects. Despite the fact these carbon market programmes produce dubious progress in actually lowering emissions, policy enthusiasm for them continues unabated. In the USA, the state of California has embarked on an ambitious cap and trade scheme (Bang et al., 2017) and, the world's largest emitter, China, plans to launch its own cap and trade system within the next few years (Buckley, 2017).

How do Marxists make sense of these policies? Many argue carbon markets represent the commodification of previously uncommodified biophysical systems – the atmosphere itself, and the carbon-sequestering properties of trees and other ecosystems (Lohmann, 2012). Felli (2014), in perhaps the most rigorous analysis, argues these 'markets' are not commodities at all – if we take a Marxist approach to commodities being produced by value-creating labour – but 'rents' made possible by state-created policies that make such 'payments' for carbon possible. Other critics also point out how private capital is making immense profits on both climate mitigation and adaptation schemes (see Bumpus and Liverman, 2008; Funk, 2014).

Neoliberalism is not just a matter of policy frameworks. It also shapes deeply entrenched political ideologies; most importantly the ideology that social change is most likely through the market via the choices of individual consumers. This represents what environmental historian Ted Steinberg (2010: 7) calls 'green liberalism'. Consumers believe they are solving climate change by buying hybrid

cars, efficient light bulbs, or even individual carbon offsets from private sellers like ‘Carbon Fund’. Meanwhile, the bulk of emissions come from the ‘hidden abodes’ of *private production* in sectors like steel, cement, chemical, and other facilities out of sight from consumer actions (Huber, 2017). Indeed, the entire narrative of ‘carbon footprints’ reproduces a highly neoliberal ideology of ‘individual responsibility’: individual consumers are not only responsible for the emission coming out of their tailpipes and chimneys but also ‘embodied’ in the products they purchase. In other words, consumers are responsible for *driving* production (where the capitalist producers passively respond to consumer demands). If I drive a car are the emissions my responsibility? Or the auto and oil (and other) corporations who sold me the commodities for profit? In reality, any given ‘emission’ is not owned by any individual; it is the product of a web of social relations that can be traced back to profit and accumulation.

Overall, neoliberal ideology creates a highly constricted vision of what is possible in view of addressing climate change. The only admissible changes are within the market construed as a decentralised field of atomised buyers and sellers. As Marx (1976: 280) pointed out in relation to his analysis of surplus value, direct controls or changes to the ‘hidden abode’ of production remain out of bounds when discussing climate policy. Yet, the relations and forces of production are not only at the centre of Marxist class analysis but also most determining when it comes to emissions. However, before we get to class, it is important to tackle another thorny issue in global climate politics: its international nature.

GLOBAL POLITICAL ECONOMY AND CLIMATE CHANGE

The atmosphere and the climate system represent a global commons. Every species on earth shares in its global stability, and even if all greenhouse gases were coming from a single local spot on the planet, the entire global population would have to face the consequences. While emissions take place (usually) within nation states, the climate system absorbs them regardless of borders. Therefore, as many commentators have pointed out (Gupta, 2014; Thompson, 2006), global climate change is a ‘collective action’ problem where sovereign nation states need to cooperate on solutions.

Marxists of various stripes have attempted to analyse international climate negotiations from a radical perspective. Roberts and Parks (2006) explain how the inequalities of power shaping climate negotiations mirror global political and economic inequality – contributing to a wider anti-capitalist politics centred around ‘climate justice’ (Angus, 2009). Ciptet et al. (2015) take a Gramscian approach to analyse how fossil fuel capital and hegemonic nations construct common sense forms of inaction through legalistic foot dragging and other forms of obstruction. The USA, the world’s worst emitter historically speaking, is notorious for its longstanding refusal to cooperate with international treaties – dropping

out of Kyoto in 2001 and Paris in 2017. Political and social movements emanating from the global South argue that the industrialised countries owe poor countries a ‘climate debt’ for their two centuries of rampant fossil fuel burning (Bond, 2010). It is a terrible irony that the countries least responsible for causing climate change are currently bearing the worst of its consequences – from the flooding islands in the South Pacific to a rapid drought and desertification throughout Africa.

As Felli (2014) cogently argues, any Marxist analysis of international climate negotiations must be rooted in Marxist theories of the state and imperialism. As Christian Parenti (2013) puts it, the relative autonomy of the state makes it perhaps the only institution with the coercive power to ‘euthanise’ fossil capital. On the other hand, both the state’s capture by fossil capital and its main concern with maintaining the conditions for accumulation make it especially ill-suited to solve the crisis (Mann and Wainwright, 2018). International negotiations, however, basically rely on state policies to reign in emissions and the power of fossil capital. While imperialism in the era of Lenin and Luxemburg was shaped by a struggle over territory and resources, climate imperialism is a struggle over an atmospheric space that imperialist countries have virtually colonised in its entirety.

One particularly neglected approach to the climate crisis that aligns strongly with Marxist politics is a focus on the need for *international* solidarity. Likewise, global climate change creates a need for a kind of global solidarity. Indeed, such a coalitional politics is already present including (for a time)² in global South governments like those in Bolivia and the Maldives. Apart from states, a vast network of indigenous peoples, peasant organisations and mainstream environmental groups have organised to demand action on climate change (Angus, 2009). The role of what we might still call the working class in this global struggle is unclear at best, and counterproductive at worst. Clearly in contexts like the USA, trade unions have actively organised against action on climate that might lead to fewer jobs in coal mines or constructing pipelines (Aronoff, 2016). However, Hampton (2015) shows trade unions in the wind sector can combine working-class concerns for security with a green energy transition. Whether or not a global solution on climate change is possible without the organised power of the working class behind it is an open question, but Marxists should be sceptical. A more important question might be what would a *class* analysis of climate change look like?

CLASS AND THE CLIMATE

When explaining the causes of climate change, radical approaches tend to focus on the ‘system’ of capitalism. The critique largely focuses on capitalism as a ‘system of *accumulation*’ (Foster et al., 2010: 203) or a system based on a ‘constant drive for endless economic growth’ (Klein, 2014: 81). Moore (2015: 2) also situates capitalism as ‘a way of organizing nature’. The political critique is

always focused on the system of capitalism and its inherent drive for environmental destruction (including emissions). Yet in much of this radical literature the language slips into a fetishism of capitalism as a thing with its own agency.

To be clear, a systemic (or better, *structural*) critique of capitalism is necessary to avoid individual moralistic or voluntarist understandings of politics. However, the relentless focus in radical climate politics on a thing-as-system called ‘capitalism’ – its most iconic slogan is ‘system change not climate change’ – presents some political difficulties. It is not entirely clear who the struggle is *against*. A Marxist framework of radical climate politics must not only be against ‘capitalism’, it must be based in an antagonistic conception of *struggle between classes* (see, Hampton, 2015). As Foster et al. (2010: 157) point out, but scarcely examine in detail, the ‘incessant drive’ for growth under capitalism is not general or abstract – it is not ‘growth’ for society as a whole – it is growth based on ‘class based profits and accumulation’. Accumulation is the *private* appropriation of wealth and profits for the capitalist class. Thus, we must not only focus our critiques on ‘capitalism’ but also on the capitalist class. What would an antagonistic climate politics focused on class struggle look like?

In *Capital* Volume I (1976 [1867]), Marx faces the problem of explaining where the extra value comes from in the formula for capital, M-C-M’. After exploring a variety of possibilities in the realm of market exchange, Marx concludes that the equivalence assumed by exchange bars an adequate explanation of surplus value. For the secret to where this ‘extra’ value comes from, Marx instructs, ‘Let us ... leave this noisy sphere, where everything takes place on the surface and in full view of everyone, and follow them into the hidden abode of production’ (Marx, 1976 [1867]: 280). From this point forward, Marx analyses the mechanisms of surplus value extraction in production. The exploitation of labour becomes the key to Marx’s theory of capital as self-expanding value.

In the twenty-first century, various kinds of hydrocarbons are exposed to oxygen and heat (i.e. combustion) to create carbon dioxide and other greenhouse gas emissions (e.g. M-CH₄ ... P ... M + CO₂). Similar to the classical political economists of Marx’s day, most political attention to the problem of climate change focuses on the ‘noisy sphere’ of market exchange. If we are emitting too much carbon, it is because there is no price for it. To lower emissions, we must focus on individual consumer choices. Yet, in order to understand the material basis of our carbon-based society, it is necessary to leave this ‘noisy sphere’ of exchange and venture into the hidden abodes of production (see also, Gould et al., 2008). It is not only that industrial production – from fossil fuel extraction to steel, chemicals, and cement – has the largest carbon footprint, it is also that we need a politics of climate change that focuses its struggles on who controls and profits from material production. Those concerned with climate change are rightly focused on those capitalists in control of energy extraction and profits (the fossil fuel companies), but it is necessary to extend our class critique to all those capitalists who control and profit from the means of production and their associated emissions.

Of course, many consumers ‘control’ their carbon footprints at the point of emissions – driving cars, heating homes. However, there is a critical class-based distinction between emissions for *social reproduction* (represented by the formula C-M-C) and emissions linked to accumulation (M-C-M). From this perspective, the class politics are clear for even the wealthy SUV driver – they only consume gasoline for their own reproduction. Yet, it is capital that owns and controls the means of oil extraction, refining, pipelines, and distribution that enter the consumer’s tank. Politically we need to link emissions back to the guiding logics of capital – profit and accumulation. Rather than obsessing over consumption habits, it would be preferable to question what this wealthy consumer did in their workplace to become so wealthy.

Climate politics could use a return to a somewhat orthodox Marxist conception of class to understand both the causes of and solutions to climate change (see, Hampton, 2015). This approach would concentrate on who owns and controls the means of production – and would aim to reignite debates over class structure that were perhaps more prominent in the 1970s and 1980s (cf. Poulantzas, 1975; Wood, 1986; Wright, 2015). The core focus is capital–labour relations in the realm of production, but a full class perspective must also take into account other key classes. For example, Marx’s ([1894] 1981) theories of the landlord class (and rent theory) are highly relevant to understanding property relations in the extractive sector – and in the case of fossil fuel reserves these are often ‘landlord states’ (Coronil, 1997; see also, Felli, 2014).

In another vein, the class at the ideological centre of the climate movement is the professional–managerial class (Ehrenreich and Ehrenreich, 1979).³ This class includes the scientists, academics, journalists, public sector, and other knowledge workers. This class lacks a materialist politics and mainly focuses on individual beliefs and actions concerning the scientific knowledge of climate change (belief/denial), market-based solutions (carbon tax or fee), and a psychology of carbon guilt (we consume too much). Thus far the professional class has rightly sought coalitions with those class formations seen as most marginalised from the global capitalist economy – and thus most likely to bear the brunt of the worst of climate change. This focus on marginalised populations includes what Ariel Salleh (2000: 30) calls the ‘meta-industrial class ... such as women domestic workers, subsistence farmers, and indigenous peoples, [who] are both inside and outside of the dominant hegemony’. Yet, the problem with the professional class and these marginalised social formations is that they represent small proportions of the population in the most heavily industrialised emitting zones of the global capitalist economy. In a neoliberal era in which an estimated 2 billion people have been added to the global proletariat, how can climate politics reach the working class?

Of course, the key questions (as suggested above) are: who is the working class today? Can the working class still be seen as an ‘agent’ or ‘historical subject’ of revolution? Broadly, the working class could include everyone who relies on wages for survival. A more orthodox perspective might focus on only those

‘productive’ labourers – not in the normative sense, but in terms of the workers who directly produce surplus value for capital. Regardless, it is clear the vast majority of society *lacks control* over the means of production – in particular, the working class lacks basic control over the energy systems causing climate change. Even if we take the classes reviewed above – professionals or those in the informal economy – they share one basic objective requirement: they must work to survive. Many political projects today talk about ‘energy democracy’ or ‘community control’ over energy, but it is unclear what role workers themselves should have in shaping a green energy transition. It is clear that any attempt to forge a true ‘energy democracy’ would have to take into account the needs of the vast majority of the population – the working class. Entrenched systems of power only bend under tremendous political pressure from below. One need not be teleological to assert that if there is going to be a *democratic* solution to climate change it will need to incorporate vast swathes of the working class to succeed.

To understand the working-class role in climate politics we should also revisit the maligned question of workers’ *objective interests* (cf. Laclau and Mouffe, 1985). As Chibber (2017) and others argue, a return to class analysis will involve wrestling with this issue. Ironically, as mentioned earlier, it is the right that argues climate policies will go against the interests of poor and low-income people by raising energy costs and costing jobs. How can a working-class politics counter these narratives? Obviously, workers and all of humanity have an ‘interest’ in a liveable planet. Yet, understanding this interest is ‘abstract’ and requires a working knowledge of complex biogeochemical cycles (it is this ‘knowledge’ and ‘science’ that the professional–managerial class insists must be central to a climate politics). There are of course many on the ‘frontlines’ of climate changes – indigenous peoples, peasants, and coastal communities – whose own direct material interests in survival are at stake. Yet, while the climate justice movement has consistently pointed this out, it’s not clear these marginalised ‘frontline’ communities form the kind of political base necessary to confront the fossil fuel industry.

What about a broader working-class interest in climate? I think workers’ interests are more directly tied to the material capacities of renewable energy to provide free and inexhaustible energy. While most left thinking on climate change suggests a politics of ‘less’ and ‘degrowth’ (Latouche, 2009), a working-class interest in climate politics must emphasise the abundance and emancipatory potential of this energy transition. From a reformist perspective, left climate politics should fight for public ownership and investment in renewable energy systems to provide cheap or free energy to the masses. From a revolutionary perspective, renewable energy can provide the material basis for what Marx ([1894]1981: 958) called the ‘realm of freedom’. Marx’s vision was always based on workers seizing the means of automated production to allow society the time and energy for free creative and humanistic development. The twenty-first century reveals this vision is not compatible with fossil fuel based machinery and abundance. Renewable energy is a more ecological form of automation: it not only requires

very little labour (Hughes, 2017) but also, as a ‘flow’ resource, it provides energy without combustion, emissions, and the depletion of a stock (Malm, 2016). After all, it was Lenin (1920) who famously said, ‘Communism is Soviet power plus the electrification of the whole country’. It is true that the revolution will be electrified; but unlike the Soviet Union, it must be electrified with renewables (see also, Schwartzman, 2013). This working-class interest in energy and freedom can shape the struggle against those private forms of capital seeking to privatise and profit from renewable energy abundance (e.g. Elon Musk’s Tesla).

Almost all viable pathways to decarbonisation involve an approach described by many as ‘electrify everything’ (Roberts, 2017) – transport, industry, and residential/commercial heating. It is unfathomable that this scale of a transformation could happen without a mass-movement against the private interests currently in control of the fossil fuel extraction industries and well as private-for-profit electric utility industry. These private interests would need to be taken over by more socially oriented institutions. Some Marxists would hope the working class itself might expropriate private fossil capital themselves; others might see a more viable path via a social-democratic transfer of energy to the public sector – what Pollin (2018), in a formula that has recently gained traction in the US political mainstream, calls a ‘Green New Deal’. Neither scenario is conceivable without a well-organised majoritarian movement from below – that is a movement which at its core includes vast swathes of the working class.

CONCLUSION: FROM CAPITALISM TO CLASS

In this chapter, I’ve outlined a Marxist approach to climate change in four steps. First, we need a historical–materialist understanding of the development of relations between fossil fuels and capitalist social relations. Second, I argued for an approach that understands the *historical specificity* of neoliberal hegemony to understand climate policies like carbon taxes, and cap and trade. Third, Marxists also require a *global* approach to state power and imperialism to understand the nature of international climate negotiations. Finally, and most importantly from a political perspective, a *class* approach to climate politics would lay out more clearly who is responsible for climate change (e.g. industrial capital, landlord states), and the working-class *interests* in a green energy transition.

The climate movement is frankly stuck in a mire of ineffectiveness. It is wedded to an ideologically powerful, but small-in-number and petty-bourgeois professional class fixated on a politics of ‘less’ consumption and growth. While radical climate activists are clear the problem is a ‘system’ called capitalism, they are less clear on the *class* struggle required to create such a ‘system change’. A class struggle against the entrenched power of fossil and industrial capital can only succeed with the organised power and masses of the working class behind it. If climate politics is going to energise the masses it must shift to a politics they can get

behind; a politics that promises direct material betterment through the solutions to climate change. A materialist view can see the seeds of that betterment directly in the very technologies of renewable energy itself. Private green or clean tech capital will not relinquish their control over these technologies without a fight.

Notes

- 1 This is distinct from those conceptualisations advanced by Jason Read (2003) and certain autonomist Marxists which focus more on the subsumption of subjectivity.
- 2 I understand that Morales's turn towards extractivism has since shaken the pro-climate environmental nature of his politics. See Andreucci (2018).
- 3 This class of knowledge workers has recently captured much attention. Perhaps most problematically, Richard Florida (2014) theorises the 'creative class' as the engine of urban growth and dynamism (and, of course, gentrification). Thomas Frank (2016) has recently argued the Democratic party in the USA has become tethered to the 'professional class' of wealthy liberals at the expense of its working-class base. Elizabeth Currid-Halkett (2017) claims an elite 'aspirational class' – focused on expensive education and environmentally conscious consumption – has walled itself off from the poor and working classes. None of these accounts is sufficiently grounded in Marxist class theory, which is why I return to Ehrenreich and Ehrenreich's (1979) classic theorisation of the 'professional–managerial class'.

PART VI

Domains

Anthropology

Erica Lagalisse

Marx relied on anthropology in his logical and historical exposition, and anthropology has long existed in dialectic with Marxism. To study anthropology with Marxist categories or subject Marxism to ethnographic scrutiny, it makes sense to proceed chronologically – the importance of history is something anthropologists and Marxists now often agree on. In the process, we consider how philosophical idealism continues to interfere in efforts to build grounded ethnographic theory, yet how ethnography remains a uniquely useful tool to unsettle idealist abstractions that limit Marxist debate itself.

With attention to how ideas about ideology themselves exist in relation to particular material and historical circumstances, I begin by discussing Marx's treatment of anthropology in his project to historicize capitalism, then how Marxist theory influenced anthropology: by the middle of the twentieth century, the anthropological notion of society was no longer the integrated whole imagined within functionalism, but rather a field characterized by conflict and struggle. Following experiments in material and ecological determinisms, it was feminist and postcolonial revisionings of the 'class consciousness' concept that sparked an epistemological debate that informs the politics of ethnography to the present day – insights of the poststructuralist turn may transcend those of Marx, but they also contain them.

The same feminist and postcolonial interventions also influenced broader social science debates around 'intersectionality', and ultimately the everyday attributions of 'good politics' among the anarchist activists who were the focus of

my own ethnographic research (Lagalisse, 2016). I present this research to suggest the utility of anthropology to resolve certain impasses in Marxist theory and practice. In my study of the ethnographic category ‘good politics’, it becomes clear that people concerned about oppressed identities are not necessarily looking for recognition (as opposed to engaging in ‘class struggle’) as some have claimed, yet insofar as identities are mobilized as property, no amount of intersectionality talk makes things better for the working class. The same research also exemplifies how cross-cultural analysis may continue to be useful to historicize and denaturalize the logic of capitalism. My ethnographic inspiration to explore the semiotic and legal senses of ‘property’ across culture helped elucidate how identity functions as property in the activities of anarchist activists, and among contemporary scholars. Transcendence is valued over immanence within the game of ‘good politics’, because successful identity-appropriation follows from successful self-appropriation.

The late twentieth-century deconstruction of truth, totality and structuralism within the discipline of anthropology was partly in response to feminist and postcolonial critiques, yet this very deconstruction has often been recuperated to interfere in feminist and postcolonial projects. My exposition may help us understand why. Beyond questions of history or justice, ones of property and propriety also lead anthropologists to ignore ‘class’ in preference for ‘race’. Now, insofar as disciplinary priorities involve putting aside ‘discourse’ to consider ‘ontology’ once more, the intellectual tools of Marxism may help explain why anthropologists tend to avoid citing the ‘material’ at the same time. Insofar as this chapter is staged as an intervention, it is to remind twenty-first-century anthropologists of the material importance of knowing their (disciplinary) history, and to challenge the Marxist who still considers identity politics a conundrum to consider applying the materialist method of ethnography.

SCIENCES OF SOCIAL CHANGE

Karl Marx and Friedrich Engels sought to historicize the logic of private property – if capitalism is the product of particular historical circumstances, then it can be overturned. The study of pre-capitalist societies was therefore important. In *The German Ideology* (Marx, 1978 [1932]) and *The Communist Manifesto* (Marx and Engels, 1978 [1848]), Marx and Engels’ historical interest concerned feudalism, the period in European history immediately before capitalism. By 1858, however, they had begun discussing ‘tribal society’. In Marx’s early drafts of *Capital* (1990 [1867]), material later published as *The Grundrisse* (1993 [1858]) or in *Pre-Capitalist Economic Formations* (1964 [1858]), we see his first elaborations on ‘tribal’, ‘classical’ and ‘oriental’ societies, a discussion further developed after 1880 when Marx and Engels discovered the work of anthropologist Lewis Henry Morgan (1818–81).

Anthropology developed largely as an evolutionary science of human society, directly inspired by Darwin's work on biological evolution (see also Bloch, 1983: 4–6). Henry Morgan's work *Ancient Society* (1877) also proposed an evolutionary scheme, yet Morgan's work differed from that of his contemporaries in that he demonstrated more sympathy for 'primitives' than his peers, and beyond defining 'stages' of social evolution, he concerned himself with *why* one 'stage' should change to another. He proposed that a society passes from one stage to another when various subsystems stop working in complement and therefore come into conflict. Morgan's model of history, wherein evolution leads to the destruction of its own stages, resonates with the Hegelian one that Marx inherited and was working to reinvent (see e.g. Marx, 1978 [1932]) – the Hegelian dialectic is characterized by theses and antitheses that invite syntheses. While figures such as Herbert Spencer (1820–1903) presumed the same laws apply to biological evolution and human societies, Marx and Morgan did not consider human historical processes the same as those of natural selection, and worked to figure them out.

Morgan's work informs Engels' approach in *The Origin of the Family, Private Property and the State* (2010 [1893]), which proposes that matrilineality is overturned because a developing system of animal domestication (which leads to material surplus) becomes incompatible with the existing system of inheritance. It was no coincidence that Marx and Engels followed Morgan here and generally concentrated their attentions on the 'family'. Following Hegel, however willingly or unwittingly, the society without private property was to be antithetical to their own and therefore without exploitation. Marx arranged 'kinship relations' and relations in the labour market as semantic opposites – kinship relations are egalitarian and do not involve one group living off the other. For Marx, the gender division of labour is 'based on a purely physiological foundation' and/or capitalism levels the difference (Marx, 1990 [1867]: 471). Marx and Engels therefore reproduce categories of bourgeois ideology as well as Hegelian ones. The concept of a political public sphere, characterized by conflict and unnatural power, vs. a domestic private sphere, characterized by non-exploitative and natural cooperation, is enshrined in *The Origin* (2010 [1893]), the first Marxist book written with significant anthropological ambition, to then be carried forward in Marxist debate.¹

A MATTER OF PERSPECTIVE

By positing primitive societies as 'classless', Engels denied subsequent Marxists the use of certain sociological tools developed within Marx's work. Debates that disputed the revolutionary role of peasants (as 'primitives') vis-à-vis the proletariat during the Russian Revolution, for example, did not accord with the nuances of Marx's theory of ideology, wherein it is understood that either 'class consciousness' or 'false consciousness' will prevail among a subjugated group

contingent on diverse questions of history – the ‘ideas of the ruling class are in every epoch the ruling ideas’ (Marx, 1978 [1932]: 172), yet also ‘the bourgeoisie produces its own gravediggers’ (Marx and Engels, 1978 [1848]: 480). In a society characterized by power, one’s own ideas are influenced by the interests of dominant groups, yet insofar as primitives were idealized as classless, their ideas could be held to reflect reality.

Figures such as Paul Lefargue (1842–1911), Karl Kautsky (1854–1938) and Georgi Plekhanov (1856–1918) thus proceeded to treat pre-capitalist human history as an extension of biology, wherein society (including ideology) is a function of technological adaptation (see Bloch, 1983: chapter 4), even though Marx had rejected utilitarian explanations that directly adapted Darwin (1964 [1859]). During this same period, Marx’s notion of the material and the ideal being indissoluble also becomes simplified into a two-stage model in which there is *first* material social life (‘base’) and *then* consciousness and its products (‘superstructure’ or ideology) – a mechanical materialist reversal of idealist dualism.² It is in this context that Gramsci’s (1971) later qualification that cultural elements that have no ‘necessary class-belonging’, necessitating a ‘war of position’ (for hegemony), becomes relevant. Yet other problems followed: the fact that ‘class consciousness’ erupts unevenly was addressed by the French Structural school, following Althusser (2005 [1965]), by debating the ‘relative autonomy’ of superstructures, whereas the British Historical school, following Thompson (1963), resolved the problem of determinism with the mitigating category of ‘experience’ (see e.g. Williams, 1980: 59–61).

These mid-century debates about conflict and perspective did not occur within the field of anthropology at the time. Georgi Plekhanov and Franz Boas (1858–1942), widely referred to as the ‘father of American anthropology’, had shared mentors, and Boas’ own rejection of culture as ‘adaptation’ was key within the development of anthropological ‘cultural relativism’ (see Bloch, 1983: 105–8), yet during this period there remained strong parallels between the romanticized primitives of early twentieth-century anthropology and contemporary Marxism. Whether we speak of Boas’ students in the USA, such as Ruth Benedict (1887–1948) or Margaret Mead (1901–78) who developed the ‘culture and personality’ school, or Alfred Kroeber (1876–1960) who is now associated with ‘symbolic anthropology’, or the ‘functionalist’ or ‘structural functionalist’ approaches in British anthropology that followed A. R. Radcliffe-Brown (1881–1966) and Bronisław Malinowski (1881–1942), anthropologists tended to view society as a cohesive system in equilibrium: cultural institutions exist because they meet the physical and psychological needs of a given people. The Manchester school (e.g. Gluckman, 1955; Turner, 1957) integrated a Marxist lens for conflict, yet much mid-century anthropology also carried forward the fancies of culture-as-adaptation: in the work of Leslie White (e.g. 2007 [1959]) and Julian Steward (e.g. 1955), structural Marxism constitutes a form of ecological determinism. The genealogy of anthropology and Marxism in French literature is largely bracketed

here, yet we may note that the structuralism of Claude Lévi-Strauss, for example, is also in dialogue with Marx (see e.g. Lévi-Strauss, 1963: 333–7).

Outside the academy, meanwhile, debates within Marxism and social movements continued and began to affect the discipline of anthropology in a new way. Controversy about the imputed revolutionary consciousness of the peasantry gave way to feminist and postcolonial theorists' own interventions with respect to the categories of 'class struggle' and 'class consciousness' – Marxist theorists produce their own gravediggers as well.

Feminist movements of the 1960s in Europe and North America likewise worked to challenge male domination by debating its historicity – just as private property needs not be an eternal truth, neither does the patriarchy. The feminist concern with historicity was partly in parallel with the Marxist method, and partly a result of adopting a then-established Marxist analytical framework, albeit applied to a different sort of class. Feminist debates also entered and changed anthropology, given their interest in the diversity of human societies across time and space. In some feminist anthropology, patriarchy emerges with agriculture (and economic surplus, à l'Engels), or with Western colonization (e.g. Etienne and Leacock, 1980); for others, 'domestic' vs. 'public' spheres are posited as universal across cultures (Rosaldo and Lamphere, 1974; cf. Rapp, 1975), yet patriarchy is nonetheless due for an overthrow (for an overview see Fraser and Nicholson, 1990; Moore, 1988). Either way, the social difference between men and women is not natural (a function of biological adaptation) and is characterized by complex forms of ideology.

As feminist anthropology circulated within social movements and other academic disciplines, renovated Marxist concepts such as social (re)production and emotional labour provided new vocabularies to articulate gendered power (e.g. Federici, 2012; Ferguson and Folbre, 1981). The implications of Marxist 'class consciousness' pertaining to women as a category also facilitated the development of feminist standpoint theory, which adapts Marx's (1978 [1932]) notion of 'partial perspective', specifically 'class consciousness' as elaborated by Lukács (1971), in relation to gender: 'the experiences arising from the activities assigned to women' provide 'less distorted knowledge claims than do men's experiences' (Harding, 1990: 95). This notion is later mobilized and qualified in feminist theorizations of 'intersectionality', which highlight (epistemological) difference among women (see e.g. Collins, 2019; Haraway, 1990).

Notably, in standpoint theory, the analytical emphasis is on the privileged perspective (versus potential 'false consciousness') of the subjugated class. This is also the case in postcolonial theory developed during the same period, wherein contemporary anticolonial and nationalist resistance movements inspired arguments about the revolutionary role of the 'peasantry' once more. The subaltern studies school that focused on South Asian resistance (e.g. Prakash, 2000; Spivak, 1988), the literature on 'new social movements' (e.g. Álvarez and Escobar, 1992) and 'decoloniality' (e.g. Cusicanqui, 2006; Quijano and Ennis, 2000) from Latin

America, and all those concerned with Orientalism (Said, 1978) suggested that racialized colonial subjects be granted specific epistemic privilege: capitalism has regularly found its ‘sternest negation’ from ‘peoples organized according to a number of principles at once, including antiracism’ (Gilmore, 2008: 39).

THE GAME OF ‘GOOD POLITICS’

Many celebrated the feminist and anticolonial interventions in their regard to multiple forms of ‘difference’. Their moves worked to ‘proliferate histories, cultures and identities arrested by previous essentializations’ (Prakash, 2000: 185). In Chandra Mohanty’s words, ‘the particular standpoint of poor and indigent Third World/South women provides the most inclusive viewing of systemic power’ (2003: 232). If revolutionary ‘class consciousness’ has not yet enthusiastically erupted on a global scale, it is partially because Marxist theories of class do not comprehend the multiplicity of structures of oppression that capitalism relies on and exacerbates, such as those of gender or race. These are now familiar critiques.

Others have voiced concern that capitalism can easily manage ‘multiple and competing claimants on the social surplus that it governs’ instead of equality in ‘the dimension of economic goods’ (Ahmad, 1997: 63). There is a danger in accepting ‘all the fetishisms of locality, place, or social grouping’ while denying theory that can ‘grasp the political economic processes (money flows, international divisions of labour, financial markets, and the like) that are becoming ever more universalizing in their depth, intensity, reach and power over daily life’ (Harvey, 1989: 116–17). These are now familiar responses.

Trying my own hand in this long-standing controversy, I suggest the conceptual impasse is partially related to a tendency to begin with abstract categories instead of material social relations, a disciplinary mistake for Marxists and anthropologists both:

While anti-racist and anti-sexist struggle are guided by the striving for the full recognition of the other, the class struggle aims at overcoming and subduing, annihilating even, the other – even if not a direct physical annihilation, it aims at wiping out the other’s socio-political role and function. In other words, while it is logical to say that anti-racism wants all races to be allowed to freely assert and deploy their cultural, political and economic strivings, it is obviously meaningless to say that the aim of the proletarian class struggle is to allow the bourgeoisie to fully assert its identity and goals. (Žižek, 2012: 33–4)

In Žižek’s formulation, for example, the subject of action is anti-racism (or anti-sexism): ‘Anti-racism wants...’. Yet words are not subjects of action. ‘Anti-racism’ does not want anything. Sometimes the person who talks about ‘anti-racism’ is seeking more evenly distributed recognition within the system, but sometimes they are organized in combative autonomist Zapatista or Black Power movements that are not about rights or recognition at all. This being said,

Žižek's confusion is perhaps understandable, as the word 'identity' is currently used to connote tacit affinities, explicit affiliations, processes of differentiation, self-identification and identification by others (see Brubaker and Cooper, 2000) – the Marxist distinction between *class-in-itself* and *class-for-itself* is neglected. By starting with ethnographic research as opposed to the abstracted category, however, we may avoid this confusion by apprehending how it happens.

My own research of collaborating anarchist activists throughout Mexico, the USA and Canada (2005–15), which attended to the 'friction' of their encounter (Tsing, 2005), highlighted both a transnational 'anarchist culture' and the place-based 'cultures' that also inevitably inform local anarchist praxes (Lagalis, 2016). In the process, the particular idiosyncrasies of the English-speaking North American left are thrown into relief, including their specific manoeuvres of self. These plays of self became clear as I studied intersecting structures of power inflecting anarchist movements, such as those of race, class, gender, before studying North American English-speaking anarchists' own particular operationalizations of 'intersectionality', a concept they themselves mobilize to address 'marginalization' in social movement spaces and the broader society. The ways in which activists cite intersectionality in meeting protocols, everyday life and formal trainings such as anti-oppression workshops, all invite certain relationships to, and (self)representations of, one's self and those of others.

Part of the reason the ethnographic method is productive to parse the 'class' vs. 'identity' debate is precisely because it requires approaching 'class' and 'identity' as emic categories: how: are 'class' and 'identity' cited in everyday life by activists themselves? Further research questions are then to follow from answers to the first: why are persons (emically) understood as 'working class' cited as oppressive more often than others? Why are the activists who are university students the ones talking about their identities? Activists want to learn about 'classism' so they can 'respect working class identity' but cannot find working class facilitators to teach them the etiquette they desire – what is going on? I studied the body language in activist organizing meetings, analysed the games that quantify participants' pain in 'anti-oppression workshops', took note of which self-identities were successfully cited to silence others, counted how many people left the assembly, wrote down who felt 'unsafe', and wondered how they felt safe enough to say so.

I explore the story of Damian, for example, an activist from Mexico living in Montreal who is a person of colour as well as a refugee, yet was not, as a consequence, able to valorize himself as epistemologically privileged within his collective. Carlo, on the other hand, another Mexican refugee more acculturated within the Montreal anarchist scene, was able to mobilize both identity and the value of self-containment (manners) against Damian in one and the same gesture. 'That's why I was so mad about Carlo complaining about me yelling in that meeting – when you know the game and have the tools you can work it (*manejarlo*) as a way to get power'. I likewise present the experience of some Balkan anarchists in Toronto who attended

a dance party fundraiser organized by No One is Illegal activists. When the DJ played Balkan music they started bouncing around, at which point they were interrupted by some women who asked if they were cops: they weren't dancing the way everyone else was. The men explained that this is how Balkan people dance to Balkan music but the activists were not impressed. The men's dancing was 'aggressive' and making queer women at the party 'feel unsafe in the space' – they had to leave.

I also invite readers to consider scenarios such as the following: an Egyptian refugee, two Canadian anarchists of colour and one queer white Canadian anarchist are chatting in the hallway of a community organization. The Egyptian says that 'Native Americans were primitives when they were colonized' whereas 'Egypt was a highly advanced civilization'. The Canadian people of colour laugh, exchange glances. (As no indigenous person is present they may laugh, but make sure to roll their eyes to indicate to each other and anyone watching that they did, in fact, recognize the presence of 'bad politics'.) The queer white person maintains a neutral expression until the two people of colour smile at her as well, then smiles back. (The queer white person follows their lead, because if she laughs and the people of colour decide *not* to, they may call *both* her and the Egyptian racist. Neither does the queer white person take initiative in challenging the Egyptian, because the people of colour may say that she is racist because she condescends to Egyptian refugees.)

The game of 'good politics' gradually begins to develop contours. We realize that the person with 'good politics' embodies restraint and deliberation, suppressing emotional and physical display, thus performing an overt display of objectivity and reflexivity. The person with 'good politics' sees the self as something to be constructed, stylized and performed, and is a serious, self-contained, self-conscious person – one who represents the self in a 'choiceful' manner. Successful seekers of 'good politics' cannot allow conditions for someone to call them oppressive, which means keeping in mind who might draw on an oppressed identity to authorize themselves or others, and maintaining a careful, tentative stance, phrasing one's speech in such a way as to be able to reverse course if necessary depending on subtle cues. All of the bourgeois cultural traits of careful self-presentation and affective restraint characterize and are further encouraged by those seeking 'good politics'. Meanwhile, it also becomes ethnographically evident that identity as 'working class' cannot be mobilized to valorize the self of 'good politics' the way other politicized 'identities' can. Why should all of this be?

Analytical attention to activists' good manners and their logic of self-identity suggested their connection via the logic of property. The proximity of the words propriety and property was also a clue, yet it was attention to activists' everyday practice and to the body, as well as their self-reported abstract categories, that invited perception of a common morphology among activists' tendency to privilege words over action, their subcultural sanction against emotional expression (and its relation to 'safe space') and their abstraction of experience into fixed and bounded identity-categories: the *form* of one's utterance being valued over its

content, and the abstraction of material oppression itself to neatly visible signifiers of the same, is homologous. In each instance, performance of transcendence is valued over a necessarily imperfect dialogic orientation, as is the abstract self over the relational body, which itself must be bounded and self-contained as much as possible. The reasons why Damian did not have the self-orientation to propertize himself with pain whereas Carlo did, the reasons why the violence suffered by the 'white' Balkan refugees could not be registered, and the reasons why middle class women were able to successfully mobilize both legible identity and the virtues of bodily containment to forbid their exuberance, are one and the same.

As my attention was gradually brought to consider the relevance of property in activist dynamics around 'identity', I proceeded to explore the cross-cultural relation between semiotic and legal property. I reproduce this discussion in part as well, as the material may suggest how cross-cultural analysis, however fraught, remains relevant to Marxist thought.

PROPERTY IN PERSPECTIVE

Across diverse cultures, words referencing 'property' often bundle three meanings. Property (1) can mean something that one controls and/or legally represents, but not necessarily exclusively, such as slaves or women whose activity may fall under the power of one or more people. Property (2) can also connote exclusion, i.e. the exclusion of others from the property or the exclusion of oneself from it. Excluding others from one's property is familiar, intrinsic to Western private property rights where something is held 'against all the world'. Excluding *oneself* may not be as intuitive for us but is clarified by considering property in the semiotic mode (3), which makes something what it is, i.e. 'heat is the property of fire'. It is an extension of this usage when we refer to 'my' boss who I do not own in the way I do 'my' car. This third meaning is likewise in operation when aristocratic clans on the Lau Islands of Fiji are said to 'own' the species of animals, fish and trees that are associated with them, and which they do not control. Exclusion of oneself here interplays with property in the semiotic mode insofar as these species are tabu: the clan is forbidden to touch the things they are said to 'own'.

Here I follow Graeber (2007), who suggests these logics of property inhere within all social hierarchy insofar as the greater the purview of (political, legal) representatives, the more they themselves are set apart, considered a more 'exclusive' sort of person, and are spoken of in a way that makes them more abstract – they are not called by their individual name but rather by a kin term or title of the group they are seen to represent. This is true in Fiji as well as regarding the transcendental property of being the 'Queen of England'. The lack of respect involved by calling the Queen by her first name, touching her, or making reference to bodily functions in her presence are all connected insofar as a relation

of avoidance and her constitution as 'property', in the dual sense of abstract and enclosed, are one and the same. Whether we speak of lineages, clans and tribes, or mayors, governors and presidents, in each case representatives are seen fit to engage in dialogue with others who share the same property as them, whereas those who they represent or 'include', those who constitute their property, must stand in a relation of avoidance.

Graeber (2007) highlights how the sanction against initiating physical contact with 'my' boss lines up with the logic of avoidance as found in the anthropological literature on 'joking' vs. 'avoidance' relations (e.g. Radcliffe-Brown, 1940), as well as Bakhtin's (1984) discussion of the carnivalesque – Bakhtin's 'classical body' (vs. the 'grotesque') suggests hierarchy and avoidance insofar as the superior party is constructed as self-contained, discrete and shut off rather than continuous with the material world around them (transcendent as opposed to immanent). Graeber (2007) emphasizes these connections to suggest that social hierarchy necessarily involves constructing superiors as abstract (transcendental) property/properties vs. the relative materiality (immanence) of others. Whether or not this phenomenon is entirely universal, Graeber's classical comparative method suggests that social hierarchy generally involves a combination of linear and taxonomic hierarchy, which is what Lévi-Strauss referred to as 'universalization' and 'particularization' (1966: 161), and what Dumont (1970) elaborated as higher categorical ranks 'encompassing' those beneath.³ Graeber's (2007) qualification is that hierarchies always involve exclusion as well as inclusion ('encompassment') wherein the higher rank is set apart from a residual category composed of all the others at the same time as it 'includes' them.

If the modern West is not to be positioned outside of human history – contra Dumont (1970) – then is it possible, I wondered, that Macpherson's 'possessive individualism' (1962) references the dynamic of exclusion and encompassment within liberal democracy? After all, modern subjective rights are modelled on property rights. Whereas rights had been reciprocal (with one person's specific right connoting another's specific obligation), with the rise of modern liberalism rights were reconceived as something identified with, and owned by, the person – a property of the person in both the semiotic and legal sense (see Tuck, 1981). Macpherson (1962) traces this 'possessive individual' of modern rights to the capitalist reorganization of social life in seventeenth-century Britain. The relation of ownership, having increasingly become the critically important relation determining one's freedom of activity, was read back onto the individual who was considered to be free insofar as they were proprietor of their own person and capacities. Women, slaves, servants and workers were thus denied legal personhood on the conceptual basis of being 'dependent on the wills of others' (Macpherson, 1962: 15), that is, unable to transcend their material entanglements to make 'rational' decisions.

Stallybrass and White (1986) study the same time period that concerns Macpherson (1962) to find that the bourgeois subject defines itself through the

exclusion of the 'low', wherein the 'low' is the racialized other, the female and the dirty masses all at once. These are constructed as polluted by mutual association and by the metonymic association of each with filth, the lower stratum of the body and materiality simply put – the bourgeois deny their carnality by projecting their immanence onto the 'hedonistic' masses. Stallybrass and White's (1986) historical particularist and psychoanalytical method is in certain tension with Graeber's comparative one, yet their studies dovetail insofar as a logic of encompassment/exclusion may be observed at work in the attribution of 'immanence' (vs. 'transcendence') to the women, slaves, servants and workers who cannot be property-holders on account of their materially entangled nature (significantly, neither could they represent themselves – being relegated to class-in-itself). That the patriarchs of the proletariat managed to distinguish themselves as 'individuals' first is no coincidence; their elevation was one and the same with 'owning' and representing their women, and servants or slaves if they had any. And, to the extent that women did propertize themselves, it was at the expense of servant, slave and proletariat women who were made to do the dirtiest work. When the white underclass propertized itself in turn, it was in contradistinction to racialized others, hence 'whiteness as property' (Harris, 1993). This material is now fairly familiar, yet what has not been sufficiently contemplated is how identity-based rights involve the same combination of encompassment and exclusion as the original franchise.

PROPERTY, IDENTITY, CLASS

Beverley Skeggs (2004) also asks: how does propriety become property? and discovers by another method, a study of contemporary class in Britain, that claiming selfhood not only brings 'into effect entitlements denied to others, it is reliant on others being made available both as a resource and constitutive limit' (Skeggs, 2004: 152). In so doing, she intervenes in Bourdieu's (1984) theorization of class 'distinction', attending to the co-constitution of race, class and gender throughout her work. She points to the advent of liberal multiculturalism as a particular historical moment when new forms of property (and its exchange) were created, yet only for those with prior forms of entitlement who could mobilize the culture (of themselves or others) as a resource (property) in self-formation (see also Davies, 1994; Strathern, 1999). At this moment, historical exclusion from property becomes rights-bearing property in itself, yet a residual underclass is nonetheless created, a constitutive limit being nonetheless required.

The anarchists in my own research are against the state and its politics of representation, yet the logic and subjectivity of legal rights have become culturally mobile in activists' concern about diverse persons being 'excluded' versus 'represented' in social movement spaces. Skeggs' (2004) insights are also relevant in this milieu: the degree to which a person enjoys material wealth and power, is master of their own

activities, and may relate to the self as does the 'possessive individual', determines the extent to which a person may access forums to speak their pain in search of compensation, be recognized as worthy of having that pain, or be willing and able to identify with pain (make it their defining property) in the first place (Skeggs, 2004: 57–60). Beyond the question of material resources necessary to mobilize 'identity' in one's favour, people who do not experience suffering as exceptional do not have the subjectivity necessary to propertize themselves via experience of pain. As a consequence, identity-claimants who enjoy substantial material resources, and thus successfully activate identity-related rights, effectively encompass and exclude materially disadvantaged would-be claimants from identity-related rights in the process (e.g. working class women, queers, trans people and people of colour).

Here, the double movement of exclusion and encompassment is generally obfuscated by a slip of statistics and reality invited by (top-down) state governance, compounded by the presumption that one's subjective identification as 'oppressed' will correspond in a linear fashion with one's objective circumstances. For example, both the fact that 'women' experience psychological and physical violence that is specific to women (e.g. misogynist rape) and also *on average* earn less money than men are mobilized to claim specific rights for 'women'. Since wealthy women who experience relatively less material violence inevitably benefit more from these rights than less well-off ones, because they enjoy the institutional resources and subjectivity required to activate such rights, they thus appropriate the suffering, pain and exclusion of women-on-average when garnering compensation for it, at the expense of working class women. The same thing happens when 'racism' comes to stand in not only for violence that is ontologically racial, like being murdered by police on the specific (however unacknowledged) basis of being black, but also for the experience of poverty that is experienced by people of colour *on average*.

Thinkers such as Wendy Brown (1995) and Lauren Leve (2011) have already explored how the mutual constitution of identities is often imagined away as a relationship between an individual and their history and pain, just as material property is a social relation confused with the relationship between an owner and an object. My qualification is that not only is identity-as-property a social relationship vis-à-vis 'all the world' excluded from that identity yet confused with a relationship to one's individual history (as property), it is also a social relationship with all those *encompassed* by the identity, which is confused with a relationship to a collective history that is constructed as shared via compounded confusions of reality and statistics.⁴ In the process, materially impoverished subjects who do not identify with pain themselves, yet who arguably experience relatively greater quantities of pain and material suffering, are effectively encompassed to constitute the semiotic and legal property (entitlement) of identity-claimants.

It is here we come to the long-controversial proposition of the 'particularity of class'. Levelling race, class and gender as of the same order is not a problem because class struggle is 'objective' (and seeks to destroy an antagonist) whereas

identity formation is 'subjective' (and necessarily concerned with seeking recognition), but rather because most other politicized oppression categories besides class are semantically organized around a body feature or practice that is *not* inherently painful (having black skin does not sting one's face), yet which translates into painful experience and treatment by others in the current social order. 'Class' oppression, on the other hand, does not refer to an immutable (semiotic) property, but simply refers to material exploitation, lack and pain.

'Races' will not actually survive the demise of 'racism' (contra Žižek), yet people's bodies will still include different colour skin and diverse genitals, facial hair, and other previously charged markers after the fall of white supremacy and patriarchy. Feminists and anti-racists do not want these attributes (properties) to cease to exist, but simply for them to stop organizing the way others treat them, i.e., they want them to be meaningless, or to take on new positive meanings. The question may be of marked practices instead of marked body parts, yet the logic still holds: queer and trans people do not want their marked practices to stop happening either. When it comes to class the equivalent is not true. People do not want to continue working long hours for low pay yet have this take on a positive or neutral connotation. The notion of 'classism', an imagined equivalent to racism or sexism, involves the notion that the working class should be able to fully assert its identity and goals in a way parallel to how 'women' or 'people of colour' can or should, even though if they did, they wouldn't be working class anymore. If class is particular it is not because the 'working class' uniquely seeks to annihilate its *other*, but rather that it alone seeks to annihilate it-*self*, and this, we might note, is not particularly conducive to the performances of self-valorization and containment that 'good politics' requires.

There do remain features – marked practices – of 'working-class-ness' that working class people value, and imagine taking with them when building a post-capitalist society, such as 'sincerity', 'solidarity' and 'sharing' (see also Skeggs, 2011). Crucially, these are collective value practices rather than values that can be imagined as embodied by one individual. Also crucially, these use-values, which have no exchange-value in the bourgeois arena, may also be found within indigenous, black or other racialized groups, or within networks of reciprocity among neighbourhood women. As collective value practices within these groups, they cannot cross the threshold into exchange value in the bourgeois sphere either. The fact that the immutable properties that come to stand in for 'woman' or 'person of colour' can, however, mean that within relevant fields of exchange, these properties can be recuperated to stand in for the practices themselves in order to valorize the self. The (processual) *practice* of sincerity cannot have exchange value, but a (reified) *symbol* for it can, which is what we see happening in the game of 'good politics' wherein (legibility as) 'woman' comes to stand in for 'superior communication style', or (legibility as) 'indigenous' comes to stand in for 'superior relationship to the land'. To use the activist lingo, oppressed groups may indeed be characterized by 'cultures of resistance', yet the potentially subversive content

of these 'cultures' (the sincerity or sharing itself) is necessarily liquidated at one and the same time as group members adopt 'sharing' or 'sincerity' as a property of their individual persons. This is especially true if they then proceed to valorize themselves vis-à-vis one another by similarly reifying as many other use-values as possible, which is what the epistemological regime cum logic of exchange in their anti-oppression workshops encourages them to do.

ANTHROPOLOGY AND PROPERTY

By now, valuable aspects of historical materialist analysis have been integrated within the discipline of anthropology to the extent that these are taken for granted – anthropologists refer only to trimmings of the beard if identifying as 'post-Marxist', as many do. It is therefore important to understand slips of semi-otic and legal property for more reasons than one: beyond ordering the activities of anarchist militants, the dynamics of identity as property arguably influence the activities of anthropologists. This will be my final provocation.

As feminist and postcolonial revisionings of 'class consciousness' politicized the positionality of the ethnographer, those engaged in the debate around 'writing culture' suggested we now learn by shifting back and forth between different lenses provided by differently positioned researchers and theoretical analyses, in lieu of seeking a singular method (Marxism included) for uncovering a static and accessible objective truth (see Behar and Gordon, 1995; Clifford and Marcus, 1986; Mascia-Lees et al., 1989). My own method in this piece is partially inspired by this directive. Grappling with this new epistemology, new challenges presented themselves: both anthropologists and the (often) indigenous activists they sought to support cited 'identity' as both end and means, wherein other anthropologists such as Leve (2011) began calling on disciplinary peers to question their involvement in a neoliberal 'identity machine'. Many anthropologists continue to feel a strong responsibility to respect the 'self-identity' of research participants and researchers both, however. Others construct an epistemological space where plural 'ontologies' serve to resolve the problem(s) of truth and perspective (consider e.g. Graeber, 2015; Todd, 2016). Still others mobilize 'affect' as a category to reintroduce the material (see e.g. Gregg and Seigworth, 2007) – yet the new materialism struggles to avoid the word.

In other words, most anthropologists now rightly reject deterministic forms of Marxism, yet at the same time may entertain some of Marxism's most 'vulgar' formulations insofar as they advance the notion that the only valid representation is the self-representation of insiders – an especially pernicious notion in an economy where possessive individual selves have privileged access to identity as property. Marx's strong theory of ideology, wherein ideas exist in complex relation to the competing interests of power blocs, is thus foregone for the simplicity of utilitarian explanations previously reserved for 'primitives', wherein one's

ideas are imagined to directly reflect reality. Indeed, the very fact that Marx's concept of *revolutionary* class consciousness vs. *false* consciousness is carried forward to pertain to oppressed identities should be the subject of further study – and I suggest this study be ethnographic.

Ethnography was my process, but it is not the only road to Rome. Jacqui Alexander's (2005: 6) argument that the 'will to divide and separate' resides in the 'archeologies of dominance' resonates with my own, as does Holloway (2005) in his critique of Marx's own fetish (the 'working class'): we 'overflow the bounds of any concept' (Holloway, 2005: 151). Even Foucault, known for a different sensibility, suggests that the challenge today 'is not to discover what we are, but to refuse what we are' (Foucault, 1983: 216). Much of what I point to is not new, yet broad interdisciplinary oversight with respect to the important role of property in the interdisciplinary 'class' vs. 'identity' debate is arguably due to the failure of diverse theoreticians to enter into conversation with one another and recognize where *they* connect – another threatening dialogical engagement. Perhaps it is only by sacrificing the property that is mobilized by each theorist to speak for and above the others according to the logic of academic knowledge production (e.g. 'sociology', 'anthropology', 'class', 'race', 'intersectionality') that may we hope to move through (not transcend) the 'class vs. identity' impasse.

Whether or not anthropologists participate in the 'identity machine', valorizing themselves and others with identity as property much like the activists involved in my study, they are nonetheless caught up with their own exclusive disciplinary property. The holistic and dynamic rendering of 'class' within anthropology continues to function as an important corrective to other, more reductive approaches, yet it is possible that anthropologists also have other, less noble reasons to de-prioritize (economic) 'class' as an analytical category. After all, anthropology's own double-movement of exclusion and encompassment – its pretensions to transcend all other disciplines and subsume them as lesser beings at once – encourages us to look down on 'class' (and the sociologists that study it). Culture is higher up the taxonomic hierarchy than class: we anthropologists have a more transcendent view and are interested in more overarching questions. Culture – now often euphemized as 'subjectivity' – is *our* property, in all three senses of the word: culture is what makes us what we are, what authorizes us to speak and represent truth just as it subsumes other categories, and our trading in these representations (as property) is what makes us a living. Culture is also arguably a thinly veiled reiteration of 'race', which became 'ethnicity', which became 'identity' – a performance of (and in contradistinction to) 'class' all the way down. Touching this is, of course, taboo.

DEDICATION

In memory of David Graeber (1961–2020). This one is for you (and the 'grand tradition') David, may we argue for years to come.

Notes

- 1 *The German Ideology* (1978 [1932]) and *Pre-Capitalist Economic Formations* (1964 [1858]) also discussed pre-capitalist societies, but only Engels' *Origin* was published at the time.
- 2 The passages where Marx clearly separates 'base' and 'superstructure' (Marx 1972 [1859], 1978 [1852]) quickly become tacit truths within Marxist debate; see also Williams (1977: 61–77).
- 3 Dumont (1970) studies the Hindu caste system; this phenomenon may also apply within the logic of 'pollution' among many pre-colonial peoples, which, as Mary Douglas (1966) illustrates, has as much to do with mixing (abstract) categories as physical contamination.
- 4 Brown (1995) comments in a footnote (60, fn. 11) that politicized identities come to include poverty and class-based violence, which is the point I develop.

Art

Gail Day, Steve Edwards and
Marina Vishmidt

There has recently been a noticeable revival of interest in the field of art for left-wing politics and expanded versions of Marxism. This is in stark contrast to the anti-Marxist wilderness that characterised the decades at the end of the twentieth century, which accompanied the collapse of the spirit of '68, the repression of emancipatory and labour movements, the end of the cycle of anti-colonial struggles, and the rapid consolidation of the neoliberal project following the 1973 oil crisis. With the new millennium, exhibitions have included artworks offering illustrations for *Capital*, re-inscribing Marx's words, or involving *Capital* reading groups. The centrepiece of the Venice Biennale in 2015 was a programme of public readings by actors, alternating English and Italian, working word-by-word through all three volumes of Marx's major opus. This new 'structure of feeling' – to use Raymond Williams' term (Williams, 1979, 1986) – became increasingly evident from the mid 1990s. The shift indexes the rise of anti-capitalist and anti-neoliberal sentiments, as well as the return of a broadly materialist and system-critical approach to issues of equity in race, gender, sexuality or coloniality that were formerly couched in terms of discursive identity. Similar concerns have erupted in art writing. The changes have been summarised by Angela Dimitrakaki and Kirsten Lloyd as 'a prioritisation of materiality over textuality, action (and often activism) over discourse, relationships over fragmentation, observed reality over appropriation, biopolitics over micropolitics' (Dimitrakaki and Lloyd, 2015: 1).

These same developments in art have also been widely criticised from broadly left and liberal perspectives. They have been seen as shallow gestures; as

decorative ‘art-washing’ of corporate sponsorship by oil, arms and finance; or as neoliberal ‘soft’ power. Critical gestures in art have been viewed as instrumentally feeding governmental agendas for increasing public participation in art, for proving art’s social impacts, or – as was the case with the Istanbul Biennial before the crisis – for securing access to international trade blocs by presenting the prevailing order with a more ‘liberal’ face. These criticisms point forcefully to the complexity and ambiguity of art’s various institutional lives. However, politico-philosophical assessments of the art itself (or the curation) can be harder to call. Paradoxically (or dialectically), art’s leftward drift could be understood, as some have argued, as indicative not of the left’s revival, but of its very opposite: its marginalisation from social and political influence (Bürger, 1984). Alternatively – and following observations made both by Williams and Lucien Goldmann on the interrelation of artistic and social transformations (respectively, in the early twentieth century and the 1960s) – the mood in art might be a barometer of as-yet-to-fully-emerge social currents (Williams, 1989a; Goldmann, 1970 [1966]).

‘Art’ (referring to the domain once known as the ‘visual’ or ‘plastic’ arts) has itself undergone fundamental transformations in practice and theory in the period since the 1950s. As Theodor Adorno said in opening his *Aesthetic Theory*: ‘It is self-evident that nothing concerning art is self-evident anymore’ (Adorno, 2007 [1969]). In the West and beyond, art practice was fundamentally transformed, no longer limited to the craft traditions of painting and sculpture, while the optical bias of visual experience was qualified. More recently, there has been growing interest in the archive and documentary, in lens- and time-based art; in performative, participatory, and relational practices; in collectivist and activist approaches. Art can now be post-object, post-medium, post-studio, post-digital, post-conceptual, post-human and post-relational. Today, the high-modernist formalism of the 1960s appears very much of the past, and the questions posed by *Aesthetic Theory* require answers rooted in quite altered terms of the relation between autonomy and heteronomy for art (Day, 2009).

Overlooked radical practices have also been recovered. Some current approaches seek to reinvent earlier moments of ‘revolutionary’ or proto-revolutionary art, such as those which sought to question the separation of art from life (early Soviet Productivism) or to pursue the ‘Brechtian’ or ‘Boalian’ impetus to overcome the distance between performer and audience. (As an example, the 2009 Istanbul Biennial was organised by a collective which identified as Marxist-feminist, and drew its title, *What Keeps Mankind Alive?*, from *The Three-Penny Opera*, by Brecht, Elizabeth Hauptmann and Kurt Weill.) The increased presence of photographic practices in the field of art has fortified the re-emergence of forms of ‘realism’. While some thinkers still closely identify realism with naturalism, others understand it as a ‘critical’, ‘relational’ or ‘epistemological’ project (again, Brecht is important), and refuse to see it in terms of a stand-off with ‘modernist’ techniques (Jameson, 1977).

Nevertheless, despite all this, art and art writing have generally remained somewhat aslant from – or in parallax with – Marxism *per se*. There remains

something of an absent object for ‘Marxism and art’ – or, if not exactly absent, then certainly elusive and contested. This is because we are confronted with problems that are political and methodological at once. To what extent is an entry on ‘Art’ to be a discussion of art as a practice, art history, art theory, or aesthetics? While they overlap, each field pulls in different directions, and each constitutes its ‘objects’ and concerns distinctly.¹ It used to be said that the problem of the conjunctions ‘art and society’ or ‘art and history’ was in ‘the *and*’. The problem ‘Marxism and art’ not only embraces these conjunctions, but the heuristic focus also becomes entwined with charged historical judgements and with practical political problems. The waters are further muddied because communist and socialist activists have sometimes treated art as irrelevant to the cause of social transformation, and the pursuit of aesthetic questions by Marxist intellectuals has been diagnosed as compensatory activity for political disillusionment.

Does a Marxist approach mean identifying Marxist artists? And, how far can ‘Marxism’ (even if understood in heterodox terms) be stretched before it ceases to be ‘Marxist’? Do artists who are Marxists make Marxist art? Clearly, things can’t be reduced to such crass identifications. Indeed, Marx and Engels suggested that there could be a disjunction between an artist’s ostensible politics and that artist’s ability to generate important insights into the social relations of capital (the touchstone was Balzac’s *La comédie humaine*). But, equally, it would be absurd to treat their observation as itself an unchangeable recipe, thereby dismissing the insightful work of politically thoughtful artists simply because they are committed to social transformation. The collapse of rigid orthodoxies and ‘productivist’ male-centric perspectives, which took root during the Second and Third Internationals, has brought many advantages, but it has always been difficult to determine where the lines are marked between fossilising, losing, continuing and reviving Marxist thought.

FRAGMENTS OF A(N IMPOSSIBLE) HISTORY

Writing an entry on art is an impossible task, because as we have indicated it is difficult to know where to draw the boundaries. From William Morris through the historic avant-garde, minimalists, Conceptual artists and many contemporary artists, the ideas of Marx and Marxism have played a crucial role in modern art practice. As Perry Anderson argued, the tradition of Western Marxism has been partly shaped by an engagement with art and aesthetics with philosophers such as Lukács and the Frankfurt School thinkers, Della Volpe, Sartre and Althusser all making important contributions (Anderson, 1976). In this entry we focus on art theory, rather than art practice, which would require its own review. We survey a broad field, before focusing on just three issues prominent in current debate: economic subjects and labour; commodity and value; and social reproduction.

Artists and writers on art, from historians and critics to publicists and propagandists, can be found participating in almost every organisational form and internal split of the international workers' movements. Famously, Marx himself wrote little on art, although he intended to do so, and the *Grundrisse* contains his famous comments on ancient Greek art (Marx, 1973). More generally, his work is replete with artistic allusions and plays with aesthetic modes, evident in Margaret A. Rose's attempt to reconstruct Marx's approach to art in her famous study (Rose, 1988). Pierre Macherey noted that Marx and Engels 'showed a constant interest in the subject, without ever dealing with it in its own terms', by which he meant that they did not deal with art systematically and methodologically (Macherey, 1978). In contrast, O. K. Werckmeister argued for a consistent account of the relation between art and ideology in the work of Marx (Werckmeister, 1973).

In the period of the Second International, Georgi Plekhanov (1974) and William Morris (2014) wrote on art (while Franz Mehring's contributions on literature, particularly his *Lessing Legend* (1938), also shaped debates) and painters and sculptors across Europe responded to the condition of labour. Art was significant for this generation of revolutionaries, exemplified by Rosa Luxemburg's (2013) polymathic interests, while Trotsky made time, during war communism and the New Economic Plan, to intervene in art debates (Trotsky, 1991) and Gramsci (1985) attended to Futurism. Lenin himself reputedly remarked 'What a fascinating subject art history is and how much there is in it for a Marxist' (Hadjinicolaou, 1973), while for Georg Lukács, the art historians Alois Riegl and Max Dvorak counted as 'the greatest *historians* of the nineteenth century' (Lukács, 1971 [1923]). Dadaists, Constructivists, Surrealists, Mexican mural painters and assorted members of the neo-avant-garde all proclaimed allegiance to Marxism. But little of this alters Macherey's central observation.

Dedicated Marxist studies of art took off in the 1930s, an inauspicious moment given the formalisation of the doctrine of 'socialist realism' at the Soviet Writers' Congress in 1934. Figures such as Max Raphael (1968, 1979), Friedrich Antal (1948, 1966), Arnold Hauser, Francis Klingender (1947) and Millicent Rose (1946) wrote detailed studies on the relation of art to society, employing a base-superstructure model (which was not always as crude and reductive as later generations imagined). Some communist historians reconstructed a history of art based on the national-popular, focusing on what they saw as proto-'realist' artists, such as popular printmakers, Goya, Hogarth, and Courbet. Hauser's *The Social History of Art* (1951) countered the formalist presumptions of the discipline, pointing to an opposing realist dynamic running through art's history. From the late 1930s and 1940s, 'Trotskyist'-influenced writing by critics and historians also emerged. These writers, including Clement Greenberg (1986), Meyer Schapiro (1979) and Harold Rosenberg (1960) in the USA, and Mário Pedrosa (2015) in Brazil, became among the very first Marxists seriously to address modern art and the art of their own time. The *Manifesto: Towards a Free Revolutionary Art* (Rivera et al., 1970 [1938]) that Trotsky authored with

André Breton and Diego Rivera, and a letter he published in *Partisan Review* the same year (Trotsky, 1970), were key, but it was Trotsky's sustained internationalism that particularly attracted these thinkers.² Released from the constraints of socialist realism, for them modern art was valued as internationalist and for its non-instrumentality – its freedom from both propagandistic and market-driven ends. The approach that had emerged within the official communist parties might roughly be characterised as a humanism committed to recovering the progressive aspects of bourgeois art (aka 'realism'); the horizon of socialism, it was believed, would overcome alienation and liberate human creativity. In the post-war period (especially in the 1960s to 1970s), many core assumptions of communist humanism were challenged. Critiques focused immediately on the then-prominent Existential variants, and were often conducted alongside challenges to the 'liberal humanist' values championed by the USA during the Cold War. John Berger might be seen as something of a transitional figure, between the earlier humanist approach (he was close to Antal) and the reanimation of Marxist art theory during the 1970s (Berger, 1965, 1972a, 1972b).

In 1973, Nicos Hadjinicolaou remarked: 'Today art history is one of the last outposts of reactionary thought', pointing to the connoisseurial antiquarianism and formalism that still dominated the discipline (Hadjinicolaou, 1973: 4). Its founding concepts – 'history of style, artistic biography, and the tradition of imagery (or iconography)' – typically treated art as independent from society and 'history as mere garnish' (Forster, 1972: 459, 461). Marxism turned out to be centrally important in reshaping the situation, particularly in Germany, France and the Anglophone world. It intersected with the resurgence of liberation politics, decolonisation and anti-war movements; reverberated with debates in literature and film, with poststructuralism and psychoanalysis, and with history from below; and was fuelled by the waves of cross-national translations and retranslations. A new 'social history of art' recovered, reconstructed and extended earlier Marxist studies.³ Gramsci, the Frankfurt School, Benjamin, Vološinov, as well as Althusser and other contemporary Marxist thinkers were important for this project. Feminist scholars made major interventions into these debates (Duncan, 1993; Parker and Pollock, 1981; Pollock, 1982: 2–21). Scholars rediscovered critical and revolutionary moments in art, but also considered the theoretical relation of art to history, ideology and representation. As with all serious intellectual formations, there was a great deal of variation in approach. Some tended to practise a type of ideology critique that treated art as a specious variant of bourgeois beliefs or interests; others tried to understand artworks as social 'condensers' (via Freudian condensation), which could provide access to historical values and which could cut against predominant ideologies. In this regard T. J. Clark noted, in debate with O. K. Werckmeister, that works of art weren't just bearers of pre-existing ideologies; they could also work actively with, on or through existing values (Clark, 1976a). During the 1980s and early 1990s, Marxists wrote major historical studies on art and the French Revolutions of 1789, 1830 and 1848

(Clark, 1976b). There were extensive debates on British landscape painting and agrarian capitalism; and the question of French urban modernity was addressed, wherein Baudelaire's 'The Painter of Modern Life' (1964) was spliced with Schapiro on Impressionism (1979) and Benjamin's account of bourgeois consumption (Benjamin, 1976),⁴ while Molly Nesbit's *Atget's Seven Albums* (1993) shifted the focus from the grand boulevards to the workers' city. While individuals continue to produce such studies, in recent times there have been no sustained debates of this earlier type.

Work influenced by the Frankfurt School criticised the commodity status of art, while simultaneously insisting that autonomous art might serve as a placeholder for critical value. More prominent in the German academy, in the Anglophone context work in this vein came increasingly to the fore in the 1990s. Theoretically (rather than historically) focused, it was especially associated with critical writing on current art (Martin, 2000, 2007; Osborne, 2001, 2013, 2018). Meanwhile, Pierre Bourdieu's writings – his considerations of art's role as a marker of social distinction and his notion of 'symbolic capital' – became important for those engaged in studies of art's institution (Bourdieu, 1984). In the early twenty-first century, as we will see later, writers from the Italian workerist and autonomist lines of thought have become influential.

There are some notable features to the current conjuncture. To refer to 'the economy' was once to invite the charge of being a vulgarian; now, few seem afraid of saying: 'It's the Political Economy, Stupid'.⁵ The acknowledgement of the 2008 crisis only confirmed some longer-running developments, from the impact of the New Economic Criticism's return to the classic texts of economic thought, through to Allan Sekula's artistic attention to the 'dismal science' (Carlyle's moniker for political economy) (Sekula, 1995). The form–content dyad that underpinned the 'realism versus formalism' debates of the early to mid twentieth century has been supplanted by Adorno's conception of form as sedimented content (Adorno, 2007 [1969]). Where earlier efforts to broach the relation of Marxism and art typically focused on struggle or oppression, emphasis turned to examining art's commodity status, and has paralleled a reorientation away from a focus on social agents and actors towards capital's more abstract, structural and systemic aspects. Many pressing questions associated with the New Left generation have also been displaced. For example, discussions of the interpretive problem of 'mediation' (how precisely to understand the relationship between an artwork and its social context) have ceded to the principle of 'immanence' (Spinoza via Deleuze). Meanwhile, closely related debates over the base-superstructure relation have given way to the detecting of cultural homologues with capital's value form.⁶ Likewise, commodity form, social reproduction, 'primitive accumulation', or real and formal subsumption have again become live issues in discussions of contemporary art. It should however be noted that a number of the debates that have re-politicised the art field have been introduced via 'post-Marxist' writers, such as Chantal Mouffe or Jacques Rancière.

Arguably, the differences of opinion involved often rest on the wider displacement of historical research by theoretical concerns. The questions asked by a social history of art differ from those posed by a social theory of art, even where they are, respectively, theoretically and historically informed. The relative decline in Marxist historical studies of art (currently, Marxist attention focuses largely on recent art) contrasts with the rising importance of historical subjects for artists. In certain ways, we can observe how, for the past several decades, Marxist art history performed the role of vanishing mediator for a loose Foucauldian historicism.⁷

In the following, we will highlight some key debates/themes in the field charted so far: commodity/value, economic subjects/labour and social reproduction.

COMMODITY/VALUE

Drawing on Adorno's social ontology (2007 [1969]), Peter Bürger's theory of the avant-garde and the writings of Guy Debord, a broad critical consensus developed that saw art as incorporated into the entertainment industry of spectacular late capitalism (Debord, 1994). The postwar 'neo-avant-gardes' were seen as depoliticised echoes of the earlier 'historical avant-gardes' (Bürger, 1984; Foster, 1996; Buchloh, 2001; Davis, 2013). Others have modified this outlook by identifying emancipatory strands in postwar art, seeing how critically acute practices reflexively internalise and thematise their commodified status or context (Foster, 1996; Buchloh, 2001). It has then been argued that critical practice was in turn fatally compromised by the institutionalisation of institutional critique. The suspicion of recent critical art *sui generis* pervades much writing. Certainly, there are important developments to be accounted for, such as art's roles in investment, urban gentrification, and the siphoning of public resources into private hands (Shaked, 2015). However, taken in isolation, such accounts can paint a dystopian picture in ways that ignore the unpredictable and active pressures involved in social processes. This interplay between emphasising the commodity and pointing to resistive exceptions continues.

An approach influenced by value-form and communisation theories has also emerged, drawing on Isaac Ilyich Rubin, Alfred Sohn-Rethel and Moishe Postone. Perhaps the strongest has been offered by Daniel Spaulding, who employs a *Capital*-centric lexicon to retell the history of the avant-garde from the mid nineteenth century to the 1970s as an activity 'continually defying its relapse into identity with the value-form' (Spaulding, 2014). However, because the cycle of class struggle that had shaped art's negations ended in the 1970s, art once again risks becoming fully subsumed under capital. Yet, as a dialectical thinker, Spaulding sees the shadow of the radical avant-garde persisting impossibly in the present as an ever-recurring image of hope.⁸ Marina Vishmidt looks at the form of value as a production of subjectivity which culminates with the

normalisation of the 'speculative subject' of art and of finance as the precarious 'subject' negotiating capitalist extraction. The imbrication of autonomy and heteronomy signalled by Adorno shifts to a new stage. Vishmidt's approach, following Marx, emphasises the form of value as a social relation, or as a heuristic of social relation (Stakemeier and Vishmidt, 2016; Vishmidt, 2018).

For some readers of Marx, there are problems in the accounts inspired by the Frankfurt School and the Situationist International. The argument of art's commodification widely deploys the concept of use-value as a historically receding entity, overtaken by exchange-value. Gail Day argues that Marx's account of the commodity's dual nature is considerably more nuanced, and that the theory of the commodity itself falls apart without the understanding of the interplay of use- and exchange-value (Day, 2011). Indeed, in certain critically important instances (for example, for understanding the distinctive commodity character of labour power), use-value retains heightened importance. There is no commodity form without the use-value of labour power. Additionally, political struggles against capital's frontiers are fought in defence of the use against its reduction to value; to 'de-commodify' is to challenge the rule of value over social life. Debates around these questions turn on the dialectical weighting given to the commodity's two aspects, or on whether to emphasise capital intensification or to focus on its limits.

Dave Beech likewise asks probing questions about the commodification thesis and gives a rigorous technical account of what kind of economic phenomenon art might actually be (Beech, 2015). Reading Marx and mainstream economics, Beech demonstrates that throughout economic literature art appears as an exceptional case. In strictly Marxist terms, he argues, it makes little sense to describe art as 'commodified'. For Beech, effective analysis of an artwork's economic status would have to proceed on a case-by-case basis. As Nizan Shaked notes, Beech addresses 'the double ontological condition of art as both an object of collective symbolic value and a hoard of monetary value, since the two operate in mutually exclusive spheres, yet function to constitute one another' (Wikstrom, 2015; Lütticken, 2016; Shaked, 2018). Even in those instances where art is produced directly for the market it fails to conform to the laws of value. Bernes and Spaulding, in a largely appreciative review, argue that Beech mistakenly treats all commodities as capitalist in form and that he confuses commodification and subsumption (Bernes and Spaulding, 2016). Meanwhile, Vishmidt proposes that while art may fall outside the laws of value at the level of production, and may not always be produced as a commodity, it becomes one in the market, and that the question of exceptionality can be read symptomatically in order to connect art to other, economically 'anomalous' social forms (Vishmidt, 2018).

As these discussions have developed in more Marxist terms, they have largely focused on how to employ Marx's categories. Comprehensive historical studies of art under capitalism, which could inform and complement these debates, remain largely absent. Many compelling critiques, for example those of art as

immaterial labour, remain at a level of abstraction that disputes technical categories but has less to say about the actual character of contemporary work (Chukrov, 2010; Roberts, 2015).

ECONOMIC SUBJECTS/LABOUR

Although ‘the retreat from class’ that characterised the late twentieth century is still in evidence, the question of labour has nonetheless returned to the fore. Artists, critics and curators have attended to migrant labour, to gendered and unpaid reproductive labour, and to super-exploited and racialised labour. Large exhibitions have often attended to capitalist globalisation, achieving their effects through juxtaposition and assemblage of multiple specific locales, with the work of curators such as Hou Hanru or the late Okwui Enwezor typifying this approach. The standard criticisms of biennials notwithstanding, these occasions summon new subjects, dramatise the violence that runs through the system, and at times point to other possible forms of life. At its best, the ‘montage mode’ helps emphasise conjunctures and tensions, or provokes viewers to intuit interconnections. Still, while social and geopolitical unevenness is often well highlighted (both by curatorial projects and by particular artworks), articulations of capitalism’s systemic combined character has proved much more elusive (Day and Edwards, 2019).

A focus on artistic labour as such has also been prominent. This is, in certain ways, a reiteration of Walter Benjamin’s argument in ‘The Author as Producer’ (Benjamin, 1999); the difference is a move away from the productive, proletarian subject to economic subjects who are not reducible to the capital-wage labour nexus. Centrally, the approach has focused on post-Fordist subjectivity, characterised as affective or immaterial labour, drawing on Maurizio Lazzarato, who suggested from the 1970s modern economies shifted from material and productive factory work to ‘immaterial’, ‘intellectual’ or ‘aesthetic’ activity (Lazzarato, 1996). The central claim is that late-capitalist artworks model new forms of subjectivity for these new labour regimes. Process-oriented relational practices are seen to parallel the move from production of commodities to services, requiring a ‘flexible personality’ whose initiative and subjective engagement is valued (Holmes, 2002). While Lazzarato later qualified this perspective, alert to its potential for simplification, artists and art-theorists have been drawn to this account of their experience. It has been argued that cultural workers are at the cutting edge of work casualisation and precarity, making cultural work a privileged zone for resistance. Subjectivity is said to be its key resource as affect is mobilised in the ‘knowledge economy’. Influential here has been the ‘post-workerist’ ontology of Michael Hardt and Antonio Negri, with its emphasis on the creative co-operation of the ‘multitude’ as already prefiguring communism, while subject to the depredations of a purely parasitic force of capital.

The category of 'immaterial labour' used to connect artistic work, intellectual work and caring labour alike, became particularly ubiquitous in these debates in the first decade of the twenty-first century, adopted as a ready-made if superficial means of politicisation for artistic activity.⁹ Some writers emphasised the creativity, flexibility and problem-solving abilities of the 'cognitariat' or the 'virtual class'.¹⁰ Important here was also the work of Paolo Virno among the post-operaist current, for his neo-Arendtian intervention in the discourse of 'multitude' around 'virtuosity' and the politics of production in public, without an object, that linked the political dimension of all 'symbolic' labour (insofar as it became hegemonic for the capitalist workplace *tout court*) and the space of contemporary 'post-object' art.¹¹ However, Hito Steyerl dramatised this situation less affirmatively as 'the nouveaux poor, trying their luck as jpeg virtuosos and conceptual imposters, as gallerinas and overdrive content providers' as the 'shock workers' of the new economy (Steyerl, 2011).¹²

It is a major contribution of the new forms of political thought (and art) that they counter the limited 'productivist focus' of older orthodox Marxisms, whose emphasis sometimes ran close to an industrial sublime and heroicised male worker. Yet while the considerations of new forms of labour around the globe are important, accounts can also be one-sided, ignoring large sections of the contemporary workforce, whether in more traditional forms of waged work or the newer, but tedious, labour of data-entry.¹³ New technologies are refashioning work, speeding up flows, lengthening the working day and intensifying exploitation – but these dimensions are less frequently addressed in art. Perhaps this is because artists are universalising from their own largely precarious positions. In any case, changes to the make-up of work in the Global North are not independent from the production forms employed in the majority world. The discussions in art have tended to evade the international division of labour, subtracting contemporary 'immaterial' labour (artistic or otherwise) from the web of social relations in which they exist both in 'national economies' and on a world scale. For these reasons, as well as a shift to more 'identity' and ecology-focused approaches to labour and subjectivity in contemporary art and its discourses, the category of 'immaterial labour' as a watchword for the politics of cultural work has to some degree been eclipsed in recent years.

Despite this new concern with work, attention to the artistic labour process has been less prominent. William Morris (2014), Boris Arvatov (2017 [1926]), Walter Benjamin (1999), Lu Märten ([1929] forthcoming) and Giulio Carlo Argan pioneered research into art and technique. For example, Argan addressed the division between mental and manual labour in the Renaissance and Baroque (Argan, 1946, 1989). In 1983, Allan Sekula's major study of 'the emergent picture language of industrial capitalism' took on the subject (Sekula, 1983). Since then, in *The Intangibilities of Form*, John Roberts has argued that the dialectic of skill and deskilling has been central to the practice of the avant-garde. Roberts elaborates a 'labour theory of culture' with Marcel Duchamp at its core (Roberts,

2008). Luiz Renato Martins draws on Argan to explore how the artist's perceptual sensations and working method translate capitalist violence into surface matter (Martins, 2017).¹⁴ Nevertheless, labour has been more often represented in art than art has been understood as a labour process.

SOCIAL REPRODUCTION

Another related dimension of the return to Marx and Marxian categories is the reference to social reproduction, which has become the main way that Marxist feminist themes have been taken up in contemporary art. In many instances, this has provided a new lexicon for the re-reading of histories of feminist art and of practice, such as the works of Mary Kelly, Martha Rosler, or Jo Spence, to name just a few well-known Anglo-American figures. This shift in focus was likewise involved in the renewed attention to the 'economic subject' cited earlier, a subject that is pre-eminently feminised (and, latterly, queered and racialised). This has prompted a reevaluation of practices that feminist theoretical trends since the 1990s had positioned largely as *discursive* or *ideological* interventions in the normatively male institution of art as *material* instead.¹⁵ Hence, the social reproduction perspective was also generative for new feminist analyses that shifted the lens from a symbolic and discursive reading of gender to a systemic one where it appeared as a form of (uncompensated) labour essential for the reproduction of capitalism.

Picking up from the orientation to the categories of immaterial and affective labour which have been circulating in politicised art circles since the turn of the century in the appropriation of post-workerist discourses, 'social reproduction' has become an emblem of intersectional feminism as it crosses over with the field's recent attention to and identification with both the theories and politics of labour. Often invoked is Silvia Federici, and her decades of work as activist and theorist of the 'politics of reproduction' – starting from the 1970s emergence of the international Wages for Housework movement – which held that unwaged domestic labour is productive labour inasmuch as it reproduces the commodity of labour power, and should be waged accordingly (a tactical demand that was often misread as an endorsement of the gender division of labour and the capitalist discipline of the wage alike). More recently, the highly systematic and Althusser-influenced approach to social reproduction developed by, among others, Lise Vogel and Martha Gimenez, has regained visibility, with the re-issue of their classic analyses by the Historical Materialism book series (Vogel, 2013; Gimenez, 2018).¹⁶ The art field's interest in these histories seemed to lie chiefly in their capacity to open up the category of labour to invisible, unmeasured and affective activities and states (such as domestic work), as we saw with the notion of 'immaterial labour'. Of course, art likes nothing more than to 'open things up' and imagine some vague proximity to the political, which often operates through developing another perspective on the status quo rather than doing anything to

change it. Since the activity of art is socially distinct from the activity of (wage) labour, many in that field have come to understand that the easiest way to achieve this alignment with expanded ideas of labour is to re-assess the field's conditions (Vishmidt, 2017). Given the relative exhaustion of the institutional critique paradigm, and the fondness for the Bourdieuan closures displayed by its more rigorous adherents, the ostensibly more 'utopian' Marxist or quasi-Marxist categories such as social reproduction have been enthusiastically embraced.¹⁷ As with cognitive, immaterial and affective labour, there has been a tendency to see this as the fast way to politicising a field, that (not uniquely – see also academia) regards its conditions of labour as privileged even though (or because they are) precarious. Likewise, competitive individualism generates structural conservatism, even when the rhetoric of the field often tends to left radicalism. Here, the basis of social reproduction of and within the field of art can be identified as global wealth inequality, as a number of artists and critics have been affirming since the financial crisis (Fraser, 2011).

The relationship between production and reproduction has been a core issue for feminist art practices – though one not consistently attended to by feminist art history.¹⁸ The 1970s saw a number of feminist art strategies which operated to de-naturalise both art and work from the standpoint of gender politics, emptying feminised domestic tasks of natural content to fill them with social content in a way that also interrogated the normative aesthetic and institutional claims of art. The depiction of working women or women's work, in and out of the market, constitutes a strong strand in the image politics of feminist art and film. A consistent strand is the serious comedy of domestic labour; during the 1970s and 1980s artists such as Mierle Laderman Ukeles, Margaret Raspé or Leticia Parente have allegorised the entropic qualities of reproductive labour. More recently, we can see practices that take the more Althusserian (or Foucauldian, since the biopolitical is never far away) stance of using the field of art to stake out embodied, affective and formal critiques of reproductive institutions, such as the carceral complex, racialised urban decline and the infrastructural violence of physical and mental normativity. Here it is the absence of any working-class identified subject that indirectly reveals both its marginality or the 'surplus population' of de-industrialised and stigmatised locales.¹⁹

Social reproduction as a politics of marginalised labour and social reproduction as the production of subjects and structures that reproduce the relations of production can both be discerned at work here. A reproductive focus implicates the art institution as a paradoxical 'state apparatus' which both normalises *and* de-functionalises, in Claire Fontaine's (2013) terms, allowing other potentials to emerge as material hypothesis. However, like all institutions whose economic significance is displaced or relatively indirect, art can also act to legitimise existing social arrangements by providing a space of indeterminacy and experimentation. The question of what traction the de-functionalisation of subjectivities and objectivities can have, just like who does the work, cannot be deflected for long.

Ultimately, the critical force of ideas around social reproduction in contemporary art lies in their capacity to displace categories of (economic and political) value, to question the commodity as rule and violence/appropriation as the exception (Gerstenberger, 2014; Moore, 2015). Its weakness, on the other hand, is the *uncritical* embrace of labour as the ontological and political vector that has autonomous value, that can ameliorate the exclusions of capital, rather than being its internal negativity. In this sense, it runs the risk of repeating earlier pitfalls of ‘productivism’ or work/er fetishism, this time through a feminist lens. It also risks re-naturalising (under the aegis of ‘re-materialising’) the association of gendered, queer and racialised subjectivities with forms of reproductive work.

Curiously, a focus on ‘social reproduction’ can also be seen as transitional to certain forms of backlash against Marxism in art. This can happen when the Marxist feminism-inspired category of social reproduction is flipped over into the more individualistic and affect-based categories of representation, and these traditionally tend to do better across the discursive and commercial wings of contemporary art. The phenomenon can be observed in the way the recent pre-occupation with labour, reproductive and otherwise, among politicised artists and art professionals has ebbed in favour of an engagement with vulnerability (Butler, 2015; Pollock, 2018). The shift to a ‘politics of vulnerability’ as the most adequate idiom of collectivity and resistance in a precarious world risks repeating the ontologisation of social relations that the focus on class as a category of struggle in Marxist art and aesthetics was meant to displace.

CONCLUSION: MATERIALITY/ABSTRACTION/CONCRETENESS

For this chapter on ‘art’ we have surveyed some of the historical developments in Marxist thinking and focused on three recent debates. This is far from an exhaustive discussion and we could easily have also considered current thinking on abstraction and materialism, which have also been receiving attention. For instance discussions of the New Materialism, which have a significant presence in discussions of art and design, have underpinned a reassertion of materials, objects and things – typically signalling turns away from Critical Theory and poststructuralist thought (aka ‘textuality’). Marxist debates allow for a more nuanced perspective – in short, one that is neither ‘narrowly textual’ nor ‘narrowly material’. Marx’s thinking developed in critical dialogue with both idealism and existing materialisms. The result was not just a blunt assertion of materiality taken in its everyday sense. Social materiality – non-empirically detectable – is crucial for understanding Marx’s account of value in *Capital*. The abstract category can be closer to actuality, and an apparently concrete one can remain abstract (*Grundrisse*). Marxists, then, need to step carefully through these recent developments in art and distinguish their accounts from these rather different claims on ‘materiality’. While some Marxists might welcome the move away

from the textual, others see traps in the privileging of things/bodies/nature, etc. There is an important politics to making visible, but simply showing, say, working conditions or social reproduction will not guarantee a Marxian-materialist approach – for that we need a serious labour of theory and history.

Notes

- 1 Many of the debates we might encounter have a professional aspect: artists, critics, art historians, and philosophers respond to the pressures and traditions of their own fields, and, although these can be mutually informing, at a deeper level they often proceed with mutual incomprehension.
- 2 The Manifesto was signed by Rivera and Breton alone. It is now accepted that Trotsky wrote the bulk of it, with input from Breton and Rivera put his name to it.
- 3 The Social History of Art is sometimes also called the 'new art history' (especially in the USA), but can also be sharply distinguished from it (UK). For fuller accounts see, Hemingway, 2006: 175–95; Roberts, 1994: 1–36; Orton and Pollock, 1996: i–xxii; Bird et al., 1996: xi–xiv, 3–5; and Day, 2010.
- 4 T. J. Clark's *The Painting of Modern Life* (1985) was the central point of crystallisation for a much wider discussion.
- 5 In addition to Sholette and Ressler's *It's the Political Economy, Stupid*, other exhibitions include: *Commerce* (Paris, 1994); *Capital and Gender* (Skopje, 2000); *ECONOMY* (Edinburgh and Glasgow, 2013). Oliver Ressler's video installations feature interviews with heterodox economists, and Maria Eichhorn's detailed studies of financial transactions have been given prominence in biennials, along with significant global art events such as *Documenta*.
- 6 The word 'form' can sometimes do a lot of work, generating parallels between art-form and value-form. On the problems of analogies and homologies, see Raymond Williams, 1989b; Jameson, 1992; Day, 2011.
- 7 Foucault is currently the most cited authority in the Anglo-American humanities. Much of the work done under his aegis, is however, eclectic and the author-function 'Foucault' serves mainly to legitimise unsystematic thinking.
- 8 For a different account of the temporality of the avant-garde, see Roberts, 2015.
- 9 Hardt and Negri, 2008 [1991], 2009, 2014, 2019; Negri, 2008. See also Wikström, 2012 for a pointed critique of the take-up of the 'immaterial labour' concept in contemporary art and curating discourse.
- 10 Bifo, 2009; Holmes, 2002. It should further be noted that, while these arguments often invoke Boltanski and Chiapello ([1999] 2005), their point is usually misconstrued. See for instance, Holmes, 2008, p. 19. His account includes difference and otherness, the rhizome, proliferation of subjectivities, which are put to work in the 'semiotic economy'. For better or worse, this has nothing to do with Boltanski and Chiapello. What they had in mind was not affective labour, but alienation and the division between mental and manual labour; this is Marcuse and not Lazzarato. The managerial response to the artistic critique involving greater autonomy and less hierarchy has to be inverted to justify the idea that precarious art labour is at the heart of late capitalism.
- 11 Virno, 2010a and 2010b. It should be noted that Virno's concept of the 'multitude' owes more to anthropology and linguistics than to the vitalist philosophical precepts drawn on by Hardt and Negri, and thus his conception carries a more equivocal tone, while equally indebted to the notion of intrinsic (if socially inflected) human capacities for performativity and co-operation – as is, of course, intermittently the case also in Marx's work. For a direct application of 'multitude' to a sociology of artistic labour, see Gielen, 2009 and Gielen and de Bruyne, 2009.
- 12 The translation is 'strike worker' but it is clear this is imagined as a kind of Stakhanovite *sans* wage-work. In the same volume, another writer asserts: 'communication, personalized services, social relationships, lifestyle, subjectivity – today establishes the conditions for the generation of wealth' Marion von Osten (2011: 41).

- 13 The 'creative industries' accounted for one in seventeen of all UK jobs, 5.8 per cent, in 2015, which is significant, but far from determinant, www.gov.uk/government/uploads/system/uploads/attachment_data/file/534305/Focus_on_Employment_revised_040716.pdf (viewed 20.8.2021). Ursula Huws and Kim Moody have undertaken important and detailed studies of the changes (Huws, 2014; Moody, 2017, 2018).
- 14 Beech develops these debates in *Art and Labour* (2020).
- 15 Dimitrakaki, 2018: 'To the extent then that contemporary feminism in art redeploys second-wave concepts, political judgment on these concepts' contextual potential – but also, crucially, their *limits* – must be constantly renewed.'
- 16 See also Arruzza, 2013, Bhattacharya, 2017, and Ferguson and McNally, 2013.
- 17 Having said that, the examination of the labour conditions of the field was always a minority current within Institutional Critique, and has been chiefly practiced by feminist artists such as Andrea Fraser – (*Services*) whose frame of reference however is strictly Bourdieuan, with psychoanalytic elements.
- 18 With specific exceptions – see Angela Dimitrakaki (2013) and Angela Dimitrakaki and Kirsten Lloyd (2015). Siona Wilson (2015), Julia Bryan-Wilson and Helen Molesworth (2003) are among the few other art historians who research the labour politics of art from a feminist perspective, though in distinction from Dimitrakaki, they do not consistently employ a Marxist-feminist optic.
- 19 An interesting addendum to this debate can be found in a recent interview with Benjamin Noys, who distinguishes cinematic representations of the 'working-class' (a sociological category) from representations of the 'proletariat' (a position of nothingness within the system). See Benjamin Noys and Ramin Alaei (2016). This line of thought can be traced back to Brecht's commentary on the limitations of representation – such as photographs of factories – to capture the rule of capitalist abstraction that organises the social conditions with respect to which such documentation would attempt to 'raise awareness'. Allan Sekula's writing has a great deal to contribute on this point as well. See Benjamin, 'A Small History of Photography', 1979 [1931]; Sekula, 1984.

Architecture

Luisa Lorenza Corna

GENERAL REMARKS

Marx wrote very little on art and literature, and almost nothing on architecture. While he never addressed the field as a discrete object of enquiry, in *Capital Volume I* he briefly invoked the figure of the architect as a means through which to explain the peculiar nature of human labour. Here, the planned, aesthetically driven labour of the architect is distinguished from the instinctual action of bees, as an activity merging beauty and functionality.¹ Consequently, the labour of the architect served to define one of the key categories of the Marxian project by appearing as a metaphor for *human* labour par excellence (Marx, 1990 [1867]).

If we expand the scope of our analysis to include the work of Engels, we find multiple references to housing in *The Condition of the Working Class in England*.² Written by Engels in 1845, during his stay in Manchester and Salford, the book offers a unique insight into the changes brought about by capitalist development on housing conditions and the configuration of cities. Engels is a meticulous observer, capturing the disarray of the emerging industrial towns in several evocative passages. Manchester is described alternately as an 'outgrowth of accident', an 'irregular cramming together of dwellings' and a 'planless, knotted chaos of houses' (Engels, 1987 [1845]: 87, 88, 90). The text also considers the newly built quarters for workers, denouncing their cheap construction and poor maintenance. In a few places, Engels ventures into a more formal analysis

of particular structures, and with the help of diagrammatic drawings reveals the economic drive underpinning certain construction methods. *The Condition of the Working Class* is important in explaining the connections between the material structure of cities and capitalism's planned obsolescence. Yet the part of the book dedicated to these themes remains a cursory analysis within a broader research project whose main focus is the emergence of the industrial proletariat.

Thirty years later, in the essays that made up *The Housing Question*, Engels would return to the same topics in light of the critique of political economy developed by Karl Marx (Engels, 1872). Engels' interventions are part of a broader debate that unfolded in Germany during the 1870s, which saw him engaging in fierce polemics against the bourgeoisie's responses to the shortage of dwellings for workers, and Proudhon's tendency to conceive the housing problem as subordinate to a broader 'social question'. *The Condition of the Working Class* already alluded to lower-class districts being removed from the sight of the bourgeoisie, but in the 1872 debate the same phenomenon is inspected more directly and linked to land speculation. The pamphlet provides a succinct examination of capitalism's tendency to shift without ever solving the problem of housing scarcity, through continuous cycles of destruction and dislocation. It is a work of crucial importance for twentieth-century Marxist geography, less so for the development of a Marxist history of architecture.

We have to look beyond the Marxian *opus* and venture into the writings of socialist and Marxist thinkers like William Morris, Walter Benjamin and Siegfried Kracauer to find the first attempts at applying a historical materialist framework to the reading of the built world. William Morris' commitment to architecture is known.³ He worked in an architectural office for a few years, made trips to Italy and France to study continental Gothic and was the founder of the Society for the Protection of Ancient Buildings. The insights gained through his surveys and professional practice materialized in a few scattered texts and interventions, which confirm his well-known penchant for craft. The 'real' target of Morris' criticism, however, was not technology per se, but its fragmentation of the labour process, a development that impoverished the worker's performance and ultimately the aesthetics of buildings. Unexpectedly, in response to the division of labour of the upcoming 'architectural industry', Morris doesn't propose a return to the figure of the genius architect, but the acknowledgement of the *cooperative* nature of design. The term *cooperation* is intended both synchronically and diachronically; as a collaborative practice amongst the actors involved in the design and fabrication of a building in the present, as well as a dialogue between contemporary and past generations of makers (Morris, 1884). In several places Morris goes as far as to praise the beauty of architecture without architects, implicitly suggesting that the latter are just another redundant professional group resulting from the division of labour (Morris, 1891).

In the writings of Siegfried Kracauer and Walter Benjamin, the built environment is a privileged ambit in which to observe the changes brought by modernity.

In exploring the crisis of experience, for example, Benjamin praises the distracted and collective perception of buildings, and sets it against the contemplative reception of other forms of art (Benjamin, 2008 [1935]). In the material later gathered in *The Arcades Project*, architectural artefacts figure as markers of a new capitalist physiognomy (Benjamin, 2012 [1927–1940]). The specific structure of Parisian arcades, for example, allows for the emerging of a new display culture that will pave the way for the commodification of urban experience as a whole. Benjamin pays particular attention to the style and materials of nineteenth-century architecture, interpreting their ‘mismatching’ – the use of a contemporary material like iron to cast older forms – as an embodiment of the specific dialectic at the core of modernity. The fetish of newness proper to the modern commodity exists alongside the tropes of the past; new technologies initially assume the form of the ones they are destined to replace. Neither the mere outcome of a designer’s choices, nor the plain reflection of a new economic order, the aesthetics of architecture are for Benjamin both the cause and the effect of a commodified metropolitan life.

Kracauer trained as an architect before turning to journalism, and through the 1920s and early 1930s wrote reviews of architecture and urbanism for the *Frankfurter Zeitung*.⁴ In his critical analysis of the work of Ernst May and Mies van der Rohe, he calls into question the presumed radicalism of modernism, asking whether its purist forms would not come too close to the abstract logic of emerging capitalism. Against the emphasis on function and structure prevailing amongst his contemporaries, Kracauer reaffirms the importance of ornament (Kracauer, 1995 [1963]). His proposal is more forward-looking than nostalgic, and introduces a methodological shift predating postmodern theory by almost 50 years. Kracauer was one of the first Marxists to offer a comprehensive materialistic reading of human artefacts, which recognized the importance of *skin*. His texts give equal attention to applied ornaments and structure, ephemeral objects and high culture, without the former ever replacing the latter (as often occurs in postmodern theories). The acknowledgement of surface called for by Kracauer is a preliminary stage to its negation; a necessary step in the journey towards a form of ‘true’ reason, as opposed to capitalist ratio. Kracauer’s Marxist lesson for architects consists in a broadened understanding of form that derives from the involvement with its most alienated and apparently trivial aspects, while retaining a transformative ambition.

Morris’, Benjamin’s and Kracauer’s works certainly lay the ground for a reconceptualization of architecture in materialist terms, but they remain episodic and fragmentary contributions. We will have to wait until the second half of the twentieth century to witness the birth of systematic Marxist theories and histories of architecture. Around that time, concomitant to workers’ and students’ protests, politically engaged architects, philosophers and sociologists coalesced around magazine projects that acted as springboards for the development of Marxist debates on architecture and urban planning. In France in 1968, a group

of students and academics gravitating around the *École nationale supérieure des beaux-arts* (ENSBA), including Jean Baudrillard and Henri Lefebvre, founded *Utopie*. Two years later, Lefebvre and the architect Anatole Kopp started *Espaces et Sociétés*. At the same time in Italy, former militants of the workerist movement founded the Marxist journal *Contropiano*, which would subsequently host contributions by architects Manfredo Tafuri and Francesco Dal Co.

The appearance of *Utopie* and *Espaces et Sociétés* intersected with the explosion of the student protests, the reform of architectural education, and De Gaulle's expansion of Paris. These events significantly contributed to centre the magazine's editorial line around the critique of the technological optimism of urban planners and public administrators. The ostensible rationality of the French government's urban plans was recast as 'scientific destruction' of the concreteness of territory, which served to cover up the social contradictions exploded under post-war neocapitalism (Lourau, 2011 [1968]: 30). In response to the government's sanitizing approach, both *Utopie* and *Espaces et Sociétés* drew attention to the radical potential of spontaneous modes of inhabiting the new urban condition. Central to both magazines was the concept of the everyday, alongside an idea of the city as the unpredictable outcome of urban practices (Tonka, 2011 [1968]): No longer a demiurge, the architect was recast as a mediatory figure that operated in 'the near order' of things, and contributed to the arising of utopias in the present (Lefebvre, 2014).

In the same years, in Italy, another journal project contributed to the emerging of a Marxist architectural debate. In 1968 militants associated with *operaismo*, a heterodox Marxist strand emerging in response to workers' struggle in the mid 1950s, gathered around *Contropiano*.⁵ Student unrest exploded in the very same year, but the magazine decided to focus on workers' struggles, exploring the complicated relationship between unions and the party. While *Utopie* and *Espaces et Sociétés* turned to the space of the city and consumption, *Contropiano* held on to factory and production. It is important to stress that the launch of the magazine coincided with a declining phase of workers' unrest, and served more as platform for theoretical analysis than as a 'militant' tool to inform contemporary struggles. This specific political position can also be observed in the architectural articles penned by Tafuri and Dal Co. Their long, theoretically loaded contributions epitomize a type of ideology critique of architecture that would come to define the Istituto di Storia dell'Architettura (IUAV), a research group directed by Tafuri at the University of Venice, from the late 1960s until his death in 1994.

The rise of a self-conscious Marxist current within architectural discipline owes as much to the political events of the 1960s and 1970s as it does to avant-gardist experiments that emerged in the aftermath of the Russian revolution. Soviet architecture was a popular subject amongst Marxist historians in the post-war period, but it was also and above all an event that prompted a comprehensive rethinking of the discipline.⁶ The projects and the writings of exponents of the Russian avant-garde allowed Western practitioners and theoreticians to think

beyond the historically established boundaries of architecture, and to call into question the politico-economic framework on which it rested. Political knowledge began to be brought to bear upon disciplinary knowledge, and the historical analysis of architecture and cities became an opportunity to interrogate broader thought systems. The case of Soviet architecture also shed a new light on Western modernism, recasting its ambitious transformative mission as an amelioration of the capitalist way of life. In a 1930 letter to Le Corbusier, Moisei Ginzburg defined the father-figure of architectural modernism as ‘the best surgeon of the contemporary city’, suggesting that his incredible talent could only be deployed within the limits imposed by his ‘therapeutic’ role (Ginzburg, 1973 [1930]: 273).⁷ Curing the metropolitan malaise, even with the best surgical methods available, meant restoring the full capacity of the city’s capitalist body. Pilotis made this approach apparent, for they lifted the buildings (and metaphorically the problems) above the surface of the city, allowing cars to circulate more freely without reducing the intensity of traffic. In the same year, Bauhaus director Hannes Meyer was expelled by the school for his ill-concealed leftist sympathies, and travelled to Moscow at the invitation of the Soviet government. In a short text announcing his decision, he defined the experience of working under a capitalist economy as ‘meaningless’, marking a distance between the projects completed in the West, and the ones he hoped to realize in the Soviet Union (Meyer, 1973 [1930]: 281). It was in the Soviet context that the link between Marxism and architecture materialized, for this latter became, as Anatole Kopp succinctly puts it, *both* a reflection and a matrix of a new society (Kopp, 1970 [1967]). Physical, discrete spaces were turned into laboratories for experimenting with new forms of living that could subsequently propagate in the surrounding urban fabric. Buildings were renamed ‘social condensers’.

Despite being mainly associated with architectural artefacts, the Soviet avant-garde comprises a large body of written works which reflect on contemporary architectural achievements and set forward proposals for a socialist society to come.⁸ In the context of this chapter, however, we will not pursue this path, but focus instead on the establishment of Marxist architectural theories and historiographies in the second half of the twentieth century, when the immediate horizon of socialist construction had largely disappeared from sight. My aim is to chart the development of Marxist research that remained independent of design practice and sought to establish a critical discourse on architectural forms and theories. Even when analysing contemporaneous architectural forms, the relevant authors refrained from adopting a programmatic approach, remaining implicitly loyal to the Tafurian credo according to which under capitalism only a Marxist ideological critique of architecture is possible (Tafuri, 1969). A further aspect shared by the authors and schools under consideration is a conceptual focus on the Marxist categories of ideology and labour. The first ‘episode’ of the intellectual itinerary I am going to retrace will be the research into the mechanisms of ideological formation in architectural culture conducted by the associates of

the Istituto Universitario di Venezia, under the guidance of Tafuri in the 1960s and 1970s. I am aware that the theme of ideology also informs the writings of the French intellectuals gathered around *Utopie*, but their critique predominantly targets urbanism, and unlike the Venice school, didn't extend into a consideration of how ideology seeped into all aspects of the architectural discipline. Additionally, their seminal interventions were never expanded into a more systematic analysis in the following years.

After probing into the Venice School, I will look at Tafuri's reception in the USA in the 1980s, and I will show how his research stirred a critical debate on postmodern architecture in the American academic context. I will then expand on Fredric Jameson's use of architecture in the frame of his analysis of postmodernity, and on his rethinking of the concept of ideology vis-à-vis Tafuri. In the fourth part of the chapter, I will explore a wave of Marxist historical research that emerged in the aftermath of the 2008 financial crisis, in the context of the PhD programme 'The City as Project' at the Berlage Institute and TU Delft in the Netherlands. Drawing on Marxist theory, the researchers affiliated to 'The City as Project' sought to write and rewrite episodes in the history of architecture with a focus on the categories of labour and production. In the fifth and final part, I will consider certain debates on the contemporary architecture industry in light of the changes brought about by technological development and automation in the UK, USA and Italy.

The chapter focuses on North American and European examples. Far from being a statement regarding the absence of Marxist architectural research in other parts of the world, the limited scope of the survey is the outcome of expertise gained within European and British institutions, whose curriculum remains predominantly centred on Western literature. It is my hope that a new wave of research and translations – for instance on Brazilian architect Sergio Ferro – will open up new lines of enquiry on the relationship between architecture and Marxism(s) in the following years.⁹

MANFREDO TAFURI AND THE VENICE SCHOOL

In the late 1960s, a group of intellectuals involved in the political struggles of the preceding years gathered around the Istituto di Storia dell'Architettura at the University of Venice. The Istituto was not a conventional architectural department, but a place where researchers coming from other fields were regularly invited to contribute to conferences and seminars, and eventually became members of staff.¹⁰ The meaning accorded to interdisciplinarity in this context had little to do with the one it has acquired in more recent decades within contemporary neoliberal education. Disciplines like philosophy, sociology or political science were not instrumentalized to justify architectural projects or theories, but to call into question their own ideological implications. Between the late 1960s and

the mid 1970s the Istituto initiated three main research projects addressing art and architecture in the USSR from 1917 to 1937, the emergence of the American city after the Civil War, and architecture in Weimar Germany. The first two resulted in collective publications, and were introduced by a prefatory text which explicitly stated the political objectives underpinning the project.¹¹ In the frame of this essay we will not focus on the content of the books, but treat them as exemplary case studies of how Marxist analysis was employed to study the history and the present of architecture by the members of the Istituto and by Tafuri in particular. It should be made clear from the outset that the group's turn to history was not conceived as withdrawal from contemporary affairs, but as a specific way of engaging in the present. Asked to recall the early years in Venice during an interview with historian Luisa Passerini, Tafuri highlights the paradox which will come to define the group's methodology: 'we started to mount projects based on historical problems that were heavily involved with the present; we were doing real history, and the present was our task' (Passerini and Tafuri, 2000 [1992]: 44). The choice to study the history of Soviet Communism, for example, served to cast doubt over a series of misbeliefs inherited by the ranks of the Italian Communist Party, and that conditioned their political plans for the present (Leach, 2006).

Tafuri and his colleagues' first research project pivots on the period of the New Economic Policy (NEP) and its ideological entanglements. In Tafuri's reading, the NEP coincides with the exaltation of the plan as the socialist form of organization par excellence, and the replacement of the concreteness of the category of class with the mythical notion of proletariat. Tafuri does not oppose Lenin's partial reintroduction of the free market but calls into question the Bolsheviks' misunderstanding of the dialectic inherent to the NEP: an expression that designates the working class' paradoxical status as simultaneously *constitutive* and *inimical* to capital (Tafuri, 1971). Whether embracing this dialectic would have given rise to an affirmation of the working class as an independent class-for-itself or not, the Bolshevik decision to dismiss it had no other outcome than the passive integration of the class into the NEP. Tafuri and his colleagues' argument is largely indebted to workerist (*operaisti*) militants Mario Tronti and Rita di Leo, but their originality lay in the attempt to transpose their diagnoses onto the artistic and architectural realms. Workerist analysis served as a corrective to the thesis that associated the demise of the avant-garde's initial goals with the curtailment of freedom under Stalin's regime, a line of argument pursued by the majority of historical accounts. The reading advanced by Tafuri and his colleagues eschews a view of cultural phenomena as reflections of politico-economical shifts, and at the same time casts doubt upon the divide between an experimental and a 'degenerated' artistic phase. Setting out from this premise, their research sought to expose how ideology had been materialized in specific architectural and artistic forms long before Stalin came to power.

Tafuri's contribution to the volume attends to the elusive 'figure' of the plan and dwells on the ambivalent meaning of the term – as both a drawing

of the division of space within a building and a proposal for organized action (Tafuri, 1971). Stepping away from orthodox Marxism's idea of the plan as the accomplishment of socialist organization, Tafuri recasts it as a *dispositif* to appease workers and capital. In his reading, the feeling of cohesion and rationality evoked by the figure of the 'plan' served to conceal the exploitative mechanisms still at work in a phase of economic transition.¹² Finally, echoing Boris Kushner, Tafuri shows how the emphasis on planning arose with the NEP as the marker of a shift between a phase of technological fetishization to a new one characterized by the myth of organization.

Sustaining the multidisciplinary approach that distinguished the Istituto, some of the contributors to the volume extended their analysis to the artistic avant-garde. Tafuri, in particular, attended to the shift from formalism to productivism and interpreted it as further evidence of the predominance of Stakhanovist ethics (Tafuri, 1971). His analysis started out from the implicit premise that every artistic or architectural movement originating in a context where capitalist elements are still present already contains within it the possibility of its future collapse. In the face of this reality, the historian needs to understand how this ideological complicity, tacitly present at the level of both content and form, develops over time, and in what relationship it stands with contemporaneous historical and political shifts. In the case of the early Russian avant-garde, for example, Tafuri discerns a latent desire to recuperate the 'lost meaning' of the sign within these very same currents that had declared its annihilation. Such a move is explained, implicitly, in psychoanalytical terms through a process akin to Freudian negation. In a word, formalist artists' decision to sever themselves from the 'real' world would have stirred a sense of guilt which ultimately prompted a return to production. Along the lines of architects and urban planners, artists failed to acknowledge what Tafuri called the 'dialectics of the NEP' and adhered to the ideology of work.

The book *Socialismo, città, architettura* (Tafuri, 1971b), and Tafuri's contribution in particular (1971a), represents a paradigmatic case study of how the members of the Istituto deployed Marxist conceptual tools to rethink crucial moments in the history of architecture. Marx's *The German Ideology*, alongside the texts of the Italian workerists Mario Tronti, Massimo Cacciari and Antonio Negri, acted as a key reference. This explains the priority Tafuri and his colleagues assigned to the category of 'work' over 'capital', and the attention they devoted to examining the position of artists and architects within the capitalist division of labour. The genealogy of this approach can be traced back to the articles for *Contropiano* later gathered in the famous book *Architecture and Utopia* (Tafuri, 1976 [1973]). *Architecture and Utopia* offers an unusual reading of the developments of art and architecture in the twentieth century, with a focus on the mechanisms that caused their gradual subsumption into the capitalist logic. Tafuri's analysis relies on a contribution by Negri to *Contropiano* which re-examines John Maynard Keynes' economic theory from the standpoint of politics (Negri, 1968). For Negri, Keynesianism coincided with the acknowledgement of the working class as an autonomous instance within

capital and with the elaboration of ‘integration strategies’ for containing its threat. Taking its lead from this thesis, Tafuri observes a similar dynamic playing out in the cultural realm (Tafuri, 1969). With regards to architecture, he illustrates how the visionary, ideological drive of the avant-garde was gradually replaced by a pragmatic approach, which he names the ‘reality of the plan’ (Tafuri, 1969: 24). In order to lend concreteness to this definition, Tafuri examines Ludwig Hilberseimer’s design, stressing the interplay between the elementary units of housing and the planimetric structure of the city. Hilberseimer’s design would reveal the disappearance of the single dwelling space as an identifiable, discrete object, and its conversion into an anonymous unit of a production line coinciding with the totality of the metropolitan space.

In a 1970 text never translated into English, which further explores the transformations undergone by architectural practice, Tafuri would go on to depict a dystopian scenario in which the ‘plan’ has become an autonomous force, to the point of dominating the labour of designers (Tafuri, 1970). Implicitly drawing on Karl Marx’s ‘Fragment on Machines’, a text of pivotal importance to workerist thought, Tafuri posits a parallel between architects and factory workers after the massive introduction of machinery.¹³ Just as workers’ labour in the factory was for Marx ‘determined and regulated on all sides by the movement of the machinery’ and reduced ‘to a mere abstraction of activity’, the labour of architects in the emerging neo-capitalist, technocratic epoch is destined to fall under the remit of the plan (Marx, 1973 [1857/1858]: 693). Echoing Cacciari’s Heideggerian-inflected research on ‘negative thought’, Tafuri envisions a scenario where designers’ human agency will dissolve into the ‘subject of development’ (Tafuri, 1970: 255).

Beside contributing to the study of ideology, Tafuri deserves credit for enquiring into the position of architecture within the capitalist division of labour. ‘Architecture’ – he writes in 1975 – is a ‘peculiar form of intellectual labour [...] that places particular emphasis on a range of directly productive activities’. Building upon this assumption, Tafuri recasts the history of the discipline as a dialectical relation between abstract and concrete labour (Tafuri, 1975: 276), and grasps in the linguistic turn of the 1970s the seeds of the process of real subsumption which will transform architectural labour in the years to come (Mometti, 2012).

THE CRITIQUE OF IDEOLOGY AND POSTMODERNISM IN THE 1980S USA

In the mid 1970s Tafuri’s work appeared in *Oppositions*, a prestigious architectural magazine directed by Peter Eisenman, Kenneth Frampton and Mario Gandelsonas. The publication of Tafuri’s writings stirred a debate about the relationship between architecture and politics, a topic that had previously received very little attention in American architectural discourse. In 1982, a group of established architects

including Joan Ockman, Alan Colquhoun and Bernard Tschumi organized the symposium 'Architecture and Ideology', later developed into a publication (Ockman, 1985). The aim of the initiative, we read in the introduction, was 'to examine approaches in criticism and practice that consider architecture as a system of beliefs and values and that explore the relationship between architecture and the existing material processes of society' (McLeod, 1985: 7). All the interventions by the keynote speakers – Tomas Llorens, Fredric Jameson and Demetri Porphyrios – directly responded or referred to Tafuri's position.

It may be worth recalling the political and cultural moment out of which this debate emerged. In the early 1980s postmodernist discourse had reached its peak, and the architects attending the aforementioned conference were looking for references that could inspire a critical response. The research carried out by Tafuri and his colleagues at the Istituto served this purpose, even though the theories of architectural ideology elaborated in that context differed significantly from the sources. Fredric Jameson's text best epitomizes this difference.

Jameson's contribution for *Architecture, Criticism, Ideology* engages in a debate with Tafuri's historiographical method. This latter is recast as a type of content, in the wake of Althusser's notion of the task of the historian as that of producing the concept of history. In Jameson's view, like Theodor Adorno and Roland Barthes, Tafuri performs a type of 'dialectical history', a term that designates an approach aimed at undermining the 'constitutive presuppositions [...] of the specialized disciplines', by means of discursive operations that unexpectedly reveal 'the existence [...] of an Other of the discipline' (Jameson, 1985: 61). Jameson accords to dialectical history the ability to expose the intricacies of ideological thinking, but he simultaneously steps aside from the sense of 'necessary failure' it may engender (Jameson, 1985: 58). Tafuri's writings best embody this prospect, for the efforts of architects are always situated within a wider capitalist frame that lays bare their futility. Jameson isn't indulgent towards Tafuri's position, and accuses him of holding to a 'classical notion of Marx', according to which a socialist society will be achieved only after 'capitalism has become a worldwide and global fact' (Jameson, 1985: 68).¹⁴ In response, he rehabilitates the concept of ideology, bending it towards radical ends.

If on the one hand Jameson distances himself from Tafuri's pessimism, on the other he uses it to throw doubt on the cynicism of postmodern discourse. After establishing a proximity between the latter and Tafuri's distrust towards a transformation of the present, he stresses their different political responses. Whereas Tafuri opts for a 'self-conscious stoicism', says Jameson, 'the practitioners and ideologues of postmodernism enjoy the post-critical present and relax within it' (Jameson, 1985: 87). It is in the realm of architecture that such relaxed, self-indulgent attitudes are most apparent.

Architecture represents a privileged point of observation in Jameson's study of postmodern aesthetics. It is both the 'art' that condenses the key formal features associated with this historical moment, and the context in which human beings

can most vividly experience the confusion induced by ‘the cultural logic of late capitalism’ (Jameson, 1984). Architecture’s ability to reveal the present depends on the specific position it occupies with respect to economics, for, as Jameson contends: ‘[o]f all the arts ... [it is] the closest constitutively to the economic’, and ‘the extraordinary flowering of the new postmodern architecture grounded in the patronage of multinational business’ is just the logical consequence of this proximity (Jameson, 1984: 56–7). Yet, in spite of the emphasis he places on architecture’s complicity with economics, Jameson never establishes a direct relation between these two ambits, holding on to a theory of mediation, and to an idea of the aesthetic realm as semi-autonomous.¹⁵

In addition to offering a vantage point from which to observe the postmodern phase, architecture inspires the American critic to devise a ‘political’ response. To this end, Jameson draws from Kevin Lynch’s study of the use of mental maps to navigate urban landscape. Extending Lynch’s discourse to larger national and global spaces, Jameson advocates for the need to create maps which could help us ‘organize ... [our] immediate surroundings perceptually’, and identify our position within them (Jameson, 1984: 83). It is in this framework that Jameson rehabilitates ideology, irremediably distancing himself from Tafuri. Building on the assumption that the totality of capitalism remains unknowable to human beings, and simultaneously drawing on Althusser’s understanding of ideology, Jameson recasts the latter as a necessary mediation between a narrow individual experience and an unattainable scientific knowledge. Finally, he assigns cognitive mapping a similar function,¹⁶ showing how this latter enables ‘a situational representation’ of the unrepresentable totality of social space (Jameson, 1984: 90).

Jameson must be praised for dislodging architecture from its disciplinary isolation and relating the built form to a new sensorial and cognitive condition induced by late capitalism. This aspect shows a clear departure from the Venice School, which had little interest in exploring how the ideological relationships between human beings and the built environment could be altered by the lived experience of space. Unlike Tafuri and his collaborators, however, Jameson largely overlooks the material conditions of the production of architecture. Aspects such as changes in the organization of architectural labour, the increasingly global dimension of studios, and the introduction of new technologies in the 1980s are not accounted for as determining factors in the aesthetic shift associated with postmodern design.

NEW MARXIST ARCHITECTURAL HISTORY AND THEORY

Following the 2008 financial crisis and the introduction of economic austerity in Europe, there has been a noticeable revival of interest in Marxian and Marxist theory across the arts. In the architectural realm, academics have also returned to look at the history of the discipline through Marxian lenses, following a

longstanding infatuation with the philosophies of Deleuze, Guattari and Derrida.¹⁷ In this (re)turn to historical materialism, the PhD research group 'City as a Project' played a decisive role. Founded by Pier Vittorio Aureli at the Berlage Institute and TU Delft in 2010, the centre gathered a group of young researchers who shared an interest in the relationship between architecture and politics.¹⁸ In the period from 2010 to 2014 the affiliates regularly posted a vast array of materials online, ranging from excerpts of unfinished PhD theses to reports on seminars and book presentations. This specific mode of dissemination denoted a desire to create a collaborative forum for discussion which would eschew the constraints of traditional academic projects.¹⁹

Another distinguishing feature of the group is the application of workerist theories to architectural analysis. Aureli's and Francesco Marullo's research, for example, takes its lead from Mario Tronti's thesis of the priority of class struggle in the transformations of capitalism, to show that the rise of new techniques and architectural forms often meet the need to mitigate conflicts over labour conditions (Aureli, 2008; Aureli and Marullo, 2013). Aureli elucidates this point with regard to Le Corbusier's *Maison Dom-Ino*, arguing that the form of the building responded to economic-political necessities as much as it did to the imperatives of modernist aesthetics. He does so by revealing how the architect's decision to leave the finishing up of the building to future inhabitants was meant to stir a desire for ownership across the working class. What may have appeared as an attempt to include and empower the unprivileged is thus recast as a strategy to keep class conflict at bay (Aureli, 2013).

Francesco Marullo adopts a similar approach to examining industrial architecture in the early-twentieth-century USA. His research seeks to establish a correlation between the introduction of new production methods and the changes in the spatial configuration of factories, such as they appear in plans. The plan is considered, at one and the same time, as a representation of the division of the factory's internal space, and as an indicator of the type of labour performed. Seen from this double optic, therefore, the generic and simplified forms of some of the drawings would allude to the indistinct mass of workers acting simultaneously inside the factory, and, at a deeper level, to the appropriation of concerted labour by capital (Marullo, 2013).

More recently, in conjunction with the growing interest in the question of social reproduction within contemporary Marxist debates, Maria Shéhérazade Giudici and Aureli have turned their attention to the relation between the development of house interiors and the changes in society and family structure. By adopting a *longue durée* approach, their research reveals that the concealment of reproduction and the maintenance of biological life from public visibility long predated the rise of capitalism. This thesis is made apparent in their analysis of houses built in the ninth millennium BCE, where areas for rituals and hospitality appear already more capacious and central than those devoted to cooking and nurturing. From there, Giudici and Aureli's account proceeds chronologically,

always relating the form of the domestic to broader societal changes. For example, the presence of ‘small vestibules, cubicula, and triclina’ in Roman houses is read as an indicator of a loosening of gendered spatial divisions, and connected to the emergence of a new type of family based on law and property rather than on habits, which paradoxically granted a relative freedom of movement within the house to all the members belonging to it by law, including the slaves. The survey terminates with a comparison between domestic and working spaces in contemporary architecture. Expanding on the thesis about the invisibility of reproductive labour advocated by Marxist feminism, Aureli and Giudici note how the blending of domestic and working aesthetics concurs to dissolve the border between life and labour, ultimately serving the goal to conceal everyone’s labour (Aureli and Giudici, 2016).

In addition to advancing historical analyses, the researchers affiliated with ‘The City as a Project’ put forward propositions for the present. Aureli, in particular, seeks to reaffirm architecture’s political potential by mobilizing the categories of ‘autonomy’ and ‘absolute’ (Aureli, 2011). His line of argument starts out from a severe critique of the dominance of urbanization over the city, which he recasts in terms of a triumph of the ‘economic logic of social management’ over a ‘political dimension of coexistence’ (Aureli, 2011: 10). Urbanization is deemed to have destroyed the ‘limit’ of individual buildings, together with the possibility of conflict between the city’s constituent parts. For this latter are replaced by an infinite expanse of built space, where ‘differences are absorbed within a process of growth that is no longer dialectical but incremental’ (Aureli, 2011: 16). Faced with this scenario, Aureli tries to restore architecture’s autonomy, turning, once again, to Tronti’s thought. Similar to the ways in which Tronti recognized the priority of workers’ struggles over capital, Aureli ascribes autonomy to the single architectural work with regard to urban planning. In this frame, the term autonomy is severed from agency, and lodged in the very form of buildings, such as Mies van der Rohe’s plinths, or the austere, mute structures of Aldo Rossi.

INDUSTRIES OF ARCHITECTURE TODAY

In the last decade, a new strand of research has started to explore the reorganization of labour within the architectural and building professions in the wake of the spread of new technologies and financialization processes. As concerns new technologies, one of the first comprehensive works to respond to this trend in architectural discussion is Peggy Deamer and Philip G. Bernstein’s *Building (in) the Future* (Deamer and Bernstein, 2010). The contributions offer different viewpoints on the introduction of parametric design and digital fabrication, but they share a focus on their impact on the labour of architects and on the organization of the building industry. As we will see in a moment, a group of British academics have recently addressed these same topics from a more openly materialist

perspective, calling into question some of the assumptions of Deamer and Bernstein's pioneering book.

Less focused on technology, but more broadly on the changes brought about by neoliberalism on architectural education and labour, is the 2016 book *Backstage* by the Milan-based Gizmo collective (Andreola et al., 2016).²⁰ The texts gathered in the publication are for the most part short reports, but taken together they offer a comprehensive portrayal of the contemporary professional landscape, with a focus on Italy. Of particular interest is the text by Riccardo M. Villa, the only one that takes a *longue durée* historical approach. Recalling Aureli's work, Villa recounts the history of architectural labour from the emergence of capitalism to today, but methodologically he proceeds in the opposite direction, from the analysis of labour to the built form. He looks, for example, at the way international studios are run, and he underlines how the continuous replacement of the labour force, alongside increasing automation, contributes to homogenizing design processes and forms.

While Gizmo's publication remains confined to an analysis of the designer's work, the research of Katie Lloyd Thomas, Tilo Amhoff and Nick Beech has addressed the architectural industry in its entirety, paying attention to its multiple sites of production and their interrelations. In the preface to the publication released after the 'Industries of Architecture' conference they organized in 2014, they describe the initiative as an attempt to contribute to the definition of 'the position and relation of the profession of the architect to other elements in the division of labour' (Lloyd Thomas et al., 2016: 8). Their work seeks to integrate what Howard Davis calls 'building culture' into the field of architecture, by acknowledging physical traces and documents, like drawings, sketches or building specifications, which are produced by all the figures partaking in the realization of architectural projects. Their approach combines a Marxist focus on labour with an interest in subjects and materials left out by architectural history, which resonates with the tradition of 'history from below'.

The 2014 conference was an important forum for discussing pressing aspects of the industry of architecture, ranging from the production of materials and the relation between building regulations and the economy to the division of labour within the construction site and more 'immaterial' issues such the use of film to represent the hidden labour that goes into the production of an edifice. The conference also included a visit to a building site near the venue, a report upon which was lately included in the publication.²¹

In the frame of this section, it is important to expand on the findings of the building-site visit, since they offer a counterpoint to Peggy Deamer and Howard W. Ashcraft's claims regarding the impact of building information modelling (BIM) on the architect's labour (Deamer and Bernstein, 2010). Now standard in the architectural industry, BIM is software for drawing, scheduling and logistical analysis which can be used simultaneously by each of the parties involved in a project. In its defence, Howard Ashcraft argues that the direct interaction

between professions through the BIM has prompted a ‘shift [of] [...] focus from individual processes [,] to project workflows and seamless interactions’, which in turn has ‘reduce[d] ... costs, increase[d] quality, and, in some instances, [allowed architects to] achieve designs that would be impossible otherwise’ (Ashcraft, 2010: 146–7). Drawing from a body of evidence gathered during the building visit, the report included in the *Industries of Architecture* publication seems to come to a slightly different conclusion regarding the efficacy of this technology. The presence of multilingual ‘handwriting across walls, floors, and formwork’ of buildings prompts them to propose that ‘contemporary advances in information technology and the new structures of prefabrication and site contracting [still] rely’ – and in crisis situations depend – ‘upon the traditional skills and communication of the building operatives’ (Beech et al., 2016: 307). All this casts doubt on the possibility of a direct relationship between digital design and building activity in the immediate future and suggests a more cautious and empirical approach to the analysis of the technology. The ‘image of a large team of discrete professionals ... wearing Google glasses and working ... on the virtual model’, warns the report, must be altered to reflect ‘what BIMing actually allows the designer to do, know or even perceive’ (Beech et al., 2016: 307).

Deamer is aligned with Ashcraft, but her argumentation in defence of BIM hinges on its impact upon the architect’s labour. The BIM has placed architects at the centre of the building industry, she claims, granting them a decisive function in the management of the architectural project. From this optic, the designers’ adoption of ‘managerial’ roles represents a challenge to a traditional idea of the profession and the notion of authorship. At first sight, her words seem to reprise Tafuri’s call to give up the idea of the architect as the lone artist-author of buildings, but a closer analysis reveals a significant difference. While for Tafuri the refusal of an idealistic image of the architect came along with the acceptance of their ‘proletarianization’, and could open up political alliances with other workers involved in the construction of buildings, for Deamer the dematerialization of designers’ work is an opportunity for the upgrading of their profession, which could be considered in the same way as that of ‘dotcomers, scientists, gamers or the experts of creative finance’ (Deamer, 2016: 56). Deamer’s argument unintentionally reaffirms a hierarchy between intellectual and manual labour, revealing an excessively optimistic reading of processes of dematerialization, confusing them with forms of liberation.

Alongside speculative research attending to the industry of architecture, we should mention the work done by Architectural Lobby to organize designers politically. Architectural Lobby is an American non-profit organization which has tried to encourage architects to get rid of the golden patina attached to their professional figure and to consider themselves as mere workers. ‘[A]rchitectural employers and employees alike’ – they state in an interview – ‘have bought into the myth of the *artiste* working outside of the labor discourse. You almost never hear the terms “labor” and “architecture” together’.²² On the homepage of their

website, we find a list of guidelines that should regulate the architect's profession, ranging from the enforcement of laws for prohibiting unpaid internships, to the replacement of fees based on percentage of construction or hourly fees with ones calculated based on the money saved or gained from clients. In one of their seminal events, a conference entitled 'Who Builds Your Architecture', they extended their analysis to the construction industry more broadly, shedding light on architects' lack of power over drawing up labour contracts. In 2016, the group launched a survey to chart the labour of architectural historians and theorists and its relationship with other dimensions of architectural practice. The answers to the survey, collected in a publication downloadable from their website, constitute a key source for understanding the precarization of various forms of intellectual labour related to architecture, including teaching, curating and writing (Cayer et al., 2016).

Notes

- 1 The passage reads as follows: 'A spider conducts operations that resemble those of a weaver, and a bee puts to shame many an architect in the construction of her cells. But what distinguishes the worst architect from the best of bees is this, that the architect raises his structure in imagination before he erects it in reality' (Marx, 1990 [1867]: 284).
- 2 As for secondary sources that have examined Marx's and Engels' understanding of the urban and social production of space, particularly notable is the pioneering Lefebvre (2016 [1972]).
- 3 For an overview of Morris' main theoretical texts on architecture, consider Miele (1996).
- 4 My account of these texts is indebted to the work of Joan Ockman. See Ockman (2003).
- 5 *Contropiano, Materiali Marxist* was founded in 1968 by literary critic Alberto Asor Rosa and the philosophers Massimo Cacciari and Antonio Negri. It continued publication until 1971. While not an architectural magazine, it included a number of contributions commenting on important moments in the historical avant-garde and Italy's pressing urban problems.
- 6 It should be recalled that a contingent of foreign architects, including former Bauhaus director Hannes Meyer, went to work in the USSR in the early 1930s. Amongst the publications on Soviet architecture released in the post-war period, it is important to refer, in this context, to Kopp (1970 [1967]). As we mentioned, Kopp was one of the founders of *Espaces et Sociétés*. A few years before, Vieri Quilici, a colleague and collaborator of Manfredo Tafuri, published two books on Soviet architecture (Quilici, 1965, 1969). The books have never been translated into English, but they predated research on the same topic published years later in the Anglophone context.
- 7 All translations from Italian texts are my own.
- 8 A charting of primary and secondary literature on the Soviet architectural avant-garde is beyond the realm of this essay, but amongst the main primary sources translated into English it is important to mention El Lissitzky (1970 [1930]) and Ginzburg (1982 [1924]). To my knowledge, many important texts from this current are still unavailable to an English readership.
- 9 An introduction to Sergio Ferro and translations of some of his texts can be found in Lloyd Thomas et al., 2016. Even within the 'European' context, architectural history remains skewed towards dominant centres, largely neglecting, for instance, the place of architecture during Yugoslavian self-management. Regarding the transformation of architectural practice in post-war New Belgrade consider the still unpublished PhD by Stevanović (2015), 'After the Blueprint: Questions Around the Unfinished in New Belgrade'.
- 10 As in the case of philosopher Massimo Cacciari, who joined the department in 1970.
- 11 The books are Tafuri (1971b) and Tafuri et al. (1973).

- 12 See Corna, 2016 for an examination of the theme of the plan in Tafuri's 1970s writings, and a map of the conceptual link with Raniero Panzieri's Frankfurt School-inflected critique of planning.
- 13 The text appeared in the fourth issue of the workerist journal *Quaderni Rossi*. On workerist readings of the 'Fragment on Machines' see Bellofiore and Tomba (2013).
- 14 Art historian Gail Day addresses the reception of Tafuri's work in the American academic context. In her view, Jameson's analysis failed to grasp the link between Tafuri's arguments and the specific political milieu out of which they emerged. Day's meticulous contextual reading reverses Jameson's thesis, and unveils how Tafuri's apparent intransigence was instead an attempt to keep the bar of political ambition high in the face of the weakening of political struggles. See Day (2012).
- 15 Jameson's defence of mediation as opposed to homology is illustrated in great detail in Jameson (1981).
- 16 It must be specified that for Jameson 'the production of functioning and living ideologies ... is not possible' in the historical situation in which we live. For this reason, he privileges the Lacanian tripartite system – composed of imaginary, real and symbolic – over the Althusserian dichotomy between ideology and science, and he assigns a function comparable to the Lacanian Symbolic to cognitive mapping. See Jameson (1984: 91).
- 17 See, for example, Deamer and Bernstein, 2010; Aitchison, 2014; and Deamer, 2015.
- 18 A brief description of the research group can be found on the official website <http://thecityasaproject.org/about/> (accessed 4 May 2018).
- 19 The research group has released two publications: Aureli et al., 2010 and Aureli, 2013.
- 20 The members of Gizmo regularly republish articles and draft research on www.gizmoweb.it (accessed 3 May 2018).
- 21 The visit was organized by Nick Beech, together with Linda Clarke and Christine Wall.
- 22 Medina, S., 'Meet the Architecture Lobby', <https://www.metropolismag.com/architecture/meet-architecture-lobby-working-change-way-profession-structured/> (accessed 11 September 2016).

Culture

Jeremy Gilbert

This chapter will consider the history of Marxian thought on culture, but with specific reference to those developments that have most directly influenced recent research and current debates in the Anglophone world. The word ‘culture’ (or any German equivalent) does not appear frequently, if at all, in Marx’s major works. As Raymond Williams wrote in 1958: ‘Marx himself outlined, but never fully developed a cultural theory’ (Williams, 1958: 265). Nonetheless, keeping in mind the always fuzzy nature of the concept, we can identify some key themes that bear upon the conceptualisation of culture from very early on in his (and Engels’) writings.

The entire philosophy of historical materialism proceeds from the understanding that human beings cannot survive without forms of organised cooperation (Marx, 1845) and the explicit transmission of information between individuals and across generations (Leroi-Gourhan, 1943). In this sense, culture as such is necessary for basic bodily survival. In fact, we could go so far as to say that this is the founding observation of historical materialism as such. ‘Materialism’ in this sense simply implies the rejection of any supernatural explanation for human existence, human consciousness, natural phenomena or cultural and social change, as well as the assumption that there is no non-material component of the human being (such as a soul or spirit) upon which organic life or consciousness depend. ‘Historical’ simply implies that the forms of social relations that emerge to fulfil the needs of biological survival change over time, and that these changes will have significant implications for the way of life – the ‘culture’, including politics, science, the arts, etc. – of the

humans engaged in them. To the extent that power relations are at work in any set of social relationships, it can be assumed that the relationships involved in the production and reproduction of the necessities for corporeal life (the 'relations of production') will be characterised by significant imbalances of power, at least some of the time (Marx, 1852). Where they are, these imbalances will have implications for power relations in multiple domains of social activity, including those which pertain to the field of 'culture' (however broadly or narrowly defined) (Max, 1848).

BASE AND SUPERSTRUCTURE

In theoretical discussion of the status of 'culture' in Marxist thought, special precedence has often been given to the correct understanding of the relationship between 'base' and 'superstructure' (Williams, 1973). This terminology is deployed occasionally by Marx and Engels when trying to explain their materialist understanding of history. According to the implied architectural metaphor, an overall social formation can be visualised as a building, the foundations of which are made up of 'material' (i.e. economic) relations, while domains such as formal politics, the media, religion, the arts, etc. all belong to the 'superstructure' that is built on that foundation. For example, the medieval chivalric romances do not merely evolve organically out of the heroic epics and sagas of previous ages. They express and celebrate a world-view and a set of values that are specifically those of the feudal warrior aristocracy that had recently come to dominate the societies of early medieval Western Europe, as do the political and legal institutions that also emerged in those places at that time.

The 'base/superstructure' metaphor has occasionally been interpreted, by both advocates and opponents of Marxism, as implying that nothing taking place in the 'superstructure' is of historical importance, being only a reflection or expression of changes occurring in the 'base'. However, the 'base/superstructure' metaphor was never intended to be taken so literally. In particular, it was never supposed to imply that activity in the fields of politics and culture could not itself have direct or indirect repercussions on the domain of economic relations. Engels made this point explicitly in a famous letter to Joseph Bloch (Engels, 1890), pointing out that the base/superstructure metaphor was only ever intended as a rhetorical and polemical trope with which to refute the romantic assumptions of early nineteenth-century idealists. Despite this, a great deal of time and energy was taken up in the 1960s and 1970s by theorists such as Louis Althusser and Raymond Williams attempting to determine precisely how much autonomy from the 'base' various aspects of the 'superstructure' can be assumed to have from a properly Marxist perspective. Williams eventually concluded that 'base/superstructure' had simply never been a useful metaphor, implying as it does a level of determinism that Marx and Engels had never intended. He was right; and we will not dwell further on this topic.

CULTURE AND THE CRISIS OF MARXISM

The development of Marxist cultural theory is inseparable from the development of Marxist political theory. Both respond to more or less the same set of problems and conditions, and the same set of issues arising from the thought of Marx and Engels, who had predicted a particular set of outcomes from the development of industrial capitalism, based on their understanding of the processes that had given rise to it and to the global dominance of the European bourgeoisie.

It is always salutary to recall that when Marx and Engels began their collaboration in the 1840s, many of these predictions would have seemed outlandish and improbable to many readers. The expectation that the industrial working class would organise itself politically and successfully – to the point of forming its own parties and being able to demand historically unprecedented social reforms, full-scale political representation and the full legalisation of trade unions – was hardly universally shared. Over the course of his life, Marx was disappointed by, for example, the cultural conservatism and xenophobia of English workers (Anderson, 2010). Nonetheless, his general prescription for the development of a politically self-conscious working class had largely been fulfilled by the 1910s, by which time mass trade-union movements allied to mass socialist parties could be found to be active and militant from Ireland to Australia, posing a clear challenge to the authority and power of the bourgeoisie in all of those places. Up to a point.

However, by that time, the limitations of that process of politicisation were also becoming widely evident. The first two decades of the twentieth century offered few examples of a significant level of revolutionary consciousness being widely achieved. There were two main reasons for this. On the one hand, since the late nineteenth century, large numbers of workers had enjoyed modest but significant improvements in pay, political representation and standards of living. Pressure from radical movements, the growing weight and success of reformist strands of socialism and the growing commitment to modest social reform within even the liberal and conservative traditions all contributed to these outcomes, as did the enormous profits being generated by capital during the era of industrial monopoly and fully mature imperialism. The gradual advent of mass suffrage reduced the appeal and the apparent necessity of violent revolution, outside of autocracies such as Czarist Russia. Under these circumstances, many workers seemed content to accept gradual and piecemeal reform, rather than pursuing the full abolition of capitalism. On the other hand, the popularity and effectiveness of various types of nationalist and imperialist ideology, their ability to secure the loyalty of workers to their national ruling classes, was proving far more enduring than Marxist theory had generally presumed that they would.

The outbreak of World War One dealt a body blow to the socialist ideal of a united, international, class-conscious proletariat taking power through mass action and largely democratic means (Sassoon, 1996). The willingness of the European proletariats to follow their respective officer classes into the trenches

came as a shock to many, who had assumed that the threat of conscription into a bloody war would instead give them the final necessary push into revolutionary consciousness. And if the war marked the final crisis of European imperialism, what came in its wake in many places was not a rejection of nationalism and concomitant upsurge of class consciousness, but a morbid intensification of the former in the unexpectedly awful form of modern fascism. In those zones of the capitalist world where fascism remained weak, from the 1920s onwards a rich and seductive commercial culture began to emerge that could offer many working-class people a level of comfort and personal amusement that it had been assumed only socialism could deliver, further eroding the assumed basis upon which class solidarity could be built and socialism finally achieved.

It is in the context of this political crisis that the major developments in Marxist political and cultural theory of the early to mid twentieth century must be understood. Marxists had largely assumed that the steady growth of the labour movement would result directly and relatively unproblematically in ever higher levels of class consciousness, as a shared proletarian culture of scientific socialism continued to grow in scope, inclusivity and influence (Sassoon, 1996). The failure of this process to manifest itself uniformly – or, arguably, anywhere – after 1910 constituted a crisis for Marxist theory to which most subsequent developments in Marxism and post-Marxism must be understood as a complex ongoing response.

THE SOVIET THEORISTS: LUKÁCS, VOLOSHINOV, BAKHTIN

The exceptions to this characterisation are those great Marxist cultural theorists who actually lived and worked in the Soviet bloc: Lukács, Bakhtin and Voloshinov. They did not find themselves in a cultural universe dominated by nationalism or liberal capitalism, and were to some extent free to explore more widely the implications of a Marxist theory of culture. Today these thinkers tend to be read for quite different reasons. Voloshinov, author of *Marxism and the Philosophy of Language* (1929), is largely remembered as a predecessor to later, post-structuralist theorists of meaning, and the way that the semantic implications of texts, utterances and statements are forever shifting as context and social relations change. For Voloshinov, language itself is a site of class struggle, where the socially accepted meanings of statements are a product of social relations and power imbalances.

Lukács, whose most famous book is *History and Class Consciousness* (1920), remains a key point of reference for cultural analysts like Frederic Jameson and Perry Anderson (1998), who aspire to understand the ‘totality’ of contemporary social relations and the place of culture within it: understanding modern capitalist societies not as a collection of experiential fragments, but as informed by an underlying social logic. At the same time, Lukács is a key point of reference for theorists and critics hoping to see through the mystificatory ‘reification’ of social

relations: the tendency to misperceive institutions, commodities and other social phenomena as autonomous objects, independent of social relations, rather than as complex and related processes. Reification is a key feature of the ‘false consciousness’ that bourgeois ideology promotes (Bewes, 2004).

Like Lukács, Mikhail Bakhtin’s most obvious contribution to critical and historical thought is a distinctive theory of the novel (1968, 1973, 1982). Both theorists emphasise the importance of the novel’s capacity to offer a complex and holistic representation of an entire social formation, and the significance of the novelist’s ability to ‘speak’ in a multiplicity of voices. But where Lukács tends to emphasise the importance of ‘the totality’ as the object of knowledge and representation, and realism as the desirable artistic objective, Bakhtin stresses the plurality, complexity and indeterminacy of the social relations being depicted as the quality that sets apart the greatest examples of prose fiction (from Rabelais to Dostoyevsky). Bakhtin is at pains to emphasise the ‘dialogic’, co-constructed and pluralistic nature of human culture, and to valorise forms of aesthetic and representational practice that can express that quality. His most often cited idea celebrates the ‘carnavalesque’ quality of cultural forms that disrupt social hierarchies while celebrating the corporeal, sensual and irreducibly material character of existence. He is therefore a common point of reference for writers who want to celebrate the possibility of cultural forms – from the music festival to the TV comedy – that seem to embody the possibility of a visceral, radically democratic culture (Stallybrass and White, 1986; McKay, 1996; Hirschkop and Shepherd, 2001).

ANTONIO GRAMSCI

Voloshinov’s emphasis on discourse as a site of struggle is echoed in the work of the great Italian Marxist thinker Antonio Gramsci (1971). The most prominent leader of the Italian communist party, most of Gramsci’s writings were written during his 11-year imprisonment at the hands of Mussolini’s regime. While they cover a vast range of topics, from Italian history to phenomenology, all of Gramsci’s thought is animated by the need to understand the conditions necessary for successful revolutionary struggle in a society very different from those described by Lenin and Marx.

For Gramsci, class struggle in a modern, complex society is characterised as a ‘war of position’: a kind of metaphorical trench warfare, wherein all of the components of civil society – the mass media, educational and religious institutions, the institutions of government and political parties, etc. – are sites of contestation, to be won and occupied by progressive forces wherever possible. One of the key aims of the war of position is to affect the content of widely held ‘common sense’. ‘Common sense’ in this usage is a term designating something like ‘conventional wisdom’: the general set of shared assumptions about the nature of the social world that members of a social group hold in common (Thomas, 2011).

Common sense is not assumed to amount to a coherent and clearly defined world-view, but is always a complex patchwork of traditional knowledges, contemporary propaganda, outright superstition and accurate social insight. Most common sense is not to be registered in the form of explicitly held and expressed opinions, but in the form of those tacit assumptions that inform everyday interactions, political discourse, religious and ethical ideas, popular culture, assumptions about history and economics, etc. Ruling elites use their power to influence the content of popular journalism, of educational syllabi, even of religious training. A contemporary example would be the tendency of popular media to blame immigrants rather than bankers for the effects of the 2008 financial crisis, encouraging this assumption as part of the common sense of contemporary culture (Hall and O'Shea, 2013).

This idea still remains central to Marxist cultural criticism. Perhaps the most celebrated work of that genre of the early twenty-first century, Mark Fisher's *Capitalist Realism* (2011), is to all intents and purposes an investigation of the institutional and mediated propagation of capitalist common sense in the epoch of advanced neoliberalism. Gramsci was not a direct source for Fisher, who was more directly influenced by figures such as Jameson and Žižek. But both of them stand in a tradition of 'Western Marxist' (Anderson, 1976) ideology-critique that begins with Gramsci.

Gramsci produced insightful analysis of emergent social forms that would come to be influential decades after his death. In his classic notes on 'Americanism and Fordism' (Gramsci, 1971), he argued that what Henry Ford had been pioneering in his Detroit factory since the 1910s was not just a new system of assembly-line manufacturing, but a new type of capitalist society, and 'a new type of man'. Gramsci's analysis of the effects on the worker of highly routinised assembly-line labour anticipated Michel Foucault's studies of 'disciplinary society' by several decades, and foresaw the culture of the post-war capitalist liberal democracies with uncanny prescience.

The monumental importance of this analysis would only become fully apparent at the end of the 1970s, when it became obvious to many observers that the 'Fordist' social settlement was crumbling. In the 1980s, commentators such as Robin Murray (Hall and Jacques, 1989) and David Harvey (1989) would make direct reference to Gramsci in their analyses of the emerging 'postmodern' world. For theorists like Jean Baudrillard, the new, fragmented and fast-moving culture produced by advanced electronic capitalist culture could only be described in apocalyptic terms, as marking some kind of terminal implosion of Western civilisation. Those who had understood Gramsci were able to make a more sober analysis, understanding that the Fordist 'regime of accumulation' was giving way to the enforced pluralism and accelerated diversity of 'post-Fordism', with its new world of niche markets, subcultures and micropolitical conflicts.

Having provided an explanatory framework that remained so robust for so long, it is little wonder that today Gramsci still remains the paradigmatic starting

point for any Marxian consideration of the politics of culture, or the culture of politics. In recent years, analysts seeking to make sense of the emergence of a new cycle of capital accumulation, the impact of new technologies on broader social power relations or the emergence of new coalitions of resistance have made continuous reference to Gramsci and his central ideas (Gilbert, 2016; Srnicek and Williams, 2016). They look likely to continue doing so for some time to come.

MID-CENTURY PESSIMISM

The middle decades of the twentieth century saw a number of Marxist critics respond with understandable dismay to the victory first of fascism, and then of American consumerism. In the 1930s and 1940s, the key figures of the ‘Frankfurt School’ – located at the Institute for Social Research at Frankfurt University – were Theodor Adorno and Max Horkheimer. The founders of ‘Critical Theory’, Adorno and Horkheimer developed (separately and together) an account of modern capitalist societies that was deeply marked by their unique experience of Nazism, and exile in the capitalist dreamworld of Southern California, especially in their 1947 classic, *The Dialectic of Enlightenment* (1947). Theirs was an account that would share many features with that of Guy Debord, whose 1967 book, *The Society of the Spectacle*, offers a near-apocalyptic diagnosis of a society in which everyday life has been totally subsumed and reified by capitalist social relations.

Since the 1980s, in an era that has seen American capitalism reach new heights of global power and ubiquity, many writers and analysts have looked to these critics and theorists for diagnoses of our present cultural conditions. Adorno has been widely criticised for his pessimism, and for some appallingly parochial critical judgements (his dismissive remarks on jazz remain notorious and indefensible). But his diagnosis of ‘the culture industry’ – as a capitalist project to instrumentalise and commodify all forms of culture – could not have been more prescient. Since the end of the 1980s, we have entered an era in which public arts policy and political decision-making over the funding of the humanities has been entirely subsumed by the idea of the ‘creative industries’ and the need to serve them. Marxist students of culture and media since the 1950s have been looking for more nuanced, less fatalistic perspectives to enable them to engage with a world in which the vast majority of the culture consumed, produced and experienced by ordinary people is the direct product of capitalist endeavours. But Adorno remains a crucial point of reference for critical media-studies scholars (Couldry, 2000; Hesmondhalgh, 2002), as for critics and aestheticians seeking to defend an avant-garde ideal of radical art as a mode of critique (Watson, 1995; Hammer, 2015). This is because, despite the limitations of their analysis, his and Horkheimer’s general descriptions of a culture almost totally subsumed by processes of capital accumulation remain accurate. Their harsh judgements on

modern vernacular culture may seem crass and elitist when applied to the innovative sonic experiments emerging from the small (commercial, but non-capitalist) record labels of the mid-century jazz world, or their contemporary equivalents. But when applied to the output of those record labels, movie studios and publishers actually committed to full-scale capital accumulation, their description of capitalist culture as almost uniformly soulless, conservative, affectless and alienating in 1947, remain startlingly accurate today (Taylor, 2015).

UTOPIAN ALTERNATIVES

An associate member of the Frankfurt School, Walter Benjamin wrote across a huge range of historical, literary and philosophical topics, during a career that was tragically cut short by the rise of fascism. A critic, historian and speculative theorist rather than a political organiser and strategist, he shared Gramsci's fascination with nineteenth-century and early-modern cultural history, understanding that the first object of historical materialist analysis must always be to understand the genealogy of the present. His unfinished study of Parisian culture during the industrial revolution – the *Arcades Project* (2002) – remains a monument to this view, and has fascinated students of urban history, consumer culture and modern aesthetics since finally being published at the turn of the twenty-first century. Benjamin's best known work to Anglophone students of culture and media is the essay 'The Work of Art in the Age of Mechanical Reproduction' (Benjamin, 1970). The questions he raised in it have only become more relevant in the age of TV and digital reproducibility, as many contemporary scholars have noted (Pusca, 2010).

Influenced by Kabbalist mysticism, bohemian modernism and the legacy of German romanticism, Benjamin's outlook on contemporary culture was never simply pessimistic, and his influence has only increased every year since his writing began to be available in English in the 1970s. From the aesthetics of animation (Leslie, 2004), to the experience of the modern city (Berman, 1982; Wilson, 1991), to the history of intoxication (Boothroyd, 2007), to non-linear theories of temporality (Derrida, 1994; Osborne, 1995), Benjamin seemingly has something for everybody. Adorno and Horkheimer worried that he wasn't a committed Marxist; but in many ways his restless intellectual promiscuity, and his love of a modern world whose limitations he always hoped to transcend, expressed the very best spirit of historical materialism. And with perhaps his most famous remark – 'there is no document of civilisation which is not at the same time a document of barbarism' (Benjamin, 1970) – he anticipated the major concerns of late-twentieth-century feminist, anti-colonial and Marxist cultural criticism and historiography in a single pithy sentence.

Other German thinkers of the period shared Benjamin's utopian imagination. In the 1950s, Ernst Bloch made a unique contribution with his three-volume

study *The Principle of Hope* (1954), investigating the history and nature of utopianism in a vast range of domains: from literature to architecture to religion to politics, always seeing a certain revolutionary potential in the attempt to imagine a world better than the present one. Like Bloch, former Frankfurt School member Herbert Marcuse would become a hero to the American New Left after settling in the USA after the war. His complex synthesis of Marxism and psychoanalysis in *Eros and Civilisation* (1955), and his critique of the limited forms of freedom offered by advanced consumer societies in *One Dimensional Man* (1964), made him a popular figure with bohemians and cultural revolutionaries. But unlike the pre-war surrealists, Marcuse did not simply preach the liberation of the unconscious; he argued that the specific forms of personal liberation offered by modern consumer culture actually had a repressive and oppressive function. His complex articulation of Freud and Marx remains a powerful critical resource.

More directly influenced by the surrealists was the main French contemporary of the Frankfurt School: Henri Lefebvre. A champion of anti-Stalinist, heterodox Marxism from the 1930s onwards, Lefebvre's extraordinary oeuvre anticipated many of the interdisciplinary concerns of cultural studies, social anthropology, cultural geography and urban studies in the late twentieth century. His three-volume *Critique of Everyday Life* (1947) opened up ordinary social existence as an object of critical inquiry and potential political intervention, directly inspiring the utopian avant-gardism of the situationists and others. Lefebvre's 1968 argument that 'the right to the city' (1968) (the right to organise, inhabit and create in the urban spaces which are so central to modern experience) should be a key radical political demand anticipated the concerns of several generations of activists, artists and cultural innovators. It is an idea that is as relevant as ever in an era when sky-high rents and rampant gentrification afflict urban populations across the globe. Lefebvre is another example of a thinker whose influence on English-language radical scholarship has grown in recent decades. He has been a key inspiration for David Harvey (2012), the radical geographer and one of the most influential expositors of Marxism in our time (e.g. Harvey, 1989), while 'everyday life studies' has become almost an entire sub-discipline of contemporary sociology and cultural studies (Highmore, 2001).

THE STRUCTURALIST MOMENT

The 1960s saw the emergence of structuralism as a distinct French intellectual tendency – in anthropology, psychology, literary studies and social science – that both drew on elements of Marxism and influenced the way that certain Marxist thinkers sought to codify their positions. The experimental psychoanalyst Jacques Lacan proposed that the linguistic theories of Ferdinand de Saussure (1916) had supplied the general theory of signification that Freudian psychology needed, famously declaring that 'the unconscious is structured like a language'

(Lacan, 2006: 223, 737). More consistently Marxian in his approach was the 'semiotologist' Roland Barthes, who pioneered the extension of Saussure's 'structuralist' method into the analysis of various communicative practices, from fashion to advertising, and the role that they play in normalising bourgeois ideology. More directly inspired by Lacan, the Marxist philosopher Louis Althusser (one of Lacan's own analysands) sought a systematic reformulation of Marxist theory, understanding class relations and the capitalist mode of production in terms of a complex set of nested social structures, within which the institutions responsible for the propagation and reproduction of culture play a central role.

Were this a straightforward narrative about the key figures in the history of Marxist cultural theory, we would spend much more time elaborating the ideas of Barthes and Althusser. Both were crucial to the evolution of left thought into the late twentieth century and the development of Marxist cultural studies. But while Althusserian Marxism remains a powerful intellectual current in its own right, in recent times it has tended to be more preoccupied with philosophical matters than with cultural analysis or commentary, while Barthes is now often relegated to historical accounts of the rise and fall of structuralism. Both deserve to be read far more widely than they are currently, but neither plays a very significant role in recent debates in the field. The same, incidentally, might be said of various non-structuralist thinkers of the mid twentieth century. Jean-Paul Sartre (Sartre, 1960/2004), the surrealist leader André Breton, the humanist Marxist Lucien Goldmann: all deserve historical attention, but they are only occasional reference points within contemporary Marxist cultural theory.

AFTER STRUCTURALISM, BEYOND FREUDO-MARXISM

The political and cultural upheavals of the late 1960s were a turning point for Marxian thinking about culture, as for so much else. The failure of the student revolt of May 1968 to mature into a full-blown revolution divided the French left and its intellectual allies. The Parti Communiste Français (of which Althusser, for example, was a loyal member) had extended only limited support to the students, judging that the time was not right for revolution in France, while making excuses for the Soviet military suppression of the Prague Spring.

The response of some thinkers was to reject Marxism altogether, or to move away from its traditional concerns to engage with the more existential and phenomenological questions typical of post-structuralism. The key theorists to emerge from this moment while retaining a clearly Marxist frame of reference were the unlikely philosophical duo of Gilles Deleuze and Félix Guattari. Deleuze was an academic philosopher who had been developing an idiosyncratic materialist and libertarian position based on readings of a distinctive canon of 'minor' philosophers: Spinoza, Leibniz, Hume, Nietzsche, Bergson, etc. Guattari was a political activist, instrumental in the events leading up to May 1968, and a psychoanalyst who had studied with Lacan.

What they attempted together in their two-volume work *Capitalism and Schizophrenia* – written over the decade following 1968 – was something extraordinary (Deleuze and Guattari, 1972, 1980). This was to be the most ambitious synthesis of Marxism and psychoanalysis to date, and one that would seek to radicalise both bodies of thought in the process. What emerged was a complex body of work that offered a unique set of intellectual tools for the analysis of power relationships at every conceivable scale. Musical forms, literary movements, political institutions, scientific innovations: all could be understood as complex mechanisms with variable potentials to restrict or enhance the creative capacities of those groups (workers, students, women, migrants, artists, philosophers, etc.) that revolutionary politics sought to emancipate.

Fifty years on from the publication of their first book, the influence of Deleuze and Guattari continues to grow, because, like Gramsci, they set out a theoretical framework that still seems able to accommodate the complex dynamics of contemporary capitalism and various forms of opposition to it. Its difficulty certainly presents an obstacle to their ideas ever achieving widespread dissemination. But this is understandable, and forgivable, in a body of work that amounts to the most ambitious attempt to date to furnish historical materialism with a fully developed theory of the psycho-social.

Today, Deleuze and Guattari are a key point of reference for critics and analysts trying to get to grips with the complex ways in which capitalist culture both liberates and oppresses at the same time. They have been a central influence on the work of Maurizio Lazzarato, Michael Hardt and Antonio Negri: arguably the most significant innovators in Marxist theory of the past two decades (Hardt and Negri, 2000, 2009; Lazzarato 2011/2018). They have been taken up as key sources by cultural analysts studying music culture, literature, digital technologies, cinema and a vast range of other contemporary topics (Buchanan and Swiboda, 2004; Parisi, 2004; Puar, 2007; etc.). Although they were very far from being ‘orthodox’ Marxists, their work arguably represents one of the most important contributions to historical materialism of the twentieth century.

THE REVERSAL OF PERSPECTIVE

Just as in France, Italian activists and theorists of the same period broke with the perceived theoretical and political conservatism of the Communist Party. In the 1960s and 70s, the *operaista* (workerist) and autonomist movements stressed the importance of understanding the agency of workers in the historical dynamics of capitalist development. The ‘reversal of perspective’ (Thoburn, 2003) proposed by Mario Tronti and other workerist thinkers argued that workers were not simply reactive and defensive in the face of capitalist exploitation, but that in fact many of the changes to production and organisational methods introduced by capitalists since the industrial revolution had been themselves defensive reactions

to the innovative resistance of workers (Tronti, 1966; Moulier, 1989: 19). This conceptual stress on the agency of workers was allied with a political orientation towards shop-floor resistance and grassroots activism.

Over the course of the 1970s, activists and thinkers inspired by such ideas allied themselves with tendencies such as the movement to build ‘social centres’: autonomous (often squatted) community spaces for cultural production, performance, education and co-habitation; and with radical experiments in politicised community radio and publishing. This experience would inform the thinking of figures like Maurizio Lazzarato and Antonio Negri, a body of work that would remain relatively obscure in the English-speaking world until the 2000s, when Negri’s collaboration with the American philosopher Michael Hardt brought it to an international audience. Since that time, this tendency has probably been one of the influential forces shaping new ways of thinking about culture in the historical materialist tradition (Gilbert, 2008). In all of this work, a stress on the creative, collective agency of workers, and an understanding of capital as largely uncreative, reactive and parasitic upon their ingenuity, has proved a consistent theme, running through Hardt and Negri’s series of collaborative works, in particular their most celebrated: *Empire* (2000). Their thought, and that of Lazzarato (2011, 2012, 2014), has been widely influential on attempts to understand the changing status of creative labour in the post-Fordist (and post-post-Fordist: see Murray, 2015) economies, even where Anglophone theorists have not always agreed with their assumptions (e.g. McRobbie, 2015).

CULTURAL STUDIES

Tronti’s ‘reversal of perspective’ had analogies in the English-speaking world. In the UK, the Marxist historian E. P. Thompson published his classic *The Making of the English Working Class* in 1963. The book made a powerful case for understanding the emergence of the industrial proletariat as a political agent in the nineteenth century as the outcome of bottom-up working-class struggle, and not merely as an inevitable reaction to the development of capitalism’s ‘productive forces’. Thompson’s approach would prove to be a significant influence (among many others) on the emergence of the field that would define anglophone radical thought for the next two generations: cultural studies.

The tradition of cultural studies that began in the UK in the early 1960s has both transformed the Anglophone humanities and social sciences, and, in the UK at least, been arguably the single most important conduit for Marxist ideas into public life and political discourse over that period. Its key founding figure – the Welsh critic, theorist and historian of ideas Raymond Williams – crowned his career by developing a coherent and explicitly Marxist theory of culture in his landmark work *Marxism and Literature* (1977). The terminology that Williams refined for cultural analysis is still indispensable today, and is to be found liberally deployed across the humanities and social sciences.

For Williams, the key task when considering any particular cultural context is to differentiate between the 'dominant' forces and those that are either 'residual' or 'emergent'. For example, in the UK of the 1970s, the culture of the bourgeois elite was clearly dominant, an institution such as the Church of England could be considered 'residual' (influential, but in perpetual decline), while punk culture could be considered 'emergent': an early manifestation of the new wave of 'independent' production that would define the landscapes of music culture as well as film and TV production in the 1980s. Perhaps Williams' most original and perennial concept was 'structure of feeling': a way of trying to name those clusters of ideas, assumptions, ideologies and affects that constitute recognisable cultural formations. Williams' work and his philosophy of 'cultural materialism' remain key reference points for scholars of cultural studies, media studies and literature.

In the 1970s, Birmingham University's Centre for Contemporary Cultural Studies (CCCS) – under the leadership of Stuart Hall – developed a distinctive theoretical toolkit derived from Althusser, Gramsci and Barthes, as well as Williams and other sources in the social sciences and humanities. CCS members used this approach to undertake ambitious and wide-ranging analyses of the politics of cultural change in modern Britain, as well as historical researches. Their ideas and interdisciplinary methods would be carried into the US academy by a cohort of American scholars such as former CCCS student Lawrence Grossberg, whose synthesis of Gramscian 'conjunctural analysis' with Deleuze and Guattari's 'schizoanalysis' would inform an ongoing project to map the contours of neoliberal American culture, new forms of conservative reaction and new sites of potential emancipation, as the USA passed through the various phases of Reaganism, Clintonism and beyond (Grossberg, 1992, 2005, 2010). All of this work, in the UK and the USA, was motivated by the desire to understand ideology, how it was that the political right and pro-capitalist forces had seized, and maintained, the political initiative after the social progress of the post-war years, and the democratic upsurge of the 1960s and 70s.

In the 1980s and 90s, the influence of post-structuralism, post-Marxism and various strands of liberal identity politics weakened the influence of classical Marxism within cultural studies. For many scholars and students, the emerging discipline became *the* intellectual space wherein a kind of post-Marxist historical materialism was worked out. Under the influence of Michel Foucault and of feminist and anti-racist ideas, 'Marxism' came to be associated with economic determinism, or with an exclusive focus on class relations as the only significant power relationships, while self-identified Marxists sneered at the conceptual promiscuity and suspect political commitment of 'cult studs'. The attempts by some cultural studies scholars to investigate the ways in which consumers could become agents of cultural change in an advanced capitalist economy (e.g. Nava, 1992) led to understandable, if arguably unfair, charges of complicity with emergent neoliberal capitalism (McGuigan, 1992). In media studies, Marxist scholars doing important work on the political economy of media institutions resented the attention that cultural

studies received for addressing potentially superficial issues, such as the ways in which particular social groups were represented on TV; in response, cultural studies scholars accused political economists of a naive economic determinism, oblivious to the war of position going on in contemporary culture.

These debates were often arguments over caricatures. Few cultural studies researchers or teachers ever actually rejected the basic Marxian analysis of class, capital and commodification. Those who distanced themselves from the apparent determinism or fatalism of a Lukács, Adorno or Debord often did so in terms no different from a Benjamin, Bakhtin or Negri. By the same token, the clichéd image of the austere scientific Marxist, claiming epistemological access to the totality of social relations, bore little resemblance to the way that Althusser or Lukács – never mind Marx – actually thought about the world. Few researchers ever actually thought that it didn't matter who owned media institutions, or that the content of media output was a matter of political indifference. The real challenge of cultural studies has always been to integrate such concerns fully, in the search for a comprehensive materialist analysis of cultural and political 'conjunctures' (Grossberg, 2010).

CLASS, RACE AND GENDER

Perhaps the most crucial contribution to emerge from the CCCS was its determination to conceptualise class, race and gender not as entirely distinct and separate types of power relationship, but as always imbricated in complex and unpredictable ways (Hall et. al., 1978; Gilroy, 1987). Of course, CCCS was not the only place where these issues were under consideration. The historical experience of civil rights, black power and anti-colonial struggles, and the writings of anti-colonial thinkers such as Frantz Fanon, C. L. R. James and Angela Davies had persuaded thinkers and activists in many fields of the need to understand racial oppression as having specific characteristics that could not be reduced to class relations. This anti-imperialist tradition has powerful echoes in contemporary Marxist cultural criticism. In literary studies, for example, scholars such as Benita Parry have argued forcefully that 'postcolonial' culture cannot be understood without reference to the material history of imperialism and the racism that it produced (Parry, 2004; see also Mascot, Chapter 52, this *Handbook*). Perhaps most importantly, the work of figures such as Cedric J. Robinson in the USA demonstrated the ongoing importance of a specific tradition of 'Black Marxism' (1983), allied to a wider history of anti-racist and anti-colonial struggle, which continues to be written (Gopal, 2019) and to shape how we understand the constitutive role of black radicalism in contemporary culture (Moten, 2003).

Always in dialogue with such work, the CCCS approach was particularly notable for its integrative and open-ended approach to the relationships between 'race' and class. In the USA, the 'black studies' movement, although never politically or

theoretically homogenous, always risked separating off questions of ‘race’ from issues of class, gender and sexuality. By contrast, the distinctive approach of CCCS was to refuse both class reductionism and the politics of black nationalism. Long before the term ‘intersectionality’ was coined, writers like Gilroy – among many other black scholars and particularly feminist scholars (see Bohrer, Chapter 57, this *Handbook*) – developed an approach that insisted on understanding class relations and experiences of ethnicity as always mutually constitutive, and always interacting with experiences of gender and the power relations that constituted them. At the same time, key CCCS members such as Angela McRobbie (1990) began to focus more explicitly on questions of gender, and how, for example, the culture and experience of working-class girls might differ from those of the boys who had been the subject of a number of CCCS ethnographies.

The conceptual problems posed by the attempt to think through the nature of gender, without collapsing into either essentialism or idealism, are considerable (see Skeggs, Chapter 11; Farris, Chapter 15; Federici, Chapter 34; and Hensman, Chapter 78, this *Handbook*). Attempts to synthesise Marxism with feminism have taken many forms since the end of the 1960s. The women’s liberation movement that emerged at that time as well as the gay liberation movements inspired by it (and later campaigns to free transgender people from the specific oppressions that they face) have inspired a wave of ongoing efforts to conceptualise gender as a product of historical and cultural forces, and have shaped a great deal of contemporary thought and culture.

Marxist feminism has been a key tendency in cultural criticism and cultural history throughout this period. Writers such as Sheila Rowbotham (1976), Selma James (2012), Cora Kaplan (1986) and many others have challenged readers to consider the history and present state of global culture through the lens of a close attention to both class and gendered social relations, often making creative use of psychoanalytic concepts to explore the subjective and unconscious dimensions of social experience. Within the Marxist tradition, but outside the domain of cultural criticism, writers such as Silvia Federici and Mariarosa Dalla Costa – associates of the autonomist movement – would take a more strictly Marxist approach to questions of gender, examining the ways in which contemporary gender relations remain imbricated with processes of domestic labour and ‘social reproduction’, inspired by their involvement with the ‘wages for housework’ movement (Toupin, 2018). Their ideas about the importance of social reproduction have been hugely influential on recent developments in feminist cultural and political theory (e.g. Hester, 2018; see also Ferguson et al., Chapter 3, this *Handbook*). More than any others, it was those theorists who focused on the nature of gender as such who would challenge historical materialism to expand and revise the way it thought about culture.

The most revolutionary feature of the women’s liberation movement was its demand for the transformation of social relations far older and apparently fixed than those that define capitalism. This produced a strand of radical feminist

theory that challenged received ideas about culture (and nature) in the most fundamental way imaginable. How much of this work can be considered Marxist is an open question. For example, the French radical feminist Monique Wittig was highly critical of many aspects of Marxism as she understood it: its inability to theorise subjectivity, its tendency to think in terms of binary logics, etc. But she did not dispute the Marxist critique of capitalism, and regarded her own theory of gender and sexuality as resolutely materialist. She also drew, as did many others, on Engels' *The Origins of the Family, Private Property and the State* (1884), which posited a narrative of the pre-history of human culture according to which a communistic and partially matriarchal hunter-gatherer society was replaced by a patriarchal, agricultural state founded on private property and the division of labour. Wittig's ideas would prove highly influential on theorists such as Judith Butler (1990, 1993), arguably the key figure of feminist cultural theory in the early twenty-first century, who would explore still further the question of how far even the apparent materiality of sexed and gendered bodies can be considered a historically contingent effect of culture. Butler is normally regarded as a 'post-Marxist' thinker, but, again, it would be hard to find any claim she has ever made that Marx and Engels would definitely have disagreed with.

In fact, the same could be said of the founding text of modern feminist theory: Simone de Beauvoir's *The Second Sex* (1949). It treats historical materialism – like psychoanalysis and phenomenology – as an important set of intellectual resources on which to draw in its overall project of understanding the condition of women in patriarchal societies and contributing to the goal of their emancipation. None of its arguments are incompatible with the basic presuppositions of historical materialism, even while they pertain to an arguably more fundamental set of issues: the nature of sexual difference and its social and cultural implications. As such, there is not only a good case for including *The Second Sex* in any account of the history of Marxist thought on culture: we could reasonably claim that the book constitutes *the* greatest contribution to that tradition, and the one that still most clearly anticipates contemporary concerns. The work of contemporary giants like Judith Butler clearly follows on from that of de Beauvoir almost directly.

Nonetheless, debates between 'Marxists' and their critics – similar to the arguments of the late 1980s and early 90s – have re-emerged in recent years, partly inspired by the interest in political notions of identity that Butler and other feminist theorists have inspired. Old caricatures have also re-emerged in this new moment, especially in the para-academic world of blogs, social media and polemical conference papers. These disagreements are often framed in terms of a conflict between 'Marxists', who believe in pursuing 'class politics', and those who believe in 'identity politics' or 'intersectionality': the latter terms more or less designating an emphasis on issues specifically affecting non-white, female, queer or trans people.

In fact, it would be difficult to find a contemporary Marxist theorist who would deny the specific salience of anti-racism and feminism to understanding

contemporary power relations, or try to argue that racism and patriarchy can be explained exclusively as effects of the capitalist mode of production. Recently, the most compelling commentary on these issues has come from writers drawing directly on the black revolutionary tradition to argue against any dichotomy being drawn between anti-racism and class struggle (Taylor, 2016; Haider, 2018, Chapter 58, this *Handbook*). At the same time, increasing theoretical and historical attention is being given to the constitutive role of colonialism in the formation of capitalism itself (e.g. Venn, 2018). None of this work accepts classical Marxism uncritically; but none of it seeks to repudiate any of its essential features.

CLASSICAL MARXISM IN THE TWENTY-FIRST CENTURY

Along with Judith Butler, the most famous cultural theorist of modern times is undoubtedly the Slovenian philosopher and critic Slavoj Žižek. Like Butler, his work has often been in a dialogue with the ‘post-Marxism’ of Ernesto Laclau and Chantal Mouffe. But unlike them he has declared his commitment to Marxism and the communist tradition, even provocatively adopting the Stalinist label of ‘dialectical materialism’ (Žižek, 2013).

Despite these rhetorical claims, Žižek’s *maitre a penser* is not Marx, but Lacan. His mature philosophy is a synthesis of Lacanian psychoanalysis with Leninist political theory and the thought of the French Maoist philosopher Alain Badiou. At times, Žižek has undertaken a genuine synthesis of such sources with a recognisably historical materialist approach (e.g. Žižek, 2009). But Žižek’s pronouncements on contemporary culture often amount to a scattergun set of loosely connected observations (e.g. Žižek, 2018). One moment he is showing how mainstream liberal multiculturalism expresses the ideological viewpoint of a global capitalist elite: a perfectly valid example of contemporary Marxist ideology-critique. The next minute he is arguing that a scene from a popular film illustrates a Lacanian truth about the permanently unsatisfiable nature of desire: an ahistorical claim that many of the thinkers discussed in this chapter would regard as incompatible with historical materialism. The appeal of Žižek’s analyses is precisely that of all earlier forms of Freudo-Marxism: they seem to offer plausible psychological explanations for the persistence of both authoritarian conservatism and the ubiquitous narcissism of capitalist consumer culture. The problem with those analyses is the same as with those of their predecessors: they rarely seem to generate plausible strategies with which to challenge bourgeois hegemony.

Žižek’s enormously popular books and media appearances have probably introduced more people to the idea of a Marxian cultural criticism than the work of any other single figure in history, apart from Marx himself. They have also proven inspirational to some of the most important Marxist cultural critics of recent time: most notably, the American political theorist Jodi Dean, whose

analyses of the emergent culture of digital capitalism have shed considerable light on the persistence of capitalist norms and patterns of experience in an age of apparently free information (Dean, 2009).

Žižek's tendency to make ahistorical philosophical claims stands in marked contrast to the final figure we will name in this roll-call of Marxist cultural theorists. The US literary scholar Frederic Jameson has done as much as any living figure to preserve the classical tradition of historical materialism. Famous for his great analytical injunction – 'always historicize' (1981) – Jameson has made analyses of historical literary form, of the totality of contemporary culture and of numerous individual topics, always deploying a method that is consistent with all of the classical assumptions of historical materialism. Jameson's work is probably more fully engaged with the entire tradition described in this chapter than that of any other scholar of the late twentieth or early twenty-first centuries, writing in any language.

Jameson is probably best known for his writing on postmodernism in the 1980s (Jameson, 1991). Although less influenced by Gramsci, his analysis essentially paralleled that of figures like David Harvey, Stuart Hall and Robin Murray, emphasising the ways in which the shift to a culture of apparently extreme relativism and pluralism was being driven by advances in capitalism and an intensification of the general logic of commodification. Jameson's analysis of postmodernism as 'the cultural logic of late capitalism' (1991) was enormously influential, directly impacting on the research of figures like Perry Anderson and Zygmunt Bauman, defining a general field of research that has never been effectively superseded. But this is only one strand of an enormous body of work that has sought to develop and extend the historical materialist analysis of culture in many different ways since the 1960s. His most recent work has sought to develop both a general theory and history of the relationship between aesthetic and social forms (a preoccupation of Jameson's throughout his career) (2015), and a fully developed account of the role of dialectics in Marxist critical thought (2010).

Jameson's career has spanned more than half a century, during which innumerable intellectual fads and philosophical movements have come and gone. At the beginning of that period, Marxism was still a thoroughly marginal force in the academic humanities and social sciences, outside of the Communist countries. Its influence within the university has been stronger at times than it is now: in the Anglophone countries, its golden age was the probably the early 1980s, at the moment when the student radicals of 1968 were beginning to take over academic departments, while the neoliberal assault on the universities had not yet made its effects felt. And yet, despite countless obituary notices being written for it, Marxist cultural theory and cultural criticism has survived and persisted, and today can confidently be said to be in certain ways stronger and more widely influential than ever before. Marxist critics from Adorno to Žižek remain a key resource for those seeking to diagnose the ills of contemporary culture. Thinkers such as Bakhtin, Bloch, de Beauvoir and Deleuze and Guattari who use Marxism remain

indispensable for trying to think about what kind of lives we need. Lazzarato's work – most of it only recently available in English – is fast emerging as a key reference point for radical critiques of contemporary media and culture.

In the early twenty-first century, blog culture, podcasting and a new wave of radical publishing has expanded the market for radical cultural criticism beyond the old audience for erudite print-media criticism or purely academic literature. In all of these domains, it is a form of Marxist critique informed by the tradition described here that supplies the critical *lingua franca* for a new generation of popular intellectual production, such as Fisher's *Capitalist Realism* (2011). At the same time, scholarly projects such as the journal *Historical Materialism* have given new life to Marxism as a potent, global intellectual force. The end of capitalism may still be very far away. But Marxism's contribution to world culture, and to that culture's understanding of itself, remains undeniable.

Literary Criticism¹

Brent Ryan Bellamy

At the turn of the twenty-first century, the magnetic pole of literary criticism reversed, inverting the importance of historical context and aesthetic features in textual analysis. A newly ascendant new formalism claims that such analysis ought to describe the forms and surfaces of literary texts rather than interpreting such texts' historical embeddedness, ideological freightage, and political implications. This development aims at overturning literary criticism associated with the Marxist- and the Foucauldian-inspired New Historicism of the 1980s and 1990s, which sought to identify literary texts' political complicity with the hegemonic structures under which they were produced. Unlike the New Historicism, the argument made in the 2000s for the primacy of surface over depth denied the critical act of interpretation could mediate the conjunctures of power and capital.² In some quarters, objects gained currency as their historical embeddedness faded from importance.

There has never been a single object for Marxist literary criticism. If one could claim that there has been one way to approach literature for Marxists, it would be to follow Marx's example in *Capital*: to understand how disciplines, fields, practitioners or schools understand literary objects, to identify the contradictions among those methods, and posit an interpretation that supersedes the others by relying on their observations. Literary critic Carolyn Lesjak's 'Reading Dialectically' argues that the post-critical position misinterprets precisely what was unique about Marxist literary criticism (as distinct from the New Historicism). Lesjak provides a strong example of such a mode of

reading. For Lesjak, the value of Marxist interpretation lies in its dual focus on history and form as existing in a complex dialectical relationship that avoids mutual reduction.

Focusing on the new formalism, Lesjak describes such formations as decidedly anti-political, and, in her words, one might imagine their rallying cry to be: “Give us back our literature and our socially unencumbered aesthetic!” (Lesjak, 2014: 410). In a time of sharpened political stakes – new fascisms, the rolling back of women’s rights, the rise of populism, state-funded police brutality that disproportionately targets black and Indigenous people, mass evictions and the loss of tenants’ rights, and the intensifying of immiseration – some, it seems, would prefer not to consider the emancipatory and egalitarian way out of such binds. The connections among immiseration, authoritarian politics, and literary formalism go deeper, too. Anti-political approaches thrive in cash-strapped departments that cannot afford the luxury of critique. They also valorize the literary as a destabilized object, which some academics understand as a bulwark to resist further threats against their autonomy and livelihoods.³

Lesjak compares the formalist avoidance of critique to the New Historicism’s abstinence from the political. Rather than advocating a return to previous methods of Marxist analysis, she argues that reading ought to be conducted dialectically. She posits that the critic might read by moving from the literary object to history and back. The critic, for Lesjak, ought to strive to connect the text to the hegemonic structures under which it was produced, and which shape its production and capacity for representation. At the same time, the dialectical reader would seek to locate the text’s utopian horizon, asking how the text reaches beyond its historical moment and why it calls out for critical re-examination now. Thus, dialectical reading stands apart from both the New Historicism and new formalism, while drawing on the literary basis of both approaches. Rather than prohibiting the mediations of history, dialectical reading seeks their evidence in the text, asking how the text’s meaning intercedes between the moment of its creation and the present tense of its interpreter.⁴

Marxism’s engagement with literature must maintain a fidelity to dialectical reading over other axioms of analysis, such as aesthetics or historical context above all else, because it puts the critic in a position of radical curiosity, especially about the critic’s own position and assumptions. Dialectical reading allows critics to apprehend capitalist social relations. The following section aims to situate late-twentieth-century developments in literary analysis. Following the discussion below, I have selected three distinct areas of twenty-first-century development in Anglophone Marxist literary criticism that could also be described as vectors of interest for drawing thinkers towards a Marxist position: financialization, the subject(s) of capital, and world literature and ecology. Finally, I return to the scene of such work in university departments to bring the chapter to a close.

SOME FOUNDATIONS OF CONTEMPORARY MARXIST APPROACHES TO LITERATURE

By the late 1970s, intellectual engagement with both Marxism and literature had completed a cycle of germination begun in the 1960s.⁵ Pierre Macherey, literary philosopher and student-collaborator of Louis Althusser, published *A Theory of Literary Production* (1966), which attends to the problematic of the not-said and to absence within a given literary work as central to detecting the workings of ideology and of capital.⁶ Critics might discover such conceptual knots within a particular field of knowledge as it produces ‘the defined excluded’ (a turn of phrase that produces tension in a similar manner to the concept of the absent cause or the vanishing mediator), which Althusser glosses as ‘excluded from the field of visibility and defined as excluded by the peculiar structure of the field of the problematic’ (Althusser and Balibar, 2009: 27). In detecting that unnamed problematic, a critic could identify the work achieved by the text. This detection involved a doubled procedure: in evaluating how a text formed around a problematic, the critic could assess the conceptual procedure that made the problematic retrospectively legible. Such problematics were never accessible directly, but only through the effects they had produced in writing: their critical reconstruction was thus conceptual. As Althusser put it, problematics were ‘the unstable index of the possible production of a new ... *critical* character’ (Althusser and Balibar, 2009: 25). Although Althusser explicitly identified this project as a break with dialectics, the Marxist critic Fredric Jameson sought to reconnect the Althusserian emphasis on the unsaid – which explicitly related to the Freudian unconscious as reconceived by psychoanalyst Jacques Lacan – with the dialectical criticism of philosopher Jean-Paul Sartre and the Frankfurt School.

Jameson published an early work of critical synthesis in a 1971 *PMLA* article titled ‘Metacommentary’. Among the audience for this intervention were literary critics emerging from the New Criticism of the post-World War II period who valued the text itself above all else. Jameson defines the work of metacommentary as ‘tracing the logic of the censorship itself and of the situation from which it springs: a language that hides what it displays beneath its own reality as language, a glance that designates, through the very process of avoiding, the object forbidden’ (Jameson, 1971: 17). In Jameson’s case, the work of mediation involved a consideration of how the past shapes the literary work as well as a strong sense of how the present conjuncture shapes the critic’s interpretive procedures. This intervention can also be traced to Sartre’s insistence that philosophy and literature, indeed cultural production *tout court*, on the one hand, and capitalism, on the other, are densely interconnected and do not unfold in isolation.⁷ Jameson emphasized criticism’s own ideological commitments to ideology, the state, and capital. The claim in short was that there is no outside to capitalism, that in order to locate oneself within the shifting totality of capitalist production one must begin to trace the mediations of capital’s workings. Jameson would

later describe such work as transcoding: ‘as the invention of a set of terms, the strategic choice of a particular code or language, such that the same terminology can be used to analyze and articulate two quite distinct types of objects or “texts” or two very different structural levels of reality’ (Jameson, 1981: 40). Producing metacommentary, then, would involve mediation and transcoding, indeed would require dialectical reading in order to proceed.

Within the 1970s, 1977 marked a moment when many other critics reckoned with the outcomes and legacies of early-twentieth-century Western Marxism. This is the year when a set of critical and polemical essays by Theodor W. Adorno, Walter Benjamin, Ernst Bloch, Bertolt Brecht, and Georg Lukács were collected and released by New Left Books as *Aesthetics and Politics*, with an afterword from Jameson. In the same year, intellectual historian Susan Buck-Morss’s book *The Origin of Negative Dialectics* would intervene in the Frankfurt School debates, provocatively arguing that Benjamin’s thought profoundly influenced and directed the development of Adorno’s negative dialectics. A forerunner, intellectual historian Martin Jay’s account of the Frankfurt School, *The Dialectical Imagination*, had been published in 1973. As with literature, literary criticism as a domain has an unstable yet persistent connection to the capitalist mode of production. From the 1970s moment of reckoning with French and German schools of Marxist thought, other affine studies followed: Michael Löwy’s *Georg Lukács* (1981); Kristin Ross’s *The Emergence of Social Space* (1988) on the poet Rimbaud and the Paris Commune; and Roberto Schwarz’s *A Master on the Periphery of Capitalism* (1990), on the simultaneous advanced and retrograde character of Brazil in the world-system through an engaged reading of Machado de Assis’s *The Posthumous Memoirs of Brás Cubas* (1881).⁸

Following these examples, dialectical reading might be said to constitute an attempt to locate an affective imprint of History within the study of a text. The concept of objective form is central to discussions of the literary from Adorno to Schwarz, and it names such an impression. Dialectical thinker Maria Elisa Cevasco identifies objective form as a uniquely aesthetic-historical element and traces it from fellow literary critic Antonio Candido to Schwarz (as well as attributing its independent discovery to the work of Adorno). Cevasco elaborates Schwarz’s treatment of objective form as the ‘aesthetic formalization of social conditions’ in the literary that reveals the ‘structural role played by historical reality’ in such a text’s production (Cevasco, 2014: 160).⁹ This, then, is the cognitive power of literary work. The argument, rehearsed and repeated by many Marxist literary critics, is this: literary texts provide imaginary resolutions to real contradictions, whether as wish-fulfillment or radical program.¹⁰ The observation of objective form or a text’s socially symbolic act (to borrow Jameson’s formulation from *The Political Unconscious*) does not mean that such texts cut of their own accord to the heart of capital’s unevenness, but rather that it is the work of the critic to elaborate the mediations of literature in order to understand and oppose the workings of capital.

PATHWAYS IN MARXIST LITERARY CRITICISM

The Anglophone Marxist literary criticism of the first two decades of the twenty-first century was shaped as much by events that transformed the life-worlds of young researchers as it was by the historicity of its objects of analysis. Supreme among these events was perhaps the 2007–8 financial crisis and the unevenness of how its effects were felt. The crisis brought critical attention to how the circulation of financial capital reverberates through cultural imaginaries and material reality. Though Marxism has often been mischaracterized as solely focusing on the exploitation of the working class at the site of production, Marxist literary criticism today shows that this assessment is by no means a limit to what Marxist theory and criticism can address. The legibility of the crisis's unevenness sparked renewed interest in the place of the unwaged within the economic totality. The loci of this discussion are gender and race: critics interpret the mediatory objects of literary and cultural analysis to show how capital genders and racializes subjects by excluding them from the wage economy and reshaping itself in the image of such dependencies – an issue especially pressing in periods of economic crisis, downturn, and growing unemployment. Alongside this renewed focus on gender and race in Marxist literary criticism, comes a renewed focus on the global character of capitalism. Critics address uneven global structures through world literatures as theoretical discourse and literary criticism manifest an increasing engagement with looming ecological crises and climate change. Each of these problematics has provided an entry point to Marxist criticism for those seeking answers to the issues of capital in the twenty-first century.

Financialization

The widespread economic freefall of the financial system raised questions that liberal economics could not answer. The 2007–8 global financial crisis presented a signal moment for the resurgence of engagement with Marx's writing and Marxism writ large.

Literary critics approach financialization and literature from at least two critical directions. Poet and critic Joshua Clover, for instance, treats literary works as making apprehensible political paths, on the one hand, and uses literature heuristically to process complex problems, on the other. First, in 'Autumn of the System' (Clover, 2011), Clover reads Thomas Pynchon's *Against the Day* (2006) and Kevin Davies' *The Golden Age of Paraphernalia* (2009) to illustrate the tension between spatial and temporal accounts of capital's development. On Clover's account, Davies' poetics, and poetry qua form, are better suited to understanding the financial machinations of capital than narrative. Here, Clover extends the spirit of the arguments between twentieth-century critics about the most suitable form for assessing and opposing capitalism. The debate is not about whether cultural forms can do this sort of work, but about which do it best.

Second, in ‘Retcon’ (Clover, 2014), Clover triangulates financial instruments, literary theory, and the poetry of Clark Coolidge’s *Flag Flutter & U.S. Electric* (1966). He turns specially to 1973 and the introduction of the Black–Scholes equation, which allowed for simultaneous trading across different markets and forms, namely derivatives. On Clover’s account, this move from trying to make a profit from a security’s price change (futures) to buying and selling simultaneously across markets (arbitrage) aligns all too closely with the emergence of postmodern architecture, aesthetics, and economics. The apparent free play of finance, seemingly uprooted from the necessities of production, becomes an ‘epistemological *seduction* for literary studies’, which are compelled by the separation between an object (signifier) and its concept (signified) (Clover, 2014: 12). Here, a narrative term, retroactive continuity (‘retcon’), gainfully describes a change in backstory to rescue the coherence of the present; the possibility of crisis arises when retcon’s capacity slips, when ‘the relations of value and price reaches its limit’, at which point the ‘line is broken, and the sentence. Things can no longer be smoothed’ (Clover, 2014: 25). In this case, the objective form of poetry mediates capital’s (in)capacity to make sense of the present through financial instruments.

The shockwaves of the 2007–8 financial crisis prompted critics to investigate the relation of literary production to moments of economic turbulence. Leigh Claire La Berge’s *Scandals and Abstractions* (2015) turns to the financial crisis of the 1980s, examining it through the literary production of the same moment. La Berge argues that finance is intensely representational: literary form offers a vital entry into the labyrinth of terminology, logic, and data that make up financial operations. Alison Shonkwiler’s *The Financial Imaginary* (2017) tracks the way literary writers of the 1990s transcode the challenging problematic associated with the financialization of the economy into fictional-narrative terms.¹¹ Abstraction is the mediating term here, as it is able to conceal both the social origins of wealth and the constructed-ness of narrative in novel form. Annie McClanahan’s *Dead Pledges* (2016) argues that the best way to come to understand the economy is through its representation. Tracking consumer debt (hence the title, which translates *mortgage*), McClanahan traces the indebtedness of everyday life to ‘the systemic totality of the credit economy’ (McClanahan, 2016: 4). *Dead Pledges* works through the relationship of the subject to processes such as credit scoring and the dynamics of finance, while exploring how representation gets bound up in property itself.¹²

The Subject(s) of Capital

Recent criticism that emphasizes circulation, reproduction, and the world economy produces new standpoints from which to understand history and totality. Alden Sajor Marte-Wood provides a clarifying account of Philippine ‘reproductive fiction’, arguing that an absence of ‘*positive agency*’ (2019: n.p., emphasis in original) does not signal a lack in the literary imagination. He concludes that:

Instead, Philippine reproductive fictions figure this agential absence as a critique leveled at the failure of the political imagination in the era of global capital's flexible accumulation and its dependence on overseas reproductive labor. The temporariness of autonomy in Philippine reproductive fiction reaffirms imaginary refusals precisely as *imaginary*, suggesting that permanent autonomy for Philippine reproductive workers can only become possible through the *real* refusal of capitalist social relations and nationalist mythos. (2019: n.p., emphasis in original)

Marxism and literature are both explanatory frames that counterbalance one another. Dialectical reading insists that one's standpoint be inflected by one's encounter with the real, and, as Marte-Wood reminds us, such revelations in the imaginary realm are only the start, and need to be met with decisive action in the real world.¹³

Running in tandem with such critique, Marxist thinker Kevin Floyd's *The Reification of Desire* (2009) and performance studies scholar José Esteban Muñoz's *Cruising Utopia* (2009) nurture a queer Marxism invested in a critique of political economy and of normative genders and sexualities through their respective engagements with literary objects of analysis.¹⁴ For example, Floyd reads Hemingway's *The Sun Also Rises* to argue that masculinity is a form of reification by looking at the strikingly 'unnatural' way the character Jake Barnes arranges fish 'with the meticulous attention of a retailer taking inventory, with a fetishistic attention to their surface and sensation' (Floyd, 2009: 106). Floyd weaves Judith Butler's arguments about gender performativity with Lukács' critique of second nature as a historical category that is presumed natural. Meanwhile, Muñoz reads poet and playwright Amiri Baraka's play *The Toilet* against political queer theorist Lee Edelman's *No Future*. He unpacks the complex interlacing of childhood, queerness, black nationalism, and the desire for better future, concluding: 'The here and now is simply not enough' (Muñoz, 2009: 96).¹⁵ Floyd's work spurs Marxists to engage with queer theory, and Muñoz's encourages queer theorists to take on Marxism (Drucker, Chapter 54, this *Handbook*).

While gender and sexuality form two vectors of analysis, writing about relations of race and capital have been central to some of the most important literary production and criticism in the Anglosphere.¹⁶ Some approaches draw on the critical legacy of C. L. R. James.¹⁷ Critical of Marxism, Sylvia Wynter provides a concise claim for the importance of black representation as class struggle when she writes in 'Black Metamorphosis' (an unpublished manuscript) that 'The task of Black scholarship for the Eighties will be to continue the theoretical delegitimation of the cultural universe of the bourgeoisie, of its *representation of reality*, of its *control* of the way we view reality' (Wynter n.d.: 917, emphasis in original; quoted in Eudell, 2016: 47). Demetrius L. Eudell, a scholar of the history and culture of slavery, abolition, and emancipation in the Americas, situates and explains the impact of Wynter's intervention here: 'Wynter proposes a theory that reinterprets the history and contemporary social reality of the Americas and, by extension, the Western epistemological locus', adding 'She does so not only by incorporating and synthesizing the insights of

the then-competing liberal, Marxist, and Black Cultural Nationalist paradigms but also by attempting to move beyond what these modes of analysis remained unable to elucidate' (Eudell, 2016: 48).¹⁸

These reconsiderations of the subject of history (or of that subject's marked absence) reorient critical assumptions about canons and formations.¹⁹ What Marxist criticism might offer is a way to connect insurrection to representation through theorizations of racialization. Take, for instance, Sean O'Brien's recent conclusions in a reading of Ralph Ellison's *Invisible Man*:

Ellison anticipates the exhaustion of industrial expansion in the postwar period, which registers in the novel as a crisis both of narrative form and of an affirmative antiracist politics. The novel thus suggests that the history of literary forms and political possibilities are similarly tied to cycles of profitability and that in the long American century some forms of invisibility are as socially necessary to capital as labor time. (O'Brien, 2019: 99)

Marxist literary criticism's capacity to mediate complex relations from multiple standpoints offers such opportunities to transcode the problematics of capitalism alongside anti-blackness, financialization, and white supremacy.²⁰ In such astute moments, Marxist criticism offers a chance to focus on elaborating the particular and the historical as a mode of recognizing the deep inequalities of the present and refuse to look away from such injustices.

World Literature and Ecology

A third way into the realm of Marxist thought for so many of late has been the scientific naming of the latest geological epoch as the Anthropocene. In seeking to parse such a generalizing and universalizing concept for critical thinking, many have argued that thinking on such a scale limits political capacity as much as it dulls our collective sense of the climate crisis (Huber, Chapter 39, this *Handbook*). Marxism's forays into energy humanities and environmental humanities provide an entry point for theorizing a Marxist literary criticism that thinks ecologically, yet postcolonial critique has made these moves already and offers its own entry point for Marxist criticism.²¹

The legacy of postcolonial critiques such as Edward Said's and Gayatri Spivak's have been formalized in emergent twenty-first-century Marxist scholarship (Mascot, Chapter 52, this *Handbook*).²² In many ways, the stresses generated by Marxist criticism's coming to terms with the vantage offered by the critique of imperialism in post-colonial writing and criticism have deepened the possibility for the convergence of these assessments of global immiseration and struggle. The work of groups such as the Warwick Research Collective (WReC) brings together Marxist criticism, postcolonial theory, and world-systems analysis.²³ In 2015, WReC produced *Combined and Uneven Development: Towards a New Theory of World-Literature*.²⁴ They draw a helpful distinction between world and global literatures in terms of disciplinary reorientation: both rely on 'the thought-figure of "globalisation"' as fundamental, yet

where 'global literature' might be understood as in the first instance an extension of post-colonial studies – as postcolonial studies under the sign of 'globalisation theory', in fact – 'world literature' is in the first instance an extension of comparative literature, and might be understood as the remaking of comparative literature after the multicultural debates and the disciplinary critique of Eurocentrism. (WReC, 2015: 4)²⁵

WReC move past the debate surrounding the publication of Jameson's 'Third-World Literature in the Era of Multinational Capitalism' (1986) to advance claims about how newly liberated post-colonies generate 'generic discontinuities' as part of their enfolding into capitalism.²⁶ As such, WReC present a theory of world-systems analysis and world literature grounded in readings of literature.

The ecological has also emerged as a vector for world-systems analysis. World-systems analysis overcomes some of the issues arising out of regionalism and a focus on the local, without compromising attention to the unique forms of expression capital takes in different geographies. For instance, Treasa De Loughry interprets Karen Tei Yamashita's *Through the Arc of the Rainforest* (1990) through 'the search for new energy frontiers' that structured 'the socio-economic and ecological reorganizations of mid- and late 20th-century Brazil' (De Loughry, 2017: 330) in order to argue that the novel represents:

Compound ecological crises ... at a moment of peak financial overheating and ecological extraction as nature bites back in waves of epidemics that not only invade the sterile Matacão theme park, but ruin the socio-ecological bases upon which the novel's export capital is premised ... *Through the Arc* concludes by imagining the exhaustion of the text's magical account of commodity booms due to ecological violence and the corresponding collapse of capital accumulation. (De Loughry, 2017: 339)

Such ecologically inflected literary scholarship layers considerations about the extraction, refinement, and transportation of resources and the cultures surrounding them, laminating work on the world-system with the commodity chains, class standpoint, and environmental impacts of resource development.²⁷ From this vantage, the literary is marked not only by class relations by also by environmental relations and ecological tipping points.

CODA: THE LOCATION OF ANGLOPHONE MARXIST LITERARY CRITICISM

Compiling the references for this chapter has led me to recognize the astounding output of emerging thinkers. In Marxist parlance, the production of scholarship has accelerated relatively and absolutely – today, there are more scholars publishing more work more of the time. Despite the packed schedules and lack of remuneration, part-time, casual, adjunct, and sessional instructors (not to mention graduate students) are publishing steadily. In the current context, full-time and tenure track jobs cannot exist for each of them (indeed they never could). The housing of Marxist scholarship in the institution of higher education allows for

the consistent if contradictory development of knowledge, while tying the fate of emerging critics to the limited possibilities of contemporary academia. This impasse of knowledge production and lack of secure employment characterizes the bind of institutionally conditioned Marxist literary criticisms today. Such a situation is made all the more painful for PhD candidates and early-career researchers with the training to know precisely the capital-driven competition that overshadows their future chances of employment. For Marxist literary critics and those otherwise entrenched in the university system, this means knowing full well that this year's batch of job applicants will be forced to look elsewhere for subsistence, not to mention the labor of those who write for a living or teach to write.²⁸ The reserve army of intellectual labor is enormously capable of producing an immense collection of critical and theoretical work, yet in the manner in which it is shared and distributed it lacks the very cohesion and coherence of individual and collective purpose experienced by those atomized by the labor market.

In an interview with the US poet Amy King, poet Anne Boyer argues that '*literature is against us*', following that provocatively clear statement with further explanation: 'And when I say "literature", I mean something with historical specificity, seen with all of its brutality intact, with our own intact too, not as we might define it from its exceptions, despite how these exceptions are honorable and instructive and how much we might ground our work in them' (King, 2015: n.p., emphasis in original). Literary criticism may be against us as well, but dialectical reading remains crucial in coming to know the conditions of the present such that the critic might be able to interpret their standpoint and articulate the conditions for their emancipation.

Notes

- 1 I would like to thank Ericka Beckman, Maria Elisa Cevalco, Joshua Clover, Sharae Deckard, Jeff Diamanti, Johanna Isaacson, Leigh Claire La Berge, Sean O'Brien, Oded Nir, Shama Rangwala, Imre Szeman, and Myka Tucker-Abramson, who each offered superb recommendations for my reading list. Thomas Laughlin remarked on a late draft, for which I am most grateful. Any misalignments are the result of my synthesis, and those who offered guidance are not to blame for such missteps. Also, I'm grateful for Annie McClanahan's superb social media thread of contemporary Marxist articles, which was very helpful. Without the annual Marxist Literary Group's Institute on Culture and Society and the MIL-ICS listserv, I would not have been able to complete this chapter. I offer special thanks to Svenja Bromberg, Beverley Skeggs, Sara R. Farris, and Alberto Toscano and to the anonymous reader for their input on and support of this chapter.
- 2 For an overview of the post-critical position, see Felski (2015). For a trenchant and concise critique of the post-critical position, see Robbins (2017).
- 3 I am indebted to an anonymous reader for this insight.
- 4 Lesjak's article draws productively on a reading of Eve Kosofsky Sedgwick's germinal chapter 'Paranoid Reading and Reparative Reading' (2002).
- 5 Worth noting from this period are also Jameson's 1972 book *The Prison-House of Language*, which engages structuralism and the Russian formalists, and his 1974 *Marxism and Form*, which covers early-twentieth-century Marxist thinkers Theodor W. Adorno, Walter Benjamin, Herbert Marcuse, Ernst Bloch, Georg Lukács, and Jean-Paul Sartre. Taking a different approach, Terry Eagleton's 1976

Marxism and Literary Criticism takes a pedagogical approach to the relationship of Marxism and literature; it proceeds to explain the complex and indirect relationship between a critique of capital and the established world of letters. For a similar, recent approach see Foley (2019). For a discussion of the work of literary criticism that draws on Williams' oeuvre as a central example, see Mulhern's (2018) review of Joseph North's 2017 *Literary Criticism: A Concise Political History*; North's (2019) response to Mulhern; and Seaton's (2019) response to North – all in *New Left Review*. Finally, cultural materialist Raymond Williams provides another vantage on the relation in question in his 1977 *Marxism and Literary Criticism*, which supports his 1976 *Keywords*, and develops a sociology of literature that some argue breaks from his commanding 1958 *Culture and Society*. For a specific take on Williams, see Stasi (2021), and for a discussion of Eagleton, Jameson, and Williams, see Hartley (2016) and Chapter 45, this *Handbook*.

- 6 Along with Althusser, philosopher Étienne Balibar, sociologist Roger Establet, and philosopher Jacques Rancière, Macherey was part of the group that produced *Reading Capital* in the late 1960s, which argues, among many things, that knowledge must be understood in terms of production (Althusser and Balibar, 2009: 24).
- 7 Critical work on Jameson has become its own small industry. For a few starting points, see Burnham (1995), Cevalco (2012), Irr and Buchanan (2005), Tally (2014), and Wegner (2014).
- 8 For further work on Latin, Central, and South American, and Caribbean literature, see Bosteels (2011), Durão (2018), Niblett (2017), Oloff (2019), and Taylor (2014).
- 9 For a further writing about the primacy of the object, see López (2011).
- 10 The formulation that posits the aesthetic as a social symbolic act originates in the work of anthropologist Claude Lévi-Strauss on 'The Structural Study of Myth' (1955), and it can be found again in the work of philosopher Louis Althusser on ideology, wherein he claims that 'Ideology represents the imaginary relationship of individuals to their real conditions of existence' (Althusser, 2001: 153). Fredric Jameson takes these formulations as foundational for *The Political Unconscious* (1981).
- 11 See also the reading of David Foster Wallace's *The Pale King* advanced by Godden and Szalay (2014).
- 12 For an alternative approach to financialization through the programs of the World Bank, see Benjamin (2007). For an approach to global financialization at the turn of the twentieth century, see, for instance, Beckman (2012).
- 13 For instance, the emergence of Marxist feminism out of Lotta Femminista's break with the Italian workerist movement of the 1970s, or the Combahee River Collective in Boston, also in the 1970s, have come to have a profound impact both on Marxist criticism writ large and on the study of the social reproduction of class, race, and gender in Marxist-feminist literary analysis. For recent criticism that builds on these critiques, see De'Ath (2016), Osborne (2016), and Rushton (2017).
- 14 Though I did not know Muñoz, I did know Kevin Floyd. Both thinkers passed well before their time, and we are all at such a detriment for it.
- 15 For further work at the intersections of queer theory and Marxism, see Holcomb (2007), Crosby et al. (2012), Liu (2015), and Rosenberg and Rusert (2014).
- 16 Please note, I by no means mean to conflate questions of subjectivity across realms of experience, yet the nature of this chapter means producing a particularly proleptic schematization of the field of Marxist literary criticism.
- 17 For work on C. L. R. James, see Kaisary (2014) and Makalani (2018).
- 18 Approaching a similar problematic from a different angle, literary scholar Anthony Dawahare (2007) triangulates the development of African American literary culture with questions of statehood and the rise of the black communist movement in the USA in the early twentieth century.
- 19 For work on the complex and indirect relationship between the legacies of slavery and settler-colonialism in the Americas in particular, see Baker (2016), Chen and Endnotes (2013), Day (2016), De'Ath (2015), and Lye (2008).
- 20 For further approaches to Marxist criticism with a focus on black struggles, see Hull (2017), Mills (2017), and Tucker-Abramson (2018).

- 21 Much literary criticism from the standpoint of world ecologies was inspired by Jason Moore's 2015 *Capitalism in the Web of Life*. For examples of specific petrocultural criticism, see Riddle (2018) and Wilson et al. (2017). On resource aesthetics, see Bellamy et al. (2016).
- 22 On Said, see Brennan (2013), McCarthy (2013), Parry (2013), and Spencer and Abu-Manneh (2019). On Spivak, see Damrosch and Spivak (2011). On Benita Parry, see Deckard and Varma (2018).
- 23 Much Marxist scholarship has been inspired by the work of Aimé Césaire, Frantz Fanon, Édouard Glissant, Hortense Spillers, Richard Wright, and Sylvia Wynter.
- 24 On the question of world literature more broadly, WReC enthusiastically write about the work of Franco Moretti. However compelling and insightful his work is, I am choosing here to pass it over in recognition of the sexual assault allegations brought against Moretti by a former graduate student in 2017 that date to 1984. I leave it up to readers to decide how to engage with Moretti's work.
- 25 WReC add: 'We can readily see the "postcolonialist" origins of the discussion of "global literature" in Frederick Buell's early, but representative, study *National Culture and the New Global System* (1994). Similarly, we can see the "comparativist" origins of the discussion of "world literature" in Emily Apter's equally emblematic work *The Translation Zone: A New Comparative Literature* (2006)' (WReC, 2015: 5). For an expansion on the concept of neoliberalism and world literature, see Deckard and Shapiro (2019). For a framing of comparative literary analysis within capital's pervasive capacity to render discrete entities exchangeable, see Ma (2017).
- 26 For the definitive critique of Jameson's 'Third-World Literature', see Ahmad (1987). For subsequent articles that engage this debate, see Buchanan (2002, 2003), Lazarus (2004, 2011), Majumder (2017), McGonegal (2005), and Szeman (2001). Cf. the discussions of Ireland's colonial struggles in Eagleton et al. (1990).
- 27 See Campbell (2016), Laughlin (2018), Paye (2018), and Westall (2017).
- 28 On the publishing industry and waste, see Bellamy (2021). On Amazon, see McGurl (2016). On corporate publishers, see Sinykin (2017).

Poetics

Daniel Hartley

‘Poetics’ comes from the Greek word *poiēsis*, meaning ‘making’ or ‘producing’, itself derived from the infinitive verb *poiein*, ‘to make’.¹ In classical Greek thought *poiēsis* was distinguished from *praxis* and *theoria*, which, together, formed the three structuring categories of Aristotelian philosophy. *Theoria* was perceived as the most noble of human activities, involving contemplation of that which is eternal and unchanging. *Praxis* was ‘free’ activity in the realm of the contingent, in which man realises and transforms only himself, seeking to attain his own perfection; this activity was autotelic – its end was immanent to the action itself (Balibar, 2007: 40–1). *Poiēsis*, by contrast, was ‘necessary’ action or production that has an end other than itself (it produces objects for use), and which the Greeks considered fundamentally servile: it was associated with the constraints of nature, mechanical rationality and material conditions. The valence of the distinction between *praxis* and *poiēsis* was thus overdetermined by the class composition of the Greek *polis*.

Historically, the Marxist tradition has tended to focus on the relation between the first two terms: theory and practice. This has given rise to a rich history of debates on the actualisation of philosophy through political praxis, the relation of intellectuals and workers, and the theory of ideology. More recent work on Marxist thought, however, has made newly visible – and extended – a subterranean current within the Marxist tradition that is premised upon the relation between *praxis* and *poiēsis*. Étienne Balibar formulated the guiding insight of this current when he explained that Marx ‘removed one of philosophy’s most

ancient taboos: the radical distinction between *praxis* and *poiēsis*' (2007: 40). Where classical philosophy had maintained a strict separation of noble 'practice' from ignoble 'production', Marx upheld

the revolutionary thesis that *praxis* constantly passes over into *poiēsis* and vice versa. There is never any effective freedom which is not also a material transformation, which is not registered historically in *exteriority*. But nor is there any work which is not a transformation of self, as though human beings could change their conditions of existence while maintaining an invariant 'essence'. (Balibar, 2007: 41; emphasis in original)

For this line of thought, *praxis* and *poiēsis* are a mutually mediating unity.

The present article aims to develop Balibar's claim in order to delineate three interrelated strands of 'Marxist poetics'. First, Marxist poetics concerns the practice and theory of poetry, with an emphasis on *communist* poetry. Second, Marxist poetics names the project of Marxist literary theory. This is a theoretical discourse which, broadly speaking, understands literature – as Aristotle understood tragedy – as an 'imitation of action' [*mimēsis praxeōs*] (2000: 1449b; translation modified). It consciously extends the domain of 'poetics' to embrace narrative as such.² Finally, at the broadest level, the term denotes a modality of political organisation. For example, there is a clear analogy between plot (*muthos*) as what Aristotle called the 'organisation of the events', and the form and strategic rationality of the political party, whose goal is to condense the sheer empiricism of sociological givens into an organised, effective totality.

POETICS AS POETRY

For centuries poetry has harboured prefigurations of communism in the form of popular ballads, broadsides and drinking songs that denounce the nascent privatisation of the commons (Jennison and Murphet, 2019: 1–4). In modernity, the poetry of Romanticism combined residual pre-modern ideals with emergent communist impulses to pose an early challenge to the incipient violence of industrial capitalism.³ In his youth Marx himself was an active poet and direct inheritor of these traditions. He drew extensively on German Romanticism, but gradually came to sense its literary and historical inadequacy as a mode of writing and thinking (Prawer, 2011: 1–22). Like Heinrich Heine, his poetic output became characterised by an ironic parody of Romantic sentiment and a lively anti-bourgeois, anti-philistine satire that would remain characteristic of his writing throughout his life. In a remarkable letter to his father in 1837, Marx explains his conversion from poetry to Hegelian philosophy. He notes that the first three volumes of his poetic output had been characterised by idealism: 'diffuse and inchoate expressions of feeling', an art based in 'a world beyond' in which 'Everything real became hazy' and 'rhetorical reflections' replaced 'poetic thoughts' (Marx and Engels, 1975a: 11). Implicit in Marx's letter is a literary

ideal: good writing adheres closely to the real and actual, is concentrated and compressed, and is enlivened by objectivity (Prawer, 2011: 19). The letter stages a Hegelian logic of sublation that hints at the role this now abandoned poetry will play in Marx's later work, summarised here by Keston Sutherland:

The poetry that is actually abandoned in this progress survives in negated form as the power of expression that contrary to its concept cannot by itself make abstract relations vivid, or bring what is dead back to life. Poetry is intensification pressed to the point of absolute impotence against the real limit of capitalist social reality, where abstract relations reveal their abhorrent imperviousness to poetry in 'brutal' detail. This is a revolutionary account of the power of poetry. (Sutherland, 2015: 12)

The concept of poetry involves the 'intensification' of objects by an act of will; it persisted in non-poetic form in Hegel's intensification of abstract thought. If the early Marx lived out the sublation of poetry in Hegelian philosophy, Sutherland locates the subsequent break with Hegel in the recognition of the impotence of poetic intensification in the face of systemic, capitalist abstraction. The density, compression and vivacity of Marx's early poetic ideal remain, but now inform a polemical mode of writing that dramatises precisely the brutality of capitalist abstraction and its imperviousness to (idealist) poetic intensification. This process reaches its apogee in *Capital*, where the violent urgency of Marx's poetics – its exhausting catalogue of human suffering (frequently figured by gothic imagery) combined with its acute sensitivity to emergent revolutionary horizons – is fundamental to its project of critique.⁴ It is a poetics that draws majestically upon the entire Western literary tradition yet stages the ultimate impotence of poetry in the face of capital. It is a call for its own sublation in revolutionary praxis.

The precise nature of this sublation remains a vexed question, not least since poetry (in non-sublated form) lived on within the revolutionary praxis of the Paris Commune and Russian Revolution.⁵ Indeed, the twentieth century witnessed a profound symbiosis of poetry and communism. From Bertolt Brecht to Pablo Neruda, César Vallejo to Lorine Niedecker, Langston Hughes to Nâzım Hikmet, Yannis Ritsos to Mahmoud Darwish: many of the century's great poets were communist, and even those who were not (e.g., Ezra Pound, Wallace Stevens, W. C. Williams) drew directly from the explosive fusion of revolution and poetry in their own work.⁶ Alain Badiou has argued that

the great poets of the twentieth century recognized in the grandiose revolutionary project of communism something that was familiar to them – namely that, as the poem gives its inventions to language and as language is given to all, the material world and the world of thought must be given integrally to all, becoming no longer the property of a few but the common good of humanity as a whole. (Badiou, 2014: 94)

He identifies certain recurrent tropes in the work of Vallejo, Neruda, Éluard and Brecht: visions of a world that has returned to what it truly is (beyond the alienating abstractions of the money form); new modes of fraternity that revive trust in one's fellows but also in the earth itself; a treasuring of humble, ordinary life that

deserves to be celebrated and defended; and, most powerfully, a ‘nostalgia for the future’ – a ‘kind of poetic regret for what we imagine the world will have been when communism has come’ (Badiou, 2014: 99–105).

Yet there also existed a more direct – and deeply fraught – relationship between communist poetry and the construction of the Soviet state. The various contradictions and permutations of this relationship were embodied most dramatically in Mayakovsky, whom Alberto Toscano has pithily described as a ‘futurist *enfant terrible* posthumously anointed by Stalin, exploding utilitarian language only to put it at the service of socialist construction’ (Toscano, 2019: 111).⁷ ‘Mayakovsky’ names the moment in the history of Marxist poetics at which the overdetermined relationship between *poiēsis* (as poetry and production) and *praxis* (as revolutionary transformation) reached a point of critical intensity. On behalf of the communist future he was trying to summon into existence, Mayakovsky railed against *byt*, a Russian word defined by Roman Jakobson as ‘the stabilizing force of an immutable present, overlaid ... by a stagnating slime, which stifles life in its tight, hard mold’ (Jakobson, 1987: 277). It was this force of inertia that Mayakovsky sought to bulldoze, determined to repurpose poetry into an intrinsic means of reconstructing everyday life. His project entailed an extremely delicate – perhaps ultimately impossible – balance between an expansion of the very meaning of poetry to embrace ‘meetings, speeches, front-line limericks, one-day agitprop playlets, the living radio-voice and the slogan flashing by on the trams’ (cited in Toscano, 2019: 115), and a continued emphasis upon judgements of poetic form (Toscano, 2019: 115ff). Poetry for Mayakovsky was thus a type of work, which he readily (if often ironically) compared to a manic Stakhanovite production, but it was also an individual craft and modality of collective agitation; in other words, the very conception of poetry was internally fractured by the overdetermined temporality of revolution, bridging the old world (craft) and the new (Soviet construction).⁸ Poetry was thus a highly volatile and multifarious practice, embedded in an often chaotic revolutionary context, whose ultimate aim was to break with *byt* and construct a fundamentally new, communist everyday life.

The relationship between poetry and revolution remains fraught today but for very different reasons. To grasp it entails periodisation. Indeed, one of the overwhelming tendencies of contemporary Marxist poetics is a nigh-on neurotic obsession with periodisation, as if the only way to navigate the doldrums of historical defeat for world revolution is to construct so many conceptual calipers and compasses that will map our precise historical coordinates and set us back on course for Utopia. Thus, the burning issues of Marxist poetics in the early twentieth century are said to have arisen in a historical period triangulated by three coordinates:

an economy and society still only semi-industrial, in which the ruling order still remained to a significant extent agrarian or aristocratic; a technology of dramatic inventions whose impact was still fresh or incipient; and an open political horizon, in which revolutionary upheavals of one kind or another against the prevailing order were widely expected or feared. (Anderson, 1998: 81)

This was the force field of modernism. Postmodernism, meanwhile, is said to have emerged from the disappearance of these historical preconditions: ‘a *déclassé* ruling order, a mediatized technology and a monochrome politics’ (Anderson, 1998: 92). Adapting Anderson’s tripartite schema, Ruth Jennison and Julian Murphet have recently suggested we have since entered a further new period characterised by: (1) the disjunctive proximity of either revolution or the complete capitalist destruction of the entire planetary lifeworld; (2) the phenomenological disappearance of the global working class from the capitalist core combined with a global consolidation of the working class beyond the core, ‘contoured by death, precarity, and surplus populations’; and (3) the relative predominance of ‘the struggle to transform or hive out absolute space into differential space’ (via practices such as occupations) over traditional struggles against absolute and relative surplus extraction (Jennison and Murphet, 2019: 12–13). They make the compelling case that such conditions explain the ‘signature strategy’ of contemporary communist poetry: parataxis (as in the works of Sean Bonney and Fred Moten). Where Mayakovsky and the Futurists were part of a complex but total social process of revolutionary transformation, contemporary communist poets of the capitalist core channel and bear witness to the spirit of exceptional insurrections, attempt to map the disjunctive axes of the contemporary world-system and metabolise the time–space of anti-capitalist occupations.

In line with these developments, one of the notable shifts in Marxist poetics in recent years has been away from a post-Lukácsian, Jamesonian emphasis on the unique relationship between *narrative* and revolutionary praxis (on which, more below) towards a sense that poetry is the more appropriate mode of representation for the current historical conjuncture. Joshua Clover’s poetic and theoretical work embodies many of these concerns. Drawing on Fernand Braudel’s claim that the reign of finance in the cycle of capital accumulation is always a ‘sign of Autumn’, Clover (2011) has argued that the period from the 1970s to the economic crisis of 2007–8 should be understood as the ‘Autumn of the system’. During periods characterised by Marx’s ‘general formula of capital’ – M-C-M’ – ‘one sees narrative’s most primitive relation on [*sic*] the logic of capitalism’: ‘Narrative requires motion and change, not simple replenishment; motion and change are exactly what constitutes the general formula’ (2011: 36). The mystery, then, is why one of the distinguishing features of literary production from the 1970s to 2008 was the relative effacement of narrative temporality. Clover’s explanation turns upon the shift from M-C-M’ to M-M’ during autumnal, end-of-cycle periods of financialisation: ‘The apparent M-M’ situation of financialization and rise in organic composition of capital, wherein the massified labor of industrial capital seems to have waned like Jameson’s affect, is thus characterized by *the subtraction of time* (appearing most evidently as productivity increases)’ (2011: 42; emphasis in original). In other words, where ‘C’ – the commodity – disappears, so do the workers who produce them and the fundamentally *temporal* processes of production. Hence Clover’s fundamental thesis: ‘that an organizing

trope of Autumnal literature is *the conversion of the temporal to the spatial*' (p. 43; emphasis in original). It is this conversion that *non-narrative* forms such as poetry are better able to grasp and figure forth. Yet, this is not to suggest that narrative simply disappears. On the contrary, just as credit presupposes the making present of *future* labour (and hence value – M-M' is actually M-M'[-C]), so narrative is always 'preserved as an absence' (2011: 45), haunting the very poetry that 'pre-vents' it.

In *The Matter of Capital* (2011) Christopher Nealon emphasises the ubiquity and variety of thematic, formal and intertextual poetic reflections upon capitalism across poetry of the 'American century'. He shows that poets as diverse as Ezra Pound, W. H. Auden, John Ashbery, Jack Spicer, the Language poets, Claudia Rankine and Kevin Davies 'have at the center of their literary projects an attempt to understand the relationship between poetry and capitalism, most often worked out as an attempt to understand the relationship of texts to historical crisis' (2011: 30). Ruth Jennison, meanwhile, has produced a devastating attack on the 'lamenting liberalism' whose 'essentially conservative ontology' (2012: 3) reads the formal fragmentation of modernist texts as indicative of the regrettable disintegration of the (high-imperial) Western subject. The book's very title, *The Zukofsky Era*, a clear riposte to Hugh Kenner's *The Pound Era* (1971), signals one of its key claims: 'the Objectivists of the Zukofsky Era inherit the first generation's experimentalist break with prior systems of representation, and ... strive to adequate this break to a futurally pointed content of revolutionary politics' (Jennison, 2012: 9). Jennison argues that the uneven geographies and radical ambience of Depression-era America were congenial to an extraordinary imbrication of Marxism and avant-garde poetry in the work of Louis Zukofsky, George Oppen and Lorine Niedecker. Meanwhile, Amy De'Ath (2018) has warned against any too simplistic inheritance of the Objectivist problematic in the present. Noting the continued presence of Oppen's methodology and formal concerns in the poetry of Jeff Derksen, Rob Halpern and Rachel Blau DuPlessis, she detects in Oppen's ruminations on subject-object relations a residual Enlightenment ideology whose racist exclusions are incapable of negotiating 'the ontological preclusion of subjecthood within a global history of antiblack structural violence' (2018: 115). She turns to Claudia Rankine's *Citizen* (2014) as an example of a 'Fanonian poetics' better able to formalise the socio-historical reduction of blackness to objecthood in capitalist modernity (De'Ath, 2018: 127). In doing so, she stresses the importance for Marxist poetics of a far broader and richer poetic terrain, including such contemporary poets as Dawn Lundy Martin, Fred Moten and M. NourbeSe Philip.

Among many possible examples of contemporary communist poetry, one of the stand-out formations has been Commune Editions, publishing such works as Juliana Spahr's *That Winter the Wolf Came* (2015), Jasper Bernes' *We Are Nothing and So Can You* (2015), and Wendy Trevino's *Cruel Fiction* (2018). It originated in the coincidence of three popular uprisings: the occupations in resistance to University

of California tuition hikes in 2009–11; the anti-police uprisings after the shooting of Oscar Grant that continued with the deaths of Mike Brown and Eric Garner; and the local Californian version of Occupy, referred to as the Oakland Commune. In dialogue with a range of communist ideas, from communisation theory (associated with the *Endnotes*, *Théorie Communiste* and *Tiqqun* collectives), Marxist feminism, anarchism and abolitionism, the collective aims to publish poetry that is both anti-state and anti-capitalist. They have also proposed a novel conception of the relationship between poetry and political struggle:

Poems are no replacement for concrete forms of political action. But poetry can be a companion to these activities, as the 'Riot Dog' of Athens was a companion in [the] streets. A dog, too, might start barking when the cops are about to kick down your door. Perhaps that's it, for now, what we're doing, what is to be done, with poetry. (Commune Editions, n.d.)

In the UK, meanwhile, the highly variable work of J. H. Prynne, Denise Riley, Wendy Mulford, Keston Sutherland, Andrea Brady (who founded Barque Press with Sutherland), the late Sean Bonney, Drew Milne and John Wilkinson, as well as younger poets including Caitlín Doherty, Joe Luna, Amy De'Ath and Danny Hayward, continues to forge new directions for poetic anti-capitalist critique.

POETICS AS LITERARY THEORY

The second, broader meaning of 'Marxist poetics' pertains to Marxist literary theory. In the classical Greek technical handbooks, the task of poetics was to describe or delineate that which was rational within the process and product of *poiēsis*. Poetics in contemporary literary criticism, meanwhile, is usually understood in the limited sense of the 'implicit principles' informing a text or oeuvre, or as a 'theory of literary discourse' (Miner, 1993). The methods and modes of exposition of a Marxist poetics, by contrast, have much in common with the operations of *mimēsis praxeōs* [imitation of action] and *muthos* [plotment] which Aristotle makes central to tragedy. They can be analytically divided into two interrelated moments: a theory of literary production and a theory of 'cognitive mapping'. Broadly speaking (since there evidently exists a great variety of Marxist approaches), Marxist poetics in the first sense can be said to 'translate' literary practices and their products into – or 'reconstruct' them as – 'imitations of praxis' [*mimēsis praxeōs*]. 'Mimesis', which has a very complex history (Halliwell, 1998: 109–37), is understood here as the operation of imitation and conversion of the raw material of social experience, itself informed by human activity and social relations (embodied at the broadest level in the mode of production), into literary works – even where those works themselves deny all mimetic relation to social reality or are non-narrative in form. Marxist critics attempt to retrace the logic of this imitation and conversion via a method that employs what Aristotle calls *muthos*: the operation of organising events into a

system or synthesis – i.e., *emplotment*. This is the process whereby the critic reconstructs the precise coordinates of the historical situation in which the work arose and to which it was a response, seeking that elusive point at which the ‘inner’ necessity of the work coincides with the ‘external’ necessity of the historical situation. Marxist literary theory thus aims to ‘emplot’ the relations between literary and social processes; these relations are not, however, limited to a reductive logic of ‘reflection’ but may assume the modality of negation, denial, mediation, symbolic resolution or Utopian supersession.⁹

Such a theory of literary production is often accompanied in practice by a theory of ‘cognitive mapping’, a term made famous in the 1980s by Fredric Jameson, who fused Kevin Lynch’s study of urban alienation with Louis Althusser’s theory of ideology to articulate the process by which individuals mentally map their place within the totality of class relations on a global scale (Jameson, 1988). For Jameson, under the extraordinarily complex spatial conditions of postmodernity, an aesthetic project of cognitive mapping has now become a necessary part of any socialist political project. The precise relation of *praxis* and *poiēsis* here is double: literary and cultural works produce cognitive maps of the capitalist world-system, which then become potential pedagogical components of practical political projects. Inversely, an ‘achieved cognitive mapping’ (which Jameson believes does not yet exist, but which he thinks will concern the form rather than the content) may have as one of its preconditions ‘some prior political opening, which its task would then be to enlarge culturally’ (1988: 356): in other words, a fully developed cognitive mapping of the world-system may require an initial *practical* revolutionary intervention. The point here is not only that cognitive mapping provides a further variation on Marx’s initial dialecticisation of the relation of *praxis* and *poiēsis*, but that Marxist poetics harnesses the productivity and pedagogical potential of ‘poietic’ production.

Jameson has recently expanded his understanding of cognitive mapping by deepening its rapport with Aristotle’s *Poetics*. Arguing that history shares a narrative structure with fiction (Jameson, 2009: 565), he transcodes the Aristotelian narrative categories of *peripeteia*, *anagnorisis* and *pathos* into concepts within an expanded *dialectical* poetics whose aim is to make history appear. *Peripeteia*, a reversal or turning point, is now aligned with the dialectic of success and failure, the unity of opposites in which historical ‘winners’ through time become ‘losers’ and vice versa: ‘The point of view must be an elevated and a distant, even a glacial one, in order for these all-too-human categories of success and failure to become indifferent in their own opposition’ (2009: 554) *Anagnorisis*, meaning ‘recognition’, now becomes a specific operation of ‘discovery’ of collective political subjects who have previously been overlooked as such: ‘the coming into view of those multitudinous others suppressed from the official story and field of vision’ (2009: 565). Just as Subaltern Studies made newly visible the Indian peasantry as a political force in its own right, so *anagnorisis* is ‘an act of theoretical production, in which new characters are produced for our collective and

political discovery and recognition' (2009: 582). Finally, *pathos*, usually understood as 'suffering', now becomes the 'Absolute' – the momentary irruption of the Real during an event-like occurrence which makes visible and experiential the total unification of the social system. Together, these are the narrative categories Jameson takes to be necessary to make history appear.

Franco Moretti is also concerned with the practico-poetic categories of modernity. His work on the *Bildungsroman* foregrounded the way in which the symbolic form of 'youth' mediated the contradictions of modernity and effected the transition from the heroic subjectivities of the Age of Revolution to the mundane and unheroic normality of everyday bourgeois life (Moretti, 1987). His study of the 'modern epic', meanwhile, focused on such texts as Goethe's *Faust*, Melville's *Moby Dick* and Gabriel García Márquez's *One Hundred Years of Solitude*, arguing that they are 'world texts, whose geographical frame of reference is no longer the nation-state, but a broader entity – a continent, or the world-system as a whole' (Moretti, 1996: 50). In a move that has proved influential for materialist theories of 'world literature' (including his own), Moretti employs the categories of Immanuel Wallerstein's world-systems analysis to suggest that such 'world texts' or 'modern epics', while 'unknown to the relatively homogeneous states of the core', are 'typical of the semi-periphery where, by contrast, combined development prevails' (1996: 50).¹⁰ 'World texts' poetically mediate and 'imitate' the practical situation of combined and uneven social and cultural forms that is prevalent at the world-systemic semi-periphery.

Moretti further developed this 'geography of literary forms' (1996: 50) in the now canonical essay 'Conjectures on World Literature' (2000). Inspired by Goethe and Marx's remarks on *Weltliteratur*, 'Conjectures' holds that world literature is 'One, and unequal: *one* literature ... or perhaps, better, one world literary system (of inter-related literatures); but a system which is different from what Goethe and Marx had hoped for, because it's profoundly unequal' (Moretti, 2013a: 46). Drawing on Roberto Schwarz's (1992) work on stylistic discontinuity in the history of the Brazilian novel, Moretti explains that 'in cultures that belong to the periphery of the literary system ... the modern novel first arises not as an autonomous development but as a compromise between a western formal influence (usually French or English) and local materials' (2013a: 50). This produces a compromise between 'foreign *plot*; local *characters*; and then, local *narrative voice*: and it's precisely in this third dimension that these novels seem to be most unstable' (2013a: 57–8; emphasis in original). Moretti's theory of 'world literature' is thus nothing less than a poetics of the modern world-system – 'a study of the struggle for symbolic hegemony across the world' (2013a: 56). More controversially, Moretti couples this poetics with a new mode of reading: distant reading. Since 'world literature is not an object, it's a *problem*' (2013a: 46; emphasis in original), it is not a question of simply reading more texts from across the world; rather, 'world literature' requires a method of 'distant reading', whereby the critic effectively becomes a meta-critic, condensing and correlating

the findings of first-order critics from across the world-system ‘*without a single direct textual reading*’ (2013a: 48; emphasis in original).¹¹ At the same time, Moretti has paradoxically continued the tradition of close reading in perhaps his most important work of recent times: *The Bourgeois: Between History and Literature* (2013b), a socio-literary study of the figure of the bourgeois, and an ingenious account of the rise of modern prose.

One of Moretti’s most significant inheritors is the Warwick Research Collective (WReC), whose book *Combined and Uneven Development: Towards a New Theory of World-Literature* (2015) aims to ‘resituate the problem of “world literature,” considered as a revived category of theoretical enquiry, by pursuing the literary-cultural implications of the theory of combined and uneven development’ (WReC, 2015: 6). Fusing Fredric Jameson’s (2002) ‘singular modernity’ thesis with a Moretti-inflected world-systems analysis and Trotsky’s theory of combined and uneven development, WReC defines world-literature (with a hyphen to show its fidelity to Wallersteinian world-systems analysis) as ‘*the literature of the world-system*’ (WReC, 2015: 8; emphasis in original). World-literature is that literature which ‘registers’ in form and content the modern capitalist world-system (2015: 20). Just as capitalism does not develop in a homogenous unilinear manner, but, rather, actively produces underdevelopment and development side by side, so world-literature is also combined and uneven, yoking together – by force of circumstance or self-conscious project – residual, dominant and emergent forms and styles so as to represent the ‘simultaneous non-simultaneity’ of the world-system itself.

The book is also an intervention into debates on the definition of modernism. WReC proposes a tripartite model: if *modernisation* is understood as the ‘imposition’ of capitalist social relations on ‘cultures and societies hitherto un- or only sectorally capitalised’ (WReC, 2015: 10), and *modernity* names ‘the way in which capitalist social relations are “lived”’ (2015: 12), then *modernism* is that literature which ‘encodes’ (2015: 18) the lived experience of the ‘capitalisation of the world’ produced by modernisation. This has temporal and geographical repercussions: temporally, ‘modernism’ can no longer be situated in the early twentieth century but must be pushed back to incorporate ‘the great wave of writing from the mid-nineteenth century onwards’ (2015: 18) and forwards to incorporate such writers as Lorine Niedecker and Roberto Bolaño (2015: 19); geographically, modernism must be extended beyond Western Europe to any location in the world-system undergoing the shock and violence of capitalist modernisation processes. As a consequence, the great realism–modernism debate (Adorno et al., 2007) is essentially obviated, since ‘realism’ is shown to be equally as ‘modern’ as modernism, in that it too responds to capitalisation processes, and modernism is just as ‘realistic’ as realism, since ‘irreality’ is a realistic response to situations of combined and uneven development.

The Warwick Research Collective is not the only proponent of a critical approach that takes as its operative scale the modern world-system. Nicholas

Brown's *Utopian Generations* argues for 'establishing the interpretive horizon of twentieth-century literature at capitalism's internal limit' (Brown, 2005: 1). Brown reconstellates modernism and African literature of the decolonisation era in such a way as to make them both comprehensible within a single framework of global capitalism within which neither now looks the same. Likewise, Carolyn Lesjak (2013) has defended what she calls 'dialectical reading' against the current vogue of 'surface reading' and the 'new formalism'. She draws explicitly on Jameson's *Valences of the Dialectic* to uphold the contemporary urgency of a 'spatial dialectic' which attempts to unify (in the manner of Jamesonian *pathos* or the Absolute) the violently intersecting scales of lived experience and the systemic drives of the capitalist world-system. Finally, Hrvoje Tutek (2016) has suggested that one of the challenges of the contemporary novel of resistance, which he calls 'anti-bourgeois realism, or the realism of anti-capitalism' has been to try and find a principle of formal unification for the 'sporadic anti-systemic dissent' that characterises movements such as Occupy. In order to overcome the logic of fragmentation that obscures the systemic dynamics of the world-system, Tutek argues that these works (e.g., *Q* by the Italian collective Luther Blissett and *From A to X* by John Berger) try – but necessarily and *productively* fail – 'to create a way of perceiving a historically consequential whole, an operative totality – as historically consequential as the nation used to be – at a global level' (Tutek, 2016: 262). He ends by suggesting (to adopt the terms of the present article) that the *poietic* shortcomings of the novels could only be overcome *in political practice*, thus continuing Jameson's line of reasoning that an 'achieved cognitive mapping' requires an initial revolutionary impetus.

POETICS AS A MODALITY OF POLITICAL ORGANISATION

Finally, in its broadest – and perhaps most unorthodox – sense, Marxist poetics names a modality of political organisation. It is a dynamic, formative process (Else, 1957: 9) that has a privileged relation to narrative. Aristotle, in the *Poetics*, defines tragedy as an 'imitation of action' [*mimēsis praxeōs*] whose 'soul' is 'plot' [*muthos*] (Aristotle, 2000: 1449b, 1450a; translation modified). Plot is itself defined as 'the organisation of the events' [*è tōn pragmatōn sustasis*], or what Paul Ricoeur (1984: 66) has called 'the synthesis of the heterogeneous'. Plot is thus a dynamic, shaping force and principle of organisation: it unifies and unites multiple events or actions into a single overarching narrative. It is this dynamic principle of organisation that connects *praxis* and *poiēsis*, the strategic rationality of the political party and the art of narrative composition. It is also this principle that makes poetry for Aristotle more philosophical than history; history is the pure empirical fact of what has happened, with no internal organisation, whereas poetry speaks of what *might* happen, and orders events according to strict causal chains of necessity, dealing in universals rather than particulars.

Yet plot as a principle of organisation has undergone several historical and literary crises. Jacques Rancière (2013) has identified the paradox whereby with the emergence of the modern revolutionary tradition the principles of organisation inherent to the Aristotelian ideal entered into crisis. This is because the classical ideal presupposed the unequal class relations of the Greek *polis*. When Aristotle defines tragedy as an ‘imitation of action that is serious’ (2000: 1449b), the adjective ‘serious’, or *spoudaias*, clearly refers to a member of the nobility who pursues virtue through the free activity of *praxis*. It is impossible for an ordinary member of the *demos* to be represented ‘seriously’ within the genre of tragedy. Likewise, as Rancière states, the ‘superiority of the poem which links actions together over history which merely recounts the succession of facts was homologous to the superiority of men who participate in the world of action over those confined to the world of life, that is to the pure reproduction of existence’ (2007: 18). It was precisely this socially regulated distribution of artistic genres, or what philologists such as Erich Auerbach (2003) have called the *Stiltrennung* (the ‘separation of styles’), that the revolutions of modernity gradually broke down. The paradox is thus that with the emergence of the revolutionary tradition, which has given rise to fierce debates over appropriate forms of political organisation, the artistic regime on which these debates implicitly draw – i.e., poetics – underwent the erosion of its social preconditions. At the level of form, modernity might be seen as a constant toing and froing between what Rancière calls the ‘poetic’ or ‘representational’ regime of art (with Aristotelian emplotment at its core) and the ‘aesthetic’ regime of art.

What Rancière calls the aesthetic regime of art spells the end of the hierarchy of high and low subjects and genres, of the Aristotelian superiority of action over life, and of the traditional schema of rationality in terms of ends and means, causes and effects (Rancière, 2008: 14). It instigates, in other words, equality in the realm of the sensible. This equality assumes the form of indifference: of subject, style and addressee. Literally anything or anyone can now be the subject of art or literature: the intricate patterns made by dust motes thrown up by passing wagons, the miniscule play of light and shade as rays of sunlight shimmer over a landscape, the feeling of warmth on a summer afternoon. The organised hierarchy of plot gives way to the sheer sequentiality of micro-events of the senses (an argument reiterated in Fredric Jameson’s *Antinomies of Realism* (2013)).¹² The aesthetic regime also produces the indifference of differences: activity collapses into passivity (as in Schiller’s definition of play, or *Spiel*), movement into stillness, sound into silence. Thus, the aesthetic regime historically instigates the an-archic distribution of the sensible which embodies an emergent democracy.

The larger question is what this apparently ‘literary’ debate means for political organisation. Of what use is the equality of disorganised atoms in bringing about *actual* social equality? This is a question that has returned with a vengeance in the context of the Occupy movement and its emphasis on a type of ‘horizontal’ organisation that refuses, on principle, the hierarchising and centralising

principles of emplotment inherent to the political party. Critics such as Jodi Dean (2016) have observed that the price paid for the organisational equivalent of the ‘equality of the sensible’ is a loss of political strategy. Rancière, for his part, has observed that, far from being able to *oppose* Marxism to the anarchic, atomic equality of the aesthetic, we must understand that Marxism itself has, from the beginning, been riven by the contradiction between the representative regime (that of Aristotle’s *Poetics*) and the aesthetic regime. Two examples will suffice. In *The German Ideology* Marx and Engels famously wrote that communism is ‘the *real* movement which abolishes the present state of things’ (1975b: 49); but this invites the question: if communism is the *real* movement, then is there, strictly speaking, a need for a communist party or other political organisation to *guide* or *accelerate* this movement? Second, whereas a common-sense understanding of the general strike would perceive it as an example of practical, centralising political organisation, Rancière describes it as ‘an exemplary equivalence of strategic action and inaction’ (2013: xvi). Like modernity itself, then, the Marxist tradition is riven by two tendencies: the centralising, organisational principle of the party form and the ‘aesthetic’ equality of democracy.

CONCLUSION

All three permutations of Marxist poetics are interconnected and directly concerned with the relationship between *poiēsis* and *praxis*. For contemporary communist poets, the central problem is the extent to which – and the ways in which – poetry can ‘accompany’ the political struggles of the present, give form to the multiple modalities of exploitation and oppression suffered by the global proletariat and bear witness to (and formally connect) the current sequence of global uprisings: from Occupy and the Arab Spring to Black Lives Matter. For Marxist literary theory more broadly, the emphasis is firmly upon reconstructing (or ‘cognitively mapping’) the operative social totalities that assume narrative form (or resist it) in a range of modern and contemporary literature. Its implicit premise is that cognitive mapping is a pedagogical precondition for contemporary class consciousness and, by extension, social revolution: ‘poietic’ maps plot the uneven terrain of possible *praxis*. Marxist poetics at the broadest level, then, raises questions about the optimal organisational form of such ‘practical’ interventions: from the centralised party to a more dispersed, horizontal collective.

Ultimately, though, the internal tensions of Mayakovsky’s project might alert us to a more variegated way of conceiving the relationship between poetics and revolution. It has been observed that Mayakovsky was caught in the competing temporalities that characterise all revolutionary transitions. The battle with *byt* (everyday life) divided every level: from the clash of residual and emergent social relations embodied in specific verse and word forms to the fraught attempt to maintain yet reinvent standards of poetic judgement; from the competing

materialities of the ‘poetic’ (pre-modern craft vying with futurist construction) to the ambiguous role of the poet (and poetic formation) within the nascent communist state. The overdetermined nature of Mayakovsky’s work arises precisely from the fact that these competing temporalities of socio-poetic transformation can never be fully synchronised. Marxist poetics hovers ever on the border of sublation and non-sublation: the precise relation between *poiēsis* and *praxis* is internally discontinuous and, ultimately, can perhaps only be grasped conjuncturally. Periodisation and cognitive mapping offer clues as to the optimal – or minimally viable – symbioses for a given situation, but truly to inherit the violent urgency of Marx’s own poetics they must remain rooted, like *Capital*, in the deathly disjunctions of capitalism: mutilated bodies and minds, earthly destruction and the uneven horizon of revolution.

Notes

- 1 I am grateful to the anonymous peer reviewer and Mark Steven for their helpful comments on earlier versions of this essay. All remaining errors are my own.
- 2 The (non-Marxist) precedent for this move is Paul Ricoeur’s *Time and Narrative* (1984).
- 3 On the ideological contradictions of romantic anti-capitalism, see Löwy and Sayre (2001) and Williams (1958).
- 4 On the poetics of *Capital*, see Sutherland (2008, 2019), Kornbluh (2014) and Hartley (2021).

- 6 On the relationship between modernism and communism, see Nickels (2012) and Steven (2017).
- 7 I cannot do justice here to the full range of Russian Futurist poetic experimentation (not least in key figures such as Khlebnikov). For an overview of Russian Futurist poetics in its geopolitical context, see Lawton (2004) and Ram (2012).
- 8 On temporality, tragedy and revolution in the poetry of Aleksandr Blok and Trotsky’s *Literature and Revolution*, see Toscano (2017).
- 9 I elaborate on this theory of literary production in Hartley (2017).
- 10 For a detailed account of Marxist literary scholars’ use of world-systems analysis, see Eatough (2015a, 2015b).
- 11 For a Marxist critique of digital humanities, see Allington et al. (2016).
- 12 It should also be noted that Rancière is here intervening in a quite specific tradition of French Marxist literary thought, one which (like Sartre in *What is Literature?* (2001)) has tended to see the drift towards stylistic absolutism in post-1848 modernist writing as a symptom of bourgeois bad faith – a symbolic denial of the bourgeoisie’s withdrawal into class particularity after the pre-1848 ‘universalist’ phase of bourgeois ascendancy. Rancière is thus implicitly revisiting these debates and re-evaluating them: where Sartre identified symptoms of bourgeois withdrawal and political betrayal, Rancière discovers the literary instantiation of democracy.

Communication

Nicholas Thoburn

INTRODUCTION

Not only does 'communication' have an integral place in the conduct of subjectivity and social life, it is incited and enshrined by a plethora of normative values, like free speech, transparency, and communicability. Adorno's exhortation *against* communication hence comes as quite a jolt to our sensitivities. Communication, he argues, has been thoroughly shaped by the needs and norms of capitalist accumulation, as seen in managed public opinion, direct command, clichéd patterns of meaning, and the identity-confirming flow of familiar speech – the 'word coined by commerce' (Adorno, 2005: 101).

In response, Adorno (2005: 101) proposes a suitably enigmatic formulation, that critical writing should create a 'vacuum' in communication. In part, this is a defence of rigour and style, clearly a necessity for Marxism in grasping objective realities against the readily consumable mystifications of capitalist common sense. But Adorno's concomitant refusal of communicability is not the strongest ground for a Marxist politics of communication – 'those who would escape', he concludes, 'must recognize the advocates of communicability as traitors to what they communicate' (Adorno, 2005: 101). Adorno's vacuum in communication also takes shape, however, as a reflexive politics of communicative *form* – an approach with more promise, and that opens to the theme of this chapter. It is apparent in the form of the book where these observations are made, *Minima*

Moralia. The title a playful inversion of Aristotle's *Magna Moralia*, or Great Ethics, Adorno's book adopts the bourgeois form of 'advice literature', then a booming market in post-war Germany, but with a confounding twist. While his book does indeed communicate much advice, it works within formal conventions in order to *undo* this form's liberal ground of the self-determining subject, Adorno 'pack[ing] a social-theoretical diagnosis into a generic form that is undermined by this very diagnosis' (Norberg, 2011: 401).

From these observations on Adorno I take a broad lesson. As much as Marxist writers seek to formulate and communicate critical ideas, we should at the same time be critical of communication itself – critical of its place and nature in capitalist society, its subject-fashioning modalities, and its media forms, in their variety and material complexity. Adorno serves here also to indicate that this reflexive critique can sometimes address Marxism's *own* communicative forms. Therein is the problem space of this chapter.

I will start with the communicative form of social media, the corporate infrastructure of compulsive communication, where it is apparent that the capitalist dimensions of communication have developed considerably since Adorno's time, and which is so era-defining that Jodi Dean (2014) identifies our contemporary as one of 'communicative capitalism'. Social media is not, for all this, the only form of communication, so I aim here to consider Marxist criticism of a broader range of mediums, as well as place emphasis on how this develops also as critical attention to Marxism's own particular communicative forms – a neglected aspect of Marxist approaches to communication that I have explored in *Anti-Book* and elsewhere (Thoburn, 2016, 2020). That said, the term 'communication' encompasses a wealth of expressive forms – oral, visual, textual, olfactory, kinesthetic, tactile – that far exceed the reach of one chapter. I focus here on *textual* communication, and then on only a limited number of textual forms and mediums: social media, the book, the manifesto, and the journal. Discussion of the latter two is developed in relation to the crisis of the Marxist subject of labour and the problem of fashioning communicative forms that are adequate to the non-identity of communism. Through an appraisal of the communist journals *Comité* (1968) and *Endnotes* (2008–), here I touch on themes of fragmentary text, anonymous authorship, and anti-dogmatic writing at the limits of struggles.

In the late twentieth century, when the ascendance of *visual* communication drew the lion's share of critical attention, my focus here on textual media might have looked outmoded. But today's digital and networked media is infused with written language, from the alphanumeric code orchestrating digital interfaces to the colossal volume of user-generated writing upon which social media platforms depend. We can hence speculate, with Nick Thurston (2016: 91), that 'rather than being *over-written* by the visual, the contemporary world has become more fundamentally *textualized* than any period before it'. This is not to say that text is in any fundamental sense *separate* from visual communication, or from our sensory

capacities in the round, a point I register by including in the discussion of journal publishing some attention to physical and visual design.

It is evident already that I take a different approach to the question of communication than might be expected, given established perspectives in Marxist cultural and media studies initiated by writers like Roland Barthes and Stuart Hall and centred on issues of ideology critique and the encoding and decoding of media messages (see also Gilbert, Chapter 43 and Ramamurthy, Chapter 61, this *Handbook*). My focus on media form is closer in orientation to Raymond Williams (1974) and the ‘Communication and Class Struggle’ project of Armand Mattelart and Seth Siegelau (1983) – though, now that their horizon of the workers’ movement has passed, this chapter develops through quite different problems. As for the geo-social scope of the chapter, it is largely limited to the global North. How the combined and uneven development of global capitalism is manifest and challenged within communicative forms in the South, in their situated variety, intermixture, and disjunction, is an important question that I here leave hanging.

COMPULSIVE COMMUNICATION OF SOCIAL MEDIA

The multiform variety of digital tools, networked platforms, and communicative protocols impress upon users a simple but often neglected fact: there is no medium-neutral communication, no communication in and of itself. With the media forms of email, blogs, Facebook, Twitter, Tumblr, and so forth, made continuous and fully mobile by the smartphone, textual communication has not only become interlaced with social practice in myriad and mutable ways, but features of mediality persistently push into the frame of communicative content – we are not ‘writing’, so much as tweeting, messaging, commenting. This makes a felt appreciation of the qualities and capacities of any medium a necessary feature of its competent handling, unsettling the distinction between textual *content* and media *form*. Think, for example, of how the structural function of the Twitter hashtag – ‘inline metadata’ that aggregates and organizes the multiplicity of Tweets in the expression of trend patterns and ‘ambient affiliations’ – is an immanent feature of the text that participants construct and consume, and is consciously manipulated as such (Zappavigna, 2011).

Such attention to the media forms of digital communication compels simultaneous inquiry into the social and subjective relations that they carry. To focus on social media, in *Blog Theory* and elsewhere, Dean (2010) diagnoses a pre-conscious compulsion encoded in its sociotechnical infrastructures. A real time immediacy of attention, connection, and user production is inscribed in each platform’s mundane operation, front-loaded as they are with ‘status’ and ‘time-line’ functions that incite users’ interaction to the same degree that they impede enduring critical deliberation and contemplative absorption. In the ever additive

pursuit of links, likes, comments, followers, friends, shares, page views, and so on, the *act* and *quantitative volume* of communication come to displace *what* is communicated, a kind of general equivalence of indiscriminate communication: ‘unlike a message, which needs to be understood, a contribution is just an addition’, ‘a fundamental communicative equivalence’ where ‘each message is communicatively equal to any other’ (Dean, 2014: 6). And this comes with its own neurochemical and affective binds, as users are captured in compulsive repetition, fuelled by ‘tiny affective nuggets’, ‘a smidgen of attention’ from each communicative act, momentarily relieving the ambient anxiety that is part and parcel of curating a successful personal profile, in a field of mimetic replication characterized by copying, comparison, envy, and rivalry (Dean, 2010: 95).

Meaning doesn’t entirely vanish of course. It tends to be capricious and ephemeral. But meaning can also take an intense and declarative form, characterized by affective dispositions that are stimulated and moulded by the algorithmic processing of our online preferences, where a relationship to verifiable realities cedes to group-think and identity replication – ‘post-truth’, as it is known. Biographical narrative also remains, is even intensified – key to the self-disclosure intrinsic to Facebook, for example – but it is incited and thoroughly shaped by social media’s infrastructural imperative of quantitative expansion, the demand for marketable data (Skeggs and Yuill, 2016).

These subjective forms are reciprocally constituted with a particular business model, one integral to social media’s technical infrastructure. As Robert Gehl (2014) and others have shown, users produce, supply, and rank online media content for free, generating at once the content that attracts user attention and granular marketing data about the tastes, preferences, desires, values, anxieties, and hostilities associated with that attention, to be mined and sold as differentiated audience to advertisers for near any conceivable product, service, or organization, in real time. Hence, on one side of the interface, social media compels compulsive individuation and self-disclosure, while on the other, it generates revenue by ‘simultaneously “dividuating” that data into multiple aggregate representations to be monetized as targeted ad space’, as Bev Skeggs and Simon Yuill (2016: 5) put it. And, to take the case of Facebook, this economic model is integrated with financialization through stock trading based on Intellectual Property control of its data, tax avoidance, and diversification and expansion well beyond the firm’s original structure, including into mobile communications infrastructure, financial services, and drone technology. Social media, then, is ‘*class* media’, as Dean stymies the cozy associations of this collective noun (2014, emphasis added).

Granted, one might respond with good reason that social media nonetheless offers ample possibility for political use by those with emancipatory values, namely, that it enables greater and broader access to the production, dissemination, and consumption of critical news and ideas; speedy and networked modes of organization at local and transnational scales; rerouting around corporate news agendas; and rapid circulation and intensification of political passions. These

points are illustrated by recent examples of Black Lives Matter, the so-called Arab Spring, the French yellow vests movement, and by the use of social media in reporting the Israeli state's maiming and murder of Palestinians in bombing assaults on Gaza, a partial outmanoeuvring of the formidable Israeli propaganda machine. Such capacities will clearly be fundamental to the future of effective political communication. Yet too often in celebrating activist and political *use* of social media, analysis fails to attend to the way that it can leave untroubled, or indeed extend, social media's incapacitating subjective and economic forms, and the broader corporate dominance and inequalities of wealth and access that social media bears (Dencik and Leistert, 2015; Fenton, 2016).

Social media can also prove disquieting in the new kinds of political media practice it fashions. Due to its often capricious and ephemeral relation to meaning and conscious critical activity, the archetypical expressions of online political commitment become petition signing and the easy and gullible solidarity of the type '#JeSuisCharlie', where, following the Islamist murders at the French satirical and racist weekly, *Charlie Hebdo*, an online affective swell played neatly into the nationalism and racialized emergency measures of the state's response. We might view this as a careless encouragement of right-wing effects (hardly less damaging for being partially unwitting), but among those *decided* in this direction, the communicative forms of social media are integral to the self-construction of the 'alt-right'. Ethno-nationalist fantasies of racial purity and rebirth, racism, misogyny, and homophobia are born of social and psychic relations in the round, but the specific forms they have taken online make one tempted to see the alt-right as social media's authentic political product. The scapegoating and rejection of complexity that are structural to the far right's foreshortened critique of capitalism here take shape in the swell-effects of social media to unleash streams of performative words and memes that belittle, bully, and humiliate – to the same degree that they consolidate and amplify the identities and practices of those whose sentiments and values accord with the invective (Seymour, 2016). At the same time, the alt-right leverages social media's capricious cognitive and affective structure to hedge its deadly serious commitments behind the claim that it's all for jokes. A more traditional structure of communication is also used for the same consequence, as the alt-right too often succeed in denying and camouflaging the material impact of racist discourse with the liberal trope of 'free speech', where communication is abstracted from its power relations and performative effects and fetishized as a realm of free and equal debate, a putative value in and of itself.

The ensuing question, 'can the left meme?', feels understandably urgent. The answer in part is, yes, of course it can – witness the proliferation of memes in support of the recent US and UK electoral campaigns of Bernie Sanders and Jeremy Corbyn, the best of which were fashioned outside of party political channels. And shifting from social democracy to Marxism, there is no inherent reason that the concentrated meaning and affect of a memetic GIF, for example, can't

work in concert with Marxism's more complex architectures of social critique. But in this, the identity-replicating tendencies of memes must also be critically handled, if they are not to construct left versions of the foreshortened critique of capital or rely for their effects on the identity forms of localism or nationalism.

BOOK COMMODITY

While critical reflexivity is hence necessary in the use of social media, it might also be achieved in the choice of different communicative mediums. For Dean, the media form of the book offers one such possibility, which she comes to while marking the apparent perversity of using a book, with its slow writing and publishing schedules, to develop a critique of social media, with its rapid technological transformations and revelry in the ever new. But herein lies its political value, she argues. The very slowness of the medium of the book enacts a 'cut' in the circuits of compulsive communication that enables thought to emerge, a medial intervention that Dean (2010: 1, 3) enticingly associates with the 'slow-down', from the classical repertoire of workplace struggle: 'As an object whose form installs delays in sampling and syndication and whose content demands postponed gratification, the book mobilizes the gap of mediacy so as to stimulate thought'. There are echoes here of Adorno's 'vacuum', and now with a provisional link between intervention in communicative form and class politics. But for Adorno, books do not readily serve this aim. Fashioned by the imperatives of market circulation, he argues, the book 'sidles up to the reader', existing not 'in itself' in expressive autonomy but 'for something other', a generic unit of exchange 'ready to serve the customer' (Adorno, 1992: 21). Intellectual engagement, which requires 'detachment, concentration, continuity', is undone by the commodity transformation of books 'into momentary presentations of stimuli' (Adorno, 1992: 21). And this is not the all of it, for the commodity form of books goes all the way down.

Dean isn't alone in passing over the capitalist structure of books, for there is a strong tendency in the popular imaginary to see the book as a form that escapes the realms of capital; this, Ted Striphas (2006: 9) suggests, is 'one of the most entrenched myths of contemporary book culture'. It is in part a function of the tendency of capitalist societies to accord works of 'culture' a transcendent value beyond that of economic utility (a value that in reality is far from extra-economic, being interlaced with class distinction and functioning as rationale and resource in any number of state and corporate schemes of governance, plunder, and profit). Of this tendency, books are perhaps the privileged instance, so much identified as repository and receptacle of culture – of the intellectual, moral, and aesthetic good and true – that they become indistinct from it. This transcendence of books does not happen all by itself, of course; it is a discourse that has played a central part in institutions of the book and learning, not least the publishing business. As Trish Travis (1999) argues, publishing has couched its advanced *industry* in

a discourse that presents books as objects immune to commodification, 'goods which pretend not to be goods at all'.

Yet print existed from its earliest days as an industry, 'governed by the same rules as any other industry', where the book was first and foremost 'a piece of merchandise' (Febvre and Martin, 1997: 109). And in this, books have by no means been reluctant players. Books have not only kept up the pace, as any good commodity, but have often been quite the innovators across numerous fields. Indeed, the printed book was the first uniform and repeatable mass industrial commodity – not comprising measured quantities of indeterminate volumes, as Benedict Anderson (2006) clarifies the point with regard to other early industrial commodities such as textiles or sugar, but a volume in its own right, a distinct and self-identical object. In combining moveable alphabetic type (a repurposing of metal-processing techniques employed since antiquity for minting coins) with a mechanical press (as adapted from that used in pressing wine), the Gutenberg letterpress shifted the manufacture of books from the self-directed movements of the scribe to mechanical process, so marking 'the line of division between medieval and modern technology' (Abbott Payson Usher, cited in McLuhan, 1962: 124). It is some three centuries before mechanization proper, but the productivity achievement is astonishing. The first 50 years after Gutenberg's Bible saw more books printed than in the preceding 1,000 years combined (Houston, 2016), as work tasks increasingly took on the quality of the assembly line, subdivided according to roles and parts in the production chain, and subject to the dictates of productivity that the conjunction of mechanism and time enforced. The principle was so established by the 1830s that it was the copperplate engraving of the printing trade (and not, say, the textile mill) to which Charles Babbage turned to illustrate the logic of modern industrial production, in his theories of mechanical process and the division of labour that informed Marx's analysis of the same in the *Grundrisse* (Makdisi, 2003).

Moving from the *production* of books to the complementary pole, we find, as part of the nexus of capitalist social relations of which the mechanical press was both product and bearer, that the mass production of print is contiguous with the first signs of mass *consumption*. Indeed, the rise of the bourgeois class, with its expanding demand for technical and literary text, was a significant social push for the invention of the Gutenberg press, the latter a technical solution to a social problem that was taxing inventive minds all across Europe (Febvre and Martin, 1997). Once established, early print media was associated with a host of mechanisms for the maintenance and cultivation of reading publics, from the simultaneous production of different books so as to avoid heavy losses if one failed, to concentration on bestsellers, of which Martin Luther's texts were perhaps the first, binding the nascent print industry with Protestantism (Anderson, 2006). The printed book was closely associated also with the development of copyright, for which the author-function, with its associated bourgeois values of individual 'creativity' and 'originality', emerges as product and guarantor.

Innovation on this front continues throughout the lifespan of the book industry. In the development of consumer credit, for instance, books pioneered debt-driven purchasing, where their esteemed cultural value eased consumers to overcome the negative moral connotations of debt (Striphas, 2006). More recently, books have had a pronounced presence in just-in-time, warehouse-based online retail, for it was the rationalized capitalist structure of books and the book industry, exemplified by the sophisticated logistical mechanism of the International Standard Book Number (ISBN), that encouraged Jeff Bezos to found Amazon.com on the sale of books and not another commodity (Striphas, 2006). And in the realm of the e-book, the book industry is currently at the forefront of technical and legal developments in rent and control, where systems of digital rights management restrict the reproducibility of digital text by locking ownership to individual consumers and time-limited contracts. Even where e-books seem to indicate flight from such mechanisms of capture, our free access on pirate sites is conditional on their transformation into aggregate data whose function is to attract advertising clicks for the multi-billion dollar industry of ad tech (Kirschenbaum, 2017).

Not all developments in the disaggregation of the book into data streams are agents of ad tech, however. File-share shadow libraries like AAAAARG, Memory of the World, Monoskop, and Sci-Hub are a tremendously valuable and critically reflexive resource for routing around the corporate constraints of the publishing industry. And developments in the ‘unbound book’ – ‘open to being continually and collaboratively written, edited, annotated, critiqued, updated, shared, supplemented, revised, reordered, reiterated and reimagined’, as Gary Hall (2013: 497) describes it – present challenging critical possibilities, grounded as they are in open-source infrastructures and opposition to the capitalist paradigms carried by the book form.

We should inquire further about the ‘people of the book’, the book and its subject. I have noted already the reciprocal relation between mass-produced books and bourgeois audiences in the emergence of the modern book commodity. Looking more closely at that class of readers, it is apparent that the culture of books and of reading has been intimately associated with and patterned by a complex of cultural values that designate and solicit distinctions of class and gender. George Steiner grasps a number of the dimensions of this complex. After noting that the book, in its ‘classic phase’, is a ‘privately owned object’, he writes:

A man sitting alone in his personal library reading is at once the product and begetter of a particular social and moral order. It is a *bourgeois* order founded on certain hierarchies of literacy, of purchasing power, of leisure, and of caste ... The classic act of reading ... is the focus of a number of implicit power relations between the educated and the menial, between the leisured and the exhausted, between space and crowding, between silence and noise, between the sexes and the generations. (Steiner, 1980: 188–9)

This appreciation of the class and gendered distinctions of book culture invites consideration of its other stratifications, not least of which concerns the role of the medium of the book in colonialism. Relativizing our notion of the book, Walter D. Mignolo assesses its place in the history of colonial conquest in Latin

America, arguing that the integration of religious authority with the book was less a particular manifestation of this media form than an integral feature of its historical emergence, the book as stand-in for God:

One could surmise that 'the idea of the book' may have entered into the system of representation of graphic semiotic interaction at the point when 'writing' gained its autonomy from orality and the 'book' replaced the 'person' as a receptacle and a source of knowledge. It is quite comprehensible that when the word was detached from its oral source (the body), it became attached to the invisible body and to the silent voice of God, which cannot be heard but can be read in the Holy Book. (Mignolo, 1994: 233)

Once established in this form, and no doubt derived from these features of autonomy and spiritual truth, the book was subsequently projected as a universal standard across time and space. Mignolo shows how, starting in the European Renaissance, books became entwined with an evolutionary model of thought that understood the codex to be an achieved form that had existed *in potentia* since the inception of writing, and hence the standard against which other forms of writing and technologies of inscription should be assessed. A series of equivalences was drawn, whereby 'true writing' is alphabetic writing, writing is indistinguishable from the idea of 'the book', and this identified with the medieval and Renaissance codex. As with time, so with space: this is the model that accompanied the colonial and missionary encounter with non-Europeans, whose writing systems and signifying practices were viewed through the European lens to be inadequate 'books' and thus to be burned as works of the devil and/or substituted with the material and ideological forms of the Western codex. As Mignolo insists, then, it is not in the *content* per se but rather in the *form* of the book that colonial power was manifest, a form that paradoxically downplayed the significance of its material instantiation in favour of a fixation on the spiritual transcendence of its content.

A more recent instance of the colonial impact of the form of the book is provided by its place in the delegitimization and destruction of the distributed textuality of Australian Aboriginal peoples. Like Mignolo, D. F. McKenzie (1999: 41) invites us to appreciate the 'nonbook' textual forms of non-European cultures, in this case where landscape is dotted with organic and geological features that are embedded in narrative structures and symbolic forms. Here the 'real absurdity' lies not in finding signifying properties in rocks but in the importation into such symbolic systems 'of a single-minded obsession with book-forms'.

AFTER THE MANIFESTO

Marxism has its renowned books, of course, but it has been constituted through a weave of diverse and numerous textual mediums and forms (Debray, 2007; Mattelart and Siegelau, 1983). Most iconic of these is the form of Marx's most famous text, the 'manifesto'. It is a peculiar textual form, discussion of which

leads me, for the remainder of this chapter, to specifically communist constructions of textual media, and to problematize these in our contemporary context of the crisis of the political subject of labour.

In its revolutionary mode, the manifesto is a purloined textual form, appropriated from the institutions of state and church where it served as a means to disseminate injunctions backed by force. As with its form in such institutions, the revolutionary manifesto articulates authority, and yet this authority is of a peculiar kind, for it is wholly fabricated, having no basis in existent institutional power. This feature is patently clear in Marx and Engels' (1973) *Manifesto of the Communist Party*, arguably the founding text of this modern genre of radical writing. One need simply to juxtapose its claims to meet the 'nursery tale of the Spectre of Communism with a Manifesto of the party itself', a manifesto that proclaims no less than the inevitable triumph of world communist revolution, with the actuality of its birth, initial impact, and institutional setting, as a work commissioned by a few dozen émigré radicals in the back room of a London pub and which, after some influence in the 1848 German revolutions, went largely unnoticed for some 20 years. This gap between claim and reality must be overcome if the manifesto's proclamations are to hold any plausibility, and it is this overcoming that is key to the manifesto's specific textual procedures, hitched, as Martin Puchner (2006) argues, to a particular subjective form.

The modern manifesto works by constructing a political subject through the diagnosis and presentation of the subject's historical emergence and future actualization. In turn, in a performative loop, this projected future flourishing lends authority to the text in the present where the subject is only nascent. The manifesto works, in other words, in the *future perfect*, as Puchner describes; its claim to authority in the present *will have been* sanctioned by the actualization of its subject in the future. It is a performance for which a certain theatricality, the staging of the authority that it lacks, is at once necessary and, if its theatre is to be taken as reality, necessarily ever excised.

Yet in this subjective structure, the manifesto is revealed to be a decidedly twentieth-century textual form, one rendered outmoded not so much by the waning of its performative power caused by over-repetition, but by the historical loss of any referent that might plausibly serve as its subject. How so?

The manifesto calls forth its subject on the condition that history is on its side. It was an approach that seemed tenable during the emergence of the industrial working class and through Fordism–Keynesianism. Here the working class was socially determined to recognize itself as a positive and expanding identity, amassed and concentrated in factories and industrial cities, and affirmed as such first through its independent institutions, by which it gained organizational power and social respectability, and later through its political and legal recognition within the social-democratic state. But even then there were significant problems. Its considerable gains notwithstanding, this was an *incorporated* antagonism, the workers' movement a pole internal to the expansion of capital, its self-perception

and social value based in its labouring capacity and hitched to its increasing productivity. The workers' movement hence *affirmed* rather than negated the subject of labour, while bearing that subject's gendered and racialized partitions and exclusions. Since the global capitalist restructuring of the post-1970s, however, the class dynamic through which this model of history unfurled went into terminal crisis. The global dispersal, fragmentation, and decline of industrial labour attendant on industrial over-capacity and deteriorating rates of growth; the long-term decline in real wages; the move to the heart of the wage relation of flexibility, precarity, and under-employment; the extension of super-exploitation and informal work attendant on the tendential rise in 'surplus populations' – from all this comes 'the impossibility of the proletariat to relate to itself positively against capital: the impossibility of proletarian autonomy' (Endnotes, 2008: 214). In other words, the working class – the precarious condition of needing to sell one's labour, whether achieved or not, and of being dependent on those whose labour power is enabled by one's unpaid work of social reproduction – is evacuated of positive identity and becomes increasingly experienced as crisis and imposed constraint, not to be affirmed in its futural expansion but abolished in its present. To this, the narrative form of the manifesto does not pertain.

The question arises, then, as to what textual and media forms might better articulate the fractured, non-identity of class? I will take this up through consideration of two communist journals, *Comité* and *Endnotes*, one published in France as the political horizon of the Fordist working class began to falter, the other, an ongoing anglophone venture, born of the class conditions of the present moment. I attend to the ways that the non-identity of class is here understood as 'rupture' or 'rift', and – the significant point for this chapter – how this emerges through a range of features of these journals' communicative forms.

FRAGMENT, RUPTURE, AND ANONYMITY IN COMITÉ

Befitting its understanding of social rupture, the first issue of *Comité*, published in October 1968, proved to be its last. It was the journal of the Student-Writer Action Committee, the May 1968 coalition of Maurice Blanchot, Marguerite Duras, Dionys Mascolo, and some 20 others. Among its short, conjunctural, and philosophically intense texts is 'Communism without Heirs', wherein one finds an exquisite definition of communism. Communism is no longer an emerging subject over time, but an operation against identity in the present, the wrenching exposure of any particularity to its outside: 'Communism is what excludes (and excludes itself from) every already constituted community' (Blanchot, 2003: 93). This is not an arbitrary feature of communism, but arises from the non-identity of class, as set out in the text's subsequent sentence: 'The proletarian class, community without any common denominator other than penury, dissatisfaction and lack in every sense of the term'.

And yet, if the working class is without identity, ever pulled out of shape by the social relations that course through it, identity remains available as an ill-fitting and misguided temporary respite. Hence communism, it is underscored, is against everything that ‘roots men (sic) in a time, in a history, and in a language’, against ‘the principle of alienation constituting man as privileged in his particularity ... imprisoning him in a contentment with his own reality, and leading him to propose it as an example or to impose it as a conquering affirmation’ (Blanchot, 2003: 92). Patriotism is the specific target here, or its espousal by so-called communist parties. But the text can also be read against tendencies to identity afflicting the May movement on its wane, tendencies towards prolonging its characteristic tactics, organizational structures, theoretical frames, and phraseology into a sanctified tradition, ‘an immobile movement in which everything is repeated without being renewed’ (Blanchot, 2003: 109).

In this tendency to identity, a particular role is played by communicative form. As dozens of books about the May movement followed inevitably in its wake, the *Comité* text ‘Tracts, Posters, Bulletins’ argued that the *form of the book* was a means to the movement’s closure:

everything that disturbs, calls, threatens, and finally questions without expecting an answer, without resting in certainty, never will we enclose it in a book, which, even when open, tends toward closure, a refined form of oppression ... No more books, never again a book, so long as we maintain our relation with the upheaval of the rupture. (Blanchot, 2003: 95)

To prolong the ‘the arrest of history’ that was May '68 requires instead writing in ‘fragments’, in mural writing, tracts, posters, bulletins, and journals, the media form of *Comité* itself intended, then, to extend the rupture:

[T]he texts [in *Comité*] will be fragmentary: precisely to make plurality possible (a non-unitary plurality), to open a place for it and at the same time never to arrest the process itself – always already ruptured and as if destined to be ruptured, in order to find their meaning not in themselves but in their conjunction-disjunction, their being placed together and in common [*mise en commun*], their relations of difference. (Blanchot, 2003: 85)

Certainly, fragments are not the only means of communist textual communication. The *Comité* text ‘Reading Marx’ draws out three modes of Marx’s writing – pertaining to his subversive pursuit of philosophy, politics, and science. Only one of these is fragmentary, while all have salience: ‘Communist speech is always *at the same time* tacit and violent, political and scientific, direct, indirect, total and fragmentary, lengthy, and almost instantaneous’ (Blanchot, 2003: 105). These modes of writing do not ‘live comfortably’ in Marx, they interplay and come apart, an ‘example [that] helps us to understand that the speech of writing, the speech of incessant contestation, must constantly develop and break away from itself in *multiple* forms’ (Blanchot, 2003: 105). Fragmentary forms, then, ‘do not say everything’. But in that is their particular quality and effect: ‘on the contrary, they ruin everything; they are outside of everything. They act and reflect fragmentarily’ (Blanchot, 2003: 95). ‘Effective or not, they belong to the decision of

the instant ... Like words on the wall, they are written in insecurity, received under threat; they carry the danger themselves and then pass with the passerby who transmits, loses, or forgets them' (Blanchot, 2003: 95).

If *Comité's* communist communication favoured textual fragments over books, it proceeded also as a practical critique of the author-function, that 'creator of scarcity', as Jeffrey Nealon (2008: 76) puts it, 'an interior space introduced into an exterior field of discourse to create privileged nodes of value'. We know from Mascolo that Blanchot penned 'Communism with Heirs', but the writings in *Comité* were published anonymously, a not incidental move. Here the un-working of the identity of communism was to be necessarily also an un-working of the identity of the author, as was broached in an editorial piece titled 'The Possible Characteristics'. It is a striking departure from the 'what we stand for' statements that usually accompany collective political publishing. These are too often catalysts for the passage to identity in political groups – totemic sets of principles through which groups seek to 'project an impressive image on the social screen', in Jacques Camatte's (1995: 20) phrasing, a self-delimitation that perpetuates capitalist patterns of group identity and self-marketing. By contrast, this piece concentrates not on *Comité's* political ideas and principles but on its communicative form, as it conjoins the 'rupture' of communism to 'breaking with the traditional habits and privileges of writing'. Fragmented publications are one of these breaks, as we have seen. Another is authorial anonymity, in order to 'remove the author's right of possession over what he writes', 'to make him impersonal by freeing him from himself (his history, his person, the suspicion attached to his particularity)', in order 'to constitute collective or plural speech: a communism of writing' (Blanchot, 2003: 85).

PUBLISHING RIFTS IN *ENDNOTES*

In this time of 4chan, hacker movements like Anonymous, and cyber-warfare, the problem space of anonymity has expanded way beyond that of the author, and, closer to my interests here, the multiplication of digital platforms has greatly increased the volume of creative text to which the author-function does not pertain. Nonetheless, in our intensely individualized and self-entrepreneurial societies, anonymous authorship remains a publishing practice of significance. It has a place in *Endnotes*, and for related reasons to its adoption by *Comité*, but it is other features of this journal's communicative form that I will consider here, as its immanent and critical relation to its outside, to rupture, shapes up as an antidogmatic approach to discussion and writing, and a pared-down visual design.

Another single-issue journal is a useful way in – the *Deutsch-Französische Jahrbücher* ('German-French Annals', published in February 1844). Co-edited by Marx and Arnold Ruge, the journal includes the full epistolary exchange in which the two had hammered out its aims, a quotation from which is carried as an epigraph on the back of the founding issue of *Endnotes*. Among other things,

Marx here opposes idealist models of abstract thought, where ideas are introduced from one particularity but claim universality, and forwards instead an immanent and ruptural quality to communist writing:

Hitherto philosophers have had the solution of all riddles lying in their writing-desks, and the stupid, exoteric world had only to open its mouth for the roast pigeons of absolute knowledge to fly into it. Now philosophy has become mundane, and the most striking proof of this is that philosophical consciousness itself has been drawn into the torment of the struggle, not only externally but also internally. But, if constructing the future and settling everything for all times are not our affair, it is all the more clear what we have to accomplish at present: I am referring to *ruthless criticism* of all that exists, ruthless both in the sense of not being afraid of the results it arrives at and in the sense of being just as little afraid of conflict with the powers that be. (Marx, 1975: 142)

In this construction, ‘mundane’ communist thought does not *impose* itself on struggles – does ‘not confront the world in a doctrinaire way with a new principle: Here is the truth, kneel down before it!’ – rather, it emerges *from* struggles, from critical relationship to their torment, and with such torment it must remain ever articulated. The role of communist writing is thus diminished; it does not offer the communist equivalent of the Word of salvation but merely adds shape, reflection, and synthesis to knowledge that ‘already abounds in the world’, as Jasper Bernes (2013: 173) characterizes the anti-didactic role of theory in this letter. Yet in this diminishing, writing becomes all the more salient and vital, because it no longer basks in the certainty of its own particularity, but seeks as best it can to grasp in thought the moving antagonistic ground of capitalist social relations, of which it is itself a part.

So, idealist models of thought are shaken by uncertainty, whereas communist thought takes uncertainty as an internal principle, a condition of its non-identity, its critical immanence to social relations and ruptures. And yet Marxism has found uncertainty hard to bear, succumbing to dogma at least as readily as any other school of thought. It makes the attempt to fashion *Endnotes* through an anti-dogmatic mode of thought and conversation an enticing feature of this project, as I will sketch, starting with the place therein of limits and rifts.

The back-cover epigraph from Marx’s letters to Ruge that adorns the first issue of *Endnotes* plays a somewhat paradoxical role. Here a text some 175 years old, written and published to explain the rationale of a nineteenth-century journal, is enlisted to demarcate and confirm a publishing project that actively seeks to *sever* itself from the past, from communism understood as an emergent historical subject, and orient instead to the mutating horizon of capitalist social relations in the present. If, as I argued earlier, the political ground of workers’ identity is now passed, communism turns instead on encounters with the *limits* to identity – the structural impasses, complicities, and exclusions that condition sectoral identities, social movements, and racialized and gendered groups – and on the attendant *rifts* with these identities such encounters might produce. Communism, then, ‘is attentive to the possibilities of a real revolutionary rupture opening up because of, rather than in spite of, those limits’ (Endnotes, 2011: 29).

This has effects on the practice of journal publishing, if we turn from the critical orientations of the journal to its communicative form, the pertinent point for this chapter. In editorial introductions to *Endnotes*, the group explains their project as a commitment to rigorous, ‘ruthlessly honest, open-ended internal debate’, ‘a place for the careful working out of ideas’, ‘in which no topics would be off-limits’, and to which the journal itself is adjacent, ‘conceived specifically as a by-product’ (Endnotes, n.d., 2013: 1). If this ‘impolite conversation’ is to take place at its limits, against rather than within the identities of the group and the struggles of our time, then it must hold at a distance ‘political position-taking or other matters in which the Ego – collective or individual – would necessarily take centre-stage’ (Endnotes, n.d.). Writing at the limit of identity impacts too on the specific content and temporal rhythm of the journal. The editorial to *Endnotes* 3 explains that the more abstract theoretical content of the first two issues was in part a result of the then low ebb in global class struggle, but also ‘because we didn’t know what we wanted to say about the struggles that were on-going, and we thought it best not to pretend otherwise’ (Endnotes, 2013: 1). Such a sensibility inclines the journal to avoid ‘rush[ing] to conclusions for the sake of being topical’ and for ‘concerns about publishing’, which I take to mean the latent compulsion of this medium to periodicity (a publishing mainstay that subsumes the complex temporalities of the social world into ‘the steady onward clocking of homogenous, empty time’, as Anderson (2006: 33) writes of the daily newspaper).

We see, then, how an immanent, anti-dogmatic communism of limits and rifts is here articulated through modes of conversation, thought, writing, and temporality, wherein the specific critical form of this journal takes shape. On shifting attention to the physical and visual form of *Endnotes*, however, success on this front becomes less clear-cut. Circumspection towards the demands of periodicity was also a feature of *Comité*, but here it played in tandem with a concern to ward off the constraints of regular physical and textual form, for the list of *Comité*’s possible characteristics informs that the journal was intended to be an ‘essentially irregular publication, bound to a temporal irregularity, just as much as an irregularity of format and formulation’ (Blanchot, 2003: 86). That is not so for *Endnotes*, which has a high degree of uniformity across issues, comprising a pared-down and rigorously ordered page layout, a sans-serif typeface of the kind favoured by the modernist International Typographic Style, and an austere, image-less cover design. Variation comes only in the cover colour, issue title, back cover epigraph, and boxed-in sketch of a part-concealed lurking urban monster that accompanies the postal address on the back flap. That said, *Endnotes* 4 gains a wraparound cover image, in the form a dust jacket. As with the journal’s other visual features, it is an image of constraint: a greyscale aerial photograph of the massive Pruitt-Igoe housing projects in St Louis, Missouri, figuring here the order, spatial containment, and domination of modern capitalist urbanism. However, in the minds of many, the image is haunted by the well-known photograph of the scheme’s

dynamiting in the 1970s, such that this scene of order bears also the concatenating *crisis* that is today's collapse of that socio-urban form.

This dust jacket notwithstanding, in these pared-down visual and design features, the temptation is strong to conclude with the anonymous writer of the blog *insipidities* (2013) that the unruly and unforeseen qualities of communist communication are missing – that *Endnotes*' 'socialist-minimalism' operates in 'sublated life registers'. Touching on some of these visual features, and returning to the journal's mode of writing with a more critical eye, *insipidities* presents a decidedly experimental book review of *Endnotes* 3. What can be gained by reviewing the journal without reading it, bypassing the 'business of serious reading and analysing and writing' and instead perceiving it as an experience of immediate encounter – 'the vital instant, the throb, the flesh, the register of immediacy ... precisely the stuff with which endnotes is structurally constrained from recording'? What are the effects of imagining *Endnotes* 'without the corrections, say in its first draft. What is writing with the mess left in?' What is it that 'carefulness, as illustrated in the group editing of collective thinking, does to the outcome of that thinking, I mean *politically*[?]' What is closed off in our conceptualization of the social and affective qualities of communism – its worlds, densities, speeds, hues, and textures – when the word 'struggle' is used 41 times in a journal's introduction alone? Such are the fecund or 'maximalist' questions to ask of this journal's form, as affective encounter and an opening to error and complexity come forward as significant features of communist communication.

And yet there is still an expansive communism articulated in this journal's visual form. We have seen how the dust jacket to *Endnotes* 4 bears crisis within an image of urban order, but that is only part of it. The visual design of *Endnotes* can be viewed as an expression of its theory of communism, where communism is so stripped down to the thin horizon of class abolition – without subject, tradition, teleology, dogma, or guarantee – that its published articulation looks like printed alienation, and may necessarily be just that, given the impossibility of positive class identity within capitalist society. But this is not a surrender of aesthetic qualities, for I suggest that *Endnotes* holds *non-identity* in its tight-laced visual style. The journal's preference for austere design is a rigorous non-preference for any identifiable leftist, communist, or counter-cultural design, or indeed for any particular design at all – a stripping out of design identity which would otherwise bind it to the past rather than open it to the rifts of the present. Minimalism, then, is a condition of maximum, unforeseen potential. It lends the journal, almost despite itself, a decided aesthetic allure.

Is it a clue that *Endnotes* makes such an intervention at the level of its visual form, or a lapse in the regimen of non-identity, or overkill, that, hiding in plain sight, its third issue contains a *flipbook*? In an article titled 'The Holding Pattern' on the 2011–13 cycle of struggles that spread from the Tunisian uprising to Occupy, the page numbers on the recto side have been substituted with a solitary black square that spins a quarter movement as one flips through the pages. It is

a modelling of the abiding weakness of this ‘movement of the squares’. These movements had the not inconsiderable power of concentrated collectivity, and visibility as such. But in the very form that their collectivity took, as spaces of public congregation and protestation, they were disembedded from the concrete relations of work and everyday life wherein they might otherwise have developed enduring emancipatory effects, leaving them spinning around without traction. And yet a spinning square can spin out of control. Perhaps this flipbook gestures also to the provisional quality of the analysis, its openness to the unforeseen future of this cycle of struggles, which as it transpires is far from contained.

CONCLUSION

‘Words *work*’, the Situationist International (2006: 114) succinctly put it, ‘on behalf of the dominant organization of life’. Some of the *ways* that words work – the ways that communication bears and extends the economies and subjectivities of capital – has been the focus of this chapter. I placed emphasis on the *forms* of communication, in particular social media and the book, since communication is never medium-neutral. As Adorno exemplified, such attention to communicative form should also be raised within Marxism, a problem internal to its own publishing practice. The manifesto form stands as an influential example of such form-reflexive publishing, but I have suggested that it is considerably limited by the collapse of its referent, the subject of labour.

Looking elsewhere for critical engagement with Marxism’s own communicative forms, the chapter explored two communist journals, which were understood to produce a more immanent mode of communication. Here the ruptural quality of communism develops through an anti-dogmatic orientation to the identitarian limits of struggles, while drawing in appreciation for fragmentary text, moves against the author-function, rigorous and impolite thought and conversation, and publishing’s visual styles. Of course, there is nothing to privilege in the journal form; in so far as ‘we live within language as within polluted air’ (Situationist International, 2006: 114), *all* of communication warrants critical and experimental intervention. The question of how such intervention takes shape through the variety, intermixture, and disjunction of different media, in particular locations and struggles, and in relay with diverse and emergent political problems presents a promising agenda for research and practice.

International Relations

Maïa Pal

International relations conventionally refers, in the academic context, to events and institutions organised between states and certain non-state actors, such as international and supra-national organisations, non-governmental organisations, multilateral and bilateral trade agreements, civil society, and large-scale social movements. More generally, it refers to people's common sense of the world as a space mapped by various institutions and organisations that provide either more, or less, opportunities for interacting with other individuals. The more privileged inhabitants of this world see themselves living in an increasingly homogeneous, open, and connected space encapsulated by the phenomenon of so-called globalisation. If Marxists have widely criticised the concept of globalisation (Gill, 1995; Rosenberg, 2000), their work on international relations has nevertheless been largely concerned with its effects on the state and other governing institutions, i.e. the increased economic and political interaction between certain individuals and organisations often to the detriment of the larger and poorer population. Thus, the primary contribution Marxists make to the academic discipline of International Relations (IR), as well as to its more common-sense notions, is to contest the ways in which capitalism is erased from analyses of globalisation and clarify how capitalism can better describe and explain its inevitably unequal dimensions.¹

To this end, this chapter problematises the idea of 'international relations'. It engages with Marxism's contribution to IR scholarship and to people's understanding and perceptions of worldwide class and power dynamics. As currents

of thinking which evolved concurrently but independently, IR and Marxism have known various encounters and tensions. The chapter will discuss some of the key issues stemming from this relationship – mostly from within an Anglophone and Western-centric context – rather than providing an exhaustive genealogy and list of Marxist scholarship in and on IR.² In addition, it will argue that one of the most pressing ways forward for Marxist international theory is to (re)engage with the state debate in terms of the materiality of legal bodies and borders, rather than with regard to the formal relations between capital and state.

The first section unfolds a genealogy of IR marked by racism and imperialism.³ It emphasises the obstacles confronting fixed and universalist definitions of IR as a domain, insisting on the multiplicity of vantage points and the politics and unequal power relations involved in their formulations. The next section explores what questions Marxists in general have asked about the domain of international relations, tracing some of the major debates between Marxists regarding the distinction between international and domestic realms. The final section explores what questions – and types of Marxism – have emerged from inside the IR discipline, discussing the state debate and the extent to which Marxism challenges the main tenets of the discipline of IR.

A RACIST AND IMPERIALIST GENEALOGY

Defining the domain of international relations presents potentially insurmountable spatial and temporal obstacles. Referring to fixed and specific dates, places, and events of origins is not only a necessarily arbitrary strategy, it is also a political one, and one that has not been sufficiently reflected upon in the literature. Instead of the conventional narrative tracing the origins of the discipline in classical ancient and early modern philosophers, from Thucydides to Kant, recent work by Vitalis (2005, 2015) has explored the discipline's institutional beginnings in Anglophone (mainly US) universities in the early twentieth century, showing that race and biology were the political and psychological determinants behind the characterisation and fixation of the world as exclusively composed of territorial states.

Although the arguments developed by early IR scholars were explicitly about formulating the transition from a world organised into empires to one constituted by states, their implicit goal was to disguise imperialism's biological erasures and hierarchies behind the apparent orderliness and sanitisation of an anarchic world of states, either newly self-determined or reformed from old empires. For Vitalis, if one has to mark the discipline's birth, 1910 is a better date than 1914 – the beginning of World War One – or 1919 – the creation of the first Chair in IR at the then University College of Wales, Aberystwyth. The year 1910 saw the founding of the *Journal of Race Development*, later re-baptised as *Foreign Affairs*, which remains one of the discipline's leading references. 'Race development' according

to a white European *qua* American standard was treated as a natural given. And this remains embedded in the ethos of the discipline, as to 'be a professional IR scholar in the US today means adopting a disciplinary identity constructed in the 1950s and '60s that rests on a certain willful forgetting' vis-à-vis the violence of its racialised, imperialist, and biological origins (Vitalis, 2005: 160). Moreover, the reception and reference to ancient and early modern classics – in the leading Realist and Liberal traditions shaping the discipline since the early twentieth century – has also been revealed as deeply embedded in assumptions of racial, imperial, and civilizational superiority, often distorting the context and meaning of those classics (Jahn, 2000; Vergerio, 2019).

In other words, the 'willful forgetting' and narrow recuperation of the past is a trademark of the discipline of IR. Its name itself is an act of erasure that makes a universalist and ahistorical claim about the world, implying that nation-states are the main actors of world politics and that the way they behave has not changed for thousands of years. This is a fallacy, since empires are by very far the most present and permanent form of political organisation. Yet the state remains one of the bases of Realist theory in IR, which – alongside International Liberalism – dominated the field for most of the twentieth century. Instead of the term 'international', the terms 'inter-societal', 'trans-national' or 'trans-societal' relations have been proposed so as to avoid the misplaced focus on states. Whichever term is used, definitional and genealogical issues are at the forefront of any critical understanding of the discipline. In other words, there is a need to clarify the level of abstraction on which an approach is based. Thus, from a Marxist or critical perspective, the point of the discipline of IR is to alert us to the level of abstraction with which certain individuals and groups of individuals – and specifically classes – act and understand their interactions. Attempts to strictly define levels of analysis in the traditional and policy-oriented approaches are necessarily political – in spite of often claiming to be objective and scientific – because they tend to obscure how the differentiated experiences and theories of what is and is not 'international' were often imposed on others through colonialism and other forms of tribal, imperial, or sovereign rule. These render the subjectivity of these experiences mediated by unequal and unjust power relations.

In other words, the study of international relations is not a type of social science with a clear object of analysis, such as exploring the geographical or anthropological encounters between different societies. Studying international relations implies – especially for Marxists – that these encounters have been shaped by social processes of domination and exploitation. These processes must be visible and incorporated into the main agents and structures used to understand international relations. Acknowledging the complexity, multiplicity, and diversity of analytical starting points enables us to be cautious about any attempt to define international relations from a geographically limited, fixed, and ahistorical standpoint, and calls for us to search for the political justifications and assumptions behind such attempts. Marxism can be a sophisticated and elaborate conceptual

matrix that provides a plethora of interdependent concepts – a dialectic – weaving historical and theoretical challenges to conventional narratives. In response to this imperative, attempts to ‘decolonise’ the discipline and to theorise it beyond its Eurocentrism by incorporating Marxist, postcolonial, and critical race theories have flourished in the last few years (Hobson, 2012; Anievas et al., 2014; Ling, 2014). Thankfully, the debate on appropriate benchmarks to retrace the history of international relations is also currently taking place beyond Marxist and critical circles (Buzan and Lawson, 2014).

Before going deeper into what Marxism can specifically bring to this challenge, it is important to recall the conventional narrative. Since the nineteenth century when the term ‘international’ first came into use – notably by the philosopher Jeremy Bentham (1748–1832) and later, following the professionalisation and institutionalisation of other disciplines such as sociology, ethnology, and international law – conceptualisations of international relations have been overwhelmingly European, Western, and/or Northern-centric, even in Marxist scholarship. It is therefore primordial to acknowledge the political and economic consequences of this narrow yet dominant definition of the world – and of international relations. The central claim of this definition is the emergence of the modern world as a European – *qua* international – order of nation-states, a supposedly increasingly homogeneous whole constituted of independent, equal, and territorially fixed entities whose main activity has been recorded as a series of military conflicts and alliances between European ruling classes, at home and abroad. This led Realists in IR to understand the sovereign state as driven by self-interest, survival, and security, while Liberals focused on opportunities for these states to cooperate and organise based on values of freedom, economic liberalism, and peace.

Questioning and critically analysing the modern origins of the expression ‘international relations’ implies (re)tracing who is assumed to have first understood and functioned with this narrow interpretation, in which the world becomes an observable ‘playground’ or, as is the often quoted image, a billiard-ball table. In this scenario, the role of IR scholars is to analyse, strategise, and (very often wrongly) predict the behaviour of states – as if their behaviour was reducible to, and as predictable as, that of billiard balls. This scenario has been widely adopted since the mid to late twentieth century, and specifically since the work of Neorealist scholars in IR such as Kenneth Waltz (1979). Reducing state behaviour and rationality to a parsimonious equilibrium presents obvious advantages for making IR into a simpler, more policy-alluring political science.⁴ But one of the crucial dangers of this approach is its implicit historicisation of the emergence of these states as unchallenged harbingers of progress and political rationality, whose methods for achieving such unprecedented universal ‘acceptance’ and ‘adoption’ by non-European societies were either justified – as the West’s ‘civilising mission’ – or could be swept aside as a dark but unavoidable part of European history, a barbarism from which liberalism has saved modernity.

For most of the nineteenth and twentieth centuries, the West ignored, exploited, and eradicated non-Western societies' ideas and practices, and the world(s) these societies lived in and traversed. Of course, the categories of 'Western' and 'non-Western' are reductive and problematic, but they are a shorthand to mark out the small group of states and individuals who created the legal categories and borders in late-nineteenth-century conferences and institutes that set up the sovereign hierarchies at the core of our contemporary order. The West considered these 'un'- or 'semi'-civilised societies – official categories used by international lawyers (Koskenniemi, 2001; Tzouvala, 2020) – as unable to participate in the institutional construction of international relations. These hierarchies and unequal power relations between different types of states and political entities must always be the starting point to any discussion of the domain of international relations, even those only concerned with relations between modern sovereign states (Zarakol, 2017). It was only through that exploitation, eradication, and downgrading of others – those not part of the nineteenth-century select club of Great Powers – i.e. France, Britain, Germany, Russia, and the USA – that the modern sovereign state could emerge as a 'standard of civilisation'.

To understand the relationship between Marxism and international relations, it makes sense to refer to the worldwide universalisation of capitalism from the late nineteenth century as the central benchmark to define the domain of international relations.⁵ Moreover, it is useful to point to how this universalisation rose in parallel to the development of an inherently internationalist Marxism since the late nineteenth and early twentieth centuries. If 1919's first Chair in IR marks, for most textbooks, the beginning of the discipline as a unique, isolated, institutional event, this chapter contrasts and rejects this ontological singularity. Instead, it understands this date as marking the early days of what Hobsbawm (1994) has called the 'Age of Extremes', of a world waking up to the Russian Revolution, and of the beginning of an age of both dreams coming true and shattering like a castle of cards for Marxists and revolutionaries worldwide. Hobsbawm ends this age, pregnant with hope yet suffering from labour pains and sickness, in 1991, providing a new terrain both for new 'global' and 'neoliberal' catchphrases and umbrella concepts of world order, and demanding that Marxists carve themselves an identity out of the dilemmas and fears of the Stalinist Soviet era.

In effect, it is no surprise that Marxist scholars, communists, and revolutionary activists came so late to a discipline that remains predominantly Anglo-American (Hoffmann, 1977), with leading scholars such as Henry Kissinger defining its contours while also actively occupying the corridors of power. The discipline was concerned for most of the twentieth century with matters of war, foreign policy, national interest, gun-boat diplomacy, fear and security, i.e. the so-called 'high' politics which left 'low'-level political issues such as the economy and the environment to other departments and disciplines. And for the same reason, it is equally obvious why scholars in this government-led discipline had no interest – except that of seeking to destroy and eradicate them – in the fundamentally

internationalist work and ideas of Marxist thinkers and political actors. We therefore need to acknowledge the fundamental antagonisms between, on the one hand, Marxism as thought and praxis and, on the other, how IR emerged and evolved academically for most of the twentieth century. This began to change post-1970s as the discipline opened to a more complex and interdependent set of approaches to understand the world, such as Feminism, Constructivism, Postcolonialism, and Poststructuralism. Marxist scholarship also started to target IR's concepts and areas of study more directly. Finally, post-USSR, it became more possible and useful for Marxists to be involved in IR debates on the state, political economy, international institutions, and other non-state actors. The two following sections will now look more closely at the encounters and tensions between Marxist thought and IR.

MARXISTS AND THE PROBLEM OF INTERNATIONAL RELATIONS

Kubàlkovà and Cruickshank wrote in the first book-length Marxist introduction to IR (1989) that 'Western and Third World Marxists, from the Frankfurt School onwards, have tended to play down international relations regardless of the fact that, as Bernstein predicted, international relations has become "the supreme and central issue of the age"'. This of course does not mean that post-1960s Marxists did not have an internationalist conception of politics, of capitalism, or of revolutions. However, it does remind us that the conceptualisation of 'international relations' as a separate or independent realm of social analysis has been problematic. Moreover, Marxists, like many intellectuals emerging out of the horrors of the early and mid twentieth century, also suffered from inheriting an understanding of the world that wilfully assumed a narrow conception of states and of international relations as derivative of those states. This can to some extent explain the rejection of this domain of study by Marxists as a way of resisting bourgeois political economy, liberal internationalism, and assumptions regarding the political and economic, international and domestic, as separate domains of analysis.

The conceptual distinction between what is international and what is not is undoubtedly highly problematic for the Marxist tradition, but it is also at the heart of its main contribution noted above, i.e. explaining globalisation and the states system as capitalist processes, whether distinct or simultaneous. Marx and Engels provided an original and ground-breaking perspective – through the broad vision of their entire corpus and the potential of the method of historical materialism – to why the international/domestic distinction reduces our abilities to understand and explain the expansion of capitalism and other modes of production. Although they wrote extensively about specific national questions, they also did so from an internationalist standpoint. However, there are important distinctions between internationalism as a standpoint and taking the international as an analytical starting point. The former is more political and strategic in terms

of, for example, advancing a working-class world revolution, whereas the latter is more academic and theoretical. Thus, certain parts of *Capital* – the often used, and abused, final chapters of volume I part VIII on ‘So-Called Primitive Accumulation’ (Marx, 1976) – as well as classic texts such as *The Eighteenth Brumaire of Louis Bonaparte* (Marx, 1968) or *The Communist Manifesto* (Marx and Engels, 1968) are obvious benchmarks for understanding Marx and Engels’ internationalist standpoint. However, they are also crucial texts to critically build on for the purpose of developing analytical starting points as a complement to their internationalist standpoint, rather than a mere amalgamation with it.⁶

As a whole, by elaborating a new conceptual framework based on the critique of classical political economy, Marx and Engels’ work provides space to analyse inter-societal relations beyond the various types of political borders that emerge alongside relations of production. In contrast, bourgeois or liberal political theory assumed these political borders as natural and given to any progressive or modern system. However, as mentioned above, the international/domestic binary did become a more persistent problem for various Marxist scholars and schools. The binary remains in various academic disciplines and everyday discourse and continues to reproduce false assumptions about – *inter alia* – the rise of the modern international order, state formation, mobility and citizenship, the role and legitimacy of institutions and organisations, and comparative methods in historical sociology. Politically, it also remains a continuing stumbling block for solidarity movements, as working classes remain tied to national political systems that can stoke the fires of racism and xenophobia by maintaining the illusion that states can control and shape economic conditions of labour. This predicament persists even though transnational corporations operate within a legal space where national boundaries have little or no leverage or authority, and where regulations for tax and labour rights often remain beyond the democratic reach of citizens.

The work of Rosa Luxemburg has known a certain revival in Marxist IR circles (Bieler et al., 2014), and more generally, after being unduly ignored for a large part of the twentieth century. An engagement with her writings is useful to showcase some of the debates and obstacles that the international/domestic binary created for early and later Marxists. Luxemburg was not content with Marx’s analysis of the expansion of capitalism, and *The Accumulation of Capital* (1913/1951) is her attempt to provide a new theory for understanding capitalism’s dependence on external markets, i.e. those provided by colonialism and imperialism. More abstractly, Luxemburg grapples with the relationships between ‘individual capital’ and ‘aggregate capital’, and what distinguishes capital accumulation from other forms of reproduction. Her central argument is that, contra Marx, the conditions for the universalisation of capitalism are different to those for the accumulation of individual capital. In other words, her astute understanding and knowledge of world events in the late nineteenth and early twentieth centuries provided her with material to separate the analysis of capitalism at the individual or local level, from the analysis of capitalism at the worldwide level. This is obviously a gross

generalisation and simplification of her complex economic theory, but it helps to set the scene for how Marxists became increasingly troubled by how to square this relationship from the specific to the general. However, on the whole, the use of national borders became a lazy – though admittedly in some cases necessary – marker for dividing and isolating analytical loci for understanding social relations, and these early theories of imperialism remained embedded in fixed territorial notions of the state and capital.

If the various theories of capital accumulation are a fundamental manifestation of how Marxists have integrated and conceptualised the international/domestic distinction, there are a number of other theories that need at least mentioning here, even if it will not be possible to elaborate on their various forms and scholars.⁷ After the period of classical theories of imperialism spearheaded by Lenin ([1917] 1973), Hilferding ([1910] 1981), Luxemburg ([1913] 1951), Kautsky (1892), and Bukharin (1929), it is important to recall a number of events shaping Marxist thought and praxis: the Russian, Chinese, and Latin American revolutions, two world wars, decolonisation movements followed by the Tricontinental (1966) and Bandung (1977) conferences, independence wars in Africa and Asia, the rise of international organisations, Western European reconstruction, Black power struggles, the 1960s student movements, the Cold War and nuclear proliferation, the fall of the Soviet Union, rapid Asian economic transitions, to name but the most salient. In trying to make sense of and participate in these struggles, Marxists and revolutionaries worldwide were either overstretched in liberation and counter-hegemonic politics, in exile, prison, or just barely trying to survive.

Dependency theory in the 1960s – developed by authors such as Andre Gunder Frank – influenced International Political Economy scholars to reverse the dominant theories of economic development between North and South. Dependency theorists provided empirically driven economic analyses to show how the advanced development of the Western or Northern capitalist states was dependent on those of the South and East, which were required to be kept in stages of under-development in order to continue providing – after the so-called end of colonialism – cheap labour, services, and raw materials. Wallerstein's (1974) world systems theory (WST) also developed a very influential variation of these relations of dependency, by developing a more radical systemisation of regions of the world (core, periphery, and semi-periphery) and grounding this theory in a long-scale history of the world. The other important Marxist influence grounding the later shift towards a more explicitly international theory of historical materialism and social relations is the work of Antonio Gramsci (1998). Gramsci's concept of hegemony – alongside analyses of civil society, subaltern actors, wars of movement, and wars of position – was a fundamental innovation that eventually led to perhaps the most influential group of IR Marxists, the neo-Gramscians (Cox, 1981; Van der Pijl, 1984; Cutler, 2001).

Critical geography is also an important influence perhaps less often and not sufficiently critically discussed in assessments of Marxism and IR. The critical

geographer David Harvey has become a reference point for Marxists worldwide, notably thanks to his pedagogical efforts known as the 'Project Marx' to make the classic texts more accessible and thus go back to Marx's method rather than its often problematic application by Marxists. Harvey's work cannot be fully accounted for here, but his emphasis on capital accumulation as 'accumulation by dispossession' and attempts to theorise imperialism and hegemony in relation to value-based circuits of capital in many ways return to some of Luxemburg's themes and aims, namely to retrieve the implicit internationalisation in the theory of historical materialism as originally proposed by Marx and Engels (Harvey, 2003). His focus on 'spatial fixes' and on capitalist expansion as not dependent on local and historical specificities of state formation has been seen as a way for some IR scholars to avoid the pitfalls of mainstream IR – notably for those interested in developing the spatial dimensions of neo-Gramscian concepts such as transnational hegemony and passive revolution (Bieler et al., 2010; Hesketh, 2017). Moreover, this has opened some avenues to integrate more discussion and conceptualisation of the environment, nature, and the Anthropocene, and these concepts are now being developed by a rich set of scholars outside narrow IR disciplinary circles (Moore, 2015; Malm, 2016).

Finally, it is essential to recall the work of Marxist scholars working from post-colonial and Third World contexts and perspectives as having a particular influence on not only providing alternative definitions of (and often rejecting) the international/domestic binary, but also going beyond the narrow relationship between states and empires found in Western Marxism (for example, see work by James, 1938; Williams, 1944; Wolf, 1982; Wilson, 1989; Banaji, 2010; Achcar, 2013; Amin 2014; Prashad, 2014). Although debates between post-colonial theory and Marxism have not always been productive and Marxists have pointed to crucial flaws in postcolonial approaches to the international (Chibber, 2013; Matin, 2013), these approaches are necessarily intertwined by their shared normative and emancipatory goals. Nurturing their encounters should remain a priority for IR scholars, as Rao (2016) forcefully reminds us by returning to the work of Frantz Fanon (1961/1967, 1952/1986), black and Third World feminists (Mohanty, 1988; Crenshaw, 1991) and Black Marxism more generally. There is also a surge of work from a decolonial and postcolonial ethics and epistemology, which has influenced political economy and Marxist approaches emerging out of the Global South, with authors such as Aníbal Quijano, Enrique Dussel, and Walter D. Mignolo (Quijano and Wallerstein, 1992), as well as Constructivist attempts to build theories of 'Global IR' (Acharya, 2014). These have largely contributed to broadening the empirical and material bases of the discipline, and to creating more space for definitions of the international and of the central issues that should concern scholars – knowledge production, the environment, imperialism, and different configurations of politics, capital, and labour from regional contexts otherwise assumed to follow the Western model of development.

INTERNATIONAL RELATIONS (IR) AND THE PROBLEM OF MARXISTS

In one of the earliest Marxist journal articles from inside the IR discipline, Fred Halliday engaged in an exercise of conceptual-empirical comparison between world events and three main ideas of international relations dominating those events, i.e. three types of internationalisms: Liberal, Hegemonic, and Revolutionary (1988). Halliday focused on the idea of international relations, on the evolution of assumptions and expectations regarding internationalism and how it is perceived differently according to the increasingly unequal worldwide distribution of power and resources. This implies, as a crucial basis to Marxist thought, bridging ‘the analytical – how the world does work – and the normative – how the world should work’ (Halliday, 1988: 187). This exemplifies the way in which IR Marxists have sought to retrieve elements from both Realism and Liberal Internationalism in IR theory, and posit themselves as a fundamental alternative to these two pillars.

There are a number of critiques made against Marxism in IR. Although these aspects are less defining than in the mid twentieth century, Marxist scholarship is still considered overly structuralist, teleological, and economically determinist. It is also still associated by the general public with Stalinist Soviet policy and other authoritarian attempts to contest the liberal order through so-called communist parties. Thus, disentangling the political engagement and critical basis essential to Marxist thought from the blind application of specific orthodoxies, events, and experiments remains a primary task for any Marxist scholar.

If Marxism officially entered the discipline of IR relatively late in the 1970s and 1980s, doing so resulted in an explosion of various strands that overlap as much as they disagree with each other. The richness of IR today and its attractiveness to Marxism is also its very much enlarged research agenda, and how it speaks more and more to everyday concerns, rather than merely to those of diplomats, foreign policy analysts, military strategists, and other government hacks. However, if, as Rosenberg (2016) argues, IR remains trapped in the narrow positivist agenda and vocabulary of Anglo-American Political Science, can Marxists identifying with this discipline salvage their work and help others break out from a Euro- and state-centric cage (Anievas and Nişancioğlu, 2014)? The following will discuss the problem of the state debate, how it has shaped Marxist scholars evolving in the IR discipline, and how it may be taken forward. It argues that more focus on the legal dimensions of the state would enrich the debate, before concluding on how Marxism presents fundamental challenges to the discipline of IR, on ontological, epistemological, and methodological grounds, each requiring further collaborative work.

Despite efforts such as Hobson’s (2000) to neatly summarise the surge of Marxist IR literature into, on the one hand, neo-Marxism, and on the other, the classical Marxism of the early and mid twentieth century, the post-1970s era is marked by a dazzling encounter between: dependency theorists, structural

Marxists, neo-Gramscians, Open Marxists, Political Marxists, World Systems Theorists, derivation school theorists, Critical Theorists, the Frankfurt School, scholarship developing Trotsky's theory of Uneven and Combined Development (U&CD), Post-Colonial Marxists, and, though more rarely, sadly, Marxist Feminists. To some extent, these distinctions have slowly been eroded in the last decade, and many scholars in IR more loosely fit under the umbrella term of the Historical Sociology of International Relations. Generally, Marxists in IR are either (1) recycling the state debate into one on transhistorical levels of abstraction or analysis, in other words the problem of 'the international'; (2) focused on specific problems and aspects of International Political Economy and Development Studies (financialisation, labour struggles, regional or area studies); or (3) exploring new subjects, problems, and interdisciplinary alliances (through concepts of race, gender, migration, Eurocentrism, international law, etc.). As Keucheyan (2014: 94) remarks, we can see broadly how theories of imperialism have shifted over the course of the twentieth century from being mostly influenced by economic analysis to the consideration of other explanatory factors, such as the political and cultural dimensions of international relations.

Ultimately, these questions and positions all concern at some point or other the state's agential power. As proposed below, this should alert IR scholarship to turn to more concrete manifestations of this power. Firstly, scholarship should focus on the bodies of second- and third-class citizens, as well as stateless people, i.e. all those considered 'disposable' (Odysseos and Pal, 2018) or of less value to the general body politic through reduced rights, opportunities, and abilities – women, migrants, minorities, prisoners, people with disabilities, precarious workers, etc. Secondly, scholarship should focus on material structures such as those used to maintain borders, offshore territories, and other extraterritorial legal spaces that provide the material means for the illusion of state sovereignty to function. These allow the state and other ruling non-state actors to evade duties and responsibilities and entrench existing and new class divisions, weakening opportunities for resistance and social movements (Mezzadra and Neilson, 2013; Mooers, 2014; see also Mezzadra and Neilson's Chapter 87 in this Handbook).

However, traditional issues from the state debate remain a central object of concern. The intractable relationship between state and capital – whether conceived as mutually constitutive or separate – and the separation between international and domestic realms remain mystified by the state form, its sovereignty principle, and by the state system derived from the state's legal form. Yet twenty-first-century struggles are – and will probably continue to be – as much against transnational capital as against authoritarian states. The seemingly universal state form produces a sense of inevitable standard that has swept all other forms of political organisation away into the dustbin of history. Because of this standard, the exploitation, inequalities, and crises of capitalism seem as natural and unavoidable as the political system that allows these to occur. Crucially, the state form is self-perpetuating, since it reproduces the idea that progress and social justice can only

be achieved through its legal mechanisms, rejecting the legitimacy of any other system or means of contestation.

Marx's theory of the state remains one of the most underdeveloped aspects of his work. Two problems have been identified from isolated readings of his early texts. One is that there is a world bourgeois state form against which the proletariat should struggle against and capture, and another is that the state is a product and property of capitalism (Barker, [1978] 2019). In some recent reflections on the state and Marxist theory, McNally (2019) highlights the distinction made by Marx and Engels in *The German Ideology* (1970) between an internal definition of the state, which we could see as based on possession (sovereignty as private property of the territorial limits of the state) and an external definition of the state, alternatively based on identity (representing a nationality distinct from other nation-states). Both dimensions require the use of force, meaning that militarism and war are indeed 'inherent elements of modern power' (McNally, 2019). However, one could add that both internal and external dimensions are used and justified distinctly depending on the internal or external projection of the state to various internal and external actors. In other words, this 'internal/external' distinction is only useful if we make sure to use it from various vantage points and map a more complex set of social relations and representations. This means, for example, mapping how the state justifies and avoids accountability and responsibility for its actions – or for the actions of those it should be responsible for, such as corporations – rather than merely explaining war and militarism as 'inherent elements' linked to each state's development. This requires us to focus on the agents acting on behalf of the state or who contribute to the construction of the state and who should thus be responsible for its behaviour and development. Moreover, legal dimensions of states' agentic behaviour are crucial to showing the interdependencies and complexities of the relations between states and those they represent and are accountable to, as well as to those they may fear.

These arguments can help us to think more distinctly about the state in terms of legal borders and property. This critical reflection on the early Marx's understanding of the state also introduces a link between Marx's thought and Marxist theories on law and international law that have been most concerned with the contradictions between the internal and external forms and manifestations of the state.⁸ The issue of the structure of international law and its relation to the history of capitalism remains the subject of debate. Those building on the work of Soviet legal theorist Evgeny Pashukanis understand the anarchic structure of the international system, i.e. the lack of world sovereign, as a necessary outcome of capitalism, which enables an important critique of the liberal state and of the liberal legal system as unable to fulfil its promises and remain inherently driven by ruling-class interests (Miéville, 2005; Knox, 2016; Baars, 2019). However, others are critical of the formalism and ahistorical construction of Pashukanis' legal commodity form theory (Marks, 2007; Bowring, 2008; Pal, 2020). For example, state formation in the early modern period varies greatly, in Europe (Wood, 1992)

as well as outside Europe, leading to contending state systems and legal mechanisms shaping social relations at both internal and external levels, i.e. in local regions and in overseas colonies being forcefully integrated into the state's territorial boundaries.

In other words, the view taken here is that a structural analysis of international law might erase various agentic mechanisms of domination and struggle necessary to better understand the history of capitalism. However, one must be extremely cautious when using 'internal' and 'external' as heuristic devices, since these have also produced some of the most problematic assumptions in IR on the distinction between the international and domestic realms, which can then end up being theorised in isolation, thereby justifying imperialism and militarism as inevitable and necessary dimensions of international relations. Moreover, as Barker notes, in Marxist theory the "external" concerns of states tend to be tagged on as an afterthought, not taken into the general analysis of the form and functions of the capitalist state', emphasising the problems the notion has created even for Marxists (Barker, [1978] 2019). In response, a more pluralist understanding of both capitals and states appears as a helpful way forward (Barker, [1978] 2019; Davidson, 2010). Moreover, in spite of their conception of capitalism, and by extension the territorial state, as a necessary stage towards socialism and communism, Marx and Engels maintained the abolition of the state as the ultimate goal of revolution (Jessop, 1978). In an age of increasingly lethal state borders and state mechanisms of exclusion, this could not be a more important goal for Marxists to engage with.

Thus, echoing previous points by Barker, Teschke (2008: 166) argues that Marx and Engels provided 'very perceptive but primarily *ad hoc* interventions' for theorising the state and crucially the states system. What they lacked was 'a sustained reflection on geopolitical and trans-societal relations for the general course of history' (Teschke, 2008: 166). This has been the burden of IR Marxists, to which a plethora of efforts have contributed influential analyses. Yet Marxism's status within the discipline of IR has decreased since the 1980s. This can be most simply explained by the turn to behavioural and quantitative 'hypothesis-testing' approaches to the discipline, especially in the North American context that continues to dominate the discipline, though increasingly less in terms of theoretical diversity and innovation. For Rosenberg (2016), this narrowing of the discipline – and its distancing from contributing to other disciplines – goes deeper than trends and can be explained by its relationship to Political Science, in which IR remains, in his words, imprisoned. Therefore, the only way to contribute to the discipline of IR as Marxists is by acknowledging and clarifying the ontological, epistemological, and methodological challenges that the Marxist framework entails. In other words, IR Marxists have to put forward more discussion of what, why, and how they can contribute to the discipline and not be constrained by the conventional Anglo-American answers to these questions.

Debates between proponents of U&CD and those associated with Political Marxism – the later school having been informally founded by historians Ellen

Meiksins Wood and Robert Brenner – have gone some way into pushing the debates on ontological and epistemological grounds by discussing what constitutes, if anything, the international.⁹ More extreme proponents of U&CD such as Rosenberg and Matin tend to elevate the concept as an *a priori* condition not only for explaining capitalism and modernity, but also for developing a generic theory for understanding all inter-societal relations (Anievas and Matin, 2016). However, U&CD has also been developed as a rich concept to focus on otherwise ignored aspects of capitalist and modern expansion (Davidson, 2012; see also Neil Davidson's Chapter 18 in this handbook). These developments in IR theory are also taken up by other IR scholars, notably in the English School tradition (Buzan and Lawson, 2015). In contrast, Political Marxism has focused on developing a position of 'radical historicism' and agency (Knafo and Teschke, 2017), rejecting the theoretical nomenclature of an 'international' analytical starting point. However, many questions remain concerning the methodological implications of this historical work, as well as how it may transform the concepts and methods developed for understanding contemporary phenomena. Moreover, it remains to some extent contained in the limits set up by the tradition of Historical Sociology, which has known various waves and scholarly interventions, many from a positivist and comparativist angle antithetical to the Marxist tradition. Historical Sociology, in its 1970s Weberian era, and in its recent iterations influenced by the English School, remains tied to concepts of Western political development and linear temporality that work from the existing world order of states and international organisations.

CONCLUSION

In sum, the main ways in which IR Marxists have contributed analytically and normatively to the praxis of international relations is by (1) reinserting capitalism as an explanatory factor – whether as social property relations, imperialism, hegemony, WST, or U&CD; (2) challenging historically how Marxism has been falsely driven by or associated with economic determinism or a simplistic teleology of world revolution at all costs; and (3) challenging how Marxism is assumed to conflate or reduce the analysis of international transitions, state formations, revolutions, and systemic orders to problems of base and superstructure.

Generously aided by the 2008 subprime credit crisis, this work, and that of intellectuals on the left more broadly, has contributed to giving 'capitalism' a bad name, shifting the general discourse about the legitimacy of capitalism as a natural, progressive, and inevitable economic system. This shift has been made possible by ongoing and relentless contributions by intellectuals across the world to dispute the natural, progressive, and inevitable assumptions regarding the inter-linked development of states and capitalism. However, the opening of new socialisms has also left the door open to new forms of racist and fascist ideologies, which Marxist IR must also find ways to theoretically integrate and condemn.

Thus, if current Marxist debates over the international/domestic distinction could do much more still to enrich and transform the discipline, recent moves have strengthened a third wave of historical sociology through questions of Eurocentrism, global history, decoloniality, and how to conceptualise and historicise revolutions, for example. To further the political and pedagogic impact of this scholarship, however, it remains essential to understand and shape the institutions that make or break ideological and material borders. Crucially, Marxists would tend to emphasise how these borders determine who has access to certain resources and therefore what mechanisms should be defended or rejected to ensure a better distribution of those resources. Whether IR scholars and Marxists operating in this domain will be able to develop theories that do not impose a position but keep open ‘reparative possibilities’ (Rao, 2016: 2) between various strands of Marxism and other critical theories remains to be seen. For now, we hope to have brought some light to where IR Marxists have contributed – and how they could continue doing so – to avoid falling into the traps of endless analytical debates often disconnected from the everyday concerns of people.

Notes

- 1 The discipline of International Relations is referred to as ‘IR’, whereas the expression ‘international relations’ refers to the ensemble of social relations that cross the boundaries of sovereign or otherwise independent entities.
- 2 For previous comprehensive analyses of IR and Marxism, see Hobson (2000); Teschke (2008); Anievas (2010); Linklater (2013); see Pal (2017) for a foundational-level entry point to the debates.
- 3 For a discussion of imperialism in this Handbook, see chapter 23 by Salar Mohandesli.
- 4 For Marxist critiques of realism and neorealism in IR see Rosenberg (1994), Bieler and Morton (2018) and Sakellariopoulos and Sotiris (2015).
- 5 Here is not the place to rehearse debates about the transition to capitalism. For a recent summary, see Rutar (2018). The point here is to emphasise the point at which capitalism becomes a fully global phenomenon, rather than the thorny issue of how and when it started to expand, whether in one setting (e.g. fifteenth- to seventeenth-century England) or simultaneously in multiple settings (e.g. throughout the early modern period).
- 6 As Barker (1978/2019) argues, it is not possible to fully develop a Marxist theory of the state – and I would add of international relations – without integrating the methods and concepts of all of Marx’s works, since the early Marx remains particularly problematic in terms of his conception of the state, as discussed further below. Thus, the early more political and historical Marx needs to be thought alongside the later author of *Capital*, more focused on the inner mechanisms and social relations of capitalism.
- 7 Debates on imperialism continue to shape IR and political theory. Sakellariopoulos and Sotiris (2015: 86–7), for example, argue that certain Marxist theories of imperialism (Harvey, Luxemburg, Gowan, Callinicos) have adopted the false territorialist premises of a realist conception of international relations and propose instead a Leninist approach.
- 8 See chapters in this Handbook by Heide Gerstenberger (Chapter 19) and Robert Knox (Chapter 48).
- 9 For some of the debates between Political Marxism, U&CD, and WST scholars, see the Symposium on *How the West Came to Rule in Historical Materialism*, 26(3), 2018.

Law

Robert Knox

THE WORLD OUTLOOK OF THE BOURGEOISIE

In an 1887 article entitled 'Lawyers' Socialism', Friedrich Engels reflected on the relationship between legal thought and the rise of the bourgeoisie. According to Engels, '[t]he medieval world view was essentially theological', with the unity of European feudalism established through opposition to the external Saracen foe. In Western Europe, he continued, 'the Church was the actual link between the different countries, and the Church's feudal organisation gave a religious blessing to the secular feudal system of government' (Engels, 1990: 597).

However, as the bourgeoisie developed within European feudalism, it found its needs could not be contained within this theological prison. Instead, with the great triumphs of the seventeenth and eighteenth centuries, 'the new world view that was to become the classical one of the bourgeoisie emerged undisguised in France: the legal world view' (Engels, 1990: 598). For Engels, in an analysis prefiguring Carl Schmitt's *Political Theology*, this was a 'secularisation of the theological world view' (1990: 598). In this outlook '[d]ogma, divine law, was supplanted by human law, the Church by the State' (Engels, 1990: 598). This new legal outlook was perfectly fitted to bourgeois hegemony:

Because the exchange of commodities on the level of society and in its fully developed form, i.e. based on the granting of advances and credit, results in complex contractual relations and thus requires universally valid regulations, which can only be provided by the

community – legal norms laid down by the State – people imagined that these legal norms did not arise from the economic facts of life but from their formal stipulation by the State. And because competition, the basic form of intercourse between free commodity producers, is the greatest equaliser, equality before the law became the bourgeoisie's main battlecry. (Engels, 1990: 598)

For Engels, therefore, law and legal thought were a key element of the worldview of the capitalist class. Sixty years later, the Bolshevik legal theorist Evgeny Pashukanis went so far as to note that in 'bourgeois society jurisprudence has always held a special privileged place', serving as 'first among the other social sciences' (Pashukanis, 1978: 33).

Typically, Marxists have attributed bourgeois political economy such a role; indeed, Marx himself likened political economy to theology (Marx, 1977: 115). In practice, however, a brief glance at the works of the classical political economists reveals that any attempt to separate the legal and political-economic world outlooks is a mistake. The classical political economists were all steeped in legal thought. They wrote their own legal treatises, and – perhaps more importantly – their political-economic works were themselves undergirded by legal notions of property and contract.

MARXISM AND LEGAL THOUGHT: AN ABSENT PRESENCE?

Given the above, it is perhaps surprising that legal questions have been quite peripheral to the Marxist tradition. Although law appeared in their historical work, Marx and Engels never completed a systematic analysis of law. This has been reflected in Marxist theory more generally. Whilst there have been attempts to think through a Marxist approach to law, there have been notably fewer of these attempts than studies of that other great worldview of the bourgeoisie, political economy. Perhaps the most obvious reason for this absence is that law has tended to be theorised primarily by lawyers. The socialist movement has tended to look rather unfavourably upon legal professionals (Lenin, 1962: 68). As Engels wrote, '[a]s soon as the new division of labour which creates professional lawyers becomes necessary, another new and independent sphere is opened up' (Engels, 2001: 60). As a profession, it is difficult to understand law as anything other than – at best – petit bourgeois. This is especially true of the highest aspects of the legal profession, particularly the judiciary, who have historically been hostile to the labour movement (Griffith, 1977).

Another, perhaps less obvious, issue is that Marxists have tended to subsume discussions about law in two other 'conversations'. Firstly, Marxists have tended to collapse discussions on the nature of law into discussions about the nature of the state. Implicit – and sometimes explicit – here is an assumption that law depends upon the state for its existence, and that law is essentially the actualised 'will' of the state. Secondly, law also plays a key role in discussions of

revolutionary strategy; in particular the polemics on ‘reform and revolution’ have also implicitly been discussions about the relationship between law, capitalism and socialism.

The result is that when Marxists have engaged with law it has tended to be without an attempt to thoroughly understand the law itself. Much Marxist analysis of the law has naturalised it, taking the existence of law for granted and treating it as an unspecific ‘background’ to social relations. However, despite these obstacles there *have* been a number of Marxist attempts to understand the role of law. This chapter will attempt to locate some of the broad themes characterising the trajectory of Marxist theorising about law.

MARX AND ENGELS ON LAW

The young Marx wrestled with questions of law and jurisprudence. First at Bonn, and then Berlin, Marx studied law but found this to be unsatisfying, feeling ‘above all ... the urge to wrestle with philosophy’ since they ‘were so closely linked’ (Marx, 1975a: 11). Accordingly, Marx sought to ‘elaborate a philosophy of law covering the whole field of law’ (1975a: 12).

Working through this idealist schema Marx eventually began to come up against its limits. This was particularly evident in Marx’s first forays into political journalism, namely his reflections on the debates around the ‘Law on the Thefts of Wood’ (Marx, 1975b: 224–63). When Friedrich Wilhelm IV of Prussia came to power in 1840, he convened a number of provincial assemblies. One issue that concerned the assemblies was the gathering of fallen wood. Historically, peasants had a customary right to gather such wood. The assembly, however, ruled that this would amount to *theft*, with the cutting down of trees an aggravating circumstance.

Marx argued that these legal proposals were wrong. For Marx, ‘[i]n the case of fallen wood ... nothing has been separated from property’, since the fallen wood had already been separated from the tree (which *was* owned) (1975b: 227). Accordingly, the law was an attempt to make ‘us believe that there is a crime where there is no crime’ (1975b: 228). Alongside this arguably idealistic analysis, Marx also displayed the beginnings of a more concrete, class-based account of the law. Marx remarked that in making cutting down trees an aggravating circumstance, the law acknowledged a difference between gathering and theft proper, but only ‘recognises this difference when it is a question of the *interests of the forest owners*’ (1975b: 228).

Marx combined these two positions, arguing that the ‘customary rights of the aristocracy conflict by their *content* with the form of universal law’ (1975b: 231). This was because as a particular feudal right it could not be available to all. By contrast, ‘a customary right by its very nature can *only* be a right of this lowest, propertyless and elemental mass’ (1975b: 230). Marx’s solution to this contradiction was

a liberal one; he argued that, since both owners and infringers were citizens, both deserved ‘the same right to protection by the state’ (1975b: 240).

Although couched in liberal terms, in these debates we see the seeds of much of Marx’s later radical analysis. It is here that Marx first found himself ‘in the embarrassing position of having to discuss what is known as material interests’ (Marx, 1987: 261–2). He later realised that ‘neither legal relations nor political forms could be comprehended whether by themselves or on the basis of a so-called general development of the human mind’ but rather in ‘the material conditions of life’, the anatomy of which ‘is to be sought in political economy’ (1987: 262).

In this way, law was a key element in Marx’s early attempts to articulate the ‘base-superstructure’ metaphor. There were essentially three – distinct but inter-related – registers in which Marx and Engels wrote about the law (Cain and Hunt, 1979), all of which were to some degree anticipated in the debates around the theft of wood. The first register was in their study of how the struggle between classes was ‘expressed’ through the law. The second was their conceptualisation of law as an ideological form. The third and final register was of law as a structural product of capitalist social relations.

Law and Class Relations

In his 1859 *Preface*, Marx characterised law as one of the forms in which the classes of a given mode of production become conscious of class conflict and ‘fight it out’ (Marx, 1987: 263). This was reflective more broadly of the role that Marx and Engels ascribed to the law in articulating class relations and conflicts.

In *The German Ideology*, Marx and Engels linked the rise of ‘civil law’ with that of private property. They argued that Ancient Rome – with its developed commercial society – provided a basic model that later societies could draw on. In particular, ‘[a]s soon as industry and trade developed private property further ... the highly developed Roman civil law was immediately adopted again and raised to authority’ (Marx and Engels, 1976: 91). This was consolidated and spread by the bourgeoisie as they broke with the feudal order.

If *The German Ideology* described the role that law played in the class struggles around the birth of capitalism, in the three volumes of *Capital* Marx demonstrated the role that law plays throughout processes of capital accumulation. This is true on a number of fronts. Firstly, Marx described the crucial role that law played in primitive accumulation – both domestically through the Enclosure Acts and internationally through colonial treaties enabling plunder (Marx, 1990a: 873–904). Secondly, in his descriptions of the legal regulation of the working day, Marx charted how the working class had leveraged law in order to limit some of capital’s exploitative power, but simultaneously pushed capital to develop more *efficient* methods of exploitation (1990a: 340–416). Thirdly, Marx traced the ways in which specific legal forms were needed to articulate changing forms

of capital accumulation. This was particularly true of Marx's explorations of the importance of the joint stock company (Marx, 1993: 567–90).

Thus, in this register, law mediated the social relations and contradictions of class society. However, law figured as something of a passive vessel: there was no sense in which it might impose limits upon or structure our understanding of social relations; that is to say there was no sense of law as ideology.

Law as Ideology

Ideology was one of the prime ways in which Marx and Engels attempted to understand law. In the 'Preface' to *The German Ideology*, Marx characterised law as an 'ideological' form. Marx linked the development of modern civil law to the development of 'private property out of the disintegration of the natural community' (Marx and Engels, 1976: 90). Yet despite the material basis for the rise of law it *appeared* 'that law is based on the will, and indeed on the will divorced from its real basis' (1976: 90). Law serves as one of the prime ideological functions because it recasts private property from a social relation into one based on 'will'. On the level of community, it presents the existence of private property in general as 'the result of the general will' (1976: 91); simultaneously, at the level of individual property relations it creates 'the illusion that private property itself is based solely on the private will' (1976: 91).

Reading *The German Ideology* in light of Marx's later work, we might say that law is ideological because it takes relationships of power and exploitation – that is to say, class relationships – and presents them as relationships 'entered into or not at will', the content of which 'rests purely on the individual [free] will of the contracting parties' (1976: 92).

Law and the Structure of Capitalism

In a sense, then, Marx's reflections on the ideological role of law centred on its abstracting and individualising character. This raises the broader question of *why* law had such an effect, and what broader relation law bears to capitalist social relations. These questions were attended to in another strand of Marx's work, most famously embodied in his 'On the Jewish Question'.

In 'On the Jewish Question' Marx gave an account of the relationship between law, liberalism and private property. He argued, following Hegel, that modern societies were marked by a bifurcation between 'political community', in which individuals act communally, and 'civil society', in which people related as 'private individuals' (Marx, 1976: 154). This situation was different from pre-capitalist social formations, the character of which 'was *directly political*' since 'the elements of civil life, for example, property, or the family, or the mode of labour, were raised to the level of elements of political life in the form of seignior, estates, and corporations' (1976: 165).

The crucial element driving the separation between ‘political community’ and ‘civil society’ was *the market*. Insofar as production was to be carried out for private profit, the two realms needed to remain formally separate. Production could not be mediated through the castes, guilds and other non-capitalist hierarchies. It was in this context that law took on a particularly salient role. In a society in which the ‘private’ and the ‘public’ were fused, human relations could be mediated through privilege and status, but with the wholesale parcelling off of civil society as a relationship between private individuals, something else had to take its place.

For Marx, it was here that the ‘so-called *rights of man*’ stepped in: a form of inter-relation between ‘egoistic man, of man separated from other men and from the community’ (1976: 162). Thus, with the birth of capitalism – and its creation of ‘civil society’ – *law* came to be the predominant mode of regulating social behaviour. In this way, Marx structurally tied the rights of man to the rise of capitalism, rooting their individualistic and abstract nature to the ‘egoistic’ nature of ‘civil society’.

BOURGEOIS LAW?

Despite rarely dealing with law directly, Marx and Engels left a rich, but conflicting, legacy. Over the course of the late nineteenth and early twentieth centuries, these questions acquired a more practical urgency. With the growing strength of socialist and communist movements, the question of how to confront and deal with state power and the law grew in importance. These debates crucially crystallised around the question of ‘reform’ or ‘revolution’.

Marx had dealt with such questions at various points but had done so most systematically in his ‘Critique of the Gotha Programme’. In that text Marx homed in on the claim that, in a communist society, ‘the proceeds of labor belong undiminished with equal right to all members of society’ (Marx, 1990b: 81). For Marx, this doctrine of ‘equal right’ could not be *communist* since ‘the same principle prevails as that which regulates the exchange of commodities, as far as this is exchange of equal values’ (1990b: 86). As such, the idea of ‘equal right’ is ‘*bourgeois right*’ and ‘bourgeois limitation’; this was because

[t]his equal right is an unequal right for unequal labor ... it tacitly recognizes unequal individual endowment, and thus productive capacity, as a natural privilege. *It is, therefore, a right of inequality, in its content, like every right.* Right, by its very nature, can consist only in the application of an equal standard; but unequal individuals ... are measurable only by an equal standard insofar as they are brought under an equal point of view, are taken from one definite side only. (1990b: 86)

In the ‘higher phase’ of a communist society, Marx argued, there would be no ‘right’, since distribution would be governed instead by the principle of from each according to their abilities to each according to their needs (1990b: 87;

Toscano, Chapter 22, this *Handbook*). In line with his comments in ‘On the Jewish Question’ he suggested that equal right was an intrinsically bourgeois category, which would ultimately need to be broken with.

Marx neatly summarised several distinct but inter-related problems that confronted Marxists in the nineteenth century. Firstly, there were practical questions – what role could law play in the transition to socialism? Would it be possible to *legislate* socialism into existence after winning governmental power? These questions were bound up in another, wider question, namely whether or not a violent break with the existing order was necessary to achieve socialism, or whether existing institutions – particularly legal ones – might be used. This raised the question of the institutional and political make-up of a socialist society – would it be governed by law? And if so, what would that law look like? These questions were themselves intrinsically linked to broader ‘jurisprudential’ questions about the nature of law and its relation to capitalism.

Reform ...

The 1891 Erfurt Programme of the German Social Democratic Party (SPD) restated many of the themes of the Gotha Programme, framing socialism in terms of ‘equal rights’. This opened up the idea that socialism could be legislated into existence. Such a position was most famously expressed by Eduard Bernstein in his pamphlet *Evolutionary Socialism*, where he defended the idea that ‘where the rights of the propertied minority have ceased to be a serious obstacle to social progress ... the appeal to a revolution by force becomes a meaningless phrase’ (Bernstein, 1973: 218). Against this, Bernstein argued for the ‘legislative way’ as a road to socialism (1973: 217–19).

Bernstein’s work signalled a more general drift in the orientation of the SPD; whilst his approach was not adopted wholesale, even ‘orthodox Marxists’ like Kautsky declared that the term ‘revolution’ encompassed both physical force and ‘means of economic, legislative and moral pressure’, with the latter likely to predominate (Kautsky, 1909: 50). Underlying these conceptions was the sense that law was a *neutral* vessel, through which different politics – up to and including revolutionary ones – could be expressed. This conception was most systematically and explicitly formulated by the Austro-Marxist Karl Renner in his 1904 work *The Institutions of Private Law and Their Social Functions*.

Renner’s starting point was that the interaction between law and economic forms was never unidirectional, with law serving as both the product and producer of particular economic regimes (Renner, 2009: 56). He argued specific economic processes under capitalism are served through ‘[a] number of distinct legal institutions’, such that laws serve an *economic function* (2009: 57). In the case of capitalist private property, Renner believed that the economic development of capitalism had outstripped property law, divorcing economic function from individual ownership (2009: 290–1). In this way ‘property in the capitalist epoch fulfils functions ...

different from those which it fulfilled in the era of simply commodity production' (2009: 293). The transformation of capitalism had led property to 'automatically change' its function to one of regulating 'the hierarchy of power and labour' (2009: 293). For Renner, private law had ceased to be 'private', being now divorced from individual ownership, and supplemented by a system of public law regulation. As such, '[e]lements of a new order have been developed within the framework of a new society', making it possible to 'simply deduce the law of the future from the data supplied by our experience of today' (2009: 298). In Renner's model no sharp break with the legal order of capitalist society was required, and the existence of law itself was fully compatible with a socialist society.

... or Revolution?

The reformists of the SPD did not go unchallenged. In her pamphlet *Reform or Revolution*, Rosa Luxemburg argued that what 'distinguishes bourgeois society from other class societies' lay in the fact that 'class domination' is not founded on juridical forms, but rather on '*real economic relations*' (Luxemburg, 2007: 90). The relationship between worker and capitalist *in legal terms* is presented as one of formal equals contracting: relations of domination and exploitation are not created, *or registered*, by legal relations. As such, for Luxemburg law 'is not a threat to capitalist exploitation'; at best it is 'simply the regulation of exploitation' (2007: 61). Accordingly, 'legislative reform' and 'social revolution' were not two roads to the same goal, but rather aimed at different goals, with the former 'not the realisation of *socialism*, but the reform of *capitalism* (2007: 90). This did not mean, for Luxemburg, that law – and the struggle for reforms – had no place in the revolutionary movement. Rather, the 'struggle for reforms' was the *means* through which the social-democratic movement gains the support and confidence of the working class.

At the time, Luxemburg's argument won out over that of Bernstein, with 'orthodox' Marxists – including Kautsky – backing her position. Yet the growing power of more conservative trade unions within Germany, and a turn to 'defence of the Fatherland' nationalism, pulled the SPD as a whole to the right and in a significantly more reformist direction (Schorske, 1955). It was such a direction that Lenin was to criticise in a number of interventions during the period leading up to the First World War, most famously in *State and Revolution* (Lenin, 1970).

DEBATES IN THE RUSSIAN REVOLUTION

Law and Revolution

The Russian Revolution was of decisive importance for Marxist engagements with the law. Here, the question of the relationship between law and capitalism had immediate practical ramifications. Heated debates took hold within the

Soviet governing strata, and amongst the legal intelligentsia (Beirne, 1990; Bowring, 2013; Head, 2007). Perhaps the key legal controversy with the Soviet debates was whether or not a ‘proletarian’ or ‘socialist’ law was conceivable. The official position of the Communist movement was that socialism would have to go beyond the ‘formal’ juridical freedom and equality of capitalist society. But would this entail creating some new ‘type’ of law or leaving law behind altogether? The newly emerged workers’ state’s own legal proclamations were at stake, especially in the context of the New Economic Policy, when the USSR was forced to restore more traditional juridical forms (Beirne and Sharlet, in Pashukanis, 1980: 12–15).

Soviet jurists tended to take one of the various approaches outlined by Marx above, and juggle them with the practical imperatives of the revolutionary process, namely in relation to their own political stances and factions. M. A. Reisner, for instance, turned to Marx’s concept of ideology to argue that in class societies ‘[l]aw develops into the separate ideological systems of class groups’ (Reisner, 1951: 95), with different legal orders belonging to different classes. In this way, law was the ‘ideological apparel’ in which class struggle made itself known (1951: 105). A similar although more materialist take was provided by Stuchka, who argued that the ‘determining element’ in law as ‘a system or an order of social relationships ... is the interest of the ruling class’, and that ‘in law we distinguish its content (social relationships) and the form of its regulation and protection (the state power, statutes, etc.)’ (Stuchka, 1967: 91). Although the bourgeoisie set out ‘a law embracing *all mankind*’, it was ‘merely the *class* law of the citizen: a code of the *bourgeoisie*’ (Stuchka, 1951: 17). For both Reisner and Stuchka, in a classless communist society law would, like the state, necessarily wither away. At the same time, in the transition to communism, there would exist a distinctly ‘proletarian law’.

Enter Pashukanis

It was in the context of these debates that, in 1924, Evgeny Pashukanis entered onto the scene with his pivotal text *General Theory of Law and Marxism*. Pashukanis’ theory came to serve as a key reference point for debates in subsequent years, and for all future Marxist accounts of law. His starting point was to differentiate his position from those who, like Stuchka (later a critic) (Beirne and Sharlet, in Pashukanis, 1980: 23), located law in class interest. For Pashukanis, simply introducing ‘the element of class struggle’ in this way only yielded ‘a history of economic forms with a more or less weak legal colouring, or a history of institutions, but by no means a general theory of law’ (Pashukanis, 1980: 42). Such an approach could not provide an account of what was *distinct* about law and legal regulation.

Against this Pashukanis sought to analyse legal categories in the same way in which Marx understood the categories of political economy. This meant putting forth an ‘analysis of the legal form in its most abstract and simple aspect, moving gradually by way of complexity to the historically concrete’ (1980: 53). He began

with the idea that law's role is to regulate social relationships; however, since law is itself a social relation, it might appear that 'social relationships therefore regulate themselves' (1980: 57). Drawing on Marx's characterisation of capitalism, Pashukanis argued that law is a social relationship 'capable to a greater or a lesser extent, of colouring or giving its form to other social relationships' (1980: 58). The key was to understand law as 'a mystified form of some specific social relationship' (1980: 58). Situating this historically, Pashukanis argued that a general theory of law must start with the idea that 'under certain conditions the regulation of social relationships assumes a legal character' (1980: 58). The task of a Marxist theory of law was to delimit the conditions under which this legal character – or legal *form* – emerged.

Pashukanis noted that legal relations are always between legal subjects and so any understanding of the legal form must examine how these subjects are produced. Marx himself had explained the 'material premises of legal relationships, or the relationships of legal subjects' in *Capital* (Pashukanis, 1980: 74). Capitalist society presented itself as a society of commodity owners in which 'the social relationships of people assume an objectified form in the products of labour and are related to each other as values' (1980: 75). Yet commodities are unable to take themselves to market and exchange themselves; hence they must be *owned*. This ownership necessarily implies a set of legal rights. For Pashukanis, this was the key moment: 'simultaneously with the product of labour assuming the quality of a commodity and becoming the bearer of value, man assumes the quality of a legal subject and becomes the bearer of a legal right' (1980: 76).

Crucially, in the act of commodity exchange, each party must recognise the other's equal and abstract capacity to *own* a particular commodity and to exchange it. As such, the commodity calls forth a sense of abstract formal equality. When these parties engage in *dispute* or have conflicts of interest, there must be a way of regulating and resolving the disputes between these abstract, formally equal individuals – this is law and the legal superstructure (Pashukanis, 1980: 67).

Under capitalism, with the generalisation of wage labour, everyone gains the capacity to engage in exchange, and so gains legal subjectivity. But the spread of the legal form is not mechanically tied to increased commodity exchange. Rather, Pashukanis argued that, with 'increasing division of labour, the expanding social relationships and the development of exchange', exchange value becomes the 'embodiment of social production relationships which stand above the individual' (1980: 77). As value separates from specific acts of exchange and becomes the embodiment of capitalist totality, the legal form itself is universalised. Legal subjectivity becomes abstracted from particular rights and the 'legal subject receives his alter ego in the form of a representative while he himself assumes the significance of a mathematical point, a centre in which a certain sum of rights is concentrated' (1980: 78).

Thus, for Pashukanis, there was a material and structural link between capitalist social relations and the *form of law*. Law did, of course, predate capitalism, but

so did commodity exchange. Yet it was only under capitalism that law assumed its predominant role. Prior to capitalism law existed only in a scattered, unsystematic way: either in specific mercantile enclaves, or intermingled with other forms of social regulation. The logical consequence of Pashukanis' theory was to deny the possibility of 'proletarian' or 'socialist' law. Law was by its very nature bourgeois – even when utilised by the dictatorship of the proletariat.

Arise Socialist Legality

Pashukanis' theory was at first widely praised, and he quickly attained pre-eminence in the Soviet legal academy. By the late 1920s, Pashukanis had essentially reshaped the Communist Academy's approach to match his own theoretical vision. Yet from 1927 onward he began to receive significant criticisms that his commodity-form theory had *overextended* an analysis of private law; that he did not take class struggle seriously; and – most crucially – that his position militated against the idea of a distinctly *Soviet* form of law (Beirne and Sharlet, in Pashukanis, 1980: 27).

This latter point became important with the consolidation of Stalin's hegemony. Pashukanis' commitment to the withering away of the law put him on a collision course with the centralisation and stabilisation that would be occasioned by the five-year plans. By 1935, he had essentially *abandoned* the commodity-form theory (Pashukanis, 1980: 346–61). As Stalin's line made an increased turn towards 'legality' – culminating in the 1936 Constitution – the entire post-revolutionary legal experience was redefined as an example of the superiority of 'Soviet legality'. Theoretically, this line was embodied by Andrei Vyshinsky, who became Procurator General in 1935 and oversaw the juridical elements of the Great Purge. Pashukanis himself disappeared in January 1937, charged with 'criminal intent to overthrow the Soviet regime' (Hazard, 1957: 386).

Whilst later political developments would distance the Soviet Union from the Stalin period – and indeed rehabilitate Pashukanis and those around him – Vyshinsky's template essentially became the legal orthodoxy in the Soviet Union. There may have been a formal commitment to the eventual 'withering away' of the law, but the Soviet Union was understood as having a distinct, and superior, 'socialist legality': a domestic legal order, with the capacity to project onto the international legal sphere.

MARXISM: OFFICIAL AND UNOFFICIAL

After the onset of the Cold War there was a significant disarticulation between Marxist thinking about law and the 'practical' tasks of building a new social order. The major, if partial, exception to this was in the anti-colonial movement. Figures from within national liberation movements engaged with Marxist thinking about both law and imperialism, to criticise the limits of self-determination

as recognised under international law. Mohamed Bedjaoui, for example, argued that international law had ‘permitted colonization, the exploitation of man by man, and racial discrimination’ and ‘facilitated and legalized the enrichment of the affluent countries’ (Bedjaoui, 1979: 63), thereby expressing imperialist social relations. A truly anti-imperialist international law would have to be anti-capitalist as well. However, figures like Bedjaoui were the exception rather than the norm, and although the Soviet Union did instigate far-reaching changes to the international legal order (Quigley, 2007), the task of *theorising* and understanding the law had migrated, to some degree, to the more academically minded Marxists in the European world.

Law, Ideology, History

As is well known, the 1960s and 1970s saw a flourishing of independent Marxist thinking. And yet this moment, and these debates, only involved law ‘accidentally’. Where law *was* invoked it was very much under the larger rubric of the questions of ideology, the state, or law’s role in historical change. Althusser, for instance, in his account of the Marxist notion of a totality, argued that the superstructure ‘contains two “levels” or “instances”’: the politico-legal (law and the State) and ideology (the different ideologies, religious, ethical, legal, political, etc.)’ (Althusser, 1971: 134). Law served as both a repressive state apparatus – directing the deployment of physical coercion – and as an ideological state apparatus (1971: 143). Althusser argued that law played a crucial role in the latter case, since ‘ideology has the function ... of “constituting” concrete individuals as subjects’ (1971: 171). It was the rise of ‘bourgeois legal ideology’ that played the central role in this rise of ‘the subject’ (1971: 170). More generally, law plays a key role in interpreting individuals as subjects, ‘subjecting’ them to a higher authority and enabling their mutual ‘recognition’ (1971: 181).

Famously, this usage of law in this context was hotly contested by E. P. Thompson. In his 1978 *Poverty of Theory*, Thompson took Althusser to task for his idea of the totality structured in dominance, noting that in his historical studies he had

found that law did not keep politely to a ‘level’ but was at every bloody level; it was imbricated within the mode of production and productive relations themselves (as property-rights, definitions of agrarian practice) and it was simultaneously present in the philosophy of Locke; it intruded brusquely within alien categories, reappearing bewigged and gowned in the guise of ideology; it danced a cotillon with religion, moralising over the theatre of Tyburn; it was an arm of politics and politics was one of its arms; it was an academic discipline, subjected to the rigour of its own autonomous logic; it contributed to the definition of the self-identity both of rulers and of ruled; above all, it afforded an arena for class struggle, within which alternative notions of law were fought out. (Thompson, 1978: 130)

Thompson was building theoretically on his 1975 *Whigs and Hunters*, in which he studied the effect of the ‘Black Acts’ upon class formation and struggle in

England. Thompson had argued that ‘one must resist any slide into structural reductionism’ when it came to the law (Thompson, 1975: 264). For Thompson, the law here played a ‘complex and contradictory’ role. It had both mediated ‘existent class relations to the advantage of the rulers’ and allowed them to impose ‘new definitions of property to their even greater advantage’ (1975: 264). Yet these legal forms also ‘imposed ... inhibitions upon the actions of the rulers’ (1975: 264). Since the rulers themselves ‘believed enough in these rules, and in their accompanying ideological rhetoric’, law served as a ‘genuine forum within which certain kinds of class conflict were fought out’ (1975: 265). As such, law was a social form deserving of social study in its own right and one had to acknowledge ‘a difference between arbitrary power and the rule of law’ (1975: 266). Infamously, Thompson concluded with the idea that ‘the notion of the rule of law is itself an unqualified good’ (1975: 267).

Thompson’s meditations upon the specific nature of the rule of law also point us towards the Marxist state theory debates. Poulantzas, one of the key figures in these debates, completed his doctoral work in legal theory. In his early (pre-1968) works, partly influenced by Jean-Paul Sartre, he criticised both Vyshinsky’s view of law as a system of norms and Pashukanis’ view of law as an order of social relations. The former was unable to understand that law and class struggle were not ‘*already* structured objects’ brought into ‘a direct, external relationship’, but rather were mutually structuring (Poulantzas, 2008: 27). It was impossible to understand how a legal regime crystallised on the basis of particular and specific class struggles (2008: 28). By contrast, Poulantzas argued that Pashukanis had *dissolved* superstructure into base, and so was unable to grasp law’s internal coherence and thus relative autonomy (2008: 28).

Against these approaches, Poulantzas proposed an account influenced by Weberian Marxism whereby the specific nature of contemporary law derived from the need for rational calculability required by mature capitalism (2008: 35–7). As a result ‘legislation and administration must take the form of predictable acts, judgements and decisions, and thus be calculable in advance’ for the sake of large monopoly capital (2008: 35). Poulantzas, drawing on Althusser, understood law as *ideology* that ‘sets up agents of production at the juridico-political level, as political and juridical “individuals-subjects”, deprived of their economic determination and, consequently, of their class membership’ (Poulantzas, 1978: 128). This ‘juridico-political ideology holds a dominant place in the dominant ideology’ of capitalism (1978: 128). Law served the role of ‘cementing together the social formation under the aegis of the dominant class’, providing an ‘ideological mechanism of imaginative representation’ for ‘social agents ... atomized and severed from their natural means of labour’ (Poulantzas, 2000: 88).

Where Poulantzas sought to contest Pashukanis’ contribution, others put his insights to use. The ‘state-derivationist’ school, most particularly represented

by John Holloway and Sol Picciotto (Holloway and Picciotto, 1977), sought to respond to Pashukanis' question of 'why is the apparatus of state coercion created not as a private apparatus of the ruling class, but distinct from the latter in the form of an impersonal apparatus of public power distinct from society?' (Pashukanis, 1980: 94). Following Pashukanis, they thus 'derived' the form of the state from commodity exchange.

European Marxism, 'BritCrit' and the Revival of Pashukanis

These wider debates about the nature of the state fed directly into Marxist legal theory in Britain. Many of the participants in the debate had been members of the Conference of Socialist Economists (CSE) State and Law group. This group worked closely with the National Deviancy Conference (NDC), an organisation of left-wing criminologists who had been active since 1968. At the same time, the translations of Althusser and Poulantzas influenced a number of legal scholars, particularly those associated with the Eurocommunist *Marxism Today* wing of the Communist Party of Great Britain, such as Stuart Hall and Alan Hunt. During the mid to late 1970s, therefore, Britain developed a distinctly Marxist current in legal thinking.

One crucial moment in the consolidation of a Marxist current in British critical legal studies (sometimes called 'BritCrit') was the publication of a new translation of Pashukanis in 1978 (Pashukanis, 1978). This was followed by several books outlining Marx and Engels' own approach to law and its contemporary relevance (Cain and Hunt, 1979; Phillips, 1980). The Pashukanis 'revival' generated a great deal of debate (Chris Arthur, 'Introduction' in Pashukanis, 1980; Redhead, 1978; Warrington, 1980). In the USA, Isaac Balbus advanced a position extremely similar to Pashukanis' own (Balbus, 1977), while in France Bernard Edelman used Pashukanis' position to stake out a theory of intellectual property (Edelman, 1979). In Britain, the CSE and NDC sought to situate law within the structures of capitalist social relations (Fine et al., 1979). Perhaps most important in this context was Bob Fine's work, especially *Democracy and the Rule of Law*. Fine followed much of Pashukanis' analysis, but also argued that he had overly abstracted exchange relations from relations of production, thus portraying class struggle as *external to the law* (Fine, 2002: 161). Fine argued that in fact the law directly mediated these contradictions, which could be boiled down to the contradiction 'between the juridic form of the individual as property owner and the natural form of the individual as producer, consumer and social being with real individual needs' (2002: 145–6).

In an early 1976 text, Hunt wrote, echoing Althusser, that '[l]aw plays an important role in sustaining the domination of the ruling class because it operates both as a form of coercive domination and of ideological domination' (Hunt, 1976: 180). For Hunt, law was ideological since

it conveys or transmits a complex set of attitudes, values and theories about aspects of society. Its ideological content forms part of the dominant ideology because these attitudes, values, etc. are ones which reinforce and legitimise the existing social order. (Hunt, 1976: 182)

Law is thus one of the primary *forms of appearance* of capitalist social relations. Yet this form of appearance abstracts from the substance of relation of production, presenting them as ‘social relations to a system of exchanges’ (Hunt, 1976: 183). At the same time, law serves a depoliticising function, since ‘bourgeois legal ideology’ posits law as responding to universal interests (1976: 185–6). In his later, influential, work Hunt explicitly argued that ideology ‘provides an instructive point of differentiation between Marxist analyses of law and mainstream sociology of law’ (Hunt, 1985: 12). Around the same time, Paul Hirst argued against the idea of a particular ‘legal form’ imbued with bourgeois content. Examining how property forms shaped capitalist accumulation in the context of company law, he noted that ‘company law and organisation does vary, that its forms do matter to the working people and that the Marxist left has immobilised itself by its own indifference and silence’ (Hirst, 1979: 144).

Over the course of the 1980s, with the growing influence of poststructuralism and post-Marxism, the emphasis shifted decisively away from *any* necessary ideological content of law (Hunt, 1985: 25). Hunt himself came to argue that certain values have ‘an elective affinity’ to the legal form, with these values ‘such as individualism, equality, and private property [becoming] universal and preponderant values under capitalism and [coming] to function as if they were the form of law itself’ (1985: 25). Hunt’s theorising of ideology dovetailed with his belonging to the Eurocommunist wing of the Communist Party of Great Britain, and his commitment to abandoning the strategy of a *rupture* with capitalism, for the sake of building a broader front, mobilising various oppressed groups *within* capitalist society. Insofar as words and concepts have no ‘necessary class content or implication’, they could be struggled over and appropriated by the left. Of course, as evidenced by Laclau and Mouffe, it was a short step from this position to one of post-Marxism, in which there was no necessary content to the social order *tout court* (Knox, 2019a; Laclau and Mouffe, 2001). This was ultimately the fate of the British Critical Legal Studies movement, with its Marxist currents eventually being defeated.

Marxism and Anti-Oppression

One of the key challenges to the Marxist tradition during the 1970s and 1980s was the rise of the ‘new social movements’ organised around racial, gender and sexual oppressions. The sustained challenges these groups posed to the existing order forced a number of Marxists to rethink how they conceptualised class and capitalism and necessitated fundamental transformations in the wider labour movement. Many Marxists *failed* to rise to these challenges, and so these movements turned to other intellectual and political resources.

This was a marked feature of Marxist legal theory. In the context of US Critical Legal Studies, whilst there were inevitable attempts to grapple with the issues of slavery and law (Tushnet, 1981), the Marxist-oriented wing did not systematically analyse race and racialisation. It was Critical Race Theory (CRT) that dealt with these issues, often in a manner antagonistic to ‘white’ Marxism and other critical theoretical positions (Williams, 1991). With the exception of MacKinnon, there was equally no Marxist feminist legal theory to be found in the USA. In the European – and particularly UK – context, there were some attempts, by Marxist theorists of state and law, to think through the relationship between race and law (Hall et al., 2013), but these were not widespread, and the same is true of feminist theory. Thus, whilst there were broader attempts by Marxists to explain ‘non-class’ antagonisms, this was not followed through in Marxist legal accounts, with legal scholars of these issues instead turning towards other intellectual traditions.

MARXIST LEGAL THEORY TODAY

As with many other disciplines, the end of the Soviet Union did not bring about a renaissance of Marxist legal theory. Many of the works that followed were *mea culpas* for the Soviet period. A common refrain was that Marxist theory had not taken ‘human rights’ (Bartholomew, 1990) or the ‘rule of law’ (Sypnowich, 1990) seriously enough. By the mid 1990s even this had largely died out.

One exception was in the field of international law, perhaps because of the continued currency of Marxist theories of imperialism, and the geopolitical competition and uneven development that remained unavoidable in the 1990s. In 1993, B. S. Chimni published *International Law and World Order*, outlining a theory of international law according to which its form and function changed in relation to transformations in the modes of capitalist accumulation (Chimni, 1993). Similarly, Susan Marks drew on Marxist accounts of ideology to explain the role of ‘democracy’ and ‘democracy promotion’ in international law (Marks, 2003a).

One of the most important developments in this regard was the publication of Hardt and Negri’s *Empire* (Hardt and Negri, 2001). They charted out a vision of international law as a smooth juridical space, and older international legal forms were becoming obsolete. Hardt and Negri’s positions were very much a product of the ‘globalisation’ of capital and the ‘unipolar moment’ and as such were problematised significantly by the US response to 9/11 and the 2003 invasion of Iraq – as evidenced also by their sequel, *Multitude*.

The 2003 invasion, and the wider War on Terror, also galvanised the left in the anti-war movement. Given George W. Bush’s open contempt for international law in the 2003 invasion, and the relatively unified legal opinions against it, many in the anti-war movement sought to leverage international law. It was in this context that a number of Marxist interventions on international law emerged

(Bartholomew, 2006; Bowring, 2008; Marks, 2003b), most importantly China Miéville's *Between Equal Rights*.

Miéville reintroduced Pashukanis' commodity-form theory to the English-speaking world. He used the latter's insights to demonstrate that, even in the absence of an overarching state authority, international law remains law, bearing as it does the character of the legal form (Miéville, 2005: 75–153). Miéville combined this with a theory of indeterminacy, taken from Martti Koskenniemi, in which international law constantly oscillates between arguments from 'sovereignty' and 'world order' (2005: 45–75). Given the *structural* connection between capitalist imperialism and international law, Miéville argued that legal disputes are resolved through the power relations of imperialism itself (2005: 293) – generating substantial debate in his wake (Bowring, 2008; Knox, 2009; Marks, 2007).

The international legal field has also seen a number of Poulantzian-inspired accounts emerge. These accounts have situated changing legal configurations in wider class international formations and their attendant relationship to the global capitalist state (Chimni, 2017; Rasulov, 2008). At the same time, such accounts have done vital work on the role of the judiciary in consolidating neoliberalism (Tzouvala, 2017).

The Commodity-Form Theory

Particularly in the international law context, commodity-form theory remains hugely important. The theory has elicited two recurring and significant criticisms: the first is that it cannot explain pre-capitalist law, and has an unduly static picture of the 'legal form', which also refuses non-European legal systems the title of 'law'; the second is that it is unduly focused on relations of *circulation* within capitalism, and so cannot understand the role of relations of production or class struggle.

This debate runs the risk of becoming purely semantic. Commodity-form theory would remain largely unchanged if it used the term 'bourgeois' or 'liberal' law but to do so would make it more difficult to track the *historical* development of the legal form, and its rupture with other modes of normative ordering. Pashukanis himself recognised other forms of normative social ordering anterior, contemporaneous and beyond capitalism. Yet he argued that to group all of these under the heading of 'law' was to engage in *legal fetishism* – projecting the present backwards and forwards. Pashukanis sought to understand how a *particular* social relationship of normative ordering seemed to become dominant in a relatively uniform but differentiated way, under the banner of 'law'. Inasmuch as this represents a 'Eurocentric' approach, it is in the sense that these legal relations are the result of a capitalist project of global homogenisation that began in Europe (Amin, 2009).

The second criticism, that commodity-form theory unduly focuses on relations of circulation, arguably misreads Pashukanis' work. On a basic level, as Miéville

points out ‘capitalist production is dependent on circulation like no other mode of production in history ... all production for exchange ... [and] the producers only avail themselves of production by exchange’ (Miéville, 2005: 94). More importantly, Pashukanis understood that class domination under capitalism *is not manifested directly* through pure, unequal domination, ‘rather bourgeois exploitation ... inheres in economic relations that *do not* achieve formal legal expression’ (Arthur in Pashukanis, 1980: 30). The focus on ‘circulation’ explained why this was the case. This does not mean, of course, that law exists unaffected by class and other struggles. Rather, those struggles are refracted *through* a legal form that is abstract in character. This abstraction will limit the possibilities for such struggles (Knox, 2010: 193–229).

Engaging with these criticisms has been central to the contemporary commodity-form theory revival. It has meant that scholars have been able to explore diverse legal regimes such as corporate law (Baars, 2016, 2019), labour law (Knox, 2016a), human rights law (Knox, 2019b), property law (Bhandar, 2018), the law regulating human reproduction (Fletcher, 2003), the legal frameworks of imperialism (Knox, 2016b; Tzouvala, 2020) and broader issues in international law (Krever, 2015; Miéville, 2008; Parfitt, 2019). In such approaches the legal form is not an all-pervasive static frame that prevents the understanding of the development of specific legal issues, but rather helps to shape how this content is articulated.

The Road Ahead

Contemporary Marxist legal scholarship remains somewhat underdeveloped. Whilst there have been some significant intellectual advances made, limits and absences remain. It is striking that, in an interesting inversion from previous periods, international law has been at the foreground of recent work. However, any serious Marxist legal research programme will need to devote more time to thinking about ‘domestic’ legal systems and regimes. It is also clear that when Marxists *have* turned to domestic law, it has been primarily in the areas of public law. Yet capitalism’s ‘deepest’ functions are tied up with mundane private legal issues of property, contract and various forms of civil liability. Attending to these areas, and mapping how these tedious and seemingly apolitical legal fields mediate and condition class struggles, is a crucial task.

Beyond mere subject matter, however, is a steeper challenge. One of the key reasons that the Marxist ‘wings’ of critical legal studies lost their relevance was their inability to grapple with questions of race, gender, sexuality and other antagonisms not traditionally dealt with by Marxists. This has meant that those traditions which *do* grapple with these issues – Critical Race Theory, Third World Approaches to International Law, feminist legal theory, Queer theories of law – have been (rightly) sceptical of insights from Marxist legal work. This absence has carried over into contemporary Marxist theorising about law, despite the fact

that Marxists from other disciplines have begun to engage systematically with these issues and traditions.

This has certainly been recognised by some contemporary figures. Chimni has called for an ‘Integrated Materialist Approach to International Law’ which combines ‘Marxism, socialist feminism and postcolonial theory’ in order to understand ‘the “logic of capital”, the “logic of territory”, the “logic of nature”, the “logic of culture” and the “logic of law”’, which make up the world today (Chimni, 2017: 440). Chimni’s call here is surely the correct one, but it is important not to simply graft other theoretical approaches onto Marxist ones. Instead the task must be to locate the phenomena of race, gender, sexuality within a social totality of which law is an integral part.

This task is particularly crucial because the basic building blocks of law – and Marxist analysis, legal or otherwise – are enmeshed in racialised, gendered relations, presupposing particular forms of sexuality and ability. The institutions of property and contract cannot be understood apart from the colonial and imperial contexts in which they emerged, and from the people whose domination and exclusion lay at their genesis – women, indigenous peoples and slaves in particular. At the same time, capitalism depends on forms of gendered reproductive labour, which support and underlie processes of capitalist accumulation (Fletcher, 2013).

In the case of race and racism, this work has already begun (Knox, 2014, 2016b; Tzouvala, 2020). A central text in this respect is Brenna Bhandar’s *Colonial Lives of Property*, which elucidates how property law is intimately interconnected with racialised forms, and relies on a logic of racial exclusion (Bhandar, 2018; see also Bhandar, 2014, 2015). With the exception of Ruth Fletcher’s important work integrating the insights of the commodity-form theory with feminist understandings of capitalist social relations and Katie Cruz’s reflections on the relationship between law, labour and sex work (Cruz, 2018; Fletcher, 2003, 2013), there have been no systematic Marxist legal engagements with issues of gender or sex, and nothing on sexuality. Remedying this situation will be crucial both to reaffirming the relevance of Marxist attempts to understand the law, and in understanding law’s relationship to the social totality.

CONCLUSION

Law has been an important element of theoretical and practical debates within the Marxist tradition. Seemingly abstract debates about the nature of law continue to have important consequences on radical movements – both ‘here and now’ and in any post-capitalist future. The more law and capitalism are understood as structurally inter-related, the more cautious one must be about law’s emancipatory potential. This is the great utility of the commodity-form theory. In specifying the relationship between law and capitalism, it provides an account

of the *limits* of legal action, aligning in this way with the revolutionary tradition exemplified by Luxemburg. Such a position does not betoken a complete *abandonment* of the legal struggle, but it does illustrate the abstracting and depoliticising effects that law is likely to have on political action (Knox, 2010). Approaches more focused on class struggle and ideology have often stressed the contingency of legal content, and its ability to articulate different struggles. Whilst this point is well-taken, absent a ‘jurisprudential’ theory of the law, we are left unable to know the limits of those struggles, and how their specifically juridical nature impacts upon them. The danger here is that one might – as with Karl Renner – imagine that law can express almost any content, and so could smoothly bring a socialist society into existence. It will only be by addressing these questions head on, and fully interrogating how law produces, mediates and reflects relations of exploitation, domination and oppression, that Marxist legal theory can play its most important role.

Management

Gerard Hanlon

INTRODUCTION¹

Within Marxism, management is not an area written about in the same way as labour or capital. This makes sense because modern management emerges after these Marxist categories. And yet management is central to capitalism (see Woodcock, Chapter 77, this *Handbook*). Modern management emerged because being managed (or increasingly self-managing) acts as a bridge between potential labour expended and actual labour delivered (Marx, 1976: 291–2). This is important because the capitalist production process was founded on a very distinct relationship to labour (and its management which itself is an output of this relationship – Braverman, 1974: 82): a relationship which must ensure capital increases as capital. This unique pursuit of valorisation created the capitalist imperative to continuously improve labour productivity and hence led to the emergence of modern management (Meiksins Wood, 2002: 55–6).

Management of the capitalist work process is foundational to capitalism because capitalist work and organisation require ‘discipline’ (Weber, 1948: 229) and this is instilled through the division of labour *and* its emergent management systems. This process means tasks are sub-divided and deskilled whilst, simultaneously, capitalism generates new skills better suited to its requirements – skills that ‘are henceforth distributed on a strict “need to know” basis’ (Braverman, 1974: 82) as knowledge becomes subsumed to capital. Critically, what we come

to see as 'knowledge' emerged from this capitalist division of labour and the social formations of the capitalist mode of production (Althusser, 2014). One key form this 'knowledge' takes is management. As such, management is deeply implicated in creating new fault lines of authority and hierarchy – something Adam Smith (1981: 758–88) noted in his calls for public education (albeit in 'prudently homeopathic doses', Marx, 1976: 484). We can see the contours of much of this in Marx's chapter on cooperation in *Capital*. I will extrapolate from this chapter to argue that Marx enables us to see the manner in which contemporary management operates (Althusser, 2014: 33–6). The coming argument suggests management operates to achieve two things – one, it pursues routinisation and standardisation and, two, it seeks out difference – it seeks out difference to divide workers and also it needs difference to see its own future e.g. renewable industries are a response to green resistance, the health and education sectors of the developed economies are a response to workers resistance and the different futures people demanded, etc. (this form of difference is not developed here, but see Hanlon, 2008). In connected ways, both standardisation and difference pivot around the concept of cooperation and, related to this, knowledge.

COOPERATION AND WORK

How does cooperation take place within capitalism? This chapter argues it increasingly takes place as management-led cooperation and, within this, capital and its management systems appear to workers as the organising force of production. Workers' separation from the means of production ensures they are dependent on wages and hence 'belong to capital' before they ever meet any individual capitalist (Marx, 1976: 723–4). Despite the seeming freedom of labour markets, compulsion and exploitation are central to labour-capitalist relations (Althusser, 2014: 29–30). These features make antagonism key to production and centralise the gap between the actual labour-power exerted and workers' potential labour-power. This implies that labour-power is already in existence and being sold in the market (Tronti, 2019: 152–9). But having been sold in the market labour-power needs to be managed in the workplace. It is the gap between labour potential and actual labour which forces capitalism to discipline labour and thus makes management necessary.

Viewed in this light, cooperation becomes located in management's capacity for force (itself necessarily backed up by the state). Importantly, force is not simply authority. For example, when analysing craft-like non-monopoly capitalist cooperation, Marx acknowledges the need for authority of some sort e.g. skill or age might lead some to exert authority over others. However, unlike other social systems, because capitalism must valorise capital, authority must increasingly be deployed for this purpose (Meiskins Wood, 2002). Likewise, because capital necessarily expands as capital, expansion means the number of workers in production

grows and the necessity of cooperation and hence authority increases. As such, management seeps into more areas of society. Furthermore, because capital valorises, it reshapes knowledge and science so that 'valuable' knowledge is housed within particular groups (managers, and accompanying this, the knowledge of other groups (workers, carers, etc.) is increasingly consigned to subordinate positions and/or embedded in technology, routines, systems, etc. (Althusser, 2014: 38–9; Braverman, 1974; Sohn-Rethel, 1978). In this sense, management and its knowledge base is an element of the class struggle embedded within the division of labour. Here management, knowledge, science, capital, etc. confront labour as the property of another, so that authority and cooperation are exploitative and something organised somewhere else. Marx (1976: 449–50) describes it thus:

These things are not their [workers] own act, but the act of capital that brings them together and maintains them in that situation. Hence the interconnection between their various labours confronts them, in the realm of ideas, as a plan drawn up by the capitalist, and in practice as his authority, as the powerful will of a being outside of them, who subjects their activity to his purpose.

In such an environment, management emerges as *the* source of planning, authority and discipline which transforms dependent potential into actual work (Federici, 2004: 133). Importantly, however, this disciplining (of ever larger numbers) of workers also expands labour's capacity *through* cooperation – Marx (1976: 447) suggests the worker 'strips off the fetters of his individuality' and hence productivity grows as managed cooperation increases. Here, the worker is transported from being a single worker working for themselves or another into a production process entirely dependent on worker cooperation e.g. the assembly line. Society moves from production by the single worker or small groups to a homogenous production process built on the 'social worker'. Through cooperation, the social worker generates greater surplus than if they were working independently and this excess of cooperation is captured by capital (Tronti, 2019: 132–3). Thus planned cooperation, or management, is central to capitalism and exists even in the era of competitive capitalism described by Marx. But later, especially with the advent of machines, the social worker increases rapidly to generate profit, concentrate capital and socialise labour still further throughout society (Panzieri, 1976). Once work becomes standardised or homogenous, what Marx determined as 'abstract human labour' (the labour any able bodied person could do e.g. work in a textile mill, work on an assembly line, cleaning dishes in a restaurant), it has no determined end until it is put to work and then given a determination by someone other than the worker. As such, management planning increasingly grows as the number of workers expands (Panzieri, 1976). In this seemingly chaotic social division of labour, the point of production, or the technical division of labour, is evermore standardised, managed and 'despotic' (Panzieri, 1976: 7).

Within this, management power is real i.e. things get done according to plans, but it is also incomplete and fragile e.g. it is built upon many other (lesser) forms

of cooperation or knowledge which come as ‘free gifts’. These free gifts emerge in the ‘general intellect’ (Smith, 2013), the ‘gift of caring’ (importantly provided by ‘diverse’ groups e.g. often by women; Skeggs, 2011, 2014), the authority of craft and other forms of skill reproduced through ‘knowledge of acquaintance’ (see the early management theorist Elton Mayo, 1949: 14–18), and so on. These gifts are often developed outside of paid work in the ‘social factory’ and yet they are central to capitalism’s reproduction (Dalla Costa and James, 1972: 11). All of this presents management with its central problem – how does it harness all of this potential cooperation and knowledge, inside and outside the factory, for capitalist valorisation? How does it ensure that when labour arrives at the individual workplace, it not only ‘belongs to capital’ but willingly belongs as a subject to be managed? And how does capital extract labour’s full potential and value at work? Management’s response to these problems is twofold: one, a search for standardisation in the technical division of labour to create workers as homogenised abstract labour to better control them and, two, in a seemingly contradictory movement, to look for difference in a continual pursuit of new terrains for primitive accumulation in the sense of ‘*an accumulation of differences and divisions within the working class* whereby hierarchies built upon gender, race, sexuality, and age become constitutive of class rule and the formation of the modern proletariat’ (Federici, 2004: 63–4, italics in original). Management needs to tame cooperation, find new sources of cooperation and (re)produce it as a fertile garden for capitalist valorisation. These tensions form the core of management.

STANDARDISATION, DEPENDENCY AND MANAGEMENT: THE SOCIAL RELATIONS OF THE FACTORY

Management has historically been closely associated with standardisation – Scientific Management is perhaps the apogee of this approach (Taylor, 1903, 1919). In this volume, Woodcock succinctly outlines Taylor’s standardising of the labour process. Taylor and Scientific Management represent the culmination of a prolonged push towards standardisation and the expropriation of labour’s knowledge to better control workers. Standardisation is not simply capitalist e.g. Aufhauser (1973) highlights its overlaps with slave plantations and Sohn-Rethel (1978) locates it in the long pursuit of interchangeability and measure. Nevertheless, within early capitalism, Pollard (1965: 265) outlines the extreme standardised division of labour in John Taylor’s Birmingham button factory as early as 1775 (Smith published the *Wealth of Nations* in 1776) – in the button factory work was divided into 70 separate repetitive tasks performed by 70 different individuals. The businessman Matthew Boulton sought to mass produce clock parts in the 1760s and he, and his partner James Watt, later sought to methodise engine making so as to improve productivity. Management of the division of labour allowed capitalists to standardise tasks to thereby eliminate ‘sauntering’

and intensify production, increase the dexterity of labour, and eventually replace labour with technology in the name of capitalist valorisation (Smith, 1981: 13–24). This growth in management reflects capitalism's relations of production in which dividing the labour process becomes a central management function because it enables greater control of workers across time and space to thereby raise productivity (Althusser, 2014; Meiskins Wood, 2002). This raising of productivity is a management task.

Braverman (1974: 58–69) too ties management's rise to the need for greater control of the labour process. He suggests it comes with the transition from earlier modes of production like 'putting out'. The putting-out system was a mercantile capitalist system characterised by the formal subsumption of labour (Marx, 1976: 1023–9). The formal subsumption of labour leaves the management of production in the hands of labour. Modern management emerges as an attack on this organising role for labour. In both the UK and the USA, the original factory was the workhouse (Pollard, 1965: 160–74; Perrow, 2002: 50). The workhouse emerged out of the pursuit of capitalist valorisation – often accompanied by a political agenda located in undermining the 'idleness' of labour and its disdain for valorisation. In the UK and the USA, labour sought to avoid the workhouse. Unlike the earlier production systems of the putting-out system, out-work or home-work, 'assembling workers within the factory enabled employers to control quality, reduce pilfering, and, above all, steady production. Employees dared not take time off for private economic activities such as wood gathering, fishing, and hunting, gardening and raising stock' (Perrow, 2002: 49–50). If people had access to these other (commons based) resources they avoided the workhouse and the factory (Linebaugh, 2006; Sellers, 1991: 10). Thus wherever working people had independence, they shunned the workhouse or factory. In light of this, it was dependent workers – particularly working class women and children – that developed the factory and management (Gutman, 1972; Hanlon, 2016; Perrow, 2002; Pollard, 1965).

One example of the role of (in)dependence can be found at the Whitin Machine Works. As part of its increasing management of workers, Whitin sought to impose clock time and literally enclose the factory within walls and gates. Older skilled workers responded to this by asserting their independence and walking off the job (Roland, 1897a). As this example suggests, where choice was available people rejected the social relations of the factory. Pollard (1965: 162, emphasis in original) comments 'This resolution [against factory work], it should be stressed, and many others like it passed in Yorkshire represents not the harking back to a mythical golden age, but the defence of *existing* social relationships'. In the USA, the feelings of ordinary people were similar. Echoing Pollard, Sellers (1991: 123) points out: 'But now, as working people began to see, an expansive capitalism threatened the traditional moral economy, that promised them a decent competence, ultimate independence, and the civic equality and respect of republican citizenship'. Such views reflect a number of issues, but perhaps most especially they

reflect the fear working people had that they would be subjected to the insecurity of the competitive market (Meiskins Wood, 2002; Polanyi, 1957). One obvious depiction of this rejection of competitive market forces was the US push west and the colonising of 'free' land to avoid the compulsion of capitalist labour relations.

In light of this, only the most vulnerable workers entered the factory. For example, Perrow (2002: 54) suggests that in the 1840s America's first industry – textiles (he disputes Chandler's claim it was the railways) – the workforce was made up of between two-thirds and three-quarters wage dependent poor women and children who worked 12 to 13 hours a day 6 days a week. As part of its promulgation of dividing difference, capitalist work separated workforces by class, race, gender and indeed age – wherein 'blondes' managed those who were progressively more and more 'non-blonde' and labour was categorised across variables such as (1) Colour, (2) Form, (3) Size, (4) Structure, (5) Texture, (6) Consistency, (7) Proportion, (8) Expression, and (9) Condition (Blackford and Newcomb, 1915: 117; see also Roediger and Esch, 2012 on race management and Robinson, 1983 on racial capitalism). Thus the management of the factory was not simply focused on craft deskilling. Rather, modern management emerged in the already standardising factory – often through the authority and cooperation of (some) master craft workers who managed production of other, more vulnerable, groups (Clawson, 1980; Wilentz, 2004: 23–61) – indeed, master craft workers had also participated in the earlier appropriation of female knowledge and value (Federici, 2004: 98). As an example of this, the famous US Lowell Textile Mills were owned by Boston financiers e.g. the Cabot family, but were managed by (non-financier) skilled male workers who initially recruited local female labour and maintained gendered hierarchies within the factories. Then, when it became available, these managers recruited unskilled poverty stricken, immigrant labour and created new divisions based on skill, gender and now, ethnicity, to deliver higher rates of exploitation. What this process reflects is that with the emergence of abstract labour, workers are already disciplined and hence 'ready' for management planning (O'Neill, 1986; Tronti, 2019: 153). Nevertheless, this 'readiness' is always partial and has to be further worked on in the workplace so that workers produce to a maximum, stay at work, etc. – Ford's \$5 day is an example of the management work still needing to be done – one way to do this is to exploit difference. As suggested, this moment starts not primarily with craft, but with other more vulnerable groups e.g. females, children, different racial and ethnic groups, and immigrants. Importantly, this difference is never permanent or natural. In the struggles between labour and capital, new subjectivities emerge e.g. the social worker creates the political figure of the mass worker.

Vulnerability located in class, gender and race are thus central to modern management. In particular, (male) employers and managers saw women as more vulnerable, compliant, better suited to the factory, and easier to mould to capitalist rhythms. For example, the Slater Mills system of the early 1800s could only get women and children into the newly emerging factory provided they granted males

of households outside work because men refused the discipline of factory life (Gumus-Dawes, 2001: 28–9). Or, in its first ‘benign’ phase, the Lowell Textile Mills employed ‘Yankee farm girls’ who stayed for a few years to accumulate cash for use for weddings or a brothers’ education or to supplement the family wage in hard times (Sellers, 1991: 280–5). In contrast, during the more exploitative ‘second phase’ (Gitelman, 1967; Gumus-Dawes, 2000; Perrow, 2002: 70–5) wage labour was increasingly based on mass immigration brought on by the Great Famine in Ireland and, a little later, by French Canadians fleeing poverty. Here, wage dependency was near total (as it also was in the immigrant fuelled mines, large infrastructural projects, and increasingly in the cities; Gutman, 1973; Roediger and Esch, 2012). Immigrants arrived as a proletarian labour-power needing and hoping for a wage and, as such, they arrived not so much as individual workers, but as a working class socialised for capitalist exploitation.

Importantly in this second Lowell phase, management science and knowledge were developed to technologically innovate and plan so that the Mills were able to make *more* use of children. Management used children to reduce adult wages by up to 50–90% on particular jobs. In this environment, management stretched the social bonds of caring so much that families were forced to send children to work in factories because they could not survive on adult wages alone. By 1865, children made up just under half of the total Lowell workforce.² Similarly, as work in the ammunition industries was deskilled and ripened for technology, employers shifted from skilled male to unskilled female labour and the industry became dominated by female (often immigrant) workers (Fitch, 1883). In short, as knowledge was increasingly located in planned systems of management, exploitation of the vulnerable increased. Thus management knowledge and planning flourishes in the ‘free’ choice of vulnerable poor women, migrants, non-whites (an important question not addressed here is how was whiteness defined) and children. Here families and immigrant communities would (unwillingly) stress certain potentialities in their children, friends and relatives and hence soften or prepare them for the drudgery and discipline of factory life and the insecurity of the competitive market in ways Marx was witness to – a free gift to capital. In this environment, the next generation inherits the production system and its accompanying knowledge system (including being managed), which helps determine its future (Althusser, 2014: 23). Vulnerability, expendability and compulsion within the division of labour created modern management in its dominant US heartland. Even in craft dominated industries (e.g. armaments), *before* skilled white men eventually lost power, women often made up 25% of the workforce and were employed and located in the most managed activities (Williamson, 1952). The dispossessed, the woman, the immigrant, the runaway, the child, are the proletariat.

Cities too created reservoirs of the vulnerable. For example, immigrants poured into New York City, which grew by 750% during 1800–50. Half the city was made up of immigrants and 80% of those were wage dependent Irish and

Germans. Wilentz (2004: 107–44) describes the New York degradation of labour in the ‘sweated trades’ – the term ‘sweated’ originates in New York at this point. He demonstrates how during 1825–50 New York came to dominate the US ready-made clothing market because of its capacity to innovate production processes and lines of credit. Retailers ‘metamorphosed New York tailoring at every level of production’ (Wilentz, 2004: 121) – a large portion of this trade was in cheap, poorly made clothing for the slave population of the South. This metamorphosis entailed the sub-contracting of various fields of clothing manufacturing to more and more vulnerable labour groups in ways that remind one of the contemporary ‘cascade effect’ unleashed on globalised supply chains by dominant firms such as Apple or Walmart (see Nolan, 2012). The influx of vulnerable immigrants meant ‘all pretension of craft vanished in the outwork system – with the availability of so much cheap labour, formal apprenticeship and a price book disappeared by 1845’ (Wilentz, 2004: 123). Yet again, workers’ difference and vulnerability were put to work to enable management to coordinate across organisational and spatial boundaries through sub-contracting, sub-division, minute surveillance and other systems. In short, homogenous abstract human labour is made to sweat as it competes with its difference e.g. ethnic conflict in New Haven labour relations at the Sargent Hardware Company. At Sargent Hardware ethnic differences existed and were exploited so that much of the workforce, many of whom were Italian in origin, feared that during the strikes of 1902, it was being sold out by an Irish dominated union (Gillette, 1988). Or between Armenians and Turkish workers in the Within Machine Works where Armenians demanded (but failed to achieve) the removal of Turkish workers (Roland, 1897a). As with a history of bombing, which starts in the colonies and moves closer and closer to the metropolis to eventually almost consume it (Lindqvist, 2000), management starts with the weakest social groups before moving closer and closer to core groups (or as Aimé Césaire’s colonialism de-civilising the coloniser). Indeed, it is important to highlight that colonialism and race were central to management theory and practice. Elton Mayo – founder of the human relations school – took the British colonial administrator as the pinnacle of what management should be and the foreperson’s empire, scientific management and race management, were all systematically deployed (Hanlon, 2016). Truly, Du Bois was right to argue the problem of the twentieth century – the century of management’s rise – was the problem of the colour-line.

In contemporary society we still see this tendency as social groups historically protected from the market are increasingly subjected to more and more competitive market forces e.g. fears concerning the automation of middle class jobs (Brynjolfsson and McAfee, 2016), the capturing of free labour in fields such as graduate level design and fashion through legally, bureaucratically and technologically managed systems (Lorey, 2015; McRobbie, 2016), skilled video-gaming employees (Josefsson, 2018), computing and IT (Barley and Kunda, 2004), and the increasing use of information technology as a source of

organisational polarisation wherein the disappearance of middle ranking occupations is accompanied by ever widening management and control within the workplace (Leavitt and Whisler, 1958). All these present elements of fear that 'protected' groups will be subject to the practices traditionally reserved for 'others'. Historically, a central group to be undermined in this rise of management was the citizen-craft workers of the 'Artisan Republic' (Wilentz, 2004). As with the emergence of agrarian capitalism which forced competitive market led tenant farmers onto tenants who had customary rights (Meiskins Wood, 2002: 95–123), the influx of property-less labour and the rise of management undermined the customary rights of craft.

THE CRAFT WORKER, DEPENDENCY AND STANDARDISATION: TRANSFORMING KNOWLEDGE TO ENABLE VALORISATION

The story of the craft worker is long told (Woodcock, Chapter 77, this *Handbook*; Braverman, 1974; Clawson, 1980; Edwards, 1979). Fundamental to that story are standardisation and routine. As we will see, this is because contingency and craft become increasingly problematic for capitalism (Veblen, 2013: 11). Central to the demise of craft is the managed deployment of standardisation. Standardisation is planned and increases because, as well as breaking down skilled tasks, producers also need standardisation for internal production, administrative and supplier systems and they themselves, as suppliers, producers and administrators must use standards. Thus through capitalist science, management, technology and planning in the technical division of labour, standardisation penetrates the whole economy (Panzieri, 1976). In short, 'useful' knowledge is developed. This exacerbates the real subsumption of labour to capital (Marx, 1976: 975–1060). Standardisation forces production to emerge as a 'concatenation of industrial processes' within a uniform process (Veblen, 2013: 14).

Standardisation itself was the holy grail of the eighteenth-century French army. The French sought to standardise munitions through the use of inter-changeable parts. This would allow arms to be repaired or restored quickly and cheaply. These ideas spread to the USA (Hounshell, 1984) where, more so than cost savings, the military sought repair efficiencies on battlefields (Ferguson, 1981: 3). But a crucial outcome of this was that standardisation came to represent a conflict over knowledge and the potential of knowledge between craft workers and capitalists (Hanlon, 2016; Montgomery, 1987). A central issue here is what is 'useful' knowledge? Should the knowledge of the craft division of labour (itself hierarchical) have autonomy from, or supersede, the knowledge of capitalism's valorising division of labour? In an economy of abstract human labour, the prioritising of craft knowledge is impossible. The struggle over who manages knowledge and the division of labour was thus a key battleground in nineteenth-century social restructuring.

Chandler (1981) argued craft work could not produce mass production and this was the reason for the implementation of deskilling through standardisation, routines and new knowledge. However, the sewing machine company Singer retained craft labour and annually mass produced 500,000 machines into the 1880s (Hounshell, 1984: 89). When Singer did standardise, it did so because it wanted to make its factory goods inter-changeable and regularised within the same organisation and network of suppliers. It developed standardised overseas factories along its US lines not necessarily because of labour costs (Scottish wages were cheaper than US wages), but because interchangeability made production both more efficient and helped to develop markets (Hounshell, 1984: 97). Efficient control in the factory enables markets to be further developed which then goes on to allow standardisation to penetrate ever greater spheres of the organisation. As such, interchangeability became hegemonic because to maintain any one non-interchangeable section of production created systematic weakness (Veblen, 2013: 14). In light of this, as it globalised, Singer managed or planned at an ever higher level. This appeared inevitable. However, it was not inevitable because its development emerged through conflict with a core social group – craft workers (Hardt and Negri, 1994: 25.5). This craft conflict was necessary because although craft workers were favourable to markets, they were not necessarily favourable to standardisation or profit maximisation and, unlike many factory workers, they had the production know-how to self-organise work (Hanlon, 2016).

This conflict is evident in struggles around the Inside Contract (Roland, 1897b). The Inside Contract system was the production regime which generated US proto-mass industrial production (Chandler, 1981; Clawson, 1980; Ferguson, 1981; Hounshell, 1984). It was a compromise regime based on the tension between capitalist owners who had finance and/or marketing skills, but no or limited knowledge of the management of production, and a group we might think of as the first knowledge workers – craft workers (indeed, Negri, 1996: 154 refers to craft labourers as ‘professional workers’ because of their knowledge and capacity to organise the whole production process). The Inside Contract system existed in the USA’s leading and most innovative industries e.g. steel, copper, tobacco, arms manufacture (Chandler, 1981) and, as a system, it facilitated bringing craft workers into the factory.³ It did so because rising costs separated craft workers from the means of production and forced them into the competitive labour market – to edge them towards the status of labour-power. Within the system itself craft workers selected and hired employees, decided on the production process and its duration, disciplined and managed staff, and importantly, innovated production processes to shave costs and hide these savings and innovations from capitalists so as to better preserve their negotiating position in the annual discussions around profit (Buttrick, 1952; Chandler, 1981; Roland, 1897b). Craft knowledge empowered contractors against owners who ‘represent a new breed of entrepreneur in the firearms industry’ (Williamson, 1952: 21) – a breed with capital and

marketing knowledge (Buttrick, 1952), but without the technical knowledge to manage production and hence little capacity to benchmark labour productivity. That is, technical craft knowledge was embodied in labour and could not (yet) be distilled into abstract management systems to thereby render craft labour as labour-power. Mental and manual labour were still conjoined, which enabled craft, not management, to plan cooperative production. But within capitalism, such a system has to be undermined.

The Inside Contract system created conflict over how much product was produced and the distribution of rewards between owners and those who were directly connected to knowledge of production and, as such, it potentially threatened the valorisation of capital (distribution itself is always a matter of class forces, Marx, 1976: 659). These tensions were often expressed as class antagonisms. For example, Williamson (1952: 136) speaks of contractors wearing 'frock coats, and sporting diamond stickpins, spats, and gloves'; Arnold (1896a: 885) refers to the 'haughty machinist'; and Roland (1897b: 995) discusses how the contractor was 'a power which must obviously be treated as an equal, although actually occupying the anomalous position of a belligerent inferior'. Being unable to control craft workers, Taylor (1903, 1919) characterised them as lazy and untrustworthy, and Arnold (1896a) called for their replacement by technology, redesigning their attitudes and subjectivities, deskilling, and rejecting the idea that their skill was an 'art' in favour of viewing their labour as mere 'selling' and hence to be used to maximise profit (see also Arnold, 1896b: 1094). Labour's knowledge and management of the division of labour had to be weakened, so authority and value could be shifted away from craft knowledge towards management knowledge and, in so doing, reduce craft labour and knowledge to labour-power awaiting direction. This weakening necessitated the destruction of the non-market customary rights of craft workers in the 'Artisan Republic' (Wilentz, 2004). A core social group had to be bombed.

In short, craft workers were a core population that needed to be managed and altered (Hanlon, 2016). One way to do this was to systematically undermine skill, non-valorising knowledge (Brody, 1965; Montgomery, 1987; Stone, 1973), and to reorganise work by 'exerting pressures for change that would benefit management' (Ferguson, 1981: 10). Thus the shift away from the organisational form of production located in the Inside Contract, was found in changes within the division of labour and the desire of capital to redistribute value away from production, intensify production processes, standardise, benchmark, measure and valorise. Alongside the workhouse and the standardising factory, this class struggle facilitated the rise of management and replaced craft as a source of managed work organisation. What informed this push was labour's knowledge, power, refusal of capitalist development and capacity to manage value so it could be guided towards producers not capital. Management knowledge was driven by these wider social forces. In this reading, the struggle to standardise lay the foundation for conflicts around modern management.

THE PURSUIT OF STANDARDISATION AND THE MANAGED BUREAUCRATIC ORGANISATIONAL FORM

Bureaucratic management is central to this process of standardisation and deskilling (Clawson, 1980). The creation of gauges, tolerances, machines and systems so precise as to repeatedly produce the same cut, joint or product requires bureaucratic forms:

The goal of inter-changeability, still very elusive, Lee believed, became an exacting exercise that imposed a bureaucratic system upon the armoury [in 1820] in its attempt to prevent any deviation from the standard pattern. (Hounshell, 1984: 35)

Anticipating the assembly line, superintendent Roswell Lee's pursuit of aligned machines to facilitate sequential production created a flow which virtually eliminated hand labour at Springfield Armory (as we will see, flow production is important to management's development). Standardisation thus brought with it a disciplined bureaucratic management order and deskilling. Most obviously, one saw this link between management order and deskilling at US Steel almost three-quarters of a century after the efforts of the Springfield Armory. US Steel emerged post the infamous 1892 Homestead strike which reshaped the industry in favour of capital. This strike, and its reshaping of relations, occurred just as the industry standardised production which had 'so simplified steel making that untrained men could successfully replace the strikers. That key fact, evident to both sides, determined the course of the Homestead strike' (Brody, 1965: 18).

Stone (1973) describes how the nature of organisation changed as a result of management developments post 1890.⁴ She argues modern bureaucratic management partly grew out of craft labour struggles at the end of the nineteenth century. So dominant was this model to become, Chandler (1981: 161) suggested that since 1910 the 'basic organizational structure and the basic techniques of coordinating and controlling their operation have changed little'. At its heart was a changing division of labour, the demise of the craft or 'professional' worker, and the transferring of knowledge from workers to management. This transformed knowledge further separated the intellectual from the manual to undermine craft labour and accelerate the ever growing importance of measurement, benchmarking, comparability, the emergence of semi-skilled workers, the development of internal labour markets, the increased deployment of technology, the individualising of the work place and the increased use of formal education to hire management cadres. The struggle over steel between 1890 and 1920 encapsulated the emergence of the modern managed corporation. Post-Homestead, the industry was radically transformed through a minute division of labour which generated three changes – one, new technology was generated to alter production and job structures; two, as a result of the creation of these job structures, new problems and solutions emerged for motivating and disciplining a labour force that was

no longer capable of self-organising production; and three, embedding lasting control over the entire labour process (Stone, 1973). In short, important pieces of the modern management template, which had already been deployed amongst other groups, were applied to the USA's leading workforce in its leading industries. The steel industry accepted new costs, new problems, new management layers, and it restructured work to destroy worker self-organisation and control of knowledge. What emerged was what we know as the bureaucratic organisational form (Clawson, 1980; Edwards, 1979; Mills, 1951). Modern management knowledge also emerged in its wake e.g. motivation theory, technology studies, the deployment of industrial psychology, fatigue studies, etc. Central to this was its transforming of concrete worker knowledge into abstract rules, systems, norms, 'simple labour' and management science. This reorganised the mental-manual split in work and created a new organisational intelligentsia (itself based on a pseudo-science of hierarchically created standards e.g. time and motion studies) (Sohn-Rethel, 1978: 153–8). It also further developed workers as inter-changeable labour-power and stripped them of any protection from competitive market forces. Unions would later attempt to insert protections for core labour groups – peripheral labour groups e.g. women, non-white populations were largely denied these protections. Management theorists would theorise this protection-seeking as an 'instinct of acquisitiveness' which manifested itself as 'property rights in jobs' (rather than the now unrealistic search for property rights in ownership of the means of production). Combined with an 'instinct for submissiveness', which made workers herd-like (and directly links to the neo-liberal elitism of management thought – see Hanlon, 2018), these instincts could be harnessed by management for the good of the emerging monopoly capital form (Montgomery, 1987: 411–2).

Within the managed transformation of steel, the composition of the labour force also changed and became more differentiated and yet standardised. During 1890–1910 the total US Steel labour force grew by 129%. However, native born skilled white workers only grew by 55% and immigrants from Germany and the British Isles (where overseas skilled workers generally originated) declined by 18%. In contrast, African Americans grew by 165% and, most remarkably, Southern and Eastern Europeans grew by 227%; so whereas in 1890 they made up less than 10% of the workforce, by 1910 they were nearly half of it (Montgomery, 1987: 42). The difference of labour was exploited within an ever homogenising production process (on this historically, see Roediger and Esch, 2012; in today's global economy, see Baldwin, 2016; Tsing, 2009). Following steel, industry generally shifted from skilled and unskilled to semi-skilled labour creating the mass industrial working class (Negri, 1996). In a seeming contradiction, despite workers' difference, the deskilling of tasks meant they became increasingly homogenised and hence more likely to experience struggle and collective grievances and see themselves as a class rather than as, for example, members of a craft (Stedman-Jones, 1974; Wilentz, 2004), or ethnic group

(however, on the resilience of ethnic and other ties, see Bodnar, 1980). As Taylor (1903: 1440) – who advocated simultaneously standardising and individualising workers – put it:

When employers herd their men together in classes, pay all of each class the same wages, and offer none of them any inducements to work harder or do better than the average, the only remedy for the men lies in combination; and frequently the only possible answer to encroachments on the part of their employers is a strike.

Like Taylor, to avoid the herding of ‘men into classes’ management deployed calculative, norm inducing, piece rates to individualise pay thereby pitting worker against worker (Marx, 1976: 692–701). This created an internal labour market with elongated promotion ladders designed to stoke desire, develop certain potentialities whilst inhibiting others and entrench a world of competitive individualism (see Taylor, 1903: 1415 who discusses something like an emergent internal labour market). These tactics were designed to convince workers they were competing with one another and that their individual interest and that of the company were the same – even as workers themselves became standardised, inter-changeable and measurable deliverers of surplus value. Management sought to generate discipline and individualisation to thereby exploit a managed hierarchical diversity within standardisation. Management was trying to create Weber’s (1978: 1148–57) disciplined organisation now workers had finally been stripped of knowledge and independent access to the means of production and confronted by the (monopoly) capitalist (Sohn-Rethel, 1978). At the heart of this was the idea – key to Smith’s pin factory – that workers could be made dependent on the competitive market, deskilled, compared, measured and, ideally, eradicated (Arnold, 1896a, 1896b) i.e. a proletariat exists (Tronti, 2019: 184–98).

In so doing, management created a form of ‘automatism’ which was not primarily technological (yet it was this), but was rather a power inherent within the relations of production because the planning or creative role of the producer fell to someone who did not produce – the manager – as intellectual and manual labour were prised further apart (Sohn-Rethel, 1978: 117–13; see Ford, 1926 who suggested it was management that was now the creative and productive force). Because craft workers acted as a stop-gap on this automatism they had to be eradicated. This was not simply about costs – as we saw with Singer – but about hegemony and controlling labour to subjugate it (where possible) to the vicissitudes of the competitive market. This is why, despite his many technological and scientific advances, Taylor claimed his most important was the management and controlling of workers through competitive inter-changeability (Sohn-Rethel, 1978: 149–53). The deployment of capitalist science – and management as a capitalist science – was central to this (Althusser, 2014). Scientific management (which has no real science) produces ‘coercive time’ by replacing producer time, the workers’ own empirical knowledge (Sohn-Rethel, 1978), with an abstraction of what management *determines* is the time of a task. Central to these developments

was the university. Technology was often developed in the factory, whilst science was increasingly created in universities and R&D labs. Both were used to build and deploy machinery and standardisation. This deployment intensified the labour process and created the ‘maximum exploitation of labour-power and the maximum submission of the worker to the capitalist’ (Panzieri, 1976: 11). Such developments dovetail with the expansion of the university (and its elite and middle class attendants) as the new source of science, planning and management. Indeed, Frederick Taylor and Elton Mayo (two founding fathers of management theory) taught at Wharton and Harvard Business Schools and, from the 1920s onwards, the Dean of Harvard Business School, W. B. Donham (1922, 1927a, 1927b, 1933, 1936), argued that universities were essential to training business leaders who would lead not just business, but society.

This expansion of planning intensified the separation of mental and manual labour and corralled the manual class in ever increasing numbers into the regimented workplace – the intellectual/manual divide emerged as a key Marxist problem (Panzieri, 1976; Sohn-Rethel, 1978). If unchecked, management would allow capital to measure, benchmark, ‘ensure competitive rates of surplus value’ (Bryan et al., 2009: 467) and search for difference within the labour market to exploit groups that are less protected and more dependent on wages in a form of primitive accumulation e.g. globalisation (Federici, 2004; Tsing, 2009). In so doing, these days it also allows capital to undermine core social groups with any protection from the competitive market e.g. the contemporary Western graduate creative class who now innovate for major corporations, often at their own expense, in the hope of being ‘recognised’ (Jofesson, 2018; Lorey, 2015; McRobbie, 2015).

MONOPOLY CAPITALISM AND MANAGEMENT AS LEGITIMATE KNOWLEDGE

The ending of craft is important, but it is only one feature in the rise of management. The creation of wage dependency amongst weaker social groups – that is the creation of dispossessed labour power – occurred before the end of craft. Thus by the early 1900s the stereotypical industrial worker in the USA was a young female who was the daughter of German immigrants. Within this factory she would have been managed by systems, procedures, standards and often white male managers/foremen (Montgomery, 1987: 112–13). Furthermore, as a way of earning a living, managed unskilled physical labour continued to grow. However, the ending of craft and the emergence of the large corporation was significant because it further enabled management to become the source of legitimate production knowledge. One example of this was the transition from the idea of craft or skill being enacted on a sensuous entity that was capable of being transformed to one where the object, or nature itself, was passive and something to be

manipulated by abstract standards and formula. Central to this was the use of standards, maths, abstraction and the rejection of worker experience and approximation (Sohn-Rethel, 1978: 111–16). Indeed, over the nineteenth century so thorough was this transition that the ownership of much craft knowledge, skill and innovation was shifted from the embodied worker and became the intellectual property rights of the corporation (Fisk, 2009). Here, intellectual labour became divorced from the physical so that management (and other sciences) became the bearers of useful capitalist knowledge.

These developments meant it was a short step to the automation of work and the replacement of labour with machines. This pushed capital towards ever greater scale and demanded the continuous flow of work and continuity of production. In turn, this required investment in fixed capital and the emergence of the quasi-monopoly firm that was less responsive to markets and further embedded in management and planning (Panzieri, 1976; Sohn-Rethel, 1978: 140–5). In this movement labour became problematic because it was unpredictable and hence needed to be controlled. Sohn-Rethel (1978: 148–58) argues this was how we should read scientific management. Its obsession was the speed at which labour could be turned into capital and this became its central problem because increasingly capital needed to be fixed capital. This made the domestication and control of labour essential because it had to be made to behave capitalistically (loss of this control e.g. through the sit down strike, heralded the Fordist compromise which itself ensured higher profitability; Hanlon, 2016). Taylor was absolutely embedded in technology, fixed capital, the organic composition of capital and the real subsumption of labour to capital. As such, Taylor's emphasis on high wages and high productivity under management, rather than its actual delivery of these, envisaged Fordism. These processes (again) reorganised the manual–mental split in the organisation (and society) so that management, as part of the intellectual class (even if pseudo-scientific), confronted the worker as a foundational feature of the class divide. Despite mass production and standardisation being a possibility in the nineteenth century, it was only through the exploitation of difference, labour conflict and increasing wage dependency that capital could turn knowledge into capitalist knowledge and create monopoly capitalism which then enabled management to appear in its modern form – as a science that confronts the worker as the organising force of production, as a legitimate source of value and as a class tool.

In a contemporary setting we should view globalisation as an extension of this process of standardisation and exploitation of difference. Hymer (1970: 446) discussed the spread of the Western corporation as a 'new imperial system' which used monopoly power, and planning to tap into diverse populations as a source of cheap exploitable labour-power – as a form of primitive accumulation. As the largely white male Western working class used its power, partly built on flow production, to protect itself from the competitive market, capital sought out labour's difference amongst groups that could be proletarianised and subjugated

to the competitive market (Fröbel et al., 1978). Using standardisation as a means of globalising production, corporations such as Apple have been able to insert themselves into a global economy as ‘systems integrators’ that can squeeze value from a range of diverse groups via a ‘cascade effect’ – such that Chinese workers receive less than 2% of the value of an Apple iPhone. Increasing standardisation allows capital to further and further manage global human difference by playing one group against another (Tsing, 2009).

But lest we think this is simply a global South problem, relatedly this also allows capital to undermine working conditions and welfare states in its heartlands and to reimpose the competitive market on those core labour groups that had won some protection from it so as to make them vulnerable anew. Generation rent, the precariat, the gig economy and indebted man/woman are all evidence of this. The rise of graduate and youth insecurity are important here. For example, central features of the modern monopoly corporation are its exploitation of free labour through strategies built on the entrepreneurial employee; human capital theory wherein an individual’s body and knowledge become the means of production that is always subservient to the valorisation of capital; open innovation wherein companies access social knowledge for free; the capture of public resources, etc. These strategies are only possible with the subjugation of old and new groups to the competitive market. Management is always exploiting, creating and seeking out forms of vulnerability and difference. In short, management is an essential mechanism for embedding ‘*the relations of production ... within the productive forces*, and [that] these are “moulded” by capital’ (Panzieri, 1976: 12, emphasis in original).

CONCLUSION: MANAGEMENT, STANDARDISATION AND DIFFERENCE

Modern management is the product of, and a direct tool in, the class struggle between capital and labour. It operates in a pincer movement of standardising processes to undermine old groups *and* locating new groups of the vulnerable in a moment of primitive accumulation. In so doing, it entirely subjugates knowledge to the valorisation of capital. As such, all forms of knowledge work (and worker) are temporary because such empowering knowledge leaves open the potential to reject capitalist valorisation in favour of something else. Importantly, this includes management itself – we may think here of the principal–agency problem in corporate governance or the hollowing out of middle management since the early 1980s. Thus within work, the role of management is to foist the competitive market on social groups and (ideally) open them up to its unbridled forces. Polanyi (1957) argued people reject such forces because they are socially destructive. In his analysis of cooperation, the presentation to capital of the free gift of sociality, capital’s ability to return this gift to labour as management’s

capacity to plan the production process and act as the authority figure within the organisation, the market and society, Marx highlighted the contours of management's expanding class role.

Notes

- 1 An important omission in this account of management is slavery. Slavery and the plantation were essential to the development of capitalism (Baptist, 2014) and to management itself (Cooke, 2003; Roediger and Esch, 2012). Plantations deployed a proto-Taylorism and revolutionised production processes through punishment. This gave rise to massive productivity gains in the early nineteenth century which were directed at producing perhaps the world's most important commodity at the time, cotton – the commodity necessary for the first mass industry – textiles. Indeed, slavery was also at the heart of early finance capitalism and connected the slave to New York, Boston, Liverpool, and London.
- 2 Later, families used these care connections to avoid work e.g. in the Amoskeay Mills large families earned enough to support each other and this was one reason why absenteeism ran at 25 per cent (Montgomery, 1987: 139).
- 3 Although it shares some similarities with the 'putting-out' system in that by 'putting out', employers dispersed raw materials to people's homes and then collected the finished product. This is an important difference because it does not create the factory. The Inside Contract also shared similarities with the 'Foreman's Empire' (see Edwards, 1979; Nelson, 1995).
- 4 Montgomery (1987: 41, ft99) acknowledges the influence of Stone's essay but suggests that she 'seriously overestimates both the pace and the extent of the steel industry's adoption of a job hierarchy based on "scientific management" principles'. Nevertheless, what Stone does highlight is the emergence of many of the management tactics and organizational strategies which dominated much of the twentieth century.

The End of Philosophy

Roberto Mozzachiodi

It is often assumed that Marx's thought can be conceptualised around a 'break' that divides his corpus into the early philosophical writing and the mature non-philosophical work of the 1850s and 1860s. This periodisation is generally understood to be synonymous with the intellectual enterprise of Louis Althusser. As such, it is often considered a peculiarly French theoretical preoccupation – not least as the problem itself has come to be associated with a distinctly French conceptual idiom (i.e. the 'problematic', 'the epistemological break' (Althusser, 2005: 32)).¹ However, the problem of the end of philosophy in Marx, which formed the basis of Althusser's rigid compartmentalisation of Marx and Engels' body of work, pre-dates this formulation, and indeed does not originate in the postwar French context. The 'end of philosophy' problematic connects the more provincial dimensions of the intellectual debates that took place inside and outside of the French Communist Party (PCF) during the 1950s and 60s to a longer and more international theoretical trajectory that encompasses the broader sweep of philosophical debates that took place within the Second and Third Internationals. In particular it links them to a set of dissenting philosophical voices that were raised during the early years of the Third International. The dissenting voices of the young György Lukács and Karl Korsch emerged at a moment when there existed a genuinely explorative and experimental research culture attached to the gradual uncovering of Marx and Engels' collected works. In this context, philosophers active within the Third International such as Lukács and Korsch reintroduced the spectre of philosophy into Marx to criticise a latent theoretical

alliance that had formed across the political and analytic splits of the Second and Third International around a superficial grasp of Marx and Engels' claim to have broken from classical German philosophy.

The interrogations that were pursued during this brief opening, when the question of Hegel's relation to the Marxist tradition was yet to be settled, brought to the surface a problem that would cast a looming shadow over all subsequent theoretical trajectories taking Marx as a starting point: namely, how to put an end to philosophy, as Marx variously proposes, without by that token taking up a philosophical position to do so. This would lead to a potentially infinite regress: by means of what philosophical position does a Marxist judge the end of philosophy to be accomplished? What linked the anti-anti-philosophical gestures of Korsch and young Lukács was a dissatisfaction with the philosophical preconceptions that underpinned most authoritative interpretations of the end of philosophy motif in Marx. The consistent factor in these interpretations was a philosophically naïve, or simply unsubstantiated, justification for the rejection of philosophy as such or its dethroning by an insurmountable theoretical substitute such as positive science.

In what follows, I will summarily trace the development of the end of philosophy motif as it appears in the writings of Marx and Engels. I will periodise the formation of the end of philosophy problematic, as it becomes a prism for understanding Marx and criticising the ensuing legacy of authoritative treatments of Marx. I will then conclude by tracing the displacement of this problem into the French context. In particular, I want to trace the pre-history of Althusser's summation of the various failed attempts to respond to the end of philosophy conceit in Marx, which constituted the departure point for his own response in *For Marx*. This pre-history primarily revolves around the PCF's journal *La Nouvelle Critique* (NC: 1948–80), which was the intellectual forum in which Althusser would publish many of the era-defining texts that would be included in *For Marx* and *The Humanist Controversy* during the 1960s. Prior to Althusser's interventions in the journal, NC was also the arena in and around which the question of Marx's relation to philosophy and its end re-entered the fray of Marxist intellectual discussions in the mid 1950s. György Lukács and Karl Korsch's questions concerning the end of philosophy in Marx, which had been pitched against the orthodoxy in the interwar years, took on a new relevance in the Cold War context, especially in NC, which, in the first 10 years of its existence, was thoroughly in thrall to Soviet cultural policy.

A central persona in these debates was Henri Lefebvre, who between 1948 and 1957 was on the editorial board of NC. Though underrepresented in the growing corpus of English-language translations of his work, the period of 1954–6 was among the most productive of Lefebvre's career. During these years, Lefebvre was pulled into a number of debates that sharpened his own interpretation of the end of philosophy in Marx. The continuity of this problem within postwar French Marxist theory across the different historical conjunctures represented by Lefebvre and

Althusser can be explained by the different eras the two represented in *NC* and the changing intellectual culture of the PCF more broadly. But it can also be explained by the persistent appeal that the question of philosophy in Marx has had, to this very day, over militant philosophers who remain unconvinced by the prevailing denials of philosophy both in the name of Marxism and anti-Marxism.

THE END OF PHILOSOPHY IN MARX

Marx ascribed to the domain of philosophy as such, and of German Idealism specifically, a number of functions and meanings. Indeed, the contexts in which he engaged with philosophy, either within its discursive register or as an object of inquiry, spanned a range of problematics. These engagements corresponded to a specific set of intellectual, political and methodological ambitions and comprised distinct sets of disciplinary reference points at given moments in his scholarly and political career. No less discontinuous and shaped by the problematics in which he was writing was the motif of the end of philosophy that appeared at various moments in his writing. In order, then, to acknowledge the divergent intentions that Marx had with his different philosophical ends, it is necessary briefly to outline at least four distinct formulations of the end of philosophy that appear in Marx and Engels' writings and that will form the textual reference for the hermeneutic legacy I will be dealing with in this chapter.

The first appears in *A Contribution to the Critique of Hegel's Philosophy of Right* (1843–44) and is later reformulated in a slightly different context in the *Paris Manuscripts*, also known as the *Economic and Philosophical Manuscripts* (1844).² In Marx's *Critique* the German proletariat is presented as the force negating the bourgeois world. On the basis of its universal suffering and social power, the proletariat is granted the desire and means to overthrow the present state of things. It is to do this as the material fulfilment of history's intrinsic dialectical movement, as laid down, albeit only speculatively, by Hegelian philosophy. To that effect, Marx concludes:

As philosophy finds its *material* weapon in the proletariat, so the proletariat finds its *spiritual* weapon in philosophy. And once the lightning of thought has squarely struck this ingenuous soil of the people, the emancipation of the *Germans* into *human beings* will be accomplished ... The *emancipation of the German* is the *emancipation of the human being*. The *head* of this emancipation is *philosophy*, its *heart* the *proletariat*. Philosophy cannot realize itself without the transcendence of the proletariat, and the proletariat cannot transcend itself without the realization of philosophy. (Marx and Engels, 1975: 187)

In other contexts, this end of philosophy has been labelled the 'realisation' thesis (Feenberg, 2014). The idea here is that the aspirations of Hegelian philosophy to deliver consciousness from estrangement – to dis-alienate man by ascending dialectically to a rational thought that aligns with the essence of reality – is an end that can be realised only *as* and *by* a real force in the world. Only a material

force such as the one embodied by the desire for social change intrinsic to the historical condition of the proletariat would alleviate the *real* conditions of estrangement that precede the estrangement of consciousness.³ Such a material force would thereby transcend the limits of Hegelian philosophy, which is only able to conceive of this dis-alienation in the form of advancing and increasing conceptual adequacy and not according to a transformation of the material conditions that generate alienation as such. Yet, in the so-called realisation thesis, Marx does not suggest abandoning philosophy as a reference point for thinking about emancipation from alienation. Rather, he alludes to the coincidence of philosophy's ambition to construct a non-normative concept which is adequate to what is, on the one hand, and the realisation of the destiny of the proletariat, on the other. The encounter is given in the form 'of the mutual "abolition" of the two protagonists' (Kouvelakis, 2018: 332). Marx therefore welds the enterprise of philosophy to the fate of the proletariat by conferring upon the latter a set of properties that draw their significance from the former.

It is in this sense that Marx also argues that the 'weapon of criticism' (Marx and Engels, 1975: 182) plays a supplementary role to that material force necessary to realise philosophy. Marx here insists that philosophy is in fact a material force – a sentiment that goes back to an article published a year before in which he claimed: 'Philosophy does not exist outside the world, any more than the brain exists outside man because it is not situated in the stomach. But philosophy, of course, exists in the world through the brain before it stands with its feet on the ground' (Marx and Engels, 1975: 184).⁴ Even if philosophy professes an understanding of the world that ascribes to thought a transcendental status, it nevertheless occupies minds that exist in the real world. And, insofar as it retains a real existence alongside its ideal existence, it does not disappear by a simple refusal or by 'muttering a few trite and angry phrases about it' (Marx and Engels, 1975: 180).⁵ In that sense, philosophy cannot be abolished without making that abolishment a reality. Accordingly, the supersession pursued within philosophy is necessary to, even if ultimately dependent upon, the proletariat.

The second end of philosophy is the one we encounter in the 11th of Marx's *Theses on Feuerbach*: 'The philosophers have only *interpreted* the world in various ways; the point is to *change* it' (Marx and Engels, 1969: 15).⁶ The aphoristic sentences that make up the *Theses* were composed in the spring of 1845 and later published by Engels in 1888 in his *Ludwig Feuerbach and the End of Classical German Philosophy*, where the text was first given its title, prior to its inclusion in the *German Ideology*, which was first published in 1932. Given this peculiar publication history⁷ and the aphoristic quality of all 11 theses it is harder to extract a single meaning from thesis 11, either from the text alone or the context. The common understanding of the 11th thesis is that it simply advances an imperative to change the world in actions over mere discursive interpretation. Moreover, the association it makes between the limitations of interpretation and what philosophers have so far achieved, and the presentation of change as a corrective to those

limitations, has often led to the conclusion that Marx is advancing a claim about his own position vis-à-vis what philosophers have accomplished hitherto – that is, an implicit assertion that his position has exceeded the limits of philosophy as such. Read as a continuation of the thrust of the realisation thesis, the 11th thesis can appear as an injunction to political revolution – one with which Marx affiliated his own position – over a revolution in philosophy alone.

Later, however, the *Theses* would be invested with a somewhat different semantic charge by a number of periodisations appearing in Marx and Engels' later prefatory remarks. In the preface to *A Contribution to the Critique of Political Economy* (1859), Marx would say of his and Engels' intention 'in the spring of 1845', when the theses were written, that it was 'to set forth together our conception as opposed to the ideological one of German philosophy, in fact to settle accounts with our former philosophical conscience'. This is one of the few definitive periodising markers that Marx provides of his relation to philosophy following the manuscripts from which the *German Ideology* would be culled. It is one that retroactively ties the position beyond the 'mere interpretation' expressed in the 11th thesis to the content of his mature critique of political economy. It therefore implicitly marks a discontinuity with the so-called realisation thesis. In the same text, the status of the 1845 manuscripts, including the *Theses*, is inflected somewhat differently again. He says: 'We abandoned the manuscript to the gnawing criticism of the mice all the more willingly since we had achieved our main purpose – self-clarification' (Marx and Engels, 1969: 505).⁸ In other words, the texts themselves did not record a definitive settling of accounts with post-Hegelian philosophy but had the merit of allowing Marx and Engels to work out how to move beyond philosophy – even if the results of this clarification would be expressed elsewhere.

Some 40 years after the *Theses* were drafted, Engels would consecrate the legacy of the 11th thesis for a generation of Marxist commentators to follow in his foreword to *Ludwig Feuerbach and the End of Classical German Philosophy* (1888). There, echoing Marx's statements in the 1859 preface, Engels explained the purpose of his text: it was precisely to carry out the work that had been left unfinished in the *German Ideology* – that is, to produce 'a short, coherent account of our relation to the Hegelian philosophy, of how we proceeded, as well as of how we separated, from it'. Reflecting on the status of the 1845 manuscripts in the light of this ambition he says:

I have once again ferreted out and looked over the old manuscript of 1845–46 [*The German Ideology*] ...in an old notebook of Marx's I have found the 11 Theses on Feuerbach, printed here as an appendix. These are notes hurriedly scribbled down for later elaboration, absolutely not intended for publication, but invaluable as the first document in which is deposited the brilliant germ of the new world outlook. (Engels, 2009: 1)

The philological significance that Engels attached to the *Theses on Feuerbach* not only reinforced the idea that the *Theses* recorded a significant threshold as regards

the division between Marx and Engels' earlier philosophical conscience and the new world outlook of a materialist conception of history but also framed the significance of this new world outlook in terms of an 'end of classical German philosophy'.

At the end of the text, Engels claimed that Marx's 'conception [of history] puts an end to philosophy in the realm of history, just as the dialectical conception of nature makes all natural philosophy both unnecessary and impossible' (Engels, 2009: 60–1). The implication was that Marx's conception of historical development, based upon a scientific investigation of the laws shaping material processes and individual motives, had rendered obsolete a philosophical conception of history. In that sense, Engels revised somewhat the realisation thesis. The 'German working-class movement' remained the 'the inheritor of German classical philosophy'. Now, however, this encounter would be composed of the will of the working class to act upon history and a scientific theory that aimed to produce an objective account of the interconnected material processes that comprise the movement of history.

This reading represents yet another inflection of the 11th thesis. According to the framework of the opposition between ruminative philosophical interpretation and practical change, Engels posits a necessary theoretical component to the revolutionary impulse of the proletariat. Unlike the reading of the 11th thesis that takes at face value the injunction for political struggle over discursive interpretation, Engels' reading confers on scientific theory a supplementary but necessary role in this dynamic. But where the weapon of criticism had been the theoretical arm of the proletariat in Marx's realisation thesis, for Engels it was the progressive development of scientific discourse that was yoked together with the proletariat in its revolutionary course.

Engels' revision brings together arguments that Marx put forward about the epistemological superiority of a dialectical and materialist conception of history over philosophy with earlier arguments about the role of the proletariat as the bearer of philosophy's destiny. Echoes of the former can be traced back to the *German Ideology*, where Marx refers to the inadequacies of philosophy on specifically epistemological grounds:

Where speculation ends, where real life starts, there consequently begins real, positive science, the expounding of the practical activity, of the practical process of development of men. Empty phrases about consciousness end, and real knowledge has to take their place. When the reality is described, a self-sufficient philosophy [*die selbständige Philosophie*] loses its medium of existence. At the best its place can only be taken by a summing-up of the most general results, abstractions which are derived from the observation of the historical development of men. These abstractions in themselves, divorced from real history, have no value whatsoever. (Marx and Engels, 2010a: 37)

Here the end of philosophy results from the revelation of philosophy's erroneous departure point (the mind as primary) on the basis of a new departure point (matter as primary). In this formulation, Marx argues that the chief defect of (Hegelian) philosophy is its assumption that the criteria of objectivity are accessible by way

of an application of a dialectical method to speculative propositions. In this sense philosophy comes to an end, not according to its own theoretical criteria, but because a sounder theoretical enterprise has proven the limitations of its epistemological aspirations from the outside. But in Engels' elucidation of this theoretical advancement, the proletariat, whose historical destiny continues to derive from and correspond to the realisation of philosophy, is assisted in its mission by a theoretical enterprise that has in fact outstripped philosophy.

The last formulation of the end of philosophy that is of relevance to our argument is one in which Engels appears to assign philosophy a posthumous vocation. In *On Dialectics* (1878) and *Dialectics of Nature* (1883), Engels describes philosophy as returning to life for the sole purpose of 'posthumously' exacting revenge over the natural sciences for the 'latter having deserted it'. In *On Dialectics*, Engels registers that the desertion of Hegel in favour of positivistic natural science reflected the epistemological exigencies of a socio-economic reality more than a genuine theoretical development. As such, 'dialectics too was thrown overboard ... and so there was a helpless relapse into the old metaphysics' (Engels, 1959: 456)⁹ in scientific discourses. With this turn, long-refuted philosophical reflexes and abstractions returned in new theoretical guises – especially as regards the conceptual ordering of results furnished by empirical science. Engels would make the point most vividly in *Dialectics of Nature*:

Natural scientists believe that they free themselves from philosophy by ignoring it or abusing it. They cannot, however, make any headway without thought, and for thought they need thought determinations. But they take these categories unreflectingly ... from uncritical and unsystematic reading of philosophical writings of all kinds. Hence they are no less in bondage to philosophy but unfortunately in most cases to the worst philosophy, and those who abuse philosophy most are slaves to precisely the worst vulgarized relics of the worst philosophies ... they are still under the domination of philosophy. It is only a question whether they want to be dominated by a bad, fashionable philosophy or by a form of theoretical thought which rests on acquaintance with the history of thought and its achievements. (Engels, 1934: 210)

For Engels, the only way of countering such philosophical impulses from diminishing the genuine achievements of positive knowledge was to 'return, in one form or another, from metaphysical to dialectical thinking' (Engels, 1959: 457). This, Engels claimed, was the objective of *Capital*, wherein Marx applied the dialectical method 'to the facts of an empirical science, political economy' (Engels, 1959: 460). From this perspective, dialectical philosophy must not come to an end, precisely because old metaphysical philosophy survives its own supersession by implanting one-sided thought determinations into the theoretical discourse that takes its place.

For Engels, therefore, all that survived of dialectical philosophy's previous incarnation was its unique capacity to assist the conceptual arrangement and development of scientific understanding. According to Engels' *Anti-Dühring* (1877), what remained of philosophy in Marx was a 'science of thought and its laws – formal logic and dialectics' (Engels, 1959: 40). Marx echoed this sentiment in his *Postface to the Second Edition* (1873) of *Capital*, where, against his

contemporaries who treated Hegel as a ‘dead dog’, he avowed his direct inheritance from his dialectical method. In *Capital*, Marx admitted, one finds a rational application of the dialectical method in the presentation of scientific material. The dialectic, Marx added, ‘does not let itself be impressed by anything, being in its very essence critical and revolutionary’ (Marx, 1982: 102) and for that reason served the purpose of lifting conclusions made within bourgeois science out of their state of abstraction.¹⁰ In this light, the afterlife of Hegelian philosophy appeared in the persistence of the negative as a critical heuristic in Marx’s treatment of one-sided thought determinations in bourgeois political economy. But the precise nature of the relationship between Marx and Hegel’s dialectical method was never explicitly dealt with by Marx. Even while he acknowledged taking cues from Hegel’s *Logic* while drafting the *Grundrisse* (1857–88) and engaged directly, if very briefly, with the question of his method in the notes that make up the 1857 Introduction to *A Contribution to a Critique of Political Economy* (Marx, 1973: 81–109), Marx never managed to write those ‘2 or 3 sheets’ that were intended to make ‘accessible to the common reader the rational aspect of the method which Hegel not only discovered but also mystified’ (Marx and Engels, 2010b: 249).¹¹ As such, the writings of Engels dealing with this question in a more sustained manner would become an influential stand-in for interpreters of the following generation. Yet, as we will see, the late Engelsian inspiration, which shifted the register from the political to the epistemological, would play an important role in postwar elaborations of the end of philosophy problematic in the French context (Althusser and Balibar, 2009; Lecourt, 1975).

AGAINST THE ORTHODOXY

The end of philosophy became an explicitly acknowledged interpretative problem in readings of Marx, especially for those committed to a critique of the legacy of ‘official’ interpretations, following the decline of the Second International and in the midst of the consolidation of the Third International. It emerged when a number of European philosophers who had studied Hegelian philosophy, either through sustained direct engagement or through the work of interpretative mediators, found their way toward Marx and the Communist parties of their own countries. Arriving at Marx and the Communist movement in this way, they came with an awareness of the motifs of the end that ran through Hegel’s body of work: the end of religion, the end of ethical life, the end of art and the end of philosophy itself in absolute knowledge and its realisation in the state (Rose, 1995). Of this grouping of dissident Marxist communists, the most prominent figures were Henri Lefebvre, Karl Korsch, Antonio Gramsci and György Lukács.

In each case these thinkers would reintegrate the full scope of the philosophical perspectives and ambitions of the Hegelian project into their readings of Marx to get to the root of what distinguished his philosophical intervention and in

particular the nature of his injunction to end or realise philosophy. In this sense they brought interpretative perspectives to the Marxian corpus that had formed around the discontinuity of the motif of the end of philosophy in Marx's writing. Their inquiry was pitched against unreflective understandings of Marx which papered over these ambiguities, and, in that regard, the way philosophy had been 'shoved unceremoniously aside'.¹²

These figures of the so-called Western Marxist¹³ camp explicitly contested the orthodoxy according to the framework of the end of philosophy problematic. Karl Korsch, in his 1923 *Marxism and Philosophy* (Korsch, 2013), was among the first Marxist thinkers to launch a polemic against the philosophical incoherence of the orthodoxy according to the conceptual framework of the end of philosophy. There and in his addendum to the text, 'The Present State of the Problem of 'Marxism and Philosophy' (1930), Korsch described the interpretative norms that had hardened around the question of philosophy in Marxism within and outside the Second International. These norms, which had distinct theoretical constituencies – mainly of the neo-Kantian and neo-Hegelian variety (Sheehan, 2017) – corresponded to a front that had formed around the question of the specificity of Marx's philosophy, resulting in the end, as in the terminus point, of philosophical development. He counselled against the pervasive philosophical eclecticism then characterising the Second International:

Any thorough elucidation of the relationship between 'Marxism and philosophy' must start from the unambiguous statements of Marx and Engels themselves that a necessary result of their dialectical-materialist standpoint was the supersession, not only of bourgeois idealist philosophy, but *simultaneously* of all philosophy *as such*. (Korsch, 2013: 49)

In Korsch's view, the lack of attention paid to these statements reflected the continued hold of bourgeois conceptions of philosophy over the intended practical purchase of Marx's philosophical intervention. Such conceptions obscured from view the central problems for Marxist philosophy:

The problem is ... how we should understand the abolition of philosophy of which Marx and Engels spoke – mainly in the 1840s, but on many later occasions as well. *How* should this process be accomplished, or has it already been accomplished ... Should this abolition of philosophy be regarded as accomplished so to speak once and for all by a single intellectual deed of Marx and Engels? Should it be regarded as accomplished only for Marxists, or for the whole proletariat, or for the whole of humanity ... what is the relationship of Marxism to philosophy so long as this arduous process has not yet attained its final goal, the abolition of philosophy? (Korsch, 2013: 51–2)

In Korsch's view, the philosophical inertia that had led to a revival of pre-Marxist philosophical positions to supplement a Marxist position in politics was a reflection and a reinforcement of the limits reached in the course of the concrete historical development of bourgeois society. He argued that most of the major thinkers associated with the Second International resolved that philosophical questions were unimportant in view of the new historical reality facing the

Second International – a situation that had both theoretical and political dimensions. Theoretically, the philosophical problematic had been overtaken by natural science. Politically, parties affiliated with Marxist theory were gaining mass support within the working classes, and a new International purified of its non-Marxist elements was on the horizon. In Korsch's view, when the orthodoxy did not uphold this tolerant indifference to philosophical questions, it either accepted that Marxism was a coherent scientific system that surpassed the explanatory power of philosophy as such, that it consisted of a fully fledged philosophical doctrine embracing all philosophical questions or that it was a theoretical discourse that required philosophical supplementation from other metaphysical systems. All these cases represented a general philosophical blockage that had its counterpart in the forestalling of a truly revolutionary social practice.

Following the Marx of the *Critique of Hegel's Philosophy of Right*, Korsch insisted on the necessity of grasping 'philosophies and other ideological systems in theory as realities, and to treat them in practice as such' (Korsch, 2013: 72). This meant neither rejecting ideological systems in favour of pure science or political praxis shorn of theoretical principle, nor reverting to prior bourgeois philosophy systems. Instead, it meant linking philosophical inquiry to the requisites of revolutionary practice, mindful of the fact that practice is itself encumbered by the reality of ideological systems including philosophy. Korsch, therefore, stressed the dialectical relationship between intellectual activity, social consciousness and social practice as part of the total movement of revolutionary practice. From that perspective, Korsch viewed Marx's critique of political economy as a continuation of his critique of ideological realities in the system of bourgeois economics. It was thus aimed at demystifying the specific forms of social consciousness corresponding to bourgeois economics in order to usher in the practical disintegration of its ideological hold over reality.

At roughly the same moment, Lukács had begun to problematise and re-instantiate Marx's realisation thesis in what would become his *History and Class Consciousness*.¹⁴ His book raised deeper questions concerning Marx's relationship with the philosophical tradition, probing the connection between the proletariat, philosophy and its realisation (Feenberg, 2014: 91–121). The result offers a profoundly revised account of the end of philosophy in Marx by linking together insights from Marx's *Critique of Hegel*, the Hegelian conception of totality, contemporaneous theories of reification (namely Weber and Simmel) and an elucidation of the material and social abstractions described in *Capital*. In Lukács' version of the end of philosophy, the discrete reified practices constitutive of the totality of capitalist social relations, and by extension the antinomies of bourgeois philosophy (i.e. the gulf between subject and object, freedom and necessity, value and fact, etc.), were to be overcome in the coincidence of a knowledge of that totality and the praxis of the proletarian class-subject.

These efforts to reckon with the end of philosophy problematic in Marx in the first quarter of the twentieth century would serve as the intellectual sources for

some of the most significant strands of Marxist theory in the following decades. It is well known that Korsch's and Lukács' formulations of the end of philosophy in Marx were central to the diverse theoretical developments that grew out of the Frankfurt School. Lukács' reconfiguration of the realisation thesis was the starting point for Theodor W. Adorno's *Negative Dialectics* (1966),¹⁵ while Korsch's challenge to the evolutionist proclivities of the orthodoxy would inform Walter Benjamin's conceptualisation of a non-linear historical materialism (Löwy, 1995).

LEFEBVRE, ALTHUSSER AND THE END OF PHILOSOPHY

In the formation of this intellectual heritage around the question of the end of philosophy in Marx, the place of French Communist intellectual culture of the interwar period tends to be overlooked in favour of the better-known trajectory of the Frankfurt School. Yet, curiously, the French course has played a considerable role in determining the development of the problem in later debates. Here I will focus specifically on the course that develops out of Lefebvre's role in this theoretical genealogy. I take his part in establishing the problem of the end of philosophy in Marx within the PCF during the Stalin years as foundational to a conceptual lineage that takes on distinct expressions in debates of the 1960s in France. Lefebvre and his collaborator Norbert Guterman played a key role in introducing French readers to many of Marx's early writings and to markedly philosophical versions of Engels and Lenin. In the late 1920s, those revolving around the *Revue Marxiste* (1928–9) received from David Riazanov, the director of the Marx and Engels Institute in Moscow, untranslated versions of the *1844 Manuscripts*, the *Critique of Hegel's Philosophy of Right*, Engels' *On Dialectics* and Lenin's *Philosophical Notebooks* and *On the Significance of Militant Materialism*. From the year of the journal's existence up to the establishment of the Vichy government and the institution of the 'Otto List', which blacklisted a number of Guterman and Lefebvre's books,¹⁶ they translated these texts and provided introductory commentaries deeply informed by their pre-Marxist philosophical interrogations. Lefebvre's interwar intellectual concerns primarily revolved around the idealist philosophy of Schelling and Hegel. He was among the earliest French intellectuals to use German Idealism to challenge the vitalist philosophy of Henri Bergson, which held a dominant position in French academia during the interwar years (Burkhard, 1994). His trajectory toward Marxism out of such philosophical predilections was formed in a context of mounting political sympathy for fascism and nationalism across Europe (Elden, 2004: 67–9). Thus, by the postwar period his interpretation of Marx would substantially part ways from both the Stalinist orthodoxy and the new wave of existentialist Marxism (Poster, 1975). Lefebvre was part of that initial generation of dissident Marxist philosophers who were contemporaneous with the immediate aftermath of the Russian Revolution and witnessed the growth of fascism across

Europe. Like Lukács and Korsch, he played a role in shedding light over unknown dimensions of the Marxian and Marxist corpus and followed Marx's own trajectory through German Idealism before reaching the end of philosophy in Marxism and political militancy. The reality of political activism within the Stalinist party would, however, profoundly alter Lefebvre's understanding of the end of philosophy motif in Marx (Lefebvre, 1959: 33–7).

I will not dwell on the philological significance of Lefebvre's formative engagements with Marx and Hegel from the interwar years. Rather, I want to explore another overlooked period of Lefebvre's intellectual trajectory – a moment when the legacy of the end of philosophy motif had acquired renewed relevance in the French context. It is at this juncture, in the 1950s, that the question of the relationship of philosophy to Marx would be significantly inflected by the prevailing conditions of both Marxist intellectual culture and academic philosophical debate in France.

The field of French Marxist debate saw two important publications in 1955. The first of these was Maurice Merleau-Ponty's *Adventures of the Dialectic*. This book brought attention to the interpretative centrality of the end of philosophy motif in reading Marx. Merleau-Ponty cast the legacies of Korsch and Lukács, which had been repressed in the Stalinist years, as the prelude to his own effort to definitively establish the philosophical status of Marxism against the anti-philosophical bent of the PCF and the existential Marxism and 'ultra-Bolshevism' of Jean-Paul Sartre. Following Andrei Zhdanov's cultural policy in the Soviet context, the PCF's spokesman on intellectuals Laurent Casanova developed a campaign in the late 1940s to minimise the initiative of intellectuals and their independence in relation to the party and its theoretical orientations (Caute, 1964). The emergence of the party journal *La Nouvelle Critique (NC)* in 1948 coincided with the PCF's embrace of Zhdanovist cultural policy. For the first seven years of its existence, the journal was the most dogmatic adherent to Soviet theoretical prescriptions among the party reviews. The writers of *NC* took up the gauntlet thrown down by Zhdanov to form a 'philosophical front' (Zhdanov, 1950: 103). On the release of *Adventures of the Dialectic*, the PCF held a conference in which a number of *NC*'s most prominent intellectuals, including Lefebvre, issued ideological rebukes against the text. The publication of the transcript of the conference included a letter written by Lukács in which he distanced himself from *History and Class Consciousness (HaCC)* and by extension the aims of Merleau-Ponty in reinstating the urgency of its inquiries (Garaudy et al., 1956).

The second important publication was Lenin's *Philosophical Notebooks*, published in full by the PCF's publishing house, Éditions Sociales (Lenin, 1955). This was the first French translation of all the notebooks after Lefebvre and Guterman's publication of the notebooks on Hegel (Lenin, 1938). A lot was at stake for the PCF in maintaining the image of a particular type of philosophical Lenin in the 1950s, especially one untainted by Hegelian residues. The reception of Lenin's *Philosophical Notebooks* was very much shaped by this historical context.

Within this context, Lefebvre took up a position that skirted the various debates and fronts that were forming around the publication of Lenin's notebooks and Merleau-Ponty's *Adventures*. Lefebvre's somewhat tendentious manoeuvre in these debates was both to contest Merleau-Ponty's effort to re-establish Marxism as a philosophy, and to avoid rehearsing Lenin's reflection theory as was the common recourse of PCF intellectuals in their dealing with counter-theorisations of subjectivity. Lefebvre did this by advancing Lenin's commentary on Hegel. In a lecture entitled 'The Philosopher and His Time', delivered at the Hungarian Institute in Paris in June 1955 to mark Lukács' 70th birthday, Lefebvre dwelt upon the attention the Hungarian philosopher's 1922 book had gained in contemporaneous French debates (Lefebvre and Tort, 1985). He argued that a philosophical alliance had formed across the ideological fronts represented respectively by 'the team of young Marxists' of *NC* and by Merleau-Ponty, precisely around their shared adherence to the young Lukács' interpretation of the realisation thesis in Marx. Merleau-Ponty praised the way *HaCC* enriched the philosophical dimensions of Marxism but lamented the fact that Lukács had been subsequently forced to accept 'the lessons of philosophical Leninism' (Merleau-Ponty, 1974: 68), which had become a philosophy of conformity. The unity between these two antagonists, one defending Marxism as a philosophy in its explicit fidelity to the young Lukács and the other representing Marxism as a political ideology in its explicit rejection of young Lukács, was forged in what Lefebvre saw as their shared understanding of the nexus between consciousness, the proletariat and the realisation of philosophy. For Lefebvre, the assumption in *HaCC* that the consciousness of the proletariat had a privileged historical character, grounded in its identity with an absolute knowledge of the historical process, ultimately aligned with the notion of a proletarian science which had been adopted by the writers of *NC*. The idea of a proletarian science had its basis in the assumption that because scientific knowledge was the product of a society divided into classes, science itself, at the level of the concept, carried a class character. Only a science based on the universal subject could challenge its ideological instrumentalisation by a dominant class and move scientific knowledge toward objectivity (Lecourt, 1977). This, as far as Lefebvre was concerned, was the argument from *HaCC* heralded by Merleau-Ponty against the Stalinist orthodoxy. The ideological fault lines dividing the two fronts obscured the philosophical consonance that had been reached in their conflation of the consciousness of the proletariat and an absolute (or objective scientific) knowledge of the historical processes. For Lefebvre, if the proletariat had already become the bearer of the destiny of philosophy by dint of the general form that consciousness takes in the process of proletarianisation, then the coincidence of the subject and the object of the revolution must necessarily have already taken place.

In the same year, Lefebvre restaged this critique in a debate with Roger Garaudy (Garaudy and Lefebvre, 1955), who had condemned Lefebvre's dalliances with the 'bourgeois' sociologist Georges Gurvitch, who himself had explicitly

criticised *HaCC* on the basis that it dealt ‘with a philosophy and even more precisely with a metaphysics of the proletarian class’ (Lefebvre and Tort, 1985: 29).¹⁷ The outcome of this debate was Lefebvre’s insistence that theoretical research must remain autonomous from the ideological priorities of the party, citing Lenin of the *Philosophical Notebooks* in his defence. For Lefebvre, it was necessary to push beyond rigid conceptual abstractions that had been gleaned from Marx and that the party had uncritically consecrated, especially class and proletariat. The responsibility of the intellectual was not, as Garaudy had suggested, to lean uncritically on Marxian categories and presume a systematic understanding of a capitalist mode of production that would reveal a logic of the proletariat. Rather, it was incumbent upon Marxist intellectuals to historicise critically such eternalised categories – to disclose the historically specific hierarchy of relations that constituted the totality of class domination and in doing so come to an enriched understanding of the conditions for revolutionary alliances and actions.

In the following year, Lefebvre would draft his definitive statement on Lenin’s philosophy, *Pour Connaître la Pensée de Lénine* (1957) – a text that would crystallise his own effort to establish a philosophical Lenin against the orthodoxy but also lay the foundations of his own re-interpretation of the end of philosophy in Marx. In the text, Lefebvre made the case that all of Lenin’s economic writings from the late 1890s onward were based on a consistent methodological principle. The common thread of Lenin’s empirical research was that he treated his own socio-economic formation as a concrete living whole not reducible to a pre-existing formal model. This made Lenin’s analyses open-ended so as to be able to critically disclose the conjunctural specificity of Marxian categories. Crucially, such examinations were sensitive to those intermediary vestiges of pre-capitalist modes of production that ostensibly fell outside the capitalist mode of production understood as a self-contained and totalising system. But it was from Lenin’s philosophical writings, namely his writings on Hegel’s *Logic* in his *Philosophical Notebooks* (1914–16), that Lefebvre extracted a philosophical elucidation of the theory of knowledge that underpinned Lenin’s methodology. There, in his ‘materialist’ commentary on Hegel, Lenin laid out the ‘methodology and logic that Marx did not have time to elaborate’ (Lefebvre, 1957: 186) but which appeared in embryonic form in the 1857 Introduction to the *Grundrisse*. Lefebvre gleaned from Lenin’s scattered notes a formulation of Marx’s theory of knowledge that represented the fundamental gesture in the latter’s prolonged struggle to overcome classical German philosophy: the imperative for an ongoing radical critique of the absolute knowledge claims of philosophy in all its variants. In his own context, Marx carried out this radical critique within the domain of political economy. For Lefebvre, therefore, the end of philosophy for Marx neither involved building a new philosophy to take the place of all that had gone before, nor denying philosophy as such in the presupposition of the constitution and inclination of the proletariat. Rather, it entailed an unending critical exposure of philosophical conceptions to their non-philosophical outside, confronting a

systematic and absolutising thought with those elements that were in excess of its formal logic. It was according to this theoretical principle that Lenin had 'de-systematised' Marx's formal account of capitalism in *Capital* in his economic analyses of Russia at the turn of the century.

In same year that Lefebvre published his Lenin book, he was excluded from *NC* along with three other members of the editorial board. The fallout of this upheaval was that in the space of two years (1958–59), the editorial board of the journal was almost completely overhauled. It was in this context that Althusser rose to prominence within the party and beyond. With a series of articles published in *NC* and the party's other major intellectual journal, *La Pensée : revue du rationalisme moderne* (1939), Althusser would radically alter traditions of understanding that had been brought to bear upon the question of philosophy in Marx. Principally, he would depart from those who had been too much prejudiced by Stalin's profanation of Marxist philosophy to take up the task of constructing a philosophy in the name of Marx. In Althusser's view, anti-systematic reflexes such as Lefebvre's were understandable in view of Stalin's use of Marxist philosophy to justify state repression. But the ideological struggle internal to the intellectual arm of the PCF had set in motion a litany of theoretical paradigms that, though critical of Stalinism, would ultimately muddy the distinction between Marxist philosophy and the philosophy of his predecessors. In the early 1960s, this theoretical inheritance showed itself most vividly, in Althusser's view, in the wave of Marxists content to bury Marx within a problematic that he had broken from more than a century before: philosophical humanism.

Althusser's 1965 introduction to *For Marx* would explicitly clarify that the articles included in the text had been concertedly aimed at radically transforming the prism through which the Marxian injunction to put an end to philosophy had previously been understood. Indeed, in the introduction Althusser would trace the roots of his own theoretical interventions to the various failed attempts in the French context to carry out the abolition of philosophy in Marx's name. In this sense, Althusser's intellectual ambitions of the mid 1960s had been directly shaped by the theoretical preoccupations of his immediate predecessors within the intellectual arm of the party. Lefebvre's radical critique was acknowledged among the various interpretations that Althusser condemned as part of a necessary phase of anti-dogmatism. It was an interpretation that assumed the death of philosophy in the form of the 'evanescent' life of philosophical negation (Althusser, 2005: 29).

In a pivotal passage in his introduction, Althusser claimed that his own bid to substantiate Marxist philosophy had been occasioned by the withering of the constrictive conditions that had so severely muffled the question of philosophy within the party for so many years – here the reference was explicitly to the dogmatism of proletarian science. Pitched against this impetus, Althusser linked the theoretical demand he was aiming to address with the previously repressed legacies of the young Lukács and Korsch. By then their names had lost their role as markers of ideological partisanship:¹⁸

The end of dogmatism puts us face to face with this reality: that Marxist philosophy ... has still largely to be constituted ... that the theoretical difficulties we debated in the dogmatist night were not completely artificial – rather they were largely the result of a meagrely elaborated Marxist philosophy; or better, that in the rigid caricatural forms we suffered or maintained, including the theoretical monstrosity of the two sciences, something of an unsettled problem was really present in grotesque and blind forms – the writings of theoretical Leftism (the young Lukács and Korsch) which have recently been re-published are a sufficient witness to this; and finally, that our lot and our duty today is quite simply to pose and confront these problems in the light of day, if Marxist philosophy is to acquire some real existence or achieve a little theoretical consistency. (Althusser, 2005: 30–1)

Contrary to those intellectual histories that would counterpose Althusser's enterprise to a generic legacy of Marxist humanism (Poster, 1975), the legacy of the end of philosophy in Marx binds Althusser's contributions to another lineage of Marxist theory. This intellectual genealogy is one that comes together around an insistent concern for the question of the relation of philosophy and revolutionary politics in Marx. In this light, Althusser's self-described 'theoreticist deviations' (Althusser, 1976: 105) of the mid 1960s can be seen less as the apologia for party bureaucracy and Marxist-Leninist orthodoxy that they would come to be regarded as (Rancière, 2011). Rather, they can be understood as an effort to recharge the stakes of a repressed legacy specifically around the question concerning the end of philosophy in Marx.

A THOUSAND MARXISMS

Among the 'thousand Marxisms' (Tosel, 2009: 82) that would flourish following the decline of orthodox Althusserianism and actually existing socialism, many thinkers influenced by his problematic would continue to pursue the question of philosophy in Marx (Labica, 1980; Sève, 1980; Garo, 2000; Derrida, 2006; Badiou, 2009; Bensaïd, 2009; Balibar, 2014). But where the exigency motivating Althusser's new response to the end of philosophy in Marx was the decline of Stalinism, contemporary efforts to formulate a response have been forced to reckon with a new reality: the withdrawal of the organisational structures that had previously guaranteed the efficacy of Marx's philosophy. What becomes an 'improbable philosophy' for Etienne Balibar, precisely because it must 'be out of step with any institution' (Balibar, 2014: 118), becomes for Alain Badiou 'the third era' of the existence of the Idea of communism distinguished above all by the fact that the 'party-form, like that of the socialist State, is no longer suitable for providing real support' (Douzinas and Žižek, 2010: 13), while for Jacques Derrida the continued interpellative address of the end of philosophy injunction in Marx after the putative 'death of Marxism' brings into relief the undialectisable anachronism of a truly self-negating philosophy (Derrida, 2006).

Responses to this impasse have varied. Derrida insists on a necessary negotiation with the political-philosophical nexus in Marx's thought. This would

begin, he argues, with a reconfiguration of the structure determining the relation between politics and philosophy in order once again to respond to the end of philosophy injunction in Marx (Derrida, 2006). Others, like Judith Balso, advocate abandoning the Althusserian-Leninist legacy altogether, urging the complete dis-articulation of philosophy from politics. The aspiration here is to give back theoretical autonomy to particularised political struggles against the universal reach of philosophical thought (Douzinas and Žižek, 2010: 15–32). Badiou, on the other hand, proposes a response to the end of philosophy that substitutes the end for ‘the watchword: “one more step”’. Or that of Beckett’s *Unnameable*: “you must go on”’ (Badiou, 2011: 67). Or, again, ‘the end of this End’ (Badiou, 1999: 121; Toscano, 2000) of philosophy. Yet, in view of what Bensaïd calls his ‘axiomatics of resistance’ (Hallward, 2004: 105), Badiou’s neo-Pascalian wager on the aleatory event – a well-subscribed current attributable to posthumous excavations of late Althusser (Althusser, 2006) – converts the injunction in Marx into a militant *attentisme* beyond all calculation. The other face of this distance-taking from institutionality is the ‘new revisionism’ that emerged out of yet another periodisation associated with Althusser – the post-revolutionary ‘crisis of Marxism’ (Althusser, 1979) – that would bear the name Post-Marxism (Kouvelakis, 2021: 5). Chantal Mouffe and Ernesto Laclau’s rehabilitation of liberal democracy as the ultimate horizon for universal emancipation (Laclau and Mouffe, 1985) becomes, in Stathis Kouvelakis’ estimation, an expression of ‘a substantial part of the “objective Spirit”, to quote Hegel’s term, of the historical moment marked by the defeat of the revolutions of the 20th century’ (Kouvelakis, 2021: 11). On that basis, and in response to what Perry Anderson had already diagnosed as a ‘poverty of strategy’ (Anderson, 1983: 28) in the hasty capitulations of late Western Marxism, and what Bensaïd detected as ‘the eclipse of strategic reason’ (Bensaïd, 2007: 44) in the Marxisant renewals that followed, Isabelle Garo opts for a return to the strategic in her re-reading of Marx. This conjunctural rebuttal to both Post-Marxist revisionism and post-Althusserian *attentisme* aims to re-establish the organic link between theory and practice around the priority of inventing concrete means of conquering power and the conceptual mediations necessary to avoid the reversal of those means into ends (Garo, 2019).

With the critique, disgrace and forgetting of Althusser, and the more recent reconstruction of a subterranean Althusser against an orthodox Althusserianism, the longer trajectory of the end of philosophy problematic has receded into the distance. The value of recounting this pre-history today is to show that Marxist thought and practice has always had a deeply uneasy relationship with the project of philosophical self-clarification and an even more unstable relationship with its intended philosophical self-negation. Yet the motif of the end of philosophy in the Marxian corpus has consistently served as a pivotal site for radicalising interpretations of the status of philosophy in Marx and revolutionary practice. It thus remains an important place for us to return in our efforts to understand the relationship between Marx, Marxism and philosophy.

Notes

- 1 Althusser imported both terms into the Marxist idiom from contemporaneous non-Marxist theories. The *problematic* was taken from Jacques Monod and the *epistemological break* was taken from Gaston Bachelard.
- 2 The philosophical questions to which this end of philosophy was a response were prefigured as far back as Marx's 1841 dissertation thesis, *The Difference between the Democritean and Epicurean Philosophy of Nature*. For a full account of Marx's broader trajectory toward this point, see Kouvelakis (2018: 238–332).
- 3 Lucio Colletti shows that, beginning in his *Critique*, Marx specifies not only that Hegel's philosophy was 'upside-down' by making mind primary, but that abstractions had taken root within the concrete reality that Hegel's philosophy attempted to reflect (Marx, 1975: 32–3). Marx's notion of 'real abstraction' has gained attention in recent years (Lange, Chapter 32, this *Handbook*).
- 4 This quote comes from *Rheinische Zeitung* No. 191, July 10, 1842, Supplement.
- 5 This quote comes from *Critique of Hegel's Philosophy of Right*.
- 6 This is also translated as 'Philosophers have hitherto only interpreted the world in various ways; the point is to change it'.
- 7 For a detailed account, see Carver and Blank (2014).
- 8 This quote is taken from 'Preface to *A Contribution to the Critique of Political Economy*'.
- 9 This quote is taken from 'The Old Preface to *Anti-Dühring: On Dialectics*'.
- 10 Chris Arthur has followed up these late attestations and has attempted to reconstruct Marx's dialectical method in *Capital* via Hegel (Arthur, 2002). Bertell Ollman and Tony Smith use Marx's famous 1858 letter to Engels as the departure point for their collection of recent writings on dialectics in Marx (Ollman and Smith, 2008).
- 11 This quote is taken from 'Marx to Engels in Manchester 16 January 1858'.
- 12 Korsch uses Engels' description of the way Feuerbach treated Hegel to condemn his contemporaries in their dealing with philosophy (Korsch, 2013: 31).
- 13 In his 1930 'The Present State of the Problem of "Marxism and Philosophy – An Anti-Critique"' Korsch draws the distinction between the philosophical unity that had formed across the theoretical representatives of the Marxist Social Democratic Camp (Kautsky and Bernstein found philosophical concordance beyond their seemingly opposed political perspectives) and Russian or Bolshevik Marxism (the theoretical offshoot of Plakhanovian Marxism consecrated by Lenin in *Materialism and Empirio-Criticism*) and the 'works of Lukács, myself and other "Western" Communists which formed an *antagonistic philosophical tendency within the Communist International* itself' (Korsch, 1925: 119).
- 14 From 'Preface (1922)': 'The author of these pages ... believes that today it is of *practical* importance to return in this respect to the traditions of Marx-interpretation founded by Engels (who regarded the "German workers' movement" as the "heir to classical German philosophy")' (Lukács, 1990: xlv).
- 15 'Philosophy, which once seemed obsolete, lives on because the moment to realize it was missed. The summary judgment that it had merely interpreted the world, that resignation in the face of reality had crippled it in itself, becomes a defeatism of reason after the attempt to change the world miscarried' (Adorno, 1973: 3).
- 16 The 'Otto List' was a list of forbidden books drawn up by the Nazi Party in 1940 following their occupation of France. The list included 934 titles by 706 authors, and included works by Jewish writers, Communist writers and anti-German books. Certain publishing houses, including Gallimard and Fayard, were hit very hard by these repressive measures (Blakesley, 2019).
- 17 Citation in Lefebvre taken from Gurvitch's *Le concept des classes sociales de Marx à nos jours* (1954).
- 18 Greek philosopher Kostas Axelos was central in introducing the work of both Lukács and Korsch to the French canon. The first French translation of *HaCC* appeared in 1960. It was prefaced and translated by Axelos in the *Arguments* series, a publishing spin-off of the journal of the same name, with which Lefebvre was closely associated (Lukács, 1960). Korsch's *Marxism and Philosophy* was published for the first time in France a year before *For Marx*. The text was also part of the *Arguments* series and prefaced by Axelos (Korsch, 1964).

Technoscience

Les Levidow and Luigi Pellizzoni

INTRODUCTION

Science and technology have been contentious topics for Marxism. Since at least the early twentieth century the dominant approach has sought authority through positivist claims for objective scientific knowledge. It has also seen science and technology as progressive ‘forces of production’ which must be freed from capitalist social relations in order to build socialism. Such perspectives spanned the political divide between the Second and Third Internationals. Dissent came from other Marxists, whose critiques were further extended and deepened from the 1960s onwards.

This chapter explores, first, how Marxist method relates to positivist science, whose claims for scientific objectivity imply or presume a knower separable from its object of study; and, second, how it understands the forces and relations of production, their interlinkages, historical changes and their potential forms beyond capitalism. To highlight relationships between science and technology, this chapter uses the term ‘technoscience’, which had a long history before becoming prominent in the academic field of science and technology studies. In the superficial sense, technoscience can mean reliance on science for solving technical problems and, conversely, reliance on techniques to answer scientific questions. More profoundly, ‘technoscience’ identifies how problems are framed through a mutual shaping process. Scientific knowledge always depends

on a technological-institutional infrastructure. Conversely, technology denotes an apparatus structuring human labour and extending its powers by drawing on specific cognitive perspectives.

Given the divergent Marxist perspectives, no overview could be politically neutral. Ours emphasises alternatives to scientific forms of Marxism. In general the epithet 'scientism' identifies agendas for extending the methods of biophysical science beyond their appropriate remit to socio-political issues. More fundamentally, the concept helps to identify tacit socio-political assumptions within science, contrary to its pretensions of objectivity.

Along those lines, the first section introduces Marx's critical method. Subsequent sections compare divergent Marxist approaches to technoscience in the twentieth century. The penultimate section surveys more recent perspectives and their various relationships with Marxist approaches. The conclusion identifies trans-historical overlaps and recapitulations, some of them perhaps unwitting. Given the limitations of space and the authors' knowledge, the survey includes perspectives from just a few countries (the Soviet Union, the USA, the UK and Italy). An analogous survey is needed for the global South, especially in terms of foregrounding decolonial perspectives (e.g. Harding, 2016).

MARX'S METHOD AS DEREIFICATION

For both the issues outlined above, Marx's method dereifies those capitalist categories that otherwise naturalise historically specific relations of production. His method contested stereotypical binaries – between humans and nature, knowledge and materiality, appearance and essence, etc. – by identifying their inner links.

Marx's Method as Social Abstraction

Marx understood science in several different senses – as a historically progressive force against superstition, as well as in terms of his own critique of an opaque capitalist reality: 'All science would be superfluous if the outward appearance of things and the essence of things directly coincided' (Marx, 1966: 817). But he warned: 'There is no royal road to science, and only those who do not dread the fatiguing climb of its steep paths have a chance of gaining its luminous summits' (Marx, 1976 [1867]: 104). At the metaphorical summit, abstractions are understood as historically specific: 'even the *most abstract categories* ... are the product of historic relations, and possess their full validity only for and within these relations' (Marx, 1973 [1861]: 105, emphasis added).

Marx's method was later theorised as 'social abstraction'. By abstracting from diverse social processes, it identifies pervasive features of capitalism, e.g. the value form, the commodity, labour power as a contradictory commodity, etc.

For Marx, ‘the natural laws of capitalist production’ were always contingent on forms of class struggle, in turn generating counter-tendencies (Kellner, 1983: 42). Such a critical science contests the positivist methods of the natural sciences. The latter have objectified biophysical materiality, facilitating capitalism’s appropriation of Nature, portrayed as external to social relations (Moore, 2015). According to Marx’s concept of ‘historical nature’, the “‘unity of man with nature” has always existed in industry and has existed in varying forms in every epoch’ (Marx and Engels, 1978: 62–63). Through social abstraction, Marx identified inner links between appearance and essence, rather than presuming their separation. In order to analyse the commodity as a specifically capitalist form, Marx noted, ‘neither microscopes nor chemical reagents are of assistance; the power of abstraction must replace both’ (Marx, 1976 [1867]: 89).

For a key example of Marx’s critical science, we can turn to the ‘The Fetishism of Commodities and Its Secret’ as elaborated in the first volume of *Capital*. What was the secret? Commodity fetishism has been widely understood as misrepresenting or misperceiving reality (e.g. Wikipedia, 2016, as a high-profile example). By distinguishing a false appearance from its essence, this binary supposedly exemplifies how Marx’s science exposes capitalist ideology. On the contrary:

[t]he commodity reflects the social characteristics of men’s own labour as objective characteristics of the products of labour themselves, as the socio-natural properties of these things ... I call this the fetishism which attaches itself to the products of labour as soon as they are produced as commodities. (Marx, 1976 [1867]: 166)

In other words, those human characteristics really do take the form of material properties. Likewise relations between people are reified as relations between things:

To the producers, therefore, the social relations between their private labours *appear as what they are*, i.e. they do not appear as direct social relations between persons in their work, but rather as material relations between persons and social relations between things. (Marx, 1976 [1867]: 164–66, emphasis in original)

The basic secret is that fetishism and reification express real social relations.

By analogy with commodity fetishism, Darwin’s new theory fetishised capitalist social relations as natural properties:

Darwin recognises among beasts and plants his English society with its division of labour, competition, opening up of new markets ... Darwin did not know what a bitter satire he wrote on mankind, and especially on his countrymen, when he showed that free competition, the struggle for existence, which the economists celebrate as the highest historical achievement, is the normal state of the animal kingdom. (Marx, 1862: 156–7)

As this illustrates, Marx’s method dereified apparently natural categories, in this instance those generated by a historically conditioned anthropomorphic projection.

Relations Constituting the Forces of Production

Fetishised and reified capitalist relations depend on subordinating human labour to wage-labour discipline as the basis of capital accumulation. Fixed capital structures the process, in ways dependent on a collective social intelligence:

The development of fixed capital indicates to what degree general social knowledge has become a *direct force of production*, and to what degree, hence, the conditions of the process of social life itself have come under the control of the general intellect and been transformed in accordance with it. (Marx, 1973 [1861]: 706)

According to Marx's definition of machines, they displace and/or discipline labour: 'The machine ... is a mechanism that, after being set in motion, performs with its tools the same operations as the worker formerly did with similar tools' (Marx, 1976 [1867]: 495). As fixed capital, machines 'confront the individual workers as alien, objective, ready-made' (Marx, 1969 [1863]). Through capitalist machinery, the forces of nature and science 'become separated from the skill and knowledge of the individual worker'. Labour is capitalised: 'the *social* characteristics of their labour come to confront the workers, so to speak, in a *capitalised* form; thus machinery is an instance of the way in which the visible products of labour take on the appearance of its masters' (Marx, 1976 [1867]: 1055, emphasis in original). Again, as with commodity fetishism, the 'appearance' is no illusion or misperception but is rather constituted by human powers fetishised in practice as properties of fixed capital.

Early on, Marx identified tensions between the forces and relations of production:

At a certain stage of development, the material productive forces of society come into conflict with the existing relations of production or – this merely expresses the same thing in legal terms – with the property relations within the framework of which they have operated hitherto. From forms of development of the productive forces these relations turn into their fetters. (Marx, 1977 [1859])

As a prevalent interpretation, the productive forces therefore must be freed from external fetters of capitalist property relations. As a different interpretation, those forces have been internally constituted in exploitative ways by capitalist property relations. As Marx observed in *Capital*:

It would be possible to write a whole history of the inventions made since 1830 for the sole purpose of providing capital with weapons against working-class revolt. We would mention, above all, the self-acting mule, because it opened up a new epoch in the automatic system. (Marx, 1976 [1867]: 563)

In that sense, Marx's critical science identified inner links between the relations and forces of production, likewise between reality and appearance, as a means to dereify them. In the following section let us explore tensions between divergent approaches in twentieth-century Marxism.

SCIENTISTIC VERSUS CRITICAL MARXISM

Marx understood bourgeois science as fetishising human powers and reifying social relations, yet its positivist methods were later adopted as a basis for official Marxism. This enduring legacy features a tension between scientific versus critical Marxism (Gouldner, 1980). In the early twentieth century the former was often called 'orthodox Marxism', a misnomer encompassing diverse approaches. Since the 1970s, many critics have cited this legacy as 'scientistic Marxism', i.e. as imitating the methods of the natural sciences. In particular, the 'laws of the dialectic' were given an ontological status as the most general laws of nature, in turn the basis for a socialist society (Engels, 1973 [1883], 1959 [1878]). Science now encompassed history and culture; this scientism united Plekhanov and Kautsky, prominent figures of the Second International (Arato, 1973). In Britain the founders of Fabianism likewise elaborated versions of evolutionary scientism (Lichtheim, 1961).

The Third International's Marxism initially diverged from those evolutionary models. The Soviet government sought to appropriate science and technology for a post-capitalist planned society. For a country that was only 5% electrified, Lenin popularised large-scale industrialisation with the slogan, 'Communism equals Soviet power plus electrification'. Rather than fetishise technology as a social agent, this agenda sought to modernise the territory under Soviet control, while also transferring political bargaining-power to the engineers in the GOELRO electrification project (Coopersmith, 1992). The Soviet government established a new body in charge of education and research, named the *Kommissariat Prosveshcheniya*, the Commissariat of Enlightenment. As its chief, Anatoly Lunacharsky sought to devise a secular belief system to undermine the Russian Orthodox Church (Fitzpatrick, 1970). In these various ways, technoscience was strategically linked with a new power base for post-capitalist social relations.

While Engels had briefly referred to 'the materialist dialectic', the new concept 'dialectical materialism' was given prominence by later Marxists (e.g. Lenin, 1972 [1908]). According to Lukács (1971 [1923]), this concept meant 'the class consciousness of the proletariat', rather than science, which in his early work he associated with the commodification and technical control of the world. Yet Stalin (1938) and his acolytes formalised a scientistic version that became known as *diamat* for short. According to Stalin's book on *Leninism*, the Bolsheviks must become technical specialists because during the reconstruction period 'technique decides everything' (cited in Werskey, 1978: 182).

In Britain science was accorded a special role by a prominent scientist and Communist Party member, J. D. Bernal. As he acknowledged, science and technology had played oppressive roles, but their potentially beneficial application was being limited by the social relations of production, i.e. private-property forms. So, knowledge must be freed from those constraints, namely by following the scientific method:

Already we have in the practice of science the prototype for all human common action. The task which the scientists have undertaken – the understanding and control of nature and of man himself – is merely the conscious expression of the task of human society. The methods by which this task is attempted, however imperfectly they are realized, are the methods by which humanity is most likely to secure its own future. In its endeavour, science is communism. (Bernal, 1939: 414)

Amid a general Marxist shift towards scientism, Bernal's version was unusually idealist. Why? By contrast with other major countries, Britain had a relatively quiescent working class after the defeat of the 1926 General Strike, so some Marxists sought a substitute force. There science became reified as 'a quasi-human activity endowed with extraordinary capacities' (Werskey, 1978: 187). This ultra-idealist version of *diamat* was popularised by the Communist Party of Great Britain and more widely. Those scientific approaches provoked dissent from prominent Communists.

Writing in euphemisms, from Mussolini's prisons, Gramsci lamented that the 'so-called exact or physical sciences' had 'come to acquire, within the philosophy of praxis [Marxism] a position of near-fetishism, in which indeed they are regarded as the only true philosophy or knowledge of the world'. Contrary to such fetishism, 'it is not atomic theory that explains human history but the other way around'; in other words, 'all scientific hypotheses are superstructures' (Gramsci, 1971 [1930]: 442, 468; cf. 'even the *most abstract categories*', Marx, 1973 [1861] : 105, emphasis added). In the same period, Gramsci critically analysed 'Americanism and Fordism'. Mass-production of low-cost motorcars was being planned as a new socio-industrial model, whereby workers' everyday habits were regulated to ensure high productivity and thus justify their high wages. Ambivalently analysing Fordism as a 'rational organisation of production', he posed questions about why this model first arose in the USA, as well as how it might be generalised beyond the motorcar sector and that country (Gramsci, 1971 [1930]: 558ff). As he recognised, an assembly-line system could be designed for different relations of production.

A Communist member of the Reichstag, Karl Korsch, criticised the Third International leadership for vulgarising Marxism. His book *Marxism and Philosophy* (Korsch, 1971 [1923]) was condemned by Karl Kautsky and Grigory Zinoviev, among others. He emphasised that Marx had treated all categories in the specific connection 'in which they appear in modern bourgeois society; he does not treat them as eternal categories' (Korsch, 1938: 29). Unlike Marx, dominant theorists used methods of positivist science to identify evolutionary change, thus weakening Communists' revolutionary capacities (Korsch, 1971 [1923]).

Critiques of *diamat* also came from the Frankfurt School, the *Institut für Sozialforschung* (Institute for Social Research), established in Frankfurt in 1923. This circle drew on critiques from György Lukács: 'it is altogether incorrect and unmarxist to separate technique from the other ideological forms and to propose for it a self-sufficiency from the economic structure of society' (Lukács, 1966 [1925]: 29; see also Feenberg, 2014). The Frankfurt School diagnosed the failure of working-class

revolution in Western Europe after the Great War. Through what became known as Critical Theory, they analysed how bourgeois society promotes ruling ideas legitimising capitalist domination. Such analysis could not imitate the positivist approaches of the natural sciences, they argued. Some analysed how technological rationality depoliticised the productive forces: ‘rational, “value-free” technology is the separation of man from the means of production and his subordination to technical efficiency and necessity’ (Marcuse, 1978: 222 [1965]). By explaining more subtle modes of domination, critical theory seeks ‘the emancipation of human beings from the circumstances that enslave them’ (Horkheimer, 1976: 219).

Critical Theory re-evaluated the Enlightenment’s rationality as a basis for mastering fellow humans and nature. Rationality has always entailed a practical tendency towards self-destruction and irrational behaviour. As a specific focus of analysis, new technology facilitates an everyday incorporation into capitalism, blurring the distinction between leisure and work: ‘the technology of the culture industry confines itself to standardization and mass production and sacrifices what once distinguished the logic of work from that of society’ (Horkheimer and Adorno, 1972: 96). This opened up the question of how a different technological design could facilitate an emancipatory anti-capitalist culture.

CRITICAL MARXISM POST-1960S: CAPITALIST RELATIONS RESTRUCTURING THE PRODUCTIVE FORCES

From the 1960s onwards, Marxist writers rediscovered and extended the earlier critiques of *diamat*. Its model linking the productive forces and relations was inverted: not simply an external constraint, capitalist social relations constitute and drive the productive forces in historically specific ways. From the aphorism, ‘Class struggle is the motor of history’, this insight was extended to technoscientific innovation. Although the latter generated new instruments to re-impose wage-labour discipline, these offered opportunities to subvert such control and create alternatives.

Such critical perspectives gained impetus from the 1960s Italian *operaista* (workerist) movement, especially in a context where new factories in northern Italy attracted migrant labour from Southern Italy. The Italian Communist Party celebrated the industrial agenda as ‘the planned development of the productive forces’, welcoming technological-managerial innovations that ultimately subordinated the working class to wage-labour discipline. By contrast, other Marxists carried out workers’ inquiries about capitalist domination in workplaces and everyday life. The journal *Quaderni Rossi* elaborated a critique that provided a theoretical basis for political interventions. In particular, the extra-parliamentary group *Potere Operaio* (Workers’ Power) developed a perspective on the ‘refusal of work’, in opposition to factory discipline and the ‘social factory’ reproducing labour power for capital (Tronti, 1972). Technological-managerial innovation

was analysed as a strategic response to class struggle. Capital accumulation cannot entirely overcome its dependence on labour exploitation as the basis for surplus value. So capitalist strategies disrupt or decompose previous forms of working-class organisation through new organisations, technologies, and techniques. These open up new spaces for struggle whereby the workers' movement can recompose itself and thus regain the initiative (Wright, 2002; Berardi, 2007). According to the *operaisti* (workerists), those dynamics have been driven by the labour-capital relation, linked with capitalism's long waves of innovation.

Along related lines, albeit in the context of a different (Trotskyist) tradition of Marxism, Ernest Mandel analysed epochal shifts in capitalist work-organisation. As he noted, 'each of these revolutions in labor organization, made possible through successive technological revolutions, grew out of conscious attempts by employers to break down the resistance of the working class to further increase the rate of exploitation'. This pattern is illustrated by three examples: the shift to machinofacture, as documented by Marx; the rise of Taylorist scientific management; and the Fordist reorganisation of production (Mandel, 1995: 35). Marx had analysed machinofacture as crucial for turning the formal subsumption of labour into its real subsumption. Now Marxists extended his analysis to technical workers, as the socialisation of labour was subordinating R&D itself to Taylorist norms of production.

In the 1960s and 1970s numerous revolts by technical staff stimulated political debate on their routine capitalist role and revolutionary potential. Some critics identified the division of labour as central to capitalist exploitation, whereby technical workers are both instruments and targets of capitalist work-discipline (Gorz, 1973, 1976). Technoscientific expertise had become indispensable to the task of class domination as much as to the process of valorising wage-labour. In the 1970s, multiple strategic interpretations vied for primacy: technicians had no distinctive attributes, or else they had their own specific struggles to fight against capital (Wright, 2002: 103–4). Given those pervasive class antagonisms, technological rationality was theorised as capitalist domination. Here 'the capitalist social relationship is concealed within the technical demands of machinery', and the division of labour appears as simply inherent in the nature of labour (Panzieri, 1976, 1980). 'Specific purposes and interests ... enter the very construction of the technical apparatus' (Marcuse, 1968: 223). Hence 'technical efficiency' at once enforces and naturalises class subordination.

The physico-natural sciences likewise were understood as naturalising capitalist social relations, especially through anthropomorphic projections onto nature. Science inherently depends on such metaphors. Through specific knowledge-forms, relations between people take the form of relations between things, by analogy with commodity exchange and its fetishised form. As a dynamic social category, moreover, 'nature' has been historically remade along with new techniques linking scientific investigation and capitalist exploitation (RSJ Collective, 1981). Capitalist social relations are reified and depoliticised as merely technical

forces of production. As a counter-strategy, 'It is no longer a question of how to liberate fixed capital from the capitalist social relations which contain and restrict them, but rather of how to liberate the working class' own forces of production from the destructive direction of fixed capital' (RSJ Collective, 1981). Such perspectives undermined claims for scientific objectivity by both the natural sciences and its Marxist imitators.

These anti-scientific perspectives gained force from wider revolts against technoscience-based political agendas. From the 1970s, such revolts were reported and stimulated by the US organisation Scientists and Engineers for Social and Political Action (SESPA), which led to the magazine *Science for the People*, elaborating an increasingly Marxist perspective. In the same period the British Society for Social Responsibility in Science (BSSRS) linked elite scientists with the New Left (Werskey, 2007; King and Levidow, 2016). They campaigned against the corporate and military agendas directing technological development. Some activists sought to promote class solidarity based on a common experience, e.g. 'by attempting to increase the identification of scientists with other members of the working class through the encouragement of unionisation and an understanding of the elitism of science and its increasing proletarianisation' (BSSRS, 1975).

Nuclear power was opposed as a strategy for class domination. As a pamphlet argued, 'the nuclear technical fix' was aiming to achieve political stability against threats of working-class solidarity around other energy sources, especially coal (BSSRS, 1981: 12). More generally, dominant expert knowledge was analysed as 'capitalist science'. This arose from a labour process constituted by capitalist social relations, e.g. a hierarchical division of labour, wage-labour discipline, proprietary knowledge, etc. (RSJ Collective, 1981; Werskey, 2007: 438–9). Marx's critique was extended to another century-and-a-half of inventions, analysed as capitalist strategies for the labour process.

Technologies were being designed to reduce managerial dependence upon living labour, especially by displacing and/or disciplining labour. Through new technologies, deskilling undermined the position of workers whose competences facilitate their relatively high wages or ability to resist capitalist work discipline. But these changes also created the need for new competences on which managers depended (Braverman, 1976). In automating machine tools, there were two main options: record-playback and computer-numeric control. Through the latter option, management gained greater control over the labour process (Noble, 1977, 1979). IT systems were being designed to overcome universities' dependence on skilled academic labour, while also degrading educational quality through the rise of digital diploma mills (Noble, 1998). In such ways, capitalist design codifies, embodies and appropriates specialist skills – not only of shop-floor workers but also those of professional staff and middle managers (e.g. Noble, 1977, 1984; Robins and Webster, 1979).

During the 1970s and 1980s, capitalist restructuring was targeting the spaces with the greatest 'porosity of labour', where workers could control the pace

and quality of work. European social democracy was trying to reconcile greater global competitiveness with class harmony at home, thus undermining its own legitimacy. As described earlier, critical Marxist perspectives helped to identify means to contest and transform capitalist social relations in the labour process (Levidow and Young, 1985: 4; also Levidow and Young, 1981: 5).

Extending labour process studies, feminist perspectives analysed the interplay between class and gender relations in technological change (Wajcman, 2004). For example, when UK male typesetting workers faced deskilling through new technology, their trade union sought to maintain control over the new equipment, thus excluding unskilled women (Cockburn, 1983). As this illustrates, technology is often gendered by its design and/or by workers' responses, in ways linking class exploitation with changes in skills. Marxist-feminist perspectives looked retrospectively at the seventeenth-century European witch-hunts as means to impose capitalist social relations through scientific rationality. In this period, the human body was being reconceptualised through mechanical metaphors; conversely, 'the machine was becoming the model of social behaviour', in a crucial basis of capitalist work discipline. Knowledge-systems sought a general rationalisation of space and time, especially through rational calculation of probable outcomes as the basis for decision-making. A major obstacle was people's widespread reliance on prophecy and magic; the great witch-hunt associated such practices with demon-women as a rationale for persecuting and slaughtering them (Federici, 2004).

In the agricultural labour process, farmers have been separated from the means of production through greater dependence on external inputs, alongside proprietary control over seeds. From the late 1930 onwards, US farmers shifted to hybrid corn seeds on the promise of higher yields, which did materialise. These benefits were more plausibly due to other changes such as better selective breeding, crop rotation, chemical inputs, etc. Yet the higher yields were fetishised as properties of the seeds' hybridity, which pre-empted biological reproducibility. Thus, agricultural technology turned seeds into a commodity, making farmers more dependent on external inputs (Berlan and Lewontin, 1986). In agriculture more generally, capital accumulation has been pursued at three levels: commodification of inputs as 'technology packages' (e.g. hybrid or transgenic seeds, agrichemicals, machinery, etc); capitalist division of breeding labour, and the world economy of germplasm transfer, especially from the South to the North. While hybrid seeds had been designed to eliminate biological reproducibility under farmers' control, from the 1990s GM seeds were deploying patents to further restrict access; and patent-holders were buying up seed companies, thus pre-empting alternatives. The farmer was reduced to a 'propertied under-labourer': cultivation methods were subordinated to input suppliers and commodity traders, by analogy with the mechanisation of craft work (Kloppenborg, 1988). Led by peasants' organisations, global protests against GM crops sought to reclaim and reconstruct a resource commons based on farmers' collective knowledge. This helped to undermine the capitalist social relations designed into agri-input packages.

TECHNOSCIENTIFIC INNOVATION FOR EMANCIPATORY AGENDAS

In the twenty-first century, Marxist debates have again discerned a contradictory potential in technology – as enclosing resource and knowledge commons, while also facilitating communities that can create new commons beyond capitalism. To relate such diverse approaches, we bring some of them together below around two broad issues – how a redesign of productive forces might supersede capitalism, and how both together recast nature for biovalue as a source of capital accumulation.

Technology Intensifying and/or Superseding Capitalism?

For a long time, Marxism has been ambivalent towards ‘labour-saving devices’, most recently since the 1970s towards automation. Saving labour for whom? Of what kind? For whose benefit? The putative common benefits have been belied by technoscientific designs for better exploiting labour, as in the examples above. Capital investment seeks to subsume labour by disciplining or replacing it with machinery, yet workers’ creativity readily overflows such attempts. A different technological design holds the potential to liberate humanity from alienated labour and from dependence on waged-labour (Sclove, 1995).

Since the 1980s the *operaista* legacy has been elaborated by ‘Autonomist’ Marxism in the changing landscape of post-Fordist capitalism. Its various perspectives have sought to identify the contradictory character of capitalist technoscientific development and its labour process. Capital accumulation depends on continuously integrating numerous social sites and activities, from public health and maternity to natural resource allocation and the geographical reorganisation of labour power, far beyond the workplace. New means of communication vital for the smooth flow of capital also permit connections between disparate points of resistance that would be otherwise isolated, beyond waged-labourers alone. Thus new sites can become focal points of subversion (Dyer-Witford, 1999). In post-Fordist capitalism, value is increasingly extracted from immaterial assets, especially the exploitation of workers’ relational, affective and cognitive faculties. Formal subsumption of labour is extended to such faculties. In this ‘cognitive capitalism’, surplus value increasingly depends on intellectual-cognitive labour whose capacities (of learning, cooperation and creation) are formed before and beyond their inclusion in production processes (Gorz, 2003; Moulier Boutang, 2007; Vercellone, 2007).

In neoliberal agendas for a knowledge-based economy, ‘knowledge’ is likewise constituted and subsumed by the drive for capital accumulation. Cultural political economy has analysed ‘economic imaginaries’ – how they are constituted by symbolic-discursive elements, e.g. ideas, values, assumptions, expectations. By promoting specific economic policies and innovation agendas, these imaginaries

drive investment and asset values (Jessop, 2009), especially through proprietary knowledge (Tyfield, 2012). The term ‘cognitive’ emphasises new characteristics of the capital–labour conflict and of the property forms on which capital accumulation rests. ‘Cognitive capitalism’ develops ‘an economy founded on the driving role of knowledge and the figure of the collective worker of the general intellect’. Yet the capital accumulation process cannot fully harness human creativity; this limitation places the ‘creative class’ of intellectual workers at the forefront of resistance and social change, argues Vercellone (2007; Virno, 2008). Indeed, capitalist control over immaterial labour faces limits; new forms of sharing and cooperation through ICTs, from open source to crowdsourcing or digital money, may challenge market relations. Yet those new forms also offer opportunities for new business models for capital accumulation (Brabham, 2013). Moreover, the creative class operates in a context dominated by the increasing precarisation of work, as well as by prescriptive cultural-organisational models of fulfilment, achievement and reward, including performance criteria and client demands (Dardot and Laval, 2014).

In such debates, ‘acceleration’ has denoted a greater organic composition of capital, i.e. a higher ratio of dead/living labour, alongside greater resource burdens. The Great Acceleration was epitomised by the motorcar industry, whose vulnerable dependence on living labour inadvertently facilitated more effective revolt against capitalist machine-discipline. This opened up the prospect of collectively applying technoscientific expertise for emancipatory futures (Nelson and Braun, 2017). In the name of superseding those conflicts, there have been proposals to push automation somehow beyond capitalism. Given the potentially cooperative use of ICTs, a prominent agenda seeks to accelerate automation in order to supersede drudgery and capitalist domination alike. This agenda would accelerate the advances of capitalism towards overcoming ‘its value system, governance structures, and mass pathologies’, which dramatically limit ‘the true transformative potentials of much of our technological and scientific research’ (Williams and Srnicek, 2013: §3.6).

As these proponents acknowledge, ‘power relationships are embedded within technologies, which cannot therefore be infinitely bent towards purposes that oppose their very functioning’ (Srnicek and Williams, 2015: 151). Nevertheless, they expect that accelerating automation would somehow ‘unleash latent productive forces’, alongside a shorter working week and universal basic income (Srnicek and Williams, 2015: 151). This potential future has been called a post-capitalist, ‘post-work world’ (Srnicek and Williams, 2015; popularised by Mason, 2015, 2019).

Among several lacunae, the accelerationist agenda evades ‘the problem of how technological capacities (forces of production) can be *reproduced* without reproducing the class relation (relations of production)’, argues Brown (2016: 168, emphasis in original). Beyond any specific technological design or reform, there remains a fundamental challenge for post-capitalism:

[t]he immaterial process of valorisation requisite for the *reproduction* of the technological process of production ... is inextricable from the way we make things. Advocating social democratic legislation predicated upon the valorisation process (taxes on the rich) or automation subsidies for individual firms merely dodges the real conceptual and historical problem to be grappled with. (Brown, 2016: 169)

Indeed, that everyday valorisation process reproduces capitalist social relations within the productive forces, as well as in the social reproduction of labour for its exploitation. The accelerationist agenda has no answer to the question of ‘how social reproduction is possible after the end of capitalism’ (Brown, 2016: 168). Or put strategically, how an anti-capitalist movement can shift everyday social reproduction towards such a different future.

Accelerationist agendas echo century-old ones for ‘advancing the productive forces’, understood narrowly as technology, in order to turn its capacities against capitalism. Such an agenda is implicit in neo-Marxist notions of law or tendency, whereby capitalism is undermined by its own contradictions. Collective struggle becomes marginal or dispensable: ‘In place of the just society generated through struggle, it is acceleration that becomes the vehicle of disenchanting redemption’, as acerbically noted in the book *Malign Velocities* (Noys, 2014: 9). Indeed, inverting Marx’s critique, accelerationists have fetishised emancipatory powers as properties of more efficient productive forces.

Today’s accelerationist agendas resonate with post-humanist, decentred standpoints, especially by advocating human–machine integration, e.g. new prosthetics or brain–computer interfaces. Under what conditions can such human–machine integration be emancipatory? This prospect is often equated with maximum individual access to technologies, e.g. via markets or state intervention. Yet individual ‘free choice’ assumes and promotes an entrepreneurial, competitive subjectivity (Pellizzoni, 2016a: 39–40); this also pervades non-economic spheres, for example in child–parent relations. While natural genetic variation limits freedom, the rising prospect of ‘genetic projects’ offers parents (and their expert advisers) a capacity to intentionally pre-orient their offspring’s lives, thus affecting the latter’s autonomy and equality (Habermas, 2003). Perhaps taking literally the claims for technoscientific control, post-humanist literature hypostatizes technology as a limitless power to transform the human body and the surrounding world. Some espouse anti-capitalist aims (e.g. Braidotti, 2013), yet without any criteria for distinguishing between hubristic, (self-)exploitative versus humble, (self-)respectful developments. Technology uses for emancipatory prospects are ultimately reduced to personal lifestyle choices, which are easily translated into consumer–market differentiation (Pellizzoni, 2016b).

Neo-Marxist agendas that suppose liberation to originate in the acceleration of capital-intensive production or the mechanisation of the body ultimately blur any distinction between overcoming versus perpetuating capitalism. In so doing, they resonate with broader ‘ecomodernist’ agendas. In particular a neo-liberal think-tank, the Breakthrough Institute, advocates a technology-enabled

ever-intensifying resource/value extraction, dubbed as society's decoupling from natural biophysical systems (Asafu-Adjaye et al., 2015). Although espousing divergent politics, these agendas share the assumption that technoscientific advance can somehow supersede societal conflicts. According to Walter Benjamin (2003), Italian Futurism idealised capitalist 'velocities', expecting that different forces of production could themselves engender a revolutionary rupture. Benjamin counterposed revolution as interruption – an emergency brake applied to the derailing train of history. This warrants 'intervention that not only stops acceleration, but also rethinks production and the very notion of "productive forces"' (Noys, 2014: 92). In this vein, the anti-scientistic Marxist legacy has highlighted technological design incorporating and renewing capitalist relations of production, thus shifting contradictions to a new terrain rather than overcoming them. These contradictions should inform intervention strategies.

Creating Biovalue from Nature and/or Labour?

Since the 1970s technoscientific knowledge has been restructured and enclosed as a potential financial asset. State support was withdrawn from public research universities, which thereby became more dependent on corporate funding (Slaughter and Rhoades, 1997). Universities' mission was shifted away from education towards providing human capital and competitive global service industries, consequently expanding insecure non-tenured and post-doctoral positions. This agenda aggressively promotes and protects intellectual property (Lave et al., 2010). Theorised as neoliberal globalisation (Moore et al., 2011), it was soon extended more widely for a 'new economy' or 'knowledge-based economy' which projects capitalist social relations into productive forces themselves.

From the late 1970s onwards, capital accumulation took a new trajectory through proprietary knowledge constituting the new Life Sciences, ICTs and their combination in the biotech industry (Thacker, 2005). Starting from Marx's distinction between the formal and real subsumption of labour, some critics extended this by analogy to the domain of nature. Nature can be formally subsumed when capital exploits natural resources by adjusting to their own features, e.g. via mineral, oil or coal extraction. By contrast, real subsumption occurs in biological industries when nature is '(re)made to work harder, faster and better' in order to enhance capital accumulation (Boyd et al., 2001: 564). Real subsumption may happen when organisms are redesigned through and for capitalist relations. For example, AquAdvantage salmon is genetically modified to grow faster; the OncoMouse has greater susceptibility to cancer, hence is more useful for cancer research. Human bodies are also increasingly integrated as 'clinical labour' into the production of exchange value, whereby biological material is donated for medical and pharmaceutical purposes. Waged forms of such labour, e.g. from drug experimentation to sperm and oocyte markets, typically entail unequal terms of exchange between poor vendors and wealthy purchasers (Mitchell and Waldby, 2010; Cooper and Waldby, 2014).

However, there is no precise correspondence between the binaries of formal/real subsumption and inorganic/organic natural realms, for at least four reasons. First, the distinction between the two realms is increasingly challenged by technoscientific advances, e.g. in neural networks or epigenetics (Keller, 2011). Second, such a distinction is increasingly blurred by industrial practices, e.g. the use of microorganisms in new mining techniques (Labban, 2014). Third,

[t]oday's real subsumption of nature, while crucially biological, is not entirely so. The real subsumption of nature is also orchestrated through the explosion of intellectual property rights ... ecological credits, mitigation markets and environmental derivatives. (Smith, 2007: 16)

In such examples, formally subsuming nature into capital depends on human cooperative capacities, based on cognitive reasoning and symbolic production. Fourth, the real/formal distinction remains flexible (even ambiguous) in the expanding interest in 'ecosystem services', i.e. the benefits that biophysical systems provide to economic activity. This interest shows the growing relevance for capitalism of 'self-organizing dynamics and regenerative social-ecological capacities outside of the direct production processes' (Nelson, 2014: 462), hence expanding a formal subsumption of organic nature. Transnational corporations increasingly regard ecosystem services as integrated 'green infrastructures', or as based on 'natural capital', both warranting investment as cost-effective assets to accommodate economic and environmental turbulence (Nature Conservancy, 2013; analysed by Nelson, 2014).

In debates on bioeconomy *qua* biocapitalism, there are disagreements about how nature is capitalised. Some perspectives attribute special economic value or powers to biophysical processes. For example, biological activity is equated with economic categories such as exchange value, capital, financial speculation, surplus value, etc. (Rajan, 2006; Cooper, 2008). However, this focus on nature fetishises human-like qualities as properties of biological material. Critics highlight 'the knowledge labour that is both turned into an asset through IPRs and is necessary to turn biological matter into commercial and profitable products' (Birch and Tyfield, 2013: 324). Their critique dereifies biovalue as collective knowledge and capitalist social relations constituting a financial asset. The latter critiques draw upon cultural political economy, thus enriching Marx's critique of political economy. Together the above perspectives help to identify how nature subsumption remains contingent on human capacities, technoscience and capital accumulation strategies.

CONCLUSION

As this chapter shows, Marxist concepts of technoscience have attracted divergent interpretations and appropriations. Marx elaborated 'science' as a critical method for analysing how reification and fetishism naturalise capitalist social relations, especially through stereotypical binaries such as subject/object, appearance/essence, nature/society or productive forces/relations. His method dereified these

through social abstraction, identifying inner links between apparent binaries, as in his concept of ‘historical nature’ (Marx and Engels, 1978: 62–63). Nevertheless prevalent Marxist approaches have adopted or imitated positivist science, presuming a knower separable from its object of study. Marx understood the productive forces as collective knowledge, capacities and artefacts, together shaped by capitalist social relations. Yet such forces were later reduced to technoscientific advance, whose greater efficiency could somehow supersede capitalist relations. Since the 1970s, Marxist debates have replicated earlier tensions between positivist, technodeterminist perspectives versus anti-scientific critiques. Some prevalent neo-Marxist perspectives today likewise extend fetishism and reification rather than critically analyse them. Post-humanist standpoints, despite contesting subject/object distinctions, naturalise human–machine integration. Similarly, accelerationism fetishises post-capitalist social relations as properties of technological change.

Profound changes in both capitalism and technoscience have been dramatically intensifying the exploitation of humans and the biophysical world. Despite the ‘Third Industrial Revolution’ of ICTs and biotech, capitalism has been unable to address its basic problems: a prolonged stagnation, a massive reduction in real wages and social expenditure, and the spiralling expansion of finance and debt (Balakrishnan, 2012). Prevalent neo-Marxist approaches lack the means to address how such problems might open opportunities for revolutionary ‘interruptions’ (Benjamin, 2003). Our historical retrospect helps us evaluate how ‘new’ perspectives may enrich, reproduce, contradict or obscure earlier ones – either consciously or unwittingly. Any emancipatory agenda must recognise the capitalist social relations which have always constituted ‘general social knowledge’ as a productive force (Marx, 1973 [1861]: 706). Such knowledge warrants dereification and transformation, alongside any technoscientific redesign. How to reshape the productive forces beyond the exploitative social relations and Nature subsumption of capitalism? This difficult question remains a challenge for Marxist approaches.

Postcolonial Studies

Jamila M. H. Mascat

Marx remains an immigrant chez nous, a glorious, sacred, accursed but still a clandestine immigrant as he was all his life. He belongs to a time of disjunction, to that 'time out of joint' in which is inaugurated, laboriously, painfully, tragically, a new thinking of borders, a new experience of the house, the home, and the economy. Between earth and sky. One should not rush to make of the clandestine immigrant an illegal alien or, what always risks coming down to the same thing, to domesticate him. To neutralise him through naturalisation. To assimilate him so as to stop frightening oneself (making oneself fear) with him.

Jacques Derrida, *Specters of Marx*, 1994: 174

The sun rises at different times upon the globe today.

Gayatri C. Spivak, 'Postcolonial Theory and the Specter of Capital', 2014: 195

Do Marxism and postcolonial studies 'have something to say to each other', or do the two fields of scholarship necessarily remain caught in irresolvable divergences and contradictions (Bartolovich and Lazarus, 2002: 1)? It is almost impossible consistently to approach such a macroscopic issue without first acknowledging that the wide variety of Marxist trends and postcolonial strands makes it very hard to address it univocally. Yet one can try to answer the question by examining the historical unfolding of the dialogue between the two camps.

This chapter aims to retrace and reflect upon the salient moments of what could be termed, paraphrasing the title of Heidi Hartmann's 1979 famous article, the 'unhappy marriage' between Marxism and postcolonial studies (Hartmann, 1979). After briefly recalling the long-standing debate on Marx, Marxism and

Eurocentrism in the first section, the chapter will then focus on the intense exchanges that accompanied the early inception and later expansion of the postcolonial field in the 1980s and 1990s (Moore-Gilbert, 1997; Gandhi, 1998; Loomba, 1998; Young, 2004; Boehmer, 2005). This ‘first round’ of the debate was characterized by strong anti-postmodern criticisms formulated by Marxist/materialist scholars (such as Aijaz Ahmad, Arif Dirlik, Neil Lazarus, Benita Parry, Epifanio San Juan Jr.) against the post-structuralist/textualist approaches embraced by leading figures of the postcolonial turn (namely Edward Said, Gayatri C. Spivak and Homi Bhabha). The following section will engage with the more recent discussions triggered by the publication of Vivek Chibber’s polemic volume *Postcolonial Theory and the Specter of Capital* (2013a, hereafter PTSC). Such discussions essentially revolve around two of the main theses that Chibber pits against the postcolonial emphasis on ‘cultural difference’ in an attempt to undermine the theoretical foundations of the whole field: on the one hand, the historical argument he elaborates to prove the global universalizing drive of capitalism; on the other, his claim for universal human invariants to be found in mankind’s need for well-being and interest in fighting for it (Chibber, 2013a). Both theses are meant to reveal the alleged weaknesses of subaltern studies historiography, whose main representatives – Ranajit Guha, Partha Chatterjee and Dipesh Chakrabarty – are the actual subjects of Chibber’s analysis, more so than postcolonial authors proper. After giving an account of this ‘second round’ of the debate generated by PTSC (Warren, 2016), the concluding section of the chapter will aim to ‘provincialize Chibber’ by advocating, with Frantz Fanon, a productive ‘stretching’ of Marxism to embrace postcolonial issues (Fanon, 1963).

MARX, MARXISM AND EUROCENTRISM

In her introduction to *Marxism, Modernity and Postcolonial Studies*, Crystal Bartolovich stresses the traditional hostility mutually cultivated by Marxism and postcolonial theory (Bartolovich and Lazarus, 2002: 1–17). Rightly, she points out that ‘[t]he neglect (even ignorance) of Marxism in postcolonial studies has often been countered by the reflexive dismissal of the entire field of postcolonial studies by Marxist writers’ (2002: 1). She also highlights that, since the academic breakthrough of postcolonial theory, the (mostly fruitless) exchange between the two camps has been shaped by ‘a good deal of oversimplification, caricature, and trivialization’ (2002: 1). Those attitudes have deeply affected the way in which the vexed question of Marx’s (and Marxism’s) alleged Eurocentrism has been debated within postcolonial studies.

Eurocentrism is the major charge directed against Marxist theorists by postcolonial scholars, particularly regarding their approach to non-European social formations (Said, 1978; Young, 2004; Castro Varela and Dhawan, 2015). But what does the accusation of Eurocentrism as applied to Marx and Marxists

precisely consist of? In his 1989 essay, Samir Amin provided a historical definition of Eurocentrism as a ‘vision’ – not having the status of a ‘theory’ – that can be traced back to the Renaissance but only prospered in the 19th century, and epitomizes the ‘culture of capitalism’ that accompanied the age of modern bourgeois expansion. An expression of European ethnocentrism in spite of its all-encompassing claims, for Amin Eurocentrism merely amounts to a ‘truncated universalism’ that reflects but, at the same time, masks the actual asymmetric configuration of capitalism worldwide (2009: 103). Reflecting on Said’s definition of Orientalism – ‘the corporate institution for dealing with the Orient – dealing with it by making statements about it, authorizing views of it, by describing it, by teaching it, settling it, ruling over it: in short, Orientalism as a Western style for dominating, restructuring, and having authority over the Orient’ (Said, 1978: 3), Amin takes issue with him for having produced a transhistorical discursive framework, which does not specifically anchor Orientalism to the origins of the capitalist mode of production (2009: 175–6). For Amin, the North/South and East/West polarization is first and foremost a consequence of global capitalism engendering unbridgeable gaps between the centre and its peripheries. Therefore, in his view, Eurocentrism should be understood as part of the dominant capitalist ideology that affirms the material and spiritual superiority of the West over the ‘fatal lethargy’ of the rest and makes it ‘impossible to contemplate any other future for the world than its progressive Europeanization’ (2009: 180).

For Amin, the thesis that

the European West is not only the world of material wealth and power, including military might; it is also the site of the triumph of the scientific spirit, rationality, and practical efficiency, just as it is the world of tolerance, diversity of opinions, respect for human rights and democracy, concern for equality – at least the equality of rights and opportunities – and social justice (2009: 180)

does not of itself necessarily entail Eurocentrism as a corollary. To speak of Eurocentrism, the legend of the ‘European miracle’ – the exceptionality of European history – must be accepted so as to become the premise that would justify the imperial political project of ‘homogenization through imitation and catching up with the West’ for the entire world (2009: 183). The historical reconstruction offered by Amin, while not reducing Eurocentrism to a minor side effect of the development of modern capitalism, aims to avoid the danger of turning a ‘mythic construct’ that emerged with and sustained the global expansion of capital into the core ground of colonial domination (2009: 103).

Kolja Lindner proposes to take into consideration four main ideological ingredients of what is classically thought of as Eurocentrism in order to estimate the extent to which Marxism (and Marx himself) can be legitimately accused of being ‘Eurocentric’ (Lindner 2010; Harootunian, 2010; Achcar 2013). The four aspects are: Ethnocentrism (or the affirmation of the superiority of Western civilizations that may also rely on racial claims); Orientalism (the production

of an homogeneous, essentialist and simplistic vision of the Eastern world); Universalism (the generalization of Western standards, values and habits and their consequent imposition on every people and society); and the effacement of non-Western history and its influence on European history.

In recent years, several Marxist scholars (Nimtz, 2002; Anderson, 2010; Lindner, 2010; Jani, 2014; Pradella, 2017) who have engaged with Marx's oeuvre with the aim of investigating its much contested Eurocentrism have demonstrated the theoretical relevance that non-Western formations and colonial matters progressively gained in Marx's own writings and stressed his commitment to anticolonial and anti-imperialist struggles. Indeed, Marx's Eurocentrism deserves to be assessed on the basis of a comprehensive overview of his entire production and his sources (Lindner, 2010). On these grounds, most scholars agree on recognizing the ambivalences that emerge in Marx's analysis of property relations in Asia, for example, or in his early understanding of colonialism as exposed in his 1853 article published in the *New York Daily Tribune* "The British Rule in India" – 'whatever may have been the crimes of England, she was the unconscious tool of history in bringing about that revolution' (Marx, 2007: 219) – while at the same time highlighting the evolution of Marx's thought on such a fundamental matter for his global theory of capital as the colonial phenomenon. If Lucia Pradella (2017) draws on the previously unpublished *London Notebooks* (1850–53) to argue that Marx unfolds his labour theory of value on an international scale by challenging the methodological nationalism of classical political economy and François Bernier's theory of Oriental despotism, Lindner states that it was in the 1860s, while looking at the situation of Ireland, that 'Marx (and Engels) had developed an awareness of the underdevelopment due to colonialism or the overall colonial context' (2010). On the other hand, Pranav Jani (2002) considers Marx's study of the 1857–59 revolt in British India already crucial to his overcoming of Eurocentrism, while Kevin Anderson (2010) focuses on his late notebooks (1879–82) on non-Western societies such as China, India, Indonesia, Algeria and Russia — to show evidence of his interest in deciphering and comprehending the peripheries of capitalism. Providing an extensive account of Marx's framework from the 'implicit unilinearism' of *The Communist Manifesto* (1848) and the articles he had written for the *New-York Daily Tribune* in the 1850s to the 'multilinear theory of history' as outlined in the *Grundrisse* (1857–58) and the French edition of *Capital* (1872–75), and finally to the complex multilinearity of the late notebooks on non-Western societies (1879–82), Anderson's *Marx at the Margins* provides the most exhaustive attempt thoroughly to engage with the Marxian corpus on these questions (2010: 3). The author presents Marx as a global theorist seriously committed to understanding the future development of the capitalist world outside of Europe, and for whom the 'proletariat was not only white and European, but also encompassed Black labor in America, as well as the Irish, not considered "white" at the time' (2010: 3). Also, for Anderson, Marx's interest in the actual evolution of non-Western societies and his defence

of oppressed minorities all over the globe ‘were not incidental to [...his] theorization of capitalism, but part of a complex analysis of the global social order of his time’ (2010: 3).

To what extent, then, can Marx and Marxism be accused of Eurocentrism? And, more generally, to what extent does the concept of Eurocentrism still retain its validity to designate the hegemony of the West as the *locus enunciationis* par excellence for contemporary theory? It is indeed hard to deny, for example, that Western philosophy – usually simply termed as ‘philosophy’ – has been historically ‘Eurocentred’ and continues to be so, often preventing the very possibility of speaking of philosophy outside of this canon. The actual *geopolitics of knowledge* (Mignolo, 2002) thus makes a serious case for the postcolonial denunciation of Eurocentrism affecting the human and social sciences alike and urges a critical reflection on for whom and from where global knowledge is produced in the last instance. Nevertheless, it would be wrong to think that the label of ‘Eurocentric’ applies – inevitably and inescapably – to all that is conceived or generated in the West, or equally to claim that scholarship produced outside the Western world is necessarily non-Eurocentric. If, on the one hand, the problem of Eurocentrism in Western thought, and in Marxism in particular, cannot be minimized as a non-existent or irrelevant issue, on the other hand, it requires painstaking critique to avoid all-too-easy simplifications. In this respect, Chibber’s acknowledgement that ‘all the Western theories we know of up to the late nineteenth century overwhelmingly drew their evidence and their data from Europe [and] [i]n this sense, they were Eurocentric’ cannot simply lead to the conclusion that ‘this kind of Eurocentrism is *natural*, though it’s going to come with all sorts of problems, but it can’t really be indicted’ (Chibber, 2013b, emphasis added). Being nothing but a historical phenomenon, Eurocentrism cannot be considered either ‘natural’ or ‘unnatural’ and, most importantly, it deserves to be scrutinized genealogically as a quintessential component of modernity, rejecting both the apologetic and the dismissive approach to the legacy of Western civilization. This is in fact the very task of postcolonial critique that Spivak incisively summed up as ‘neither accusing nor excusing’ (1999: 4, 345).

The endeavour to decolonize Marxism is thus no blasphemy, insofar as the history of Marxism (and even more so, the history of communism, socialism and social-democracy) has not been immune from the conditioning of imperialist drives or from complicity with colonial prejudice and domination (Young, 2004: 34). Thus, as Bartolovich acknowledges,

it would be foolish to pretend that some concepts – even many – generated in the history of Marxist thought (including by Marx himself) are not guilty as charged here, as it would be foolish to pretend that some – even many, including some of the most decisive – Marxist theorists (especially those with no experience of and no regard for non-European conditions) have not construed their own narrowly conceived horizons universalistically. (Bartolovich and Lazarus, 2002: 11)¹

To this extent postcolonial theory can be credited, as Lazarus highlights, with ‘the salutary demonstration that such historically resonant “master narratives” as

enlightenment, modernity, progress, and reason – narratives that have almost always been phrased in universalistic terms – have often been mobilized in defence of practices both ethnocentric and intolerant of difference (sometimes murderously so)’ (2002: 43). At the same time, it can be convincingly argued that Marxists have also significantly contributed to the understanding, critique and denunciation of colonial systems and imperialism, of racism and racial hierarchies. Ultimately, as Bartolovich once again has been rightly recalling, ‘[t]he very fact that many of the most brilliant, prominent, and effective anticolonial activists have insistently pronounced themselves Marxists should give pause to postcolonialists who stand poised to dismiss Marxism as a “European” philosophy’ (2002: 11).

THE CULTURAL LOGIC OF POSTCOLONIALITY

The emergence of postcolonial studies in the literature departments of Anglo-American academia – the publication of Said’s *Orientalism* in 1978 has been retrospectively considered as the date of birth of the new field *ante litteram*² – was surrounded from the outset by a vigorously polemic debate about the ideological positioning of postcolonialism with regards to Marxism (Ahmad, 1992; Dirlik, 1997; Lazarus, 1999; Parry, 2004). While the early work of subaltern studies social historians in India in the 1980s – a scholarship that mostly gained influence abroad through the growing international consecration of postcolonial studies in the 1990s – was unanimously perceived as an expansion and a continuation of the Marxist tradition, the theoretical and political relation of the postcolonial with Marxism has been at the centre of intense contention (Kaiwar, 2014; Sinha and Varma, 2017).

Indeed, the label ‘postcolonial’ has been deeply and widely questioned even as it began to gain currency, with particular scrutiny as to the very meaning of the prefix ‘post’ in conjunction with ‘the colonial’, and in resonance with other examples of its use, as in ‘postmodernism’ (Appiah, 1991; McClintock, 1992; Shohat, 1992; Dirlik, 1994; Ahmad, 1995; Parry, 1997; Lazarus, 2011b). In her ‘Notes on the “Post-Colonial”, Ella Shohat first stressed the ‘theoretical and political ambiguities’ of the term while noticing its absence from discourses opposing and taking issues with the 1990–91 Gulf War, discourses where other words such as ‘imperialism’, ‘neo-colonialism’, ‘neo-imperialism’ were instead widely mobilized. ‘Was this absence sheer coincidence’, she asked, ‘or is there something about the term “post-colonial” that does not lend itself to a geopolitical critique?’ (Shohat, 1992: 99). Reflecting on the ‘politics of location’ of postcoloniality, which had not in her view been critically investigated by scholars in the field, Shohat provided a meditation on the ‘depoliticizing implications’ of the postcolonial, inaugurating a long series of essays that shared similar concerns (1992: 99). For most of the detractors of postcolonialism, its inception resulted from the eclipse of the older Third Worldism that had nourished liberationist ideologies

and boosted anticolonial struggles against European imperialism (Lazarus, 1999; San Juan Jr., 2000; Parry, 2004). Since postcolonial theory emerged in the 1980s as a response to the global defeat of Third World liberation projects by imperialist counter-revolutions and the weakening of class struggle in First World societies (Dirlik, 1997; Parry, 2002; San Juan Jr., 2002; Kaiwar, 2014), the postcolonial paradigm has been almost unanimously interpreted as imbued with disillusionment – ‘a convenient doctrine for those who dislike what the system does while doubting that they will ever be strong enough to bring it down’ (Eagleton, 2005: 175) – and defeatism – as an allegory for ‘the depressing absence of a collective subject of postcolonial liberation’ (Taylor, 2018: 244) – and eventually as a weak ideology destined to fill the ‘redoubled vacuum’ left by the abandonment of both socialism and nationalism as anti-imperialist strategies (Ahmad, 1992: 34). Among the partisans of postcolonial theory, Young emphasizes a certain continuity between its stances and those of Third Worldism, by claiming that ‘postcolonialism as a theoretical discourse can operate as a kind of popular front for a whole range of different inter-related political movements [...] a new tricontinentalism or socialism of the South’ (Young, 2004: 30). Conversely, most of its critics tend to stress discontinuity between the revolutionary spirit of cultural Third World nationalism and the postcolonial celebration of difference and hybridity. Benita Parry, for example, highlights the ‘meager reception’ that liberation theories encountered in postcolonial studies as well as the disowning of ‘all forms of anticolonialist rhetoric and organization’, and advocates an urgent reassessment within the field of the ‘socialist goals and internationalism of Marxist-inspired movements’ (Parry, 2002: 125, 143).

At the same time, both champions and opponents seem to agree in acknowledging postcolonial theory’s manifest aim to replace Third World liberation’s Marxism with a new critique of imperialism (Young, 2004). Interestingly, Vasant Kaiwar recognizes the capacity of postcolonial studies to subsume the legacy of previous political projects of the kind of Third Worldism, Maoism, Liberation Theology and Pan-Africanism, but argues that ‘by and large, the postcolonial also seems to signify a de-radicalized reading of what many of the social movements stood for’ (Kaiwar, 2014: 5). For Kaiwar, instead, the postcolonial stands for a series of detrimental replacements – of a history from below with a history of the margins, of a history of class struggle with a pseudo-history of civilization, of internationalism with localism, of ungrounded Western Orientalism with an artificial Postcolonial Orient – aiming at repudiating Marxism in order to absorb new, grand postmodern narratives. Such a massive repudiation of Marxism resulted in ‘shallow forms of retrogressive indigenism’ and inevitably led postcolonial theory to unreservedly embrace the culturalist turn, endorsing a post-structuralist emphasis on discourse and textuality (Sarkar, 1997: 106). As Stuart Hall admitted, since ‘the postcolonial and the analysis of the new developments in global capitalism have indeed largely proceeded in relative isolation from one another’, the outcome of the postcolonial rejection of economism

merely plunged the whole field into a ‘massive, gigantic and eloquent disavowal’ of political economy *tout court* (Hall, 1996: 257–8).

Furthermore, some Marxist critics have strongly pointed out that the flip side of class-blindness in theory translates in practice into a postcolonial ‘legitimation of contemporary forms of power’ (Dirlik, 1999a: 286) and the complicit affiliation of the discipline with the interests of postcolonial national bourgeoisies, with the latter mirroring themselves in the new ideology circulated by intellectual elites of the Global South in the institutions of metropolitan academia (Dirlik, 1994). Associated with the debacle of anticolonial liberation struggles to which it could offer no more than ‘cultural compassion’ (San Juan Jr., 2006), aligned with the postmodern spirit of the time (and in fact one of its most prominent manifestations in the academic field of the humanities), postcolonial theory roused generalized hostility in the Marxist milieu for allegedly lacking both the aims and the tools to elaborate a radical critique capable of challenging the capitalist status quo and rejecting it as the only existing order.

POSTCOLONIAL FETISHES: CULTURE, THE WEST AND THE REST

Hall’s regretful remark concerning the postcolonial abandonment of economic analysis resonates with several accusations that have been levelled at postcolonial theory by Marxist scholars, whether from within or outside the field, during the 1990s. Criticism arising at that time during the ‘first round’ of exchanges between Marxists and postcolonial theorists mostly targeted the affiliation of postcolonial studies to postmodernism in its post-structuralist and deconstructionist variants. Such criticism amounted in some cases to outright rejection – as from Ahmad (1992), whose stern critique of *Orientalism* in his *In Theory: Nations, Classes, Literatures* provoked a ‘seismic shock’ (Moore-Gilbert, 2001: 9), or from Dirlik (1997) and San Juan Jr. (2000) – and in others, such as for Parry and Lazarus, to more constructive confrontation (Parry, 2004; Lazarus, 2011a).

‘Is There History after Eurocentrism?’ asks Arif Dirlik in a provocative essay published in 1999, suggesting that as a consequence of the postcolonial penchant for ‘reductionist culturalist understanding of Eurocentrism’, another major ‘disavowal’ had occurred in the domain of postcolonial theory: that of history (Dirlik, 1999b: 1). Echoing Terry Eagleton’s analogous verdict about post-structuralism’s ‘hedonist withdrawal from history’ (Eagleton, 1983: 150) – a verdict that resonates in turn with Perry Anderson’s warning against the dangerous ‘randomization of history’ resulting from the abandonment of historical materialism in the name of radical textualism (Anderson, 1983: 48) – Dirlik’s admonition seems to contradict postcolonial scholars’ disseminated interest in investigating modernity and the colonial past. Yet the paradox is only apparent, since, according to its detractors, postcolonial investigation of colonial modernity approaches its subject matter as a ‘cultural affair’, leaving aside in most cases the task of comprehending processes of capitalist expansion and the co-implication of capitalism and

colonialism (Eagleton, 2005: 161). Hence, for sympathetic Marxist critics such as Lazarus, ‘a credible historical materialist alternative to the idealist and dehistoricizing scholarship currently predominant in that field in general’ is urgently needed to counter postcolonial theorists’ tendency to avoid ‘any focus on capital and class in favor of a thoroughly culturalist definition of the neocolonial world order’ (Lazarus, 1999: 1, 2002: 52).

Thus, the recovery of both Marxism and nationalism, as proposed by Lazarus in *Nationalism and Cultural Practice*, in support of a project he terms ‘nationalitarian socialism’, should work as a remedy against postcolonial theory’s ‘category error’ (Lazarus, 1999; 2011b). Such error consists firstly in offering a purely civilizational framework for the critique of the world we live in – a framework that the author aims to deconstruct in his influential essay ‘The Fetish of “the West” in Postcolonial Studies’ (Lazarus, 2002) – and secondly in replacing ‘a concrete ideological specification (“bourgeois”, “capitalist”) with a pseudo-geographical one (“Europe”, “the West”)’ as is manifestly the case, for example, in Dipesh Chakrabarty’s *Provincializing Europe* (Bartolovich and Lazarus, 2002: 63). Unlike Ahmad, Lazarus praises Said’s critical work on Orientalism for unveiling the ideological construction of colonial discourses about the East. At the same time, Lazarus draws on Fernando Coronil’s analysis of the uses of the West in postcolonial theory, holding such ‘an imperial fetish’ – ‘the imagined home of history’s victors, the embodiment of their power’ (Coronil, 1996: 78) – accountable for the transvaluation of a complex entanglement of historico-geographical relations into ‘the material, thinglike, tangible form of geographical entities’ (1996: 77).

Lazarus remarks that

[i]n such texts as Said’s magisterial *Orientalism* and Chandra Talpade Mohanty’s widely read and frequently anthologized essay, ‘Under Western Eyes: Feminist Scholarship and Colonial Discourses’, for instance, the category of ‘the West’ comes to stand for imperialist power. But since what is thus named is preeminently a civilizational value rather than a mode of production or a social formation, this alibi of ‘the West’ serves to dematerialize what it tacitly references. (Lazarus, 2002: 54)

In fact, the mobilization of the concept of the West in postcolonial theory appears highly problematic from a Marxist viewpoint in at least two senses: on the one hand, it is synonymous with postcolonial studies’ cultural reductionism and its antimaterialist methods; on the other hand, by promoting the primacy of a reified global geography against history and by fostering a crude hypostatization of cultures, peoples, nations and ethnicities, it ends up rendering the rise and reproduction of capital worldwide ultimately unintelligible.

THE TEXT AND THE CONTEXT: A MATERIALIST CRITIQUE

According to Marxist critics, the ahistoric fetish of the West in postcolonial theories has gone hand in hand with the fetish of textuality. While dismissing or even

occluding the path for a materialist analysis of culture, postcolonial studies have resolutely shifted towards semiotic approaches that earned the field accusations of 'textual Idealism' (Parry, 2004: 3–4). Alex Callinicos, for instance, has pinpointed the fundamental 'idealist reduction of the social to the semiotic' that is at play in Homi Bhabha's work (Callinicos, 1995: 111, see Bhabha, 1994); Epifanio San Juan Jr. has denounced the dangers of a postcolonial 'metaphysics of textualism', lamenting 'the cult of linguistic and psychological ambivalence' (San Juan Jr., 2000: 22); Benita Parry, in her invective against the 'exorbitation of discourse' in the writings of Spivak and Bhabha, indicted the textualist drift unabashedly embraced by both authors as the cause of the impoverishment of their conceptual setting (Parry, 2004: 26).

Drawing on Said's own disappointment with the 'astonishing sense of weightlessness with regard to the gravity of history' that spread across the humanities as a consequence of the linguistic turn, Parry regrets the exacerbation of a certain post-structuralist sensibility in postcolonial theories (Said, 1993: 366–7, also quoted in Parry, 2004: 4), which results in textual practices that are indifferent to understanding both social formations and social praxis. In her *Postcolonial Studies: A Materialist Critique*, the author develops a detailed assessment of the field, singling out limits and inconsistencies of the critical strategies responsible for drowning the social into the symbolic and the material into the textual. On the one hand, according to Parry, postcolonial theory normally privileges a one-sided comprehension of the (post)colonial experience which is almost exclusively centred on its epistemic import and reduces power to a textual function while dismissing political categories of analysis (Parry, 2004: 10, 26). On the other hand, postcolonial theory's discursive inflation has created a brand-new jargon that eliminates from its conceptual landscape crucial notions and references belonging to the classical tradition of anticolonial thought (2004: 83). For Parry, recovering and rehabilitating those 'missing terms' (2004: 192) is quintessential to preserving the antagonistic dimension that permeated colonial relations and anticolonial struggles. Indeed, postcolonial studies abandoned the oppositional semantics of antagonism for a 'postulate of hybridity' that translates the binary structure of colonial encounters into transactional negotiations of cultural differences and processes of transculturation (2004: 25). As Epifanio San Juan Jr. recalls, 'the focus on contrapuntal flux, hybrid positionalities, and directionless or aleatory ambivalence [...] can only serve as a vehicle for soothing the anguish of the oppressed' without offering political alternatives or critical tools (San Juan Jr., 2007: 110). Furthermore, in Parry's view, the postcolonial perspective, being premised on the absolutely disruptive power of imperialism's epistemic violence, actively contributes to the foreclosure of subaltern agency it denounces. For Parry, this is precisely the case in Spivak's work, whose task should consist, in the author's own words, of inspecting 'soberly the absence of a text that can "answer one back" after the planned epistemic violence of the imperialist project' (Spivak, 1985: 251, in Parry, 2004: 19).

Finally, one could sum up the many criticisms raised by Marxist proponents against the postcolonial paradigm by paraphrasing Nancy Fraser's famous 1985 article entitled 'What Is Critical about Critical Theory?': what is actually critical about postcolonial critique? Indeed, if global gaps and inequalities cannot be reduced theoretically by deconstructing the colonial symbolic order (Dussel, 1997), and if the theoretical weapons offered by the postcolonial framework are unsuited to a conceptualization of 'neo-colonial imbalances in the contemporary world order' (Loomba, 1998: 256–7), then postcolonial theory severed from Marxism ultimately seems destined to stand as little more than an innocuous, harmless approach.

CAPITALISM AND UNIVERSALISM AS POSTCOLONIAL SPECTRES

Variouly described as 'a bomb' (Hung, 2016: 123), 'a burst of fresh air dispelling the stale aroma of pseudo-radical academic establishment' (Žižek's blurb, *PTSC*, 2013), a critical intervention 'shak[ing] up our intellectual and political landscape' (Brenner's blurb, *PTSC*, 2013), or a 'work of scholarly necromancy' merely resurrecting dead debates (Taylor, 2018: 234), Chibber's *PTSC* had the merit of polemically re-staging the long-standing antagonism between Marxism and postcolonial scholarship (Lazarus, 2016; Sinha and Varma, 2017). Furthermore, although not as its main purpose, the book implicitly revisits 'the long-drawn debate between the Marxists and post-structuralists, or the modernists and post-modernists' (Hung, 2016: 123), revealing also the manifest 'internal bifurcation of humanist and social-scientific interpretations of Marxism' (Brennan, 2016: 198).

Curiously enough, a book that purports to engage with postcolonial theory at large, as the title promises, in fact engages solely with (a sampling of) subaltern studies, erroneously considering them 'the most illustrious representative of postcolonial theory in the scholarship on the Global South' (Chibber, 2013a: 5). In doing so, the volume dismisses the most representative authors in the postcolonial field as such (like Spivak and Bhabha, *entre autres*) and ends up portraying postcolonial theory as a much less contentious field than it always has been (Jani, 2014; Brennan, 2016; Lazarus, 2016; Parry, 2017).

Premised on what has been named as Robert Brenner's and Ellen Meiksins Wood's 'political Marxism', Chibber's analysis develops a materialist critique of the works of three significant subalternist scholars whose research focused on the social history of colonial India: Ranajit Guha, Partha Chatterjee and Dipesh Chakrabarty. Openly clashing with postcolonial theory, Chibber accuses the entire field of fostering Orientalism and '*relentlessly promot[ing] Eurocentrism* [by portraying] the West as the site of reason, rationality, secularism, democratic culture, and the like, and the East as an unchanging miasma of tradition, unreason, religiosity, and so on' (Chibber, 2013a: 291). A first thread of Chibber's critique, concerning the appraisal of the nature of bourgeois power in both metropolitan

and colonial contexts, engages with the differential assessment of the historical roles played by European and Indian bourgeoisies in Ranajit Guha's major work *Dominance without Hegemony* (1997). The goal is to disprove Guha's diagnosis of the structural weakness of bourgeois elites in colonial regimes and of their inability to entrain modernization and implement liberal reforms. A second critical element that Chibber singles out in the works of subalternist scholars regards the history of capitalist modernity. Chibber highlights the primacy of the universalizing function of capitalism – defined as 'market dependence' (Chibber, 2013a: 100) – against the alleged praise of 'locality' and essentialization of 'differences' at stake in postcolonial theory. In particular, he takes issue with Dipesh Chakrabarty's effort in *Provincializing Europe* (2000) to conceive of multiple histories of modernity, namely targeting his notion of 'History 2', that is meant to express 'a politics of human belonging and diversity' and to incarnate an obstacle to the unlimited expansivity of History 1, the history of capital as outlined in classical Marxism (Chakrabarty, 2000: 67; Tomba, 2013).

Firstly, Chibber aims to show that Guha's reconstruction of the bourgeois revolutions in Europe and his assumption of the hegemonic status of Western bourgeoisies as capable of carrying forward and integrating the interests of subaltern classes in their revolutionary programmes are 'deeply flawed' (Chibber, 2013a: 87). This, Chibber continues, leads Guha to achieve a distorted apprehension of the limited margins for manoeuvre of the Indian bourgeoisie, seen as a pale caricature of its British counterpart. Secondly, while subscribing to the idea that capitalism undoubtedly acquired distinct shapes in different colonial contexts, Chibber rejects the thesis by which a universalist account of the history of capital would be doomed to teleology, determinism or historicism, and brings in support of his argument several theoretical experiments from within the Marxist tradition – Lenin's theory of imperialism, Kautsky's work on agrarian society, Trotsky's theory of combined and uneven development, and world-systems theories among others – that examined 'social reproduction in parts of the world where capital was *not* working in exactly the way Marx described it in *Capital*' (Chibber, 2013a: 292). Finally, a third element of criticism concerns what Chibber improperly terms 'subaltern psychology', namely the analytical portrait of subaltern agency as it appears in particular in the works of Partha Chatterjee and Dipesh Chakrabarty regarding, respectively, the peasant movement in Bengal and the experience of jute mill workers in Calcutta (Chatterjee, 1986; Chakrabarty, 1989). Along the lines followed in his analysis of the driving forces of capitalist expansion, Chibber advances an argument in favour of universalism in order to question the validity of postcolonial approaches that see peasant consciousness in colonial India as incommensurably different from the consciousness of the oppressed in Western societies. The dominated subjects, Chibber states, share the same human nature and some universal human features. Ironically, Chibber's conception of universalism appears quite peculiar for being reduced, as has been noticed, to 'capital's drive to universalize itself and the attempts of the poor to

defend their well-being', while gender and race are by no means comprised as historically universal or universalizable traits (Robbins, 2016: 113).

In fact, Chibber's theses, in his own words, amount to arguing that

[t]here are some needs that exist and endure independently of culture, and chief among these is the need to attend to one's physical well-being. Second, that people are typically cognizant of this need and it therefore generates interests that influence political and social interaction. And third, that it is the universality of this need that explains the universality of resistance to exploitation – since the latter typically undermines the former. (Chibber, 2013a: 262)

In sum, the book's most substantial claim consists of maintaining that capitalism 'does not have to obliterate social difference in order to universalize itself' and that differences between colonial and European societies do not entail incommensurability (Chibber, 2013a: 150). Yet, as Bruce Robbins has sharply remarked, even if '[o]ne can agree with Chibber, still the role played by difference should be analysed especially in view of strategic composition of subalterns' struggles', while the author 'does not even try to account for the Great Divergence between capitalism in the style of IKEA and capitalism in the style of Rana Plaza' (Robbins, 2016: 112). In a similar vein, Sandro Mezzadra has also highlighted that Chibber's theory of the universalization of capital does not help to understand how such a universalizing tendency influences or simply interacts with the subjective experiences of the exploited and their struggles in distinct locations of the globe (Mezzadra, 2014).

Besides being accused of acritically rehabilitating Enlightenment concepts and values as univocally progressive, Chibber's book has also incurred the charge of fabricating a Marxist version of liberal political theory (Workman, 2016). This points to his equally acritical endorsement of rational choice theory as the best device to explain individual agency on the basis of universal principles such as basic needs and self-interest (Chatterjee, 2016; Parry, 2017). In this regard, it has been rightly noticed that Chibber's argument collapses into tautology inasmuch as it does not give any account of what it is meant to explain: namely, how alleged universal needs and interests are shaped empirically – how individuals become aware of their needs, how their interests determine their actions – and, one could add, how universal needs translate into interests that people are willing to fight for or, eventually, into political struggles (Eriksen, 2016).

Even accepting Chibber's assumption that '[a] concern for certain basic needs – for food, shelter, safety, etc. – is part of the normative repertoire of agents across localities and time', the most significant question about how such concern is collectively expressed and articulated remains unanswered (Chibber, 2014: 74). It is actually far too simplistic to define the striving of individuals for well-being as a 'central fount for resistance [...] that drives workers into the arms of capitalists [and] also motivates them to resist the *terms* of their exploitation'; similarly, it is far too inaccurate to argue that 'the same slogans can be found in Cairo, Buenos Aires, Madison and London' because some universal interests are expressed in

them (2014: 75, 67). Indeed, quite the opposite is true: not only do the struggles of the exploited not necessarily share the same slogans or the same political orientation, but the very needs and interests of the oppressed do not historically translate into the same claims or the desire for the same things, let alone the same strategic options.

In the end, Chibber's universalism does too little – and much less than it promises – as it seems to remain indifferent to the particularities it should account for, showing that the author 'is less interested in the dialectical, temporalized, and temporalizing interpenetration of the universal and the particular, the abstract, and the concrete' (Taylor, 2018: 242). As Spivak aptly remarks:

The moment you go from body to mind, from physical well-being to fighting for physical well-being, there is language, history and 'permissible narratives' (Said, 1984: 27–48). For example, the mother thinks honour, the daughter thinks reproductive rights [...] If physical well-being were a race-free, class-free, gender-free grand narrative, there would be no point in having any theories of justice, politics, human rights and gender compromise. (Spivak, 2014: 189)

Thus the explanation offered by Chibber remains insufficient for at least one good reason, which has been summarized as follows:

[W]hile the need for physical well-being may well stand outside of culture, it is 'culture' that enables a consciousness of this interest as something to which one is entitled rather than as a privilege that must be earned not to mention a cognizance of how one might attain this interest acting individually or in concert with others. (Rao, 2017: 595)

In this regard, Bruce Robbins' (2016) commentary highlights the lack of any theory of culture in Chibber's perspective. In fact, Chibber believes that cultural differences are irrelevant to the development of capitalism, just like culture is irrelevant to his Marxist materialist analysis. Nevertheless, as has been suggested, only a Marxism 'more infused with cultural sensitivities' would be capable of accounting for the specificity and the historicity of colonialism and of the postcolonial condition we live in (Sewell, 2016: 281)

PROVINCIALIZING CHIBBER, STRETCHING MARXISM

After briefly revisiting the confrontational exchanges between Marxist and postcolonial proponents, Moore-Gilbert's optimistic reconciliatory view that Marxism and postcolonial theory 'may move by different routes, but their objectives lie in the same direction' sounds hard to credit (Moore-Gilbert, 2001: 24). Yet, without necessarily aiming to harmonize existing tensions between the two camps, it is possible to look at the way in which Marxist and postcolonial scholars – namely Marxists who engaged with postcolonialism and postcolonial theorists who embraced a Marxist perspective – have been arguing for a fruitful rapprochement of the two paradigms (Bartolovich and Lazarus, 2002; Parry, 2004; Lazarus, 2011a; Mezzadra, 2012; Brennan, 2014; Nilsen, 2017; Rao, 2017; Samaddar, 2018).

How can postcolonial theory be valued from a Marxist perspective? Among the detractors of the postcolonial, two very different approaches can be distinguished (Jani, 2014): some (such as Ahmad, Dirlik, San Juan Jr.) have adopted a purely hostile attitude towards postcolonial theory in defence of Marxism, while some others (Brennan, Lazarus, Parry, to name a few) have operated as a counterforce in the field and worked to 'create a space for Marxist scholarship within postcolonial studies, combating and constructing alternatives to its postmodernist elements' (Jani, 2014). Among those who adopted a more conciliatory stance, a good number – including Lindner, Moore-Gilbert, Jani, Rao, Nilsen – have made relevant theoretical efforts at bridging gaps by mobilizing the resources elaborated by both postcolonial and Marxist scholarships, arguing that Marxists should not merely oppose postcolonial theory; while others – like Young in his *White Mythologies* (2004) – proposed a consecutive reading of the two paradigms by making of postcolonial theory, so to speak, the 'continuation of Marxism by other means'. Lastly, Spivak's claim that Marxism, feminism and deconstruction should critically interrupt each other stands as a significant attempt by one of the most illustrious postcolonial representatives to conceive, against the paradigm of mere complementarity, the *conflicting supplementarity* of the different traditions (Spivak, 1990: 110; Mascari, 2016).

The task of thinking the 'substantial obstacles to an accommodation between postcolonialism and Marxism as modes of cultural analysis' may raise concerns about the nature of the divergences that emerge between the two fields (Moore-Gilbert, 2001: 16): are these unbridgeable differences? In very general terms, one can argue that a manifest conceptual irreconcilability already surfaces at the semantic level, with the deployment of the notions of totality, universalism, causal determination and class antagonism that are part and parcel of the Marxist lexicon, on the one side, and the mobilization of the concepts of particularity, incommensurability, ambivalence and hybridity that weave the texture of the post-structuralist idiom, on the other (Sinha and Varma, 2017: 546). In the effort to move forward from the long-standing polemic harshly reignited by the publication of Chibber's PTSC, three main aspects seem deserving of careful analysis in order to assess the possibility of superseding the existing 'conflict of interest' between Marxism and postcolonial theory. Capitalism appears as the first matter of major divergence between the two fields, since the Marxist perspective grants a central role to the existing mode of production in accounting for the divides existing in modern and contemporary societies, and often perceives postcolonialism as a radical diversion from such framework. A crucial issue, then, is the alleged inefficacy of postcolonial theory in the critique of capitalism, taken for granted as a historical background whose co-constitutive relation with colonial domination remains often overlooked (Sinha and Varma, 2017). As a consequence, on a conceptual level, what is lost to postcolonial theory's predilection for singularity and fragmentation is precisely the capacity to attain the 'standpoint of the totality' when reading colonial history and interpreting

contemporary neocolonial dynamics, of which capitalism and its abstracting and universalizing tendency constitute a structural pivot. To borrow Vasant Kaiwar's words: 'What is missing [...] in postcolonial studies, besides the "imperative to historicize", is the equally critical imperative to totalize' (Kaiwar, 2014: 18). Last but not least, insofar as Marxism cannot but advocate for the rehabilitation of the lost standpoint of the totality, from a Marxist perspective the very notion of incommensurability that results from the strenuous postcolonial emphasis on differences – as in Chakrabarty's distinction between History 1 and 2 *qua* incommensurable histories – should be resolutely rejected.

A different assessment of the centrality of capitalist relations and of the notions of universalism and totality so crucial for grasping the abstract logic of the unfolding of capitalism seems to represent the major conceptual obstacle to the sharing of common theoretical and political views between Marxism and postcolonial theory (Lazarus, 1999). Would pleading for a postcolonial reprise of the language and concepts of political economy, historical materialism and political universalism (a plea that has in fact already been raised in many theoretical efforts conducted by several Marxist scholars from within the field of postcolonial studies) necessarily and ultimately amount to advocating a critical incorporation of postcolonial theory within Marxism? A similar suggestion has been explicitly formulated by Vasant Kaiwar in his 2014 volume *The Postcolonial Orient*, which although adopting a very different (and far more accurate) critical strategy than Chibber, shares a similar goal. After indicting postcolonial theory for its anti-Marxist and, indeed, reformist-revisionist political stances, Kaiwar concludes that '[t]o the extent that postcolonial studies has the ability or ambition to enrich Marxism, it must perforce become *an aspect of Marxism*' (Kaiwar, 2014: xviii, emphasis added). In this respect, the aim to incorporate postcolonial theory in Marxist critique may appear as a ruthless delegitimization of the postcolonial as such, and an unreasonably dismissive assessment of the impact of its significant intervention in the broad field of the humanities. However, while reaffirming the primacy of Marxism as the 'unforgoable' horizon of critique for the present times (Bartolovich and Lazarus, 2002: 10), the proposal outlined by Kaiwar somehow resonates with Fanon's suggestion in *The Wretched of the Earth* of 'stretching Marxism' in order to expand its capacity to engage with colonial matters. If indeed 'Marxism is not a theory of everything', but can expand, as Chibber himself admits (Chibber, 2013a), postcolonial theory can incarnate such an enriching expansion of the Marxist domain, of its tasks and tools, of its conceptual heritage and political genealogy.

Two slippery misunderstandings should nevertheless be cleared up if the much hoped for stretching of Marxism towards postcolonial theories is not to be read simplistically. Firstly, we should bear in mind that Marxism as a living philosophy does not constitute a purely Western heritage – or, in other words, that 'Marx and Marxism belong (and have always belonged) to the whole world, not merely to Europe, or still less, to that mythical entity "the West"', and one only has to look

at the many historical circumstances in which Marxism has inspired struggles for liberation in non-Western countries to see this point proved (Bartolovich and Lazarus, 2002: 10). Secondly, the actual richness of the Marxist corpus and its many resources for thinking both the expansion of capitalism and the revolution outside of Europe – from Marx to Lenin and Trotsky via Bloch, Kautsky, Cabral, James, Mandel, etc. – should not be evoked as a theoretical shield to secure the field from postcolonial incursions into the debate. In other words, the fact that there is significant Marxist accumulation on issues of colonial modernity and postcolonial societies clearly does not mean that there is nothing to add. Quite the opposite is true, if the aim is to accomplish what Chibber's book does not (and does not even try to, because of its intentionally limited remit): namely, explaining *how* capitalism, moved as it is by its expansionist and universalizing drives, manages to integrate for its own purposes local particularities into its abstract functioning, proving itself not merely *indifferent* but rather fully *instrumentalizing* in its relation to concrete local differences. Thus, the task of understanding the concrete adaptive mechanisms of capitalism requires first and foremost a reflection on the complicated and conflicted relationship between unity and heterogeneity, between particular experiences and generalizable standpoints. Or, to put it in more manifestly political terms: how can international class solidarity of the exploited and the oppressed across the globe be fostered for revolutionary anticapitalist purposes, without assuming that abstract universal human invariants would do the trick – a trick that is in fact to be conjuncturally effected through a global recomposition of labour (Mezzadra and Neilson, 2013)? What, then, could be the specific *supplement* provided by postcolonial theory to the Marxist analytical framework? And how could postcolonial theory help us produce “‘better’ Marxist histories’ (Chakrabarty, 1993: 1094)?

Paradoxically, it seems as if its most fruitful and promising contribution to Marxism could come from what postcolonial theory has been mostly blamed for by its Marxist detractors: its emphasis on differences, its attention to microhistories and singularities, its dedication to discourse, textuality and the symbolic. This is not to say that Marxist criticism has failed to develop appropriate tools for cultural analysis weaving together text and context; rather, it is a way of valuing the work accomplished by postcolonial theorists to discover, discuss and impose new knowledge, i.e. approaches, readings and sources that were absent in Marxist scholarship as in the field of Western humanities. Postcolonial theory can thus *critically supplement* Marxism with its fruitful efforts to decolonize the canon and reshape that ‘geopolitics of knowledge’ that mirrors the current divisions of global capitalism. The tasks also amount to recreating the colonial archive, exposing postcolonial counter-narratives of the world we live in, fostering a plural politics of translation against linguistic and literary imperialism and relocating the margins at the centre of contemporary critical theory. A postcolonial enterprise, vitally ‘supplementary’ to Marxism, would also enable a sharp reconsideration of the way cultural and socio-historical differences mediate and articulate the uneven expansion of capital

across the globe as well as of the role that cultural specificities play on the possibility for the dominated to forge shared views and common strategies for struggle – thus, *entre autres*, pointing to a way out of the theoretical and political impasse to which Chibber's Marxism would ultimately consign us towards a reconceptualization of 'postcolonial capitalism' (Mezzadra, 2012).

To claim for postcolonial theory a critical engagement with (post)colonial difference as its most proper field of intervention does not imply assigning postcolonial critics to the *custody of the particular* as opposed to the *care of the universal* that would instead be attributed to Marxist theorists. Therefore, the option of 'stretching Marxism' in order to accommodate the contribution of postcolonial theory within it does not entail any rigid division of labour. Rather, it envisions a Marxist galaxy where postcolonial constellations may fruitfully proliferate. However, such an option remains inevitably selective and only applies to those postcolonial critics who believe that Marxism still is, as Jean-Paul Sartre famously suggested, 'the philosophy of our time'. Once relocated in this perspective, far from merely cultivating a narcissistic fetish of particularity, postcolonial theory may embody a powerful and permanent warning for Marxism, by reminding it that facile socio-historical generalizations risk overlooking the legacy of the colonial wounds cut into our postcolonial present and the import of "situated knowledge" for radical politics. This is how postcolonial theory fulfils its highest critical function, incarnating precisely that 'persistent critique' of what 'we cannot not (wish to) inhabit', including – first and foremost – Marxism (Spivak, 1993: 284).

Notes

- 1 A propos, Benita Parry remarks how Perry Anderson 'inadvertently provided some insights into the metropolitan disregard of Third-World Marxisms' within the 'circumscribed horizons of European Marxism [...] by failing to recognize that anticolonialist insurrections, which at the very moments he examines were expanding exponentially, had indeed joined Marxist theory with revolutionary practice – a blindspot more remarkable in a British Marxist scholar than the myopia of metropolitan theorists in environments where signs of overseas empire were not as ubiquitous' (Parry, 2004: 276).
- 2 The other significant date of founding for the postcolonial field is the publication in 1988 of *Selected Subaltern Studies*, a collection of writings from Subaltern Studies, co-edited by Ranajit Guha and Gayatri C. Spivak with a foreword by Edward W. Said.

Psychoanalysis

Samo Tomšič

INTRODUCTION: THE FRAGILE ALLIANCE OF MARXISM AND PSYCHOANALYSIS

In the past decade, the crisis-driven developments of capitalism triggered a renewed interest in theoretical and political intersections between Marxism and psychoanalysis. The political value of psychoanalysis continues to be tied to the fact that Freud significantly reframed the problematic of alienation with his theory of the unconscious, elaborated a complex denaturalised conception of sexuality and provided wide-reaching insights into the intertwining of power and enjoyment. The common thread of various historical and contemporary attempts in allying Marxism and psychoanalysis thus departs from the recognition that critique of political economy always already calls for a critique of libidinal economy, and vice versa. Nevertheless, the interaction between Marxism and psychoanalysis has always been marked by mutual mistrust, criticism and distance. Of course, working on their alliance does not imply that Freud's therapeutic method, its conceptual frameworks and clinical goals are entirely in tune with the outlooks of emancipatory politics. Still, there are important lessons to be drawn from the unconscious and other fundamental Freudian concepts, which question or criticise modern conceptions of subjectivity in terms of consciousness, autonomy, intentionality and freedom. Another political perspective follows from Freud's focus on the socio-genesis of 'mental illnesses', his exposure of the traumatic impact of social

imperatives, structures and processes. In his writings on culture Freud openly recognised in exploitation, war and crisis three essential features of capitalism that a traumatic aetiology of neurosis must take into account. Again, this recognition alone does not make of Freud a thinker of emancipation, but his name and work is the site of a philosophical, epistemological and political conflict, a terrain that the Left should strive to reclaim, instead of dismissing Freud as an obsolete or reactionary thinker. The paradigm of emancipatory appropriation of Freud remains the work of Juliet Mitchell (2000). A broader discussion of the place of psychoanalysis in the history of feminism can be found in Campbell (2016: 233–52).

Freud's analytic method has been repeatedly suspected of being a class-therapy and his theories a reflection of the bourgeois ideology (according to this clichéd criticism, the Oedipus complex describes the pathology of bourgeois family, the central role of the father expresses Freud's patriarchal leanings, etc.). Freud's occasional rejection of Marxism, as well as his insistence that psychoanalysis neither promoted nor amounted to a political worldview, seemed caught in its own clichés and superficialities. His polemic targeted the politicisation of psychoanalysis in the works of early Freud-Marxists such as Wilhelm Reich, Otto Fenichel and Otto Gross, who opted for an alliance between psychoanalysis and dialectical materialism.¹ Beyond the question of political worldviews, Freud-Marxism bypassed an important ambiguity in the way Freud conceived the link between libidinal forces (drives) and social structures (culture). For Freud the drive was ultimately a limit phenomenon, neither 'psychological' (cultural) nor 'physiological' (natural). This implied that the drive was distinct from instinct,² a presumable natural force, on which culture would impose restrictive vicissitudes (*Tribschicksale*) – destinies, in which the drive could only reach mediated, partial or substitute satisfaction. In their conviction that human libidinal forces must be liberated, the early Freud-Marxists narrowed down Freud's views. Most importantly, for Freud there is no uncorrupted natural drive outside its cultural destinies; the drive *is* a force demanding mediated satisfaction. Because human libidinal forces know no uncorrupted, natural state, the clinical task of psychoanalysis cannot consist in their liberation, but rather in the transformation of the drive's problematic destiny. Here, Freud most overtly parts ways with Freud-Marxism.

The Freud-Marxist renewal of the opposition between drives and culture lead its representatives to a misconception of repression (*Verdrängung*). This mental mechanism in Freud designates the most common destiny of the drive, its satisfaction through detours and deviations, while in thinkers like Reich it obtained the exclusive meaning of oppression.³ Further, in the Freudian scenario the drive stands for a conservative force, which is supposed to explain the compulsive subjective and social resistance against change in the existing mode of enjoyment.⁴ From the Freudian perspective, enjoyment therefore cannot be a subversive political factor; more than anything it is as an essential form of labour for the system.

In contrast to the 'Marxist wing' of the early psychoanalytic community, the Frankfurt School's take on the political implications of psychoanalysis appears

more committed to the letter of classical Freudianism and its speculative developments, such as the death-drive. Theodor W. Adorno famously wrote: 'In psychoanalysis nothing is true except the exaggerations' (Adorno, 2005: 29). Indeed, it was by amplifying the signification of apparently minor and insignificant short-circuits, errors and disturbances in conscious thought that Freud ended up unfolding an unprecedented theory of human subjectivity and of the cultural condition. Herbert Marcuse was arguably the one who brought the engagement of critical theory with Freudian psychoanalysis the furthest. At first, his attempt to combine Freud with Marxism may resemble what Michel Foucault (1976) criticised under the term 'repressive hypothesis', the already mentioned conviction that cultural mechanisms in general and capitalism in particular deprive libidinal forces of direct satisfaction. A closer look at Marcuse's take on the relations between libido and social structures nevertheless shows that his position is more ambiguous. At the core of his critique is the link between enjoyment and exploitation, which he examines through the shift from the *ancien régime* of repression to the specificity of advanced industrial capitalism and its 'one-dimensional' consumerist society, the libidinal economy organised around the mechanism of 'repressive desublimation' (Marcuse, 1991: 56–83).⁵ From the psychoanalytic perspective capitalism indeed appears as a culture of imposed enjoyment, and Marcuse's developments already point toward the link between compulsive enjoyment and extraction of surplus-value, or toward the conversion of enjoyment into surplus-value. The latter would then stand for the quantified, systemic enjoyment specific to the capitalist organisation of social and libidinal economy. This is also where the Lacanian contribution to the renewal of Freudo-Marxism enters the picture.

If Freud was at the core of the twentieth-century Freudo-Marxist debates, contemporary discussions of political significance of psychoanalysis focus extensively on Lacan, whose later work combined Marx and Freud through an epistemologically and philosophically oriented homological reading, pointing out the shared structural problematic that traverses critique of political economy and psychoanalysis.⁶ Just as for Marx 'individuals are ... personifications of economic categories, the bearers of particular class-relations and interests' (Marx, 1990: 92), for Lacan they are personifications of symbolic categories and discursive relations; their suffering bodies are the terrain, where the autonomy and the causality of symbolic order, including the economic one, manifest as disturbance and compulsive action.

THE UNCONSCIOUS WORKER: FREUD'S LABOUR THEORY OF THE UNCONSCIOUS

Paraphrasing Foucault's notion of 'power-knowledge', one could say that psychoanalysis from the very outset circulated around the nexus of power-enjoyment; and although Freud's early commentaries on the cultural condition still unfold on the background of the opposition between nature and culture, he soon came to the

insight that relations of power and libidinal bonds form a continuum.⁷ As Lacan occasionally remarked, ‘the only discourse there is ... is the discourse of enjoyment’ (Lacan, 2006b: 78). In other words, production of enjoyment cannot be eliminated from any symbolic system, speech act or social link. Abolishing this problematic surplus would ultimately require dissolving language altogether. For this reason, too, psychoanalysis cannot subscribe to political ideals such as ‘liberation of sexuality’ or ‘abolition of alienation’, which are often associated with the popularised versions of Freudo-Marxism (justifiably with Reich, less so with Marcuse). Capitalism itself seems to have introduced its own version of such liberation through universal commodification, which, to repeat Marcuse’s and Lacan’s framing of the problem, gave rise to the regime of repressive desublimation and imposed enjoyment. No need to recall that this development had anything but dealienating or liberating consequences for the subject; it may in turn have demonstrated the incompatibility of enjoyment and emancipation.

Freud’s aetiology of neuroses comes with a reminder that socioeconomic orders play a significant role in the genesis of ‘mental illnesses’. In writings such as *Beyond the Pleasure Principle* (1920) and *Civilisation and its Discontent* (1930) Freud most openly insists that the proliferation of traumatic neuroses is an inevitable collateral damage of capitalism. On the one hand, there is the evident aetiological link between traumatic neurosis and two crucial aspects of capitalism, war and crisis; on the other hand, there is another aspect, which concerns the problematic capitalist organisation of labour and enjoyment around the insatiable systemic imperative of production of surplus-value and around the superego injunction to enjoy.⁸ Seen in this light, traumatised or damaged subjectivity indeed stands for a ‘social symptom’.⁹ Of course, it would be wrong to envisage in traumatic neurosis an invention of capitalism (Freud does not draw this conclusion), but its technological and economic development seems to enforce rather than reduce cultural traumatism. Recall the grotesque figure of ‘prosthetic God’ that Freud introduces in his discussion of the modern cultural malaise.¹⁰ In contrast to *homo oeconomicus*, this strong, greedy and self-loving subject propagated by economic liberalism and neoliberalism, psychoanalysis accentuates the weakness of the human subject, whose artificial organs barely camouflage its incomplete and alienated nature. Lacan went further in this critical direction, recalling that the ultimate point of alienation remains anchored in the abstract and virtually endless character of labour: ‘It is true, then, that work (in dreams, among others) gets rid of thinking, calculating and even judging. It knows what it must do. This is its definition: it presupposes a “subject” that is *Der Arbeiter*’ (Lacan, 2001: 551). Lacan evokes here the controversial German conservative Ernst Jünger and his 1932 volume *The Worker*, but he equally targets ‘the ideal worker, the one Marx made the flower of capitalist economy’ (Lacan, 1990: 14). Psychoanalysis thus comes across the problematic of abstract labour, an economic category that Lacan explicitly associates with Freud’s description of the unconscious work in *The Interpretation of Dreams* (1900). As structural being – that is, as personification of an economic

abstraction – the worker does not think, judge or calculate: in other words, abstract labour overlaps with unconscious thought. Although the ‘ideal worker’ does not exist, it explains the problematic mode of existence of the proletarian, a labouring body consumed by economic abstractions and systemic imperatives: ‘There is only one social symptom – each individual is really a proletarian’ (Lacan, 2011: 18). The proletarian overlaps with the subject of the unconscious, or, to be more precise, with the subject of the capitalist unconscious, since Freud and Lacan do not postulate the existence of a transhistoric or transcultural unconscious (in contrast to Carl Gustav Jung). From Lacan’s point of view, Marx’s figure of the proletariat and Freud’s figure of the neurotic thus seem to share a common fate, insofar as they are compulsively working, both physically and mentally, for an exploitative symbolic system, which consumes their entire existence.

According to Marx, the capitalist organisation of social labour around ‘production for the sake of production’ (Marx, 1990: 742) and its imperative of constant increase of value confront the labouring subject with a virtually infinite task and with an actually insatiable demand. The mutual conditioning of production for the sake of production and of abstract labour – one could say, labour for the sake of labour – imposes on to the labouring subject a most problematic compulsive action, which pushes him or her to the point of exhaustion. In his analysis of production Marx indeed came across a ‘parasitism of the infinite on the finite’ (Milner, 1995: 67).¹¹ In Freud a homological problematic is at stake, but in order to evaluate the scope of this homology, it is necessary to give full weight to the notion of *Arbeit* (work, labour). The latter is indeed an underestimated concept in Freud, overshadowed by more evident fundamental concepts such as unconscious, drive or pleasure. However, by adopting the notion of labour Freud amounts to a double philosophical thesis, which resonates well with Marx. First, the equation of thought and labour: in *The Interpretation of Dreams* and other founding works intellectual operations such as condensation and displacement or visualisation of thought material are described as productive labour. The aim of these processes consists in producing pleasure for the sake of pleasure. This implies that at a certain level thinking no longer pursues the intellectual ideals formulated by philosophy throughout history (cognition, production of knowledge, unveiling of truth etc.). Thinking involves an activity, which serves no purpose:

Our mental activities pursue either a useful aim or a direct gain in pleasure. In the former case what we are dealing with are intellectual judgments, preparations for action or the conveyance of information to other people. In the latter case we describe these activities as play or phantasy. What is useful is itself (as is well known) only a circuitous path to pleasurable satisfaction. (Freud, 2001: 127)¹²

The psychoanalytic aim is not to delimit useful intellectual activities from useless fantasy but to show the wide-reaching consequences of their intertwining or indistinction, the mobilisation of thought – that is, of mental work – and more generally of discourse for producing surplus-enjoyment. This production is immanent to every thought-process, or, as Lacan eventually put it, thought *is* enjoyment. Both

aspects of thought that Freud mentions in the above quote are as inseparable and at the same time as distinct as the use-value and exchange-value of commodities. The main critical contribution of psychoanalysis to the critique of political economy can thus be brought down to the recognition of the link between thought, enjoyment and labour, underpinned by the recognition of their compulsive character.

A more general question emerges here: what to make of the fact that Freud repeatedly used economic metaphors and vocabulary in order to explain the unconscious and sexuality – to the extent that the features of libidinal economy become hard to distinguish from the features of capitalist economy? Freud discovered in the production of surplus-enjoyment a crucial problem, which is directly linked with what is in German called *Verausgabung*, consumption in the economic sense and exhaustion in the psychological sense. The more the mental activities are channelled through the drive's demand of surplus-enjoyment, the more the subject's mental apparatus needs to sustain the laborious process that is thought as such. The centrality of labour in Freud's theoretical and clinical work draws attention to something like libidinal exploitation, which manifests as exhaustion-consumption of subjectivity. Put differently, Freud directly links production of surplus-enjoyment and exploitation of labour. If we recognise in Freud's economic vocabulary more than mere rhetoric or metaphoric, it makes sense to conclude that his work proposes a labour theory of enjoyment. Both Freud-Marxism and Lacan depart from the assumption that the proliferation of economic terms in Freud's work is not coincidental and that Freud's economic vocabulary must be interpreted by means of Marx.

The thesis that unconscious labour and enjoyment form two sides of the same productive process in mental life goes against the 'homeostatic' conception of pleasure that predominated in the history of European philosophy since Aristotle. In *Nicomachean Ethics*,¹³ Aristotle famously equated pleasure with the state of rest, in which presumably no bodily or mental excitation takes place – hence a state of homeostasis, conceived as an ideal, to which human beings must aspire and conduct their actions accordingly. Aristotle depicts the divine immovable mover as the ultimate example of such a pleasurable state without any need that would imply a lack and require satisfaction. Human pleasure too presumably tends toward this ideal homeostasis, when humans act in accordance with the right measure. In Aristotle's ethical scenario, pleasure is understood as an affect accompanying the satisfaction of needs and signals the renewal of homeostasis, the decrease of tension caused by the manifestation of a physiological need or a symbolic demand. The problematic of surplus-enjoyment and the compulsive character of unconscious labour clearly have no place in this scenario. Freud focused on two tendencies in the mental apparatus, desire and drive, which directly contradict the Aristotelian assumption of right measure and which explain constant tension in the mental apparatus, the uninterrupted process of unconscious labour and the striving of mental activities toward production – not simply of pleasure, but of increase of pleasure. The movement of desire is sustained by the metonymy of lack; here every object comes as disappointment and

failure and cannot live up to the task of fulfilling desire. The movement of the drive, on the other hand, is sustained by the metaphor of surplus; here an object-fixation is at stake, the object of satisfaction has been found and the drive cannot get enough of it, always demanding more, but in an entirely different way from desire. For desire every object comes with a lack, which directs desire to another object, whereas for the drive there is only one surplus-object, which stands for the ultimate materialisation of enjoyment. Desire and drive each demonstrates in its own way the impossibility and the fictitious status of ideal homeostasis; and, moreover, in contrast to the Aristotelian right measure, each outlines two scenarios, which demonstrate the unmeasure of pleasure.

THE CAPITALIST VICISSITUDE OF THE DRIVE: A RETURN TO MARX

In contrast to a supposedly natural instinct such as hunger, the satisfaction of which is rhythmic rather than constant, and whose demand appears and vanishes, the drive never ceases to demand pleasurable satisfaction. An instinct comes as one-time impulse, while the drive is a 'constant force' (Freud, 2001, vol. 14: 118). The former pursues goals that can be described in terms of self-preservation of individual or organism, and therefore assumes the appearance of an entirely natural force. The drive, on the other hand, can be satisfied only by constant repetition of pleasurable satisfaction, since its object is pleasure as such. The perspective is therefore inverted: satisfaction of the drive generates an increase of tension and points toward a constitutive imbalance and disequilibrium rather than homeostasis. Its object of satisfaction, pleasure, is not a more or less accidental affection accompanying the act of satisfaction, but rather *the* object of demand. Lacan occasionally remarked that enjoyment is characterised by the fact that it 'serves no purpose' (Lacan, 1999: 3); in relation to this formula we can repeat that the drive demands production of pleasure for the sake of pleasure, which is in itself a useless production. This brings us again to Marx's formula 'production for the sake of production', which ultimately describes capitalism as organisation of social production around the imperative of uselessness and as a useless mode of production. The ultimate expression of this uselessness is fictitious capital or financial economy. At this point Freud's theory of the drive and his non-homeostatic conception of pleasure seem to intersect most overtly with Marx's theory of surplus-value and his description of capital as drive (*Trieb*). If we take this terminological feature seriously, it places Marx and Freud in another shared conceptual history.

At the core of this history stands a depsychologisation and denaturalisation of the drive, which results from the recognition of the drive's constant character. Marx saw that the demand of capital, understood as a specific force of capitalist economic structures and relations, is immanently redoubled on the demand of surplus-value and the demand of surplus-labour. This redoubling appears in

several crucial passages of *Capital*, where the economic category of capital is brought down to the drive of self-valorisation (*Selbstverwertungstrieb*). Further, the drive comes in the guise of a more common and seemingly transhistoric drive of enrichment (*Bereicherungstrieb*), which builds the bridge from the premodern miser to the modern capitalist:

Except as capital personified, the capitalist has no historical value ... But, in so far as he is capital personified, his driving motive is not use-value and enjoyment, but exchange-value and its augmentation [*Vermehrung*]. He is fanatically intent on the valorization of value; consequently he ruthlessly forces the human race to produce for the sake of production ... Only as a personification of capital is the capitalist respectable. As such, he shares with the miser an absolute *drive of self-enrichment*. But what appears in the miser as an individual mania is in the capitalist the effect of a social mechanism in which he is merely a cog [*Triebrad*] (Marx, 1990: 739, emphases added, translation modified).

Marx is nevertheless aware that the drive undergoes historical metamorphoses instead of being an invariable and transhistoric force, which obtains its full actualisation under capitalist socioeconomic conditions. To follow Freud again, there is no drive that precedes its destinies (repression, sublimation, self-aggression, etc.), no *drive-nature* before *drive-culture*. If Marx's and Freud's takes on the problematic should indeed be brought together, then the logic of capital implies a specifically modern vicissitude of drive, a modern form of repression, which grounds the socioeconomic relations on a particular renunciation of enjoyment, associated with the transformation of labour. Ultimately, the modern vicissitude of the drive is conditioned by two central abstractions specific to capitalism: surplus-value, the quantified form of surplus-enjoyment, and abstract labour, or labour-force, the quantified form of mental and bodily processes and activities.

The last excerpt from Marx deserves a closer reading. At first sight the miser and the capitalist seem to be motivated by the same drive of enrichment, which is conditioned by the same 'spectral materiality' of money, the embodiment of value-abstraction: 'The hoarding drive is boundless [*maßlos*¹⁴] in its nature. Qualitatively or formally considered, money is limitless, that is, it is the universal representative of material wealth because it is directly translatable into any commodity' (Marx, 1990: 230–1). But Marx exposes a fundamental difference in both logics of the drive, even though they depend on the same monetary abstraction:

This absolute drive of enrichment, this passionate chase after value, is common to the capitalist and the miser; but while the miser is merely a mad capitalist, the capitalist is a rational miser. The restless augmentation [*Vermehrung*] of value, which the miser seeks to attain by saving money from circulation, is achieved by the more acute capitalist by means of throwing money again and again into circulation. (Marx, 1990: 254–5, translation modified)

From the modern, capitalist perspective avarice appears as madness, while in the premodern, non-capitalist modes of production it follows an economic rationality. In the 'closed world' of pre-capitalist modes of production, which knows no surplus-value, the 'restless augmentation of value' can economically only be

achieved by means of evacuating money from circulation. In this way value is purified first and foremost of its embedding in the social link, of its social character, and transformed into an asocial fetish-object, the miser's treasure. In the 'infinite universe' of capitalism, in contrast, the question is no longer how to liberate money but how to set free its creative potentials.¹⁵ Hence, Marx's talk of *Vermehrung*, procreation, in relation to money: once transformed into capital, money finally obtains its *procreative force*, *Zeugungskraft*.

The image of self-engendering value, the appearance of value as an automatic subject, is what finally characterises the three stages of economic fetishism: commodity fetish, money fetish and capital fetish. The task of their critique, on the other hand, consists in showing that the liberation of creative potentials of money can only take place through overinvestment, speculation and indebtedness – three economic practices that are not only completely foreign to the miser, but that also directly contradict his tendency to liberate money from circulation. The miser can therefore never become a capitalist and his treasure can never transform into capital no matter how much wealth he accumulates. The drive (of enrichment) is here internalised, restricted to the body and the mind of the miser, and therefore *appears* as purely psychological force ('individual mania'). The virtual infinity of the drive is restricted by finitude also in the sense that the miser is driven by a concrete object-fixation: money may be an abstraction, but in avarice it still anchors the drive in some kind of empiricism, which motivates the miser to evacuate money and valuable metals from circulation, to save them from bad exchange. Again, the infinity is finalised, restricted to the miserable finitude of miser. The latter may be a hostage of his treasure and subjected to the fanaticism of 'his' drive of enrichment, but one could equally say that the treasure and the drive of enrichment are hostages of the miser's finitude. A double parasitism is at work, that of infinity on finitude and of finitude on infinity.

The capitalist, on the other hand, stands entirely on the side of speculation. Value is here finally freed from its empirical anchoring and *appears* to become an automatic subject, which can generate more value without the mediation of social labour or other forms of organised exploitation. The capitalist's drive is no longer fixated exclusively on money and other objects of value, but rather takes value, more precisely the surplus (*mehr*) of value in all its abstraction, as the exclusive object of its insatiable demand. The economic sphere is no longer destabilised through withdrawal of money, as in the case of the miser, but through the imperative of *overproduction*, the ultimate expression of which is again financial economy. Production for the sake of production or overproduction is the main modern economic invention; there is no capitalism without this immeasurable and useless production and, consequently, without the transformation of treasure into capital and the accompanying metamorphosis of the drive of enrichment into the drive of self-valorisation.¹⁶

This is where the drive as 'demand for work',¹⁷ and, more fundamentally, the historical transformation of all concrete forms of labour into abstract labour enters the picture. This transformation goes hand in hand with the above-mentioned metamorphosis of the drive from the drive of enrichment into the drive of

self-valorisation. In the miser's case no universal 'demand for work' could ever be articulated; the only person who must labour without interruption for satisfying the drive of enrichment is the miser himself, namely labour in the sense that he has to renounce private consumption in order to make the treasure grow. Enjoyment is externalised in the sensuous materiality of treasure. The capitalist drive of self-valorisation, in contrast, comes in the guise of the universal imperative to renounce enjoyment, or, in Marx's phrasing, in the guise of the capitalist's tendency to extend the length of the workday (or worklife), motivated by the economic fantasy of total subsumption of life-day under workday and life-force under labour-force. Because the drive's 'demand for work' is now universal, every subject ultimately becomes a hostage of the system:

The capitalist has bought the labour-force at its daily value. The use-value of the labour-force belongs to him throughout one working day. He has thus acquired the right to make the worker work for him during one day. But what is a working day? At all events, it is less than a natural day. How much less? The capitalist has his own views of this point of no return, the necessary limit of the working day. As a capitalist, he is only capital personified. His soul is the soul of capital. But capital has one sole life-drive [*Lebenstrieb*], the drive to valorize itself, to create surplus-value, to make its constant part, the means of production, absorb the greatest possible mass of surplus labour. (Marx, 1990: 341–2, translation modified)

The capitalist cannot be considered a subject, because the latter is defined by the fact that, by entering the economic act of exchange – that is, by selling his labour-force – he is transformed into an object, the capitalist's private property: 'If the worker consumes his disposable time for himself, he robs the capitalist' (Marx, 1990: 342). The selling of labour-force follows a compulsive law, which places every subject in the position of debtor toward the capitalist system as a whole. By selling their labour-force the labourers owe their existence to capital. Behind the ideological quadrivium of 'Freedom, Equality, Property and Bentham' (Marx, 1990: 280) Marx reveals a radical asymmetry, which ultimately blurs the difference between commodity exchange and exploitation. Moreover, when Marx compares capital with the life-drive, one cannot but think of Freud's Eros, or the drive of self-preservation, which in Marx's framework openly assumes the destructive features of Thanatos, or the death-drive. The survival of capital as drive of self-preservation inevitably implies the death of the subject, its consumption-exhaustion. As subject of the capitalist mode of production – that is, as labourer – one must sacrifice one's own life; this is the ultimate renunciation of enjoyment associated with the drive in both Marx and Freud.

STRUCTURALIST FREUDO-MARXISM: A PROJECT IN CRITICAL EPISTEMOLOGY

Beyond concrete conceptual continuities or translations a renewed interest in the alliance between psychoanalysis and critique of political economy readdresses

the more general question of whether Marx's critique and Freud's clinic have a shared epistemological framework. Lacan's response to this question was affirmative. His thesis on the homology of surplus-value and surplus-enjoyment questions the usual 'division of labour' between psychoanalysis and critique of political economy in accordance with dichotomies such as 'individual–society', 'mental–social' and 'personal–political'. Lacan's epistemological take envisages beyond these oppositions a structural problematic that the psychoanalytic 'hermeneutic' of social phenomena or the Marxist 'hermeneutic' of mental phenomena failed to address. Lacan is interested less in the manifold of analogies, similarities and parallels, as well as the differences, between individual and society than in the structural continuum, which precedes and sustains the two registers in question. Hence, for instance, the double meaning of the term 'discourse' in Lacan, which designates both the structure of speech (*parole*) and the formal matrix of social links.¹⁸ By focusing on the structural grey zone in-between the individual and the social, the homological reading pursues a depsychologisation of the individual and at the same time avoids the psychologisation of society.

The shared epistemological horizon of Marxism and psychoanalysis was also highlighted by Louis Althusser, who argued that Marx and Freud invented two '*conflictual sciences*' (Althusser, 1993: 226), whose critical conception of scientificity contradicts the one propagated by the logical-positivist and empiricist epistemologies. With regard to this epistemological quarrel, psychoanalysis and historical materialism are conflictual not only in relation to other sciences, but also in relation to themselves: they are '*scissional sciences*' (Althusser, 1993: 226), subject to internal struggles, splits and revisions, which are directly related to their critical stance toward the capitalist mobilisation of scientific knowledge. Althusser's observations resonate with the overall tendency of twentieth-century structuralism, and particularly with Lacan's structural psychoanalysis, to repeat the foundational gesture of modern natural sciences in the field of 'human objects', such as language, labour and thinking. As Koyré (1971: 87–98) argued, premodern science was dominated by the Aristotelian view, according to which there can only be a mathematised science of being and not of becoming. Modern science, in contrast, abolished the divide on the superlunary sphere of eternal and immovable being, where Aristotle believed to have found the ultimate ontological homeostasis, and the sublunary sphere of transient and unstable being. The immediate consequence of this abolition was the exposure of the gap between subjective experience and scientific experimentation. Modern science no longer 'saves the phenomena' (describes, in the natural language of sense and meaning, the way the real appears to the conscious human observer), but rather mobilises, by means of mathematisation and experimentation, a real that remains irreducible to appearance and foreign to subjective experience. For Koyré, this was the main epistemic conflictuality introduced by modern science, so that in this respect the entire modern regime of knowledge would correspond to Althusser's notion of '*conflictual science*'.¹⁹

In their focus on discursive autonomy, Marx's critique of political economy and Freud's psychoanalysis uncovered the same gap between the appearance and the real in the realm of human objects. But according to Lacan, it was structural linguistics that finally turned this gap into the main object of a scientific inquiry:

With Saussure and the Prague Circle, linguistics was grounded on a cut, which is the bar posed between the signifier and the signified, so that the difference from which the signifier is constituted prevails absolutely, but also orders itself with an autonomy that has nothing to envy in the effects of the crystal. (Lacan, 2001: 403–4)

Lacan exemplifies the structuralist appropriation of the epistemic foundations of modern science on the Saussurean bar, which stands for the arbitrary and unstable relation between signifier and signified. The bar implies that language is irreducible to mere communication, representation and reference, hence to the way it appears to its human users. Marx's science of value too operates with a bar, which distinguishes in a commodity its use-value, which relates to a psychological need, from exchange-value, which relates to another exchange-value and therefore constitutes an autonomous sphere or symbolic system. The universe of commodities, then, appears homologous to the structure of language;²⁰ it is internally doubled, and the actual autonomy of the logic of exchange, its compulsive character and its determination of human thought and action, can only be revealed once Marx's dialectical method moves beyond the way the universe of commodities appears to its subjects. Political economy was restricted to appearance, examining the way the 'immense collection of commodities' (Marx, 1990: 125) appears to the conscious economic subject. From Marx's perspective, political economy is no 'science of value', because it remains stuck with the appearance of commodities, without questioning their problematic, unstable and inconsistent character. It considers commodities either pragmatically, as mere use-values, or fetishistically, as value incarnated, which is from Marx's critical view equally wrong: utilitarianism explains too little (it overlooks the problem of fetishist appearance, against which its pragmatism is not immunised) and fetishism explains too much (it turns value into a self-engendering subject, instead of conceiving it as social relation). In this respect political economy remains anchored in the premodern, Aristotelian epistemological paradigm: it 'saves the appearances', meaning that it does not analyse them – in the etymological meaning of *analysis* as decomposition, dissolution or deconstruction – in order to reach the abstract level of structural relations sustaining the world of appearances.

Psychoanalysis and historical materialism reveal a structural conflictuality that cultural institutions and instances strive to repress (Freud) or mystify (Marx). Their privileged object is structure grounded in an underlying conflict, tension or contradiction. Lacan himself brought this conflictuality to the point in the following manner:

There are, insofar as the unconscious is implicated, two sides presented by the structure, by language. The side of meaning, the side we would identify as that of analysis, which pours out a flood of meaning to float the sexual boat. It is striking that this meaning reduces to non-sense: the non-sense of sexual relation. (Lacan, 1990: 8)

The side of meaning is not what primarily interests psychoanalysis, even if Freud occasionally claims that production of sense out of non-sense is the main achievement of unconscious work. Persisting on the side of sense would still entail an error, which would consist in attributing sexual meaning to everything. Following the stereotype, the technique of psychoanalysis consists in uncovering the repressed, camouflaged or repressed sexual meaning behind every senseless parapraxis, random dream or banal joke. Freud was not immune to overemphasising the sexual meaning. Nonetheless, he recognised a side of linguistic structure that follows a different mechanism from the logic of sense and meaning: compulsive repetition. Lacan addressed this crucial aspect of psychoanalysis by contrasting sense and sign: ‘Whence the unconscious, namely the insistence through which desire manifests itself, in other words the repetition of the demand working through it ... reminds us that [to] the side of sense that fascinates us in speech ... the study of language opposes the side of the sign’ (Lacan, 1990: 8, translation modified). By decomposing the sign, structural linguistics isolated its differential element, the signifier, which is at the same time the opposite and the support of sense. In the signifier we encounter senseless repetition, which drives production of enjoyment, something that immanently distorts the pragmatic function of language and its univocal relation both to the signified and to reality outside language. As already mentioned, the speaking subject experiences this repetition as compulsion, which brings the dimension of the unconscious and the force of the drive into the picture, two bodily actualisations of the autonomy of the symbolic order. Freud himself already intuited the dependency of the unconscious on the abovementioned double-sidedness of language, when he wrote the following lines:

The dream-wish belongs to a different unconscious – to the one which we have already recognized as being of infantile origin and equipped with peculiar mechanisms. It would be highly opportune to distinguish these two kinds of unconscious by different names. But we would prefer to wait till we have become familiar with the field of phenomena of the neuroses. People consider a single unconscious as something fantastic. What will they say when we confess that we cannot make shift without two of them? (Freud, 2001, vol. 15: 227)

The true novelty of Freud’s discoveries consisted in this redoubling of the unconscious. One cannot deny that the unconscious of unclear representations, repressed and camouflaged meanings, was familiar to his predecessors.²¹ Freud initially departed from this notion of the unconscious, but the true discovery could only be made in the displacement from sense to repetition, which revealed the persistence of an insatiable unconscious demand for enjoyment in the mental apparatus, a demand which addresses the subject, so to speak, from outside, as a foreign force. In the same way, Marx differs from classical political economy in his demonstration that in order to understand production of surplus-value and the crisis-driven reality of capitalism, one ultimately needs to distinguish between two capitalisms, or, rather, between the appearance and the logic of capital. As already discussed, the point of departure for this differentiation is the gap between use-value and value, which stands at the very beginning of the first volume of *Capital* and

which shows that Marx indeed grounded his critique on a structural problematic that would become omnipresent in the twentieth-century humanities. In addition, Marx's mobilisation of the problematic of the drive is the ultimate expression of this distinction between two inseparable yet entirely distinct faces of capitalism. To return to Adorno's comment on psychoanalysis, in Marx, too, nothing is true except the exaggerations.

INSTEAD OF A CONCLUSION: ANALYSIS AS CULTURAL WORK

In his later years Freud extensively focused on the theoretical and clinical deadlocks of psychoanalysis. One could say that the most charged political moments of psychoanalysis are tied to two fundamental deadlocks, which obtained their expression in Freud's metapsychological notion of death-drive and in the clinical dilemmas concerning the end of an analysis and the overall problem of resistance to psychoanalysis. In a famous passage, Freud spelled out the clinical task of psychoanalysis in the following manner: 'Where id was, there the ego shall be [*Wo Es war soll Ich werden*]. It is cultural work – not unlike the draining of the Zuider Zee' (Freud, 2001, vol. 22: 80, translation modified).²² Freud's comparison of psychoanalysis with the Dutch reclamation of land is only partially successful, for what is at stake in analysis is not a taming of natural instincts or cultivation of some aggressive libidinal nature, but a transformation within culture. The analytic work first and foremost transforms the psychic conflict that forced a person to undergo analysis into a new conflict, which consists in the effort of analysis to work on the resistance to change of established libidinal structures and modes of enjoyment. One could argue that what takes place during the analytic process is indeed organisation, an ongoing effort in mobilising the analysand's mental work, hitherto consumed to sustain an exploitative libidinal economy, the mechanism of repression and the 'consumption of being' that this logic of enjoyment inevitably entails. According to Freud and Lacan, psychoanalysis as clinical practice must orientate the analysand to work on structure – and in this respect its goals indeed stand in conflict with the various popularised psychotherapies, such as cognitive behavioural therapy, which begins with a thorough 'privatisation of symptoms' without addressing their broader socioeconomic conditioning. In its theoretical aspects, Freud-Lacanian psychoanalysis can be understood and mobilised as a crucial chapter in the broader history of critical thought, since it openly confronts culture with its immanent deadlocks. In this respect psychoanalysis can participate in establishing the conditions of emancipatory 'cultural work'.

Psychoanalysis addresses the analysand with its own 'demand for work'. Freud named this work-imperative 'working-through' (*Durcharbeiten*), understood as work on resistance to the progress of the cure (which, again, ultimately

manifests as resistance to change).²³ In this framework the crucial psychoanalytic problem concerns the fact that resistance is not simply psychological, localised in the analysand, but also constitutive of social structures and institutions. In a way, Freud understands culture as organised resistance, and what psychoanalysis ultimately confronts in its clinical practice is resistance, or primary resistance, which *precedes* every counterforce and which manifests as structural inertia and as libidinal fixation of the drive. As ‘cultural work’, hence as organised mental work on structures that condition the analysand’s illness and whose character is always already social, analysis must become more than mere opposition to resistance against the exploitative libidinal economy imposed by capitalism, hence more than resistance to resistance. The imperative of working-through makes analysis an ‘impossible profession’, an open-ended (Freud even writes *unendlich*, infinite) task, which must continue in different form and without the analysand’s dependence on the analyst even after the actual termination of the cure.²⁴ To return again to Freud’s clinical imperative, the task of analytic work consists in triggering a process of becoming, which will move the analysand away from ‘where id was’, destabilising her embedding in an exploitative libidinal economy or consuming-exhausting mode of existence. Rather than proposing a ready-made therapeutic solution, psychoanalysis contaminates the analysand’s life with a new conflict: where the existing psychic conflict consumed the entirety of the analysand’s mental work, the analysand ‘shall become’ the subject of a labour process, aiming to transform the compulsive mode of enjoyment imposed by the capitalist organisation of life and thinking. Here psychoanalysis *can* intersect with the imperatives of emancipatory politics – another example of cultural labour striving to organise subjectivity, this time in a collective process of becoming, and a politics of working-through confronting the structural resistance of capitalism to every significant socioeconomic change.²⁵

Lacan was aware that working toward a ‘way out of the capitalist discourse’ (the capitalist mode of production and its corresponding mode of enjoyment) is a task from which psychoanalysis is not exempt; but he was also conscious of the fact that such an exit ‘will not constitute progress, if it happens only for some’ (Lacan, 1990: 16). Since there are many ways leading out of capitalism, some significantly worse than others, psychoanalysis cannot avoid the decision of what kind of social transformation it wants to participate in. The psychoanalytic clinic may be structurally and empirically restricted to particular cases, but it nevertheless comes with a universalistic outlook (not ‘only for some’) that psychoanalysts often forget in their reflections on the political significance of their theory and practice.²⁶ Despite the fact that Freud and Lacan were critical of Marxism, their work remains open for emancipatory appropriation. But whether the ‘cultural work’ of psychoanalysts will unfold in the same direction as other emancipatory social movements ultimately remains a political decision of analysts themselves.

Notes

- 1 The most recent account of the historical (mis)alliances between psychoanalysis and Marxism can be found in Pavon Cuellar (2017). Freud's critique of Marxism appears in the final chapter of his *New Introductory Lectures on Psychoanalysis* (Freud, 2001, vol. 22: 176–82). See also Dolar (2008: 15–29).
- 2 The English translation of the German *Trieb* contains this mistake, thus sustaining the impression that Freud's doctrine of the drive was naturalistic and biologicistic. Freud himself often resorted to biological metaphors in order to provide a 'scientific grounding' of his notion. Still, he never abandoned the idea that the drive stands for the border phenomenon between the physiological and the psychological.
- 3 For Freud, repression contains an internal redoubling, which distinguishes it from simple oppression: 'it is a mistake to emphasise only the repulsion, which operates from the direction of the conscious upon what is to be repressed; quite as important is the attraction exercised by what was originally repressed upon everything with which it can establish a connection' (Freud, 2001, vol. 14: 79). While oppression prohibits satisfaction, repression constitutes it through postponement, displacement or mediation. Lacan brought this nuance to the point, when he translated repression as 'renunciation of enjoyment' (Lacan, 2006c: 17–19, 109–10), which aims at obtaining surplus-enjoyment. Hence, for Lacan this renunciation grounds what he calls 'capitalist morality'.
- 4 The controversial notion of the death-drive stands for the ultimate expression of the conservative character of drives. It is worth recalling that the phenomenon, which led Freud to assume its existence, was compulsive repetition. The early Freudo-Marxists rejected this assumption. See, for instance Reich (1932: 303–51) and Fenichel (1985: 361–71). For the most updated theoretical account of the death-drive, see Zupančič (2017: 94–106).
- 5 Marcuse's idea of repressive desublimation comes close to Lacan's reduction of the super-ego to the imperative of enjoyment (Lacan, 2006a: 648–9; 1999: 3).
- 6 A systematic account of Lacan's relation to Marx can be found in the work of Slavoj Žižek (1989: 11–53; 2017: 149–223), as well as in my own attempt (Tomšič, 2015). For a broader Lacanian take on the link between enjoyment and capitalism, see also McGowan (2016).
- 7 In this regard, Freud's famous essay 'Group Psychology and Analysis of the Ego' (1921) remains representative of his critical examination of the link between libidinal economy and social power. The text served as the main source for the Frankfurt School's analysis of fascism. See, for instance, Adorno (2003: 408–33). For a sharp commentary of the relation between the individual and the group in Freud, see Copjec (2014).
- 8 This is where Lacan's thesis that surplus-value and surplus-enjoyment are homological, or that in capitalism enjoyment obtains its socioeconomic expression in surplus-value, finally comes in: '*Mehrwert* is *Marxlust*, Marx's surplus enjoyment ... surplus value is the cause of desire, of which an economy made its principle: that of extensive, hence insatiable production of lack of enjoyment' (Lacan, 2001: 435).
- 9 According to Lacan, the category of social symptom was invented by Marx, who recognised in this position the proletariat (Lacan, 2006a: 194).
- 10 'Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times' (Freud, 2001, vol. 21: 91–2).
- 11 To anticipate later developments, in order to conceptualise this problematic parasitism Marx introduces the notion of the drive, which brings his developments close to Freud's critical examination of the intricacies of pleasure.
- 12 Freud uses the term *Lustgewinn*, which literally means pleasure-profit. On this background Lacan could propose the translation *plus-de-jouir* (surplus-enjoyment) and draw the homology with surplus-value.
- 13 The following developments relate notably to the Book X of *Nicomachean Ethics* (Aristotle, 1995: 1852–67).
- 14 *MaBlos*, literally *measureless*, hence the scandal it represents for Aristotle's doctrine of right measure.

- 15 The expressions 'closed world' and 'infinite universe' are adopted from Koyré (1957). See also Johnston (2017: 270–346).
- 16 From the viewpoint of Marx's discussion of the role of national debt and of the credit system in the historical genesis of capitalism one could also say that the miser's drive of enrichment has been transformed into the capitalist's drive of indebteding, *Verschuldungstrieb*. Economic debt is what horrifies the miser; he is anything but a gambler or a speculator. For the notion of debt-drive, see Schuster (2016).
- 17 'If we now turn from the biological side to the observation of psychic life, then the "drive" appears to us as a limit-notion between the psychic and the somatic, as psychic representative of stimuli coming from within the body and reaching the soul, as measure of demand for work [*Maß der Arbeitsanforderung*], which is imposed on the psychic due to its connection with the bodily' (Freud, 2001, vol. 14: 122, translation modified). The formula 'connection of the psychic with the bodily' directly addresses the parasitism of the infinite on the finite. The virtual infinity that Freud detected in the human subject follows from the gap between the bodily and the mental (the symbolic). In Marx the same gap is placed between use-value and exchange-value of commodities.
- 18 See Lacan (2006b). Lacan's main points of interest are structural instabilities and logical contradictions, as well as the disfunctioning of discursive mechanisms.
- 19 Modern natural sciences, however, do not match with the 'scissional' feature: they are not subjected to splits, revisions and antagonisms in the same way as psychoanalysis or historical materialism.
- 20 Marx (1990: 143), incidentally, spoke of the 'language of commodities'. For a most sharp recent account of this problematic, see Khatib (2017: 49–72).
- 21 This understanding of the unconscious could be traced all the way back to Descartes (Lewis, 1950).
- 22 Most post-Freudians understood this ambiguous phrase in the sense that psychoanalysis should strengthen the ego.
- 23 For an extensive discussion of the political weight of the clinical conflict between resistance and working-through, see Comay (2015: 237–66) and Hamacher (2002: 180–96).
- 24 See Freud (2001, vol. 23: 216–53), where these clinical problems are most directly addressed, as well as the critical account by Kofman (1983).
- 25 In the end Lacan's thesis on homology of surplus-enjoyment and surplus-value implies that production of enjoyment is precisely a concrete manifestation of systemic resistance on the level of the subject.
- 26 For an emancipatory framing of psychoanalysis, see Šumič (2016: 28–42).

Queer Studies

Peter Drucker

INTRODUCTION

Marxists working in queer studies, while addressing theoretical and political differences among themselves, have gradually been building a body of theory during the first decades of the twenty-first century. They have been synthesizing core Marxist concepts, like class, totality, reification, social reproduction and combined and uneven development, with concepts from other paradigms, such as social construction, performativity, homonationalism and intersectionality. Their efforts have both engaged with and challenged the poststructuralist approaches that have been largely dominant in contemporary queer theory.

To begin with, Marxists working in queer studies were able to draw on earlier connections between sex reform movements and the Second and Third Internationals, and between lesbian/gay liberation and the New Left. But over the past quarter-century they have to a great extent engaged in academic debates with contemporary queer theory, while looking as well to queer-identified radical activism since the emergence of ACT UP and Queer Nation in the late 1980s and early 1990s. The influence of their largely academic milieu is reflected in their attention to philosophy, literature and the arts, as well as the more core concerns of historical materialism. They generally share a broad social constructionist approach to sexuality and an aversion to economic reductionism. While the USA, UK and Canada have been the main centres of academic queer Marxism,

it has been expanding recently in East Asia, and has a perceptible presence in the Arab region and Latin America.

Marxist approaches within queer studies have been heavily indebted to Marxist feminist theorizing, notably about social reproduction and the gendered division of labour. Marxists in both queer and feminist studies have been centrally concerned with lesbian feminism, with intersectional analysis, and with providing a historical and materialist underpinning to a performative understanding of gender. Queer Marxist understandings of gender have been increasingly inflected by a focus on transgender, intersex and gender-queer lives and struggles. Marxists working in queer studies have also engaged critically with radical queer people of colour critique, and in efforts to craft a global, non-Eurocentric understanding of sexuality.

At the same time many Marxists in the field (though not all) have stressed the importance of class, developed concepts linked to political economy such as 'outlawed needs' and 'moral deregulation', and explored connections between successive long waves of capitalist accumulation and different sexual regimes. Differences over the centrality of class and production have in fact constituted a key dividing line among self-identified historical materialists working in queer studies. The category of totality has been important to Marxists in the field of queer studies, all of whom are seeking a global, non-reductionist vision, though different Marxists vary in the way they interpret the concept. The concept of reification, too, has been both key to Marxist approaches to queer studies and a fruitful source of divergences, as has the originally non-Marxist concept of homonormativity. These theoretical divergences can be linked to different approaches to political issues like same-sex marriage.

PRECURSORS

The roots of Marxist queer studies go back to the first interactions between Marxist theorists linked to socialist labour movements, on the one hand, and successive waves of homosexual emancipation and lesbian/gay liberation, on the other. Initially passing in silence over Marx and Engels' homophobic remarks in their writings and letters, German Marxist Eduard Bernstein responded to the 1895 trial of Oscar Wilde with a critique in *Die Neue Zeit* of sexually repressive legislation (see Lauritsen and Thorstad, 1995). German Social Democracy's support for the Scientific-Humanitarian Committee (linked to Magnus Hirschfeld's Institute for Sex Research) was reflected in the Russian Bolsheviks' post-revolutionary decriminalization of homosexuality and support for research in sexology. In the absence of an autonomous homosexual movement Russian Marxists devoted little sustained theoretical attention to homosexuality, but the pioneering theorist of sexuality Alexandra Kollontai largely set the tone for international Marxism in the 1920s with her rejection of anti-homosexual repression and prejudice (see Healey, 2001, for the definitive history of policy and research on homosexuality in the early Soviet Union.)

The Stalinized Communist movement made a sharp turn towards anti-homosexual attitudes in the 1930s. Nevertheless, the sexual attitudes of pre-Stalinist Marxism were sustained and further theorized after the Second World War, notably with Herbert Marcuse's defence of the 'perversions' in his *Eros and Civilization* (1966). By far the outstanding work produced by the Freudian left, this book coined the concepts of 'the performance principle' (a specifically capitalist form of Freud's 'reality principle'), 'surplus' as opposed to 'socially necessary' repression, and 'repressive desublimation'. It not only was an inspiring text for lesbian/gay liberation during the period of the New Left, but has also continued to influence some of the Marxists working in queer studies today.

The near-simultaneous rise of New Left Marxism and of lesbian/gay liberation in the 1960s and 1970s resulted in a new flowering of lesbian/gay Marxist theory. This was as notable in Latin America, where Marxism had a strong presence and lesbian/gay liberation took off in several countries, as in imperialist countries. Round-ups of gender and sexual dissidents in Cuba's UMAP camps and other forms of discrimination provoked soul-searching among lesbian/gay Marxists (see Lumsden, 1996), but lesbian/gay interactions with the Nicaraguan Sandinista Liberation Front (FSLN), the Brazilian Workers Party (PT) and the much smaller but disproportionately influential Mexican Revolutionary Workers Party (PRT) (see Lumsden, 1991) were more positive. These led to significant theoretical results, often published in English by North Americans campaigning in solidarity with Latin American struggles. In Nicaragua, for example, activists challenged the FSLN's early intolerance both internationally and from within, with a significant measure of success (see Randall, 2000). In Brazil, the anti-lesbian/gay attitudes of Guevarist guerrilla groups in the 1970s gave way to more positive approaches in the PT (Green, 2000, 2012). These experiences fostered further Marxist theorizing on sexuality in both the Americas and Western Europe.

However, greater resources and less severe repression gave an advantage to lesbian/gay Marxists in imperialist countries, such as Third World Gay Revolution in New York and Chicago. The London Gay Liberation Front (GLF) and the journal *Gay Left* were particularly stimulating for theorizing: in the 1980s they yielded such work as David Fernbach's (1981) account of the uniqueness of lesbian/gay identity under capitalism (notable for its linkage of sexuality to gender and the family), which laid out a Maoist-influenced 'national front' strategy for social, sexual and ecological transformation. Italian Mario Mieli produced a pioneering and idiosyncratic book (1980), remarkable for its championing of transvestism and its psychoanalytically inspired defence of schizophrenia, which drew both on the strength and theoretical originality at the time of the Italian far left and on Mieli's activism in the London GLF. Later, Jamie Gough and Mike Macnair's (1985) central focus on sexual fetishism anticipated twenty-first-century queer Marxist work.

In the USA, John D'Emilio's seminal essay 'Capitalism and Gay Identity' (1983), linking 'free' labour under capitalism to identity formation, was widely and lastingly influential. D'Emilio's article dovetailed with the work of other

historians in showing that modern gay identity, as opposed to other forms of same-sex desire and practices, originated only in the nineteenth century. It used this argument to challenge the strategies of the emerging lesbian/gay rights mainstream and to link lesbian/gay liberation to anti-capitalism. David Evans (1993), while recognizing the importance of D'Emilio's focus on the labour market, emphasized the role of commodities in the material construction of sexuality through consumerism, and the especially objectifying character of masculine sexualities.

As the field of lesbian/gay history began to establish a solid infrastructure in the course of the 1980s, explicitly historical materialist contributions had a respected place within it (e.g. Padgug, 1989). The still significant influence of Marxism was also manifest in several studies of the sociology of class within lesbian/gay communities. Jeffrey Escoffier (1997) gave a perceptive account of how the expansion of gay commercial scenes had segmented LGBTIQ communities by class, race and gender, while Steve Valocchi (1999) showed how the emergence of gay identity and the rise of lesbian/gay movements were inflected along class lines.

The transnational turn in LGBTQ studies towards the end of the twentieth century prompted Marxists to move beyond the focus on imperialist countries that had characterized much of their work in the 1970s and 1980s. My own introduction and conclusion (Drucker, 2000) to the anthology *Different Rainbows*, for example, provided an early exposition of the combined and uneven social construction of sexuality and of an anti-Eurocentrist, anti-imperialist sexual politics.

As queer theory spread and became increasingly hegemonic in lesbian/gay studies in the course of the 1990s, some Marxists responded with scepticism or outright hostility. Teresa Ebert (1996) and Donald Morton (1996), for example, were scathing in their dismissal of queer theory's contributions; their articles had a keen eye for its idealist failings and for its roots in the changing political economy of neoliberal capitalism. A later Marxist work like Wolf (2009), too, made a stern critique of queer theory as well as of queer-identified activism. By the early years of the new century, however, dismissal increasingly gave way among Marxists to efforts to forge a new queer Marxism, engaging more deeply with queer theory while trying to avoid its idealist and postmodernist pitfalls. Marxists working in queer studies cannot escape the reality that historical materialism became an embattled minority paradigm in the field. Many felt compelled to engage and dialogue with queer theory that is rooted in more poststructuralist approaches, even as they dissent from its poststructuralist assumptions.

QUEER MARXISM

Marxist queer studies, strictly speaking, is a twenty-first-century phenomenon. It is not a product of the strength of Marxism in politics or social movements; Marxist theorists in the field are in fact strongly critical of the current course and leadership of the largest LGBTIQ organizations, almost without exception. Rather,

the ‘Marxist renaissance’ in queer studies (Colpani, 2017) has largely been a by-product of the continuing rapid growth of queer studies generally, particularly in North American universities. Marxist approaches, at first marginalized, gained some credence for a time after 2007, as several years of intense capitalist crisis provoked a rethinking of Marxism’s possible contributions.

The academic setting of most Marxist queer studies has resulted in focuses ranging beyond core concerns of historical materialism – political economy, social struggles and transformations, and political power – to the more common concentration in queer studies on philosophy, literature, film and other arts. Such major works of queer Marxist theory as Floyd (2009), Liu (2015) and Alderson (2016) have combined economic, social and political theory with philosophical and cultural critique. Other works have focused entirely on cultural criticism, introducing Marxist concepts more or less in passing and among others. Matthew Tinkcom (2002), for example, has used Marxist concepts to analyse camp films as a mode of intellectual production that allowed gay men to design their own relationship to labour. Elissa Glick (2009) has used Marxism to explore queer dandyism from Oscar Wilde to Andy Warhol. José Muñoz (2009) has drawn on the work of Ernst Bloch and Herbert Marcuse to illuminate poetry, performance, film, the world of queer and punk bars, and Warhol’s musings on the essential democracy of Coke. He explained his interest in Marxism as a search for ‘new thought images for queer critique, different paths to queerness’ (2009:15).

The academic foundations of Marxist queer studies may also help explain its geographical concentration in the USA and other English-speaking imperialist countries, despite queer Marxists’ solidarity and dialogues with activists in other parts of the world. Canadian historian Gary Kinsman’s work (e.g. 1987) pioneered a specifically queer historical materialism that drew on Antonio Gramsci for the concept of ‘heterosexual hegemony’ (a focus taken up again more recently in Colpani, 2017). Rosemary Hennessy’s *Profit and Pleasure* (2000) was (without adopting the term) a key early text of queer Marxism, though somewhat atypical because of its particularly strong critique of the queer theory of the 1990s. Later in the twenty-first century, Alan Sears, Kevin Floyd, Holly Lewis, David Alderson and I produced significant queer Marxist works.

Although all these writers are of US, UK, or Canadian origin (I am based in the Netherlands), there has nonetheless been a striking emergence of Marxist queer studies in other regions, particularly in Asia. The Taiwanese queer Marxists Ding Naifei of the Gender/Sexuality Rights Association Taiwan (G/SRAT) and Petrus Liu (2015) are distinguished by their conflicted but still significant relationship to the official ‘Marxism’ of the People’s Republic of China. This has evoked harsh criticism from more independent-minded Taiwanese queer Marxists (see Hioe, 2015). An implicit queer Marxist perspective has also been perceptible in critiques of Joseph Massad’s work (2007) by embattled anti-imperialist LGBTIQ activists in the Arab region (notably in Makarem, 2009). In both Lebanon and Palestine, activists have struggled to find ways of defining and expressing their

sexualities in ways that are fully integrated into their peoples' anti-imperialist and anti-Zionist combats.

In Latin America, there is less explicit engagement with Marxism in queer debates today than there was in the 1970s and 1980s. Yet Marxist-related issues continue to be raised, particularly in English-language publications in the USA that discuss Latin American movements. Lionel Cantú (2009) has argued for a 'queer political economy of migration'. Rosemary Hennessy's work (2013) on sexual dimensions of labour and community organizing in and around Mexican *maquiladoras*, while relying more on Michael Hardt and Antonio Negri than on the more Marxist references of her *Profit and Pleasure* (2000), has deepened her earlier close attention to processes of production (for example of jeans) and to unmet needs under neoliberalism. Gregory Mitchell (2015) has mapped the impact of class, race and global hierarchies on sex tourism and sex work in Brazil. Despite the Afro-centric focus of Mitchell's work on Brazil, however, Marxist influences have so far been less prominent in the growing body of queer scholarship on sub-Saharan Africa and the Afro-Caribbean region.

Despite differences among Marxist writers in queer studies, they share several central preoccupations and commitments. In the broadest sense, they share the understanding of sexuality as socially constructed that has usually predominated in the field (though some of them view 'social constructionism' narrowly defined as an idealist approach in conflict with Marxism). Wolf (2009) in particular has cogently dissected essentialist accounts of a 'gay brain' or gay gene' that have gained currency in the media and culture at large.

Marxists working in queer studies share a strong aversion to economic reductionism, which has traditionally contributed to Marxists' neglect of sexuality. Hennessy (2000, a more Marxist work than her earlier or later publications) has drawn on both E. P. Thompson and on Louis Althusser's concept of overdetermination – evidence of a broad openness to different Marxist schools characteristic of other Marxists in the field – in exploring the ways in which sexuality permeates and is in constant interaction with a complex and contradictory social totality. Some Marxists in queer studies, conceiving of sexuality as part of culture and ideology, have questioned Marxism's traditional consignment of culture and ideology to the superstructure. My work (Drucker, 2015), by contrast, has drawn on Michel Foucault's argument that the very concept of sexuality is a historically recent and unique amalgam of biological reproduction, social reproduction, kinship, eroticism and romance, contending that some of these elements are integral components of social relations of production and reproduction.

GENDER

Marxists in queer studies all (to a greater or lesser extent) acknowledge their indebtedness to Marxist feminist theorists who since the 1970s have been

emphasizing the conjoined centrality of class and gender. Attention to Marxist feminism in queer studies has been reciprocated by Marxists' growing interest in queer approaches within feminist studies. Cinzia Arruzza (2013), for example, is one recent exploration of Marxism and feminism that pays particular critical attention to the contributions of queer theory.

Hennessy (2000) has provided a far-reaching synthesis of lesbian feminism with Marxism, following in the path Charlotte Bunch sketched out when she called in a speech to a 1975 socialist feminist conference for a commitment to class struggle. In keeping with Gayle Rubin's classic Marxist-influenced essay 'The Traffic in Women' (1975/2011), Hennessy highlighted lesbians' special stake in resisting rape, sexual harassment, and male trafficking in women in the broadest sense. Drawing on Miranda Joseph's (2002) discussion of the performative as a dimension of production and consumption, Floyd (2009) showed how Judith Butler's concept of performative gender should be historicized, as a form of gender that emerged due to changes in early-twentieth-century capitalism. Shifting from the earlier, nineteenth-century emphasis on 'manhood' and 'womanhood', performative constructions of gender have been defined more by patterns of consumption, dress and everyday behaviour, linked to 'engineered production and engineered desire-inducement'.

Different Marxists in queer studies rely on different feminist founding mothers, however. I (Drucker, 2015), for example, have relied more on Iris Young (1981) and Johanna Brenner's (2000) emphasis on the gendered division of labour. I have argued that the gendered division of labour has combined with the growing emphasis since the late nineteenth century on desire and romance to lay the foundation of the pervasive heteronormativity now central to the capitalist order. The 'gay normality' that has grown up since the 1970s, I have contended, has integrated a layer of gay men and lesbians into the heteronormative order while at the same time reinforcing their structural subordination within it. Holly Lewis (2016) has built more on Lise Vogel's (2013) work on social reproduction theory. Lewis' 'queer, trans-inclusive reading' of social reproduction helps in particular to explain many men's rage at lesbians and trans people: open lesbians, together with trans people who transition away from their originally assigned female gender, are the people who most flagrantly rebel against women's assigned task of caring for men.

Marxists in queer studies have generally welcomed the rise of the intersectional analysis pioneered by African-American feminists Kimberlé Crenshaw (1993) and Patricia Collins (1998). Marxists have however been more enthusiastic about intersectionality in some cases (e.g. Drucker, 2015) than in others. While interested in delving into complex and multiple identities, Lewis (2016) has criticized intersectionality as a metaphor that can facilitate a 'vector theory of oppressions', reifying and ossifying the very structures that it tries to complicate. Marxists have in any case pressed for greater inclusion of intersections with class and sexuality, alongside the more usual focus on gender and race.

Marxists have also focused in queer studies on trans and intersex struggles as cutting-edge battles with far-reaching implications for the meaning of gender. This reflects Judith Butler's (1999) path-breaking insistence that not only gender but also sex itself is in large part socially constructed (explored from a Marxist point of view in Girard, 2009). I (Drucker, 2015) have argued that transgender underlies the cross-culturally, transhistorically most prevalent forms of same-sex sexuality. Marxists' attention to trans, intersex and particularly self-defined gender-queer lives has often expressed a sense that they can be profoundly subversive of the neoliberal gender and sexual order, unlike the more mainstream lesbian/gay identities that have been more successfully integrated into neoliberal societies, particularly in imperialist countries. Leslie Feinberg's work as a self-identified trans Marxist made a significant early contribution to this analysis. Although much of Feinberg's work (e.g. 1998) did not make Feinberg's Marxism explicit, these founding texts of trans liberation anticipated many later queer Marxist positions. Lewis (2016) has made particular contributions to exploring the significance of social reproduction theory for trans struggles. She has however pointed out the growing role of transnormativity in throwing up class divides between trans people, giving wealthy trans people access to gender-affirming surgeries while marginalizing impoverished and non-binary trans people.

RACISM AND IMPERIALISM

Racism and imperialism are central preoccupations for a number of Marxists in queer studies. They have drawn on Cathy Cohen's analysis (e.g. 1997) of the promise and above all the pitfalls of queer theory and activism for a radical, anti-racist, class-aware politics. This makes sense if, as I (Drucker, 2015) have argued, the very existence of queer studies is due to the space originally opened up in universities by the battles for Black Studies and Latino/Chicano Studies in the 1960s and 1970s.

Herzog (2011) has insisted that racism 'has necessarily always been also about sex'. More generally, Marxists in queer studies have been engaging critically with the school of radical queer of colour critique. Aaron Lecklider (2012) has written that radical queer of colour critique 'has been at the vanguard of [the] return to Marxist categories' (p. 184), although this current has been selective about the Marxist categories it has focused on; class is not often central to its approach. Colpani (2017) has embraced the critique of Marxism in the work of Roderick Ferguson (2004), which concluded that Marxism, like liberalism, 'conceal[s] the materiality of race, gender, and sexuality' (p. 5). Colpani has also hailed Gloria Wekker's Afro-centric explorations of 'the politics of passion' (e.g. 2006) for keeping 'intersectional antiracist theorizing alive' (p. 155). More concretely, in exploring the origins of the Afro-Surinamese same-sex 'mati work' that Wekker described, I (Drucker, 2015) have highlighted Wekker's insistence

on early-twentieth-century Suriname's place 'squarely in the [world] system's foundation' (p. 135), notably through bauxite mining. Marxist feminist insights have also been visible in Mitchell's (2015) exploration of the role of racism in interactions between African-American and Afro-Brazilian men.

My work has highlighted the relevance of the Marxist theory of the reserve army of labour to an understanding of racism. I have also celebrated radical queer organizing against anti-Muslim racism, engaging critically with the work of Houria Bouteldja of the French Party of Natives of the Republic and defending her comments on same-sex marriage from charges of homophobia.

Linkages between imperialism and sexuality have been salient in Hennessy's and my work in particular. Hennessy (2000) has stressed the need to map the links between empire and the emergence of homosexual identities, as well as the 'interpenetration [today] of ... local arrangements with capital's global structures'. Her attention to imperialism has continued and been made more concrete in her more recent work on the political economy of Mexican *maquiladoras* (2013). I (Drucker, 2000, 2015) have drawn on the theory of combined and uneven development to propose an approach I call combined and uneven social construction, which illuminates how 'different indigenous starting points, different relationships to the world economy, and different cultural and political contexts can combine to produce very different results' (Drucker, 2000:15; 2015: 63). I have specifically linked the emergence of European classic imperialism in the nineteenth century to the social invention of homosexual persons. I have described Lenin's analysis of imperialism and national oppression as in some ways a useful template for a Marxist understanding of other non-class oppressions.

In recent years, Marxists working in queer studies have tended to draw especially on Jasbir Puar's concept of homonationalism to expose the instrumentalization of LGBT rights in the service of imperialism and Islamophobia. I (Drucker, 2015) have emphasized that the contemporary stigmatization of Muslims and Africans as sexually backward serves much the same ideological purposes today that these same groups' stigmatization as perverted did from the sixteenth to the early twentieth centuries. Coining the parallel concept of 'heteronationalism' (the deployment of anti-LGBTI prejudice in defence of national identities perceived as threatened), I have more recently (Drucker, 2016) argued for a queer internationalist response to the escalating vicious circle of 'pro-' and anti-LGBTI nationalisms.

POLITICAL ECONOMY AND TOTALITY

A number of Marxists working in queer studies criticize mainstream queer theory's aversion to economics, stress the importance of class, and explore the sexual dimensions of different concepts of Marxist political economy. Hennessy (2000) has insisted on the need to imagine 'collective class agency that does not reify "the proletariat", foreclose sexuality, or relegate it to a secondary status'

(p. 231). She has identified a realm of outlawed needs, 'the monstrous outside to capitalism that haunts it' (p. 389). Sears (2005) has paralleled an account of neoliberal economic deregulation with an exploration of what he calls moral deregulation, which facilitates capital accumulation from sexual niche markets. I (Drucker, 2015) have drawn on Ernest Mandel's theory of capitalist long waves for a periodization of different same-sex regimes over the past century and a half, while insisting on a broad conception of relations of production and reproduction and stressing the relative autonomy and asynchronous tempos of different levels of social formations.

Wolf (2009) and I (Drucker, 2015) have drawn attention to political economy, in conjunction with a defence of independent working-class sexual politics. Both books are attempts at primers of radical sexual politics. I have advocated both bringing a working-class, feminist, anti-racist perspective to sexual issues and queering class-based and other mass social movements, not only trade unions but also campaigns for housing and healthcare, as well as the political left.

People who identify as Marxists are of course strongly critical of capitalism and neoliberalism. Strikingly, however, a Marxist frame of reference appeals to some people in queer studies who shy away from an emphasis on production and reproduction. Instead they insist on the primacy of culture and ideology in the study of sexuality (see Colpani's (2017) critiques of Hennessy, Floyd and my work). Matthew Tinkcom (2002) has probably gone the furthest in this direction, by insisting that his book 'is *not* a Marxist treatment of camp' (p. 3), since for him Marxism and camp are simply 'two philosophical practices of modernity' (p. 2). Other Marxists are suspicious of what they see as an overemphasis on structural explanations, preferring to showcase the role of human agency. Kinsman (2017) for example has criticized my periodization of same-sex regimes as ultimately succumbing to economic determinism. Even in *GLQ*'s special issue on the crisis, a high point of recent queer theory's attempts to engage with Marxism (see especially Rosenberg and Villarejo, 2012, and Crosby et al., 2012), many contributors seemed to shrink from a full theoretical embrace of totality or a political commitment to a project of global transformation.

To avoid any narrow economic determinism, Marxists in queer studies have deployed György Lukács' category of totality to explore how sexuality is embedded in broader social power dynamics. Floyd (2009) in particular made a vital contribution to showing the relevance of the category to the study of sexuality. However, different Marxists have used different concepts of totality, perhaps reflecting the general suspicion of, or even hostility towards, the concept that Glick (2009) notes in contemporary theory. Hennessy (2000) and I (Drucker, 2015) have insisted on a vision of gendered capitalism as a coherent if deeply contradictory mode of production and reproduction. Floyd tended to warn particularly against the dangers of a conception of totality that would relegate sexuality to the superstructure. In some of his more recent statements (e.g. in Crosby et al., 2012), Floyd shrank from choosing between 'characterizing global capitalism as either heterogeneous

or unified' (p. 138), thus opting for a contrast between heterogeneity and unity rather than a more dialectical formulation of unity in contradiction.

REIFICATION AND HOMONORMATIVITY

Floyd (2009) also strikingly developed the sexual dimensions of the concept of reification (particularly as analysed by Lukács). Drawing on historical analyses of the late-nineteenth-century invention of heterosexual and homosexual persons, he has pointed out the particular reification of gender manifest in these supposedly scientific sexual categories. Today, Marxists note, male and female bodies are reduced to things to be obtained, like so many other fetishized commodities.

Yet Marxists in queer studies have drawn out different implications from the concept of reification. Hennessy (2000) has deployed the Marxist theory of reification to critique queer theory, arguing that queer theory often reifies sexual identities by removing them from the material social relations in which they are grounded. She described these reified identities as increasingly functional to capital in an era of growing market segmentation. She called for a critical examination of all sexual identities, including the 'unlearning' of our own identities. I have defended (against Floyd's critique) Marcuse's vision of sexual liberation as ultimately transcending identities, linking this vision with the general queer suspicion of fixed sexual and gender moulds.

Floyd (2009) initially dwelled on Lukács' late self-criticism for failing to distinguish adequately between (humanly inevitable) objectification and (specifically capitalist) reification. Yet in his desire to emphasize the political importance of 'the use of the body as a pleasurable means' (p. 68), Floyd ended up emphasizing reification's positive role in opening 'certain conjunctural, historically specific conditions of possibility for liberation' (p. 153). Alderson (2016) too has argued that capitalism is 'progressive for queers' inasmuch as it 'renders sex profane' (p. 145), even if it is characterized under the conditions of the neoliberal 'diversified dominant' (pp. 160) by (in a Foucauldian twist on Marcuse) 'repressive incitement' (p. 31). Like Floyd, Alderson is attuned to what he considers the upside of reification.

Marxists in queer studies seem united in embracing the queer critique of heteronormativity, homonationalism, cisnormativity and transnormativity. I (Drucker, 2015) have treated Lisa Duggan's (2003) critique of homonormativity (linked specifically to neoliberalism) as a logical correlate of these other critiques, while insisting that an anti-homonormative politics should not judge people's personal choices. I have portrayed queer-identified lives as often implicitly if not explicitly in opposition to homonormativity. Citing New York Queers for Economic Justice as one example, I have suggested that queer radical activism is increasingly in opposition to the neoliberal order that underpins homonormativity. Lewis (2016) has disagreed, tending to see Duggan's concept as providing a theoretical rationale

for a moralistic, petty-bourgeois queer normativity, politically useless and in no way intrinsically superior to the homonormativity it critiques. She has criticized queer milieus and groups whose organizational forms and tactics cut them off from masses of potentially anti-neoliberal working-class and poor LGBTI people.

Different attitudes towards the concept of homonormativity are often linked to different political stances towards same-sex marriage. While critical of neoliberal arguments for marriage equality used (for example) by the US Human Rights Campaign, Marxists in queer studies in general support marriage equality as long as the institution of marriage exists, and do not advocate abstaining from the political fight for the right to same-sex marriage. As Floyd (2009) argued, same-sex marriage is not 'inherently conservative or assimilationist'. However, Marxists in the field vary significantly in the degree of criticism that informs their support.

Laura Kipnis (1998) has even drawn on Marx's analysis of the working day to portray adultery as a rebellion against the 'routinized, unfulfilling, dead' (p. 294) reality of marriage-as-work and against the 'toxic levels of everyday unhappiness or grinding boredom' (p. 319) in working-class lives under neoliberalism. I too (Drucker, 2015) have been strongly critical of marriage, highlighting pressures on same-sex couples to comply with norms for household stability, self-sufficiency and respectability in the interests of neoliberal austerity. I have argued for a transitional approach to the issue that combines advocacy of equality with demands pointing towards the abolition of marriage. Lewis (2016), by contrast, has argued for an analysis of the different functions of marriage among different classes, specifically opposing the notion that queer sex is inherently radical and anti-capitalist while working-class same-sex marriages are somehow counterrevolutionary. Wolf (2009) has been especially positive about same-sex marriage overall, stating that its legalization 'creates an obvious confrontation with the very idea that there is anything natural about the heterosexual nuclear family' (p. 36). Linkages between the critique of marriage and Marxist and feminist theoretical approaches to the state largely remain to be explored, since even the more critical Marxist discussions of marriage within queer studies rarely stress the ways that marriage as an institution is embedded in the state.

Marxists will doubtless continue in the coming years to share key concerns of queer theorists and of others working in queer studies. They will be in harmony with other radicals in queer studies in rejecting the neoliberal present as, in José Muñoz's words (2009), 'impoverished and toxic for queers' (p. 27). In particular, Marxists' engagement with anti-racist and anti-imperialist theory will doubtless continue, dovetailing with a widespread concern in queer studies. This reflects the growing urgency of anti-racist struggles as the far right continues to rise, as confrontations between imperialist powers and political forces claiming Islamic or populist inspiration continue to multiply, and as white LGBTIQ people continue to often occupy difficult or problematic positions in these conflicts.

Marxists will face more of a challenge in addressing intersections between sexuality and gender, on the one hand, and class and political economy, on the other.

Queer studies more generally has so far been only variably and intermittently open to these central Marxist preoccupations. While the outbreak of the crisis in 2007–8 ushered in a decade in which the field seemed to be opening up to historical materialism to some extent, the suspicion of class- and totality-based approaches typical of queer theory since the 1990s may have been regaining ground more recently. In response, some self-identified Marxists seem to be tailoring their approaches more to the queer studies mainstream, while others are more concerned with reaching out to a new generation of socialists that is battling the threatened ascendancy of a new reactionary right. It is by persistently engaging with class and political economy as well as racism, imperialism and culture that Marxists can make particularly distinctive contributions to queer studies.

ACKNOWLEDGEMENTS

Thanks to Kevin Floyd (whose recent death is a tragedy for queer Marxist scholarship), Rosemary Hennessy, Holly Lewis and Alan Sears for their comments and suggestions, and to Alan Wald for his help.

Sociology and Marxism in the USA

David Fasenfest and Graham Cassano

The relationship of Sociology to Karl Marx is an ambivalent one; every US Sociology program begins with a foundations course in which Marx, Durkheim and Weber are presented as the theoretical underpinning of contemporary sociology. And yet, as a rule, there are few if any Sociology departments in the USA that promote programs of study which delve more fully into the works and implications of the writings of Karl Marx. Rather, most sociologists find themselves informed by the work of Emile Durkheim or Max Weber, and those sociologists who follow them. Marx's work challenged some basic premises that informed early sociological thinking. As we demonstrate below, the influence of Marx on emerging US sociology reflected contributions of European scholars, like Max Weber and Georg Simmel, whose work engaged with Marx. However, the destruction of the Second World War, post-war US economic and political hegemony, and the Cold War brought with it significant changes in the USA; social scientists (and especially sociologists) 'followed in the footsteps of the new world order' (Gottfried, 2013: 188), leading to a very different impact of the work of Karl Marx on sociology in the USA. Anti-communism coupled with a focus on empire and nation building bred a different kind of sociology, one invested in US exceptionalism is not present in sociological thinking in Europe (particularly France, Germany and the UK), one invested in ignoring the contributions of Karl Marx until the late 1960s.

Marx argued that social class dictated one's social life in a process that relied on a material concept of history. First, he rejected the notion that all individuals

share a common self-interest, arguing rather that within capitalism individuals were placed in conflicting positions vis-à-vis the forces of production, positions that put those without control over those forces in opposition to those with control. Second, his focus on the specificity of human history and the importance of examining how historically specific material conditions effectively rejected the idea, promoted by followers of Auguste Comte, that there were some essential laws of society. Marx's search for an understanding of the workings of the capitalist system, its origins and potential future developments led him to conclude that (a) society is based on antagonistic social classes, and those classes reflect the material conditions extant during any epoch (defined by the dominant mode of production); and (b) the only way to understand limits implicit in and potentials for change of any society is by applying a theory of history rooted in existing social relations and practices. Human development was a history of how people engaged with nature, how and why those relationships changed, and what constraints are placed on the direction of any society going forward.

Karl Marx influenced the emergence of several threads in sociology, some explicitly Marxist in tone and theory, others highly influenced by the questions raised and methods developed in his work. Among them are (a) political sociology, the origins of elites and the concern for state-making; (b) the nature and form of social classes and the struggles that ensue as a result; (c) historical sociology as a way to explore the way material conditions provide a purchase on social change and development; (d) labor process focusing on both accommodation and resistance to the organization of work; (e) class analysis to understand the systemic outcomes and non-class factors like race, gender, religion, ethnicity and new forms that fall under the rubric of 'identity politics'; and (f) colonialism, globalization, world systems, the forces of so-called modernization that examine both internal and international forces and relations of production. These will be discussed in some detail below. But first it is worth exploring how Marx influenced early sociological scholarship, and how it was sidelined in American sociology until the 1960s, when the social, political and intellectual upheaval challenged mainstream sociological inquiries.

THE FIRST 100 YEARS OF MARX AND SOCIOLOGY

Unlike other intellectual traditions, Marxism maintained its vitality throughout the nineteenth and twentieth centuries by cultivating a distinct existence outside the academic marketplace and the 'knowledge factories' that Marx himself disdained. Nonetheless, in addition to its existence as a political discourse utilized by partisans in their fight against capitalism, Marxism also exercised a profound influence over the first generation of sociologists. Some, like Max Weber, constructed their sociological accounts in direct opposition to historical materialism; or Emile Durkheim, who did not mention Marx in his writings on society.

Others, like Georg Simmel, W. E. B. DuBois and Thorstein Veblen, attempted to supplement or expand Marxian discourse. Still others, like Florence Kelley, attempted to put Marxism directly to work in the attempt to analyze, and solve, contemporary urban, social problems.

Max Weber was Marx's most influential early critic in sociology. Taking issue with the materialist conception of history set out in *Capital* and *The Communist Manifesto*, a good part of Weber's life work was devoted to challenging the idea that economic forces determine historical outcomes. In particular, *The Protestant Ethic and the Spirit of Capitalism* sets out to demonstrate that capitalism emerged as the product of symbols/ideals, and through material processes. As Weber saw social development, it was 'a contribution to the understanding of the manner in which ideas become effective forces in history' (Weber, 1958: 90). However, by underscoring the role of ideas in history, and thereby critiquing Marx's materialism, Weber attempted to steer clear of philosophical idealism as well. Ideas were no more determinative than material forces. Rather, Weber attempted to outline an interaction in which ideal forces become 'switchmen' who merely determine 'the tracks along which action has been pushed by the dynamic of interest' (Weber, 1946: 280). In a sense, Weber's project can be seen as a corrective to certain interpretations of Marx's work, rather than an outright rejection of Marxism itself. As can Weber's revision of the Marxian notion of economic class as determinative. Weber takes direct aim at the Marxian idea that classes have common, scientifically determinable 'interests'. Instead, he argues that such interests are shaped by social and communal relations, and by status processes, that are relatively independent from economic processes:

According to our terminology, the factor that creates 'class' is unambiguously economic interest, and indeed, only those interests involved in the existence of the 'market.' Nevertheless, the concept of 'class-interest' is an ambiguous one: even as an empirical concept it is ambiguous as soon as one understands by it something other than the factual direction of interests following with a certain probability from the class situation for a certain 'average' of those people subjected to the class situation. (Weber, 1946: 183)

Anticipating the work of later Marxist labor historians, like E. P. Thompson, Weber argues that 'class interests' depend upon the prior existence of a class community. In other words, the notion of 'interests' depends upon social processes of solidarity, not just economic processes of exploitation. Class action is communal action and '[c]ommunal action...is oriented to the feeling of the actors that they belong together' (Weber, 1946: 183).

Like Weber, Georg Simmel's reception of Marx had a profound impact upon early sociology, and like Weber, Simmel's revision of Marx's work influenced later generations of Marxists. However, while Weber attempts to leap over Marx's historical perspective, Simmel attempts 'to construct a new story beneath historical materialism' (Simmel, 1978: 56). Further, while Weber concentrates upon Marx's analysis of history and class action, Simmel's masterwork, *The Philosophy of Money*, represents an extended examination of the unexplored

cultural implications of Marx's value theory. More accurately, Simmel takes one aspect of that value theory, money as universal equivalence, and extends its implications into a relativist epistemology that encompasses everything from the phenomenology of perception to the new subjectivity produced by urban experience. Recall Marx's general formula for capital $M-C-M'$, 'where $M' = M + \Delta M =$ the original sum advanced plus an increment...I call "surplus value"' (Marx, 1977: 251). Simmel rejects Marx's notion that the increment, surplus value, emerges from the exploitation of wage labor. But he holds on to Marx's fascination with the 'metaphysical subtleties' (Marx, 1977: 163) of the commodity in exchange, and with the power of money to transmute one substance into another through universal equivalence. Thus, Simmel's later sociology depends upon Marx's idea of 'reification' (Marx, 1977: 163–77), that the objects (and ideas) human subjects produce become objectified forces shaping and conditioning later social reproduction:

Objects and people have become separated from one another. Thought, work effort and skill, through their growing embodiment in objective forms, books and commodities, are able to move independently; recent progress in the means of transportation is only the realization or expression of this. By their independent, impersonal mobility, objects complete the final stage of their separation from people. The slot machine is the ultimate example of the mechanical character of the modern economy, since by means of the vending machine the human relationship is completely eliminated even in the retail trade where, for so long, the exchange of commodities was carried out between one person and another. (Simmel, 1978: 460–1)

While Simmel shared Marx's perception of the alienation that necessarily arises as the consequence of capitalist commodity exchange through money, he did not share Marx's perspective on the possibility of revolutionary change. For Simmel, the increasing objectivity of social life was as inevitable as bureaucratization was for Weber, but Simmel offered no possibility of charismatic revolution.

Despite the fact that both rejected fundamental axioms within Marxist thought, Simmel and Weber had an important impact on the future of Marxian theory, and, thus, Marxian sociology. In particular, the first major attempt to synthesize Simmel, Weber and Marx emerged from the hand of their student, Georg Lukács. In *History and Class Consciousness* (1968), Lukács returns to Marx via Hegel, but his dialectics are decisively shaped by Simmel's relativistic sociology, and by Weber's historical sociology. In part because of Lukács, Simmel and Weber influenced nearly the entire Frankfurt School, with Simmel's hand most evident in the work of Walter Benjamin, and Weber's in the work of Theodor Adorno, Herbert Marcuse and Erich Fromm. Lukács, Benjamin and the Frankfurt School rejected the simplistic economic determinism of early Marxist thought, and replaced it with a nuanced sociology that attempted to account for the relative autonomy of ideas in the development of historical forces.

As Weber and Simmel confronted the implications of Marxian theory in Germany, Florence Kelley was instrumental in bringing Marxian political economy into American sociology. She believed that a strong state has important

uses for the implementation of progressive social, economic and public policy. Because of her gender, she found educational opportunities in the USA limited, and thus studied the social sciences in Europe, discovering socialism through the work of Marx and Engels, leading her to translate Engels' *The Condition of the Working Class in England* for an American audience.

During her years as a resident at Hull House (1892–1899), Kelley was an intellectual force and the political force leading the struggle in Chicago and in Illinois for new factory and wage legislation; she became a factory inspector and during the Illinois Pullman strike she visited Eugene Debs in prison and, perhaps, helped convert him to socialism (Sklar, 1995: 171–315). In one of her earliest public articulations of her Marxian views, 'The Need of Theoretical Preparation for Philanthropic Work' (originally published in 1887), Kelley argues that those who undertake what will later be called 'social work' require theoretical training in political economy. Kelley stated:

Another of the indispensable books is *The Condition of the Working Class in England* by Friedrich Engels, which is especially valuable for American readers because the conditions described in it... are reproduced upon a large scale in America now... It is the best introduction to the study of modern scientific political economy and the fundamental work *par excellence* thereof, *Capital*, by Karl Marx. (Kelley, 1986: 102)

Kelley argued that *Capital* is the fundamental work of modern scientific political economy and found it to be the key to unlocking the mystifications that protect capitalist exploitation. Her description of the conditions of manufacturing echoes Marx's argument in *Capital*, but with a new inflexion. She argues that under conditions of mass immigration, worker organizations and trade unions do not necessarily have the capacity to organize, which further undercuts the power of trade unions. Thus, as Sklar points out, Kelley held onto her Marxian theory of exploitation, even as she distanced herself from Engels' 'belief in trade unions as the mainstay of socialism' (Sklar, 1995: 215–16). Kelley never rejected trade unions or working-class self-organization, seeing opposition to the systemic exploitation of capitalism as a cause that transcended class differences.

For Kelley, the implication of Marx and Engels' work was the necessity for a strong legal and regulatory framework to protect the exploited from the systemic imperatives capitalist accumulation imposed on all actors within the system. Her contemporary, Thorstein Veblen, also took Marx seriously, but rejected many of the theoretical foundations of Marxism. Nonetheless, Veblen, unlike Kelley, was a revolutionary socialist who supported armed struggle as a method for the re-appropriation of social wealth from the hands of the 'vested interests'. In two essays, from 1906 and 1907, Veblen offers carefully considered comment on Marx, and Marx's followers. His discussion of Marx, in particular, merits some attention. Like Weber, but with more sympathy, Veblen takes Marx's contribution seriously, and begins by challenging the premises of the misreading of Marx (for and against) that were proliferating in the late nineteenth and early twentieth centuries. According to Veblen, the source of these misunderstandings is the fact

that too many readers fail to recognize ‘the radical character of [Marx’s] departure’, the fact that his work signifies a kind of epistemological break with earlier economic theories. ‘It differs characteristically from all systems of theory that had preceded it, both in its premises and in its aims’ (Veblen, 2003: 409). Nonetheless, Veblen argues that Marx’s work is limited, in particular, by its Hegelian dialectics.

While Veblen questions particular elements of Marx’s theory – his materialist conception of history, his emphasis upon the necessity of class consciousness for social change, his theory of surplus value – all of this is incidental to Veblen’s real objection. According to Veblen, Hegelianism, including Marx’s Hegelianism, unlike Darwinism, depends upon two fallacious principles: (1) that the unfolding of the spirit is imminent in the subject itself, without regard to contingent events; and (2) this unfolding has a single, teleological direction. For Marx, history has a progression, from primitive production, to medieval guilds, to contemporary capitalism, and then socialism, and this progression unfolds through the imminent necessities of class struggle. Against this position, Veblen posits what he thinks of as a Darwinian world of opaque cause and effect, ‘the unteleological Darwinian conception of natural selection’. From Veblen’s Darwinian point of view, history is

a cumulative sequence of causation, opaque and unteleological, ...[which] could not, without an infusion of pious fancy by the speculator, be asserted to involve progress as distinct from retrogression or to tend to a ‘realisation’ or ‘self-realisation’ of the human spirit or anything else. (Veblen, 2003: 416)

Despite his criticisms, Veblen’s sophisticated discussion of the meaning of ‘value’ in Marx and the importance of ‘surplus value’ show his affinity for Marx’s work. Like Marx, Veblen argued that ‘capital’ is created by ‘an unearned increment’ of wealth drawn from the life of producers (Veblen, 2003: 425). But for Veblen, this unearned income was not necessarily the result of the surplus product of labor. Rather it was the result of monopolistic and vested interests institutionalizing an unjust distribution of income at the expense of the entire community (Veblen, 1919).

In sum, Veblen appreciates (and is influenced by) many of the particulars in Marx’s analysis of capitalism. But he rejects the optimism built into Marx’s dialectics:

This goal or end, which controls the process of human development, is the complete realization of life in all its fullness, and the realization is to be reached by a process analogous to the three-phase dialectic ... into which scheme the capitalist system, with its overflowing measure of misery and degradation, fits as the last and most dreadful phase of antithesis. Marx ... is necessarily an optimist, and the evil ... in life is to him a logically necessary evil (2003: 430)

Against this vision of capitalism as a necessary step toward a more humane economic and social world, Veblen posits his own Manichean, apocalyptic, possibility: that ‘the capitalist system is the mortal agony of the [human] race’ (Veblen, 2003: 430). Veblen was a radical anti-capitalist, a supporter of the Industrial Workers of the World, and the Bolshevik revolution. Whether he was a neo-Marxist, or

whether he was attempting to build a socialist discourse based upon pragmatism and Darwinism, rather than Hegelian foundations, remains an open question. But he took Marx seriously, and influenced subsequent attempts by American sociologists (most notably, C. Wright Mills) to understand and utilize Marx.

For much of his early career, W. E. B. Du Bois showed in works like *The Philadelphia Negro* and *The Souls of Black Folk* serious, non-Marxist, attempts to understand and explain both the political economy and the social psychology of a racialized society. But Du Bois lived longer than other first-generation American sociologists, and throughout his lifetime remained engaged in activist, as well as scholarly, networks. Thus, during the Great Depression, Du Bois began to utilize the tools of Marxian political economy. The resulting work, *Black Reconstruction* (1935/1992), synthesized Du Bois' early social psychological insights with a new emphasis upon class struggle and capitalist imperatives. With a method that seems to have influenced later historians (most notably, E.P. Thompson), Du Bois carefully examines the class conditions that defined the North and the South, before, during and after the war. He demonstrates that Northern victory in the Civil War depended, at least in part, on the General Strike of the Slaves, as Black workers withdrew their labor by running away, or by simply slowing down production. DuBois further takes note of the ways in which the struggles of the war undermined the absolute dominance of white supremacy and made possible a brief moment of interracial unity. Perhaps most importantly, Du Bois also explains the resurgence of white supremacy after Reconstruction, and the emergence of a newly born white identity based upon the social-psychological wages of whiteness. With this symbolic theory of political identity, Du Bois certainly reaches beyond the bounds of traditional Marxism, but his methods of research, and his theoretical emphases, clearly betray the influence of Marxism on this late work.

A decade after the publication of *Black Reconstruction*, the re-emergence of virulent anti-communism in the USA coincided with the synthesis of 'grand theory' offered by Talcott Parsons and his collaborators. While Marxism continued to survive among German émigré sociologists like Marcuse and Fromm, Parsonian adherents attempted to stigmatize Marxian discourse in sociology. During this period, C. Wright Mills was one of the leaders of the anti-Parsonian left. His work contested Parsonian functionalism and offered complex portraits of an American society divided by multiple contradictions and at war with itself. Yet Mills' influences were Weber and Veblen, and he consciously distanced himself from Marx and 'the marxists'. Mills' attitude toward Marx did much to define the New Left in US Sociology. While Mills' critique of Marx and Marxism appears in various of his central texts, near the end of his life he wrote a full-length polemic, *The Marxists*. While he finds some value in Marx and his later followers, Mills rejects most of Marx's central tenets. Mills critiques Marx based upon the prior critiques by Max Weber and Thorstein Veblen. For instance, like Weber, Mills is dissatisfied with Marx's emphasis upon class and consequent blindness to the significance of status. 'Marx's model stripped away all status remnants,

defining the position of men within capitalist society solely in terms of their relation to the means of production ... As a method, it is a fruitful simplification only if "class" is then used as *one* dimension of stratification' (Mills, 1962: 106). Like Veblen, Mills rejects Marx's dialectical view of history, as well as the idea that class struggle and material relations of production determine social relations and ideologies. Most importantly, Mills rejects the 'labor metaphysic' (1962: 129) at the heart of Marx and Marxism – the twin propositions that class struggles determine social relations, and that the proletariat is the agent of historical and social transformation. While Mills finds value in Marx's '*method*', as a 'signal and lasting contribution to the best sociological ways of reflection and inquiry available' (1962: 129), he finds Marx's '*model* of society...inadequate' (1962: 130). From Mills' perspective, in terms of his model of society, Marx is an important nineteenth-century precursor to science, but authentic, scientific sociology begins 'somewhere "beyond Marx"' (1962: 130).

The first 100 years of American sociology with respect to Marx must close with Alvin Gouldner (1970), and his ultimate rejection of Marx. In his *The Coming Crisis of Western Sociology*, Gouldner notes that a version of an Academic Sociology like that in the USA has emerged in the Soviet Union. He concludes:

This development has been intellectually troublesome to those radicals who, out of a rote Marxism, have concluded that American Academic Sociology is an instrument of American corporate capitalism. For clearly the conservative character of American sociology cannot be attributed to its subservience to corporate capitalism if an essentially similar sociology has emerged where, as in the Soviet Union, there is no corporate capitalism. (1970: 9)

Where were academic Marxists? He points out that

Marxism was borne by unattached intelligentsia, by political groups and parties oriented to lower strata groups who were in rebellion against an emerging bourgeois society that excluded them. Academic Sociology was developed in the United States by university academicians who were oriented to the established middle class, and who sought pragmatically to reform rather than systematically to rebel against the status quo. (Gouldner, 1970: 20)

Throughout, Gouldner speaks of Academic Sociology and Marxism as if they are distinct forms of scholarship, in which the latter has no real place in the former. In the spirit of the Cold War, American Sociology is 'for all practical purposes, the model of Academic Sociology throughout the world' (Gouldner, 1970: 23), while Marxism is the product of the Soviet Union. Anticipating his conclusions later, Gouldner (1980) states that

world sociology underwent a binary fission; one 'half' of it became Academic Sociology, in which the Functionalist tradition finally became the dominant theoretical synthesis, while the other 'half' of world sociology became Marxist. (Gouldner, 1980: 447)

In the end, Gouldner (1980) envisioned two Marxisms, Critical and Scientific, the first represented by the Frankfurt School with a potential for understanding society able to avoid the pitfall of the second, a devolution to what he considered

to be Soviet socialism. He argued that the ideological commitment to Marxism, juxtaposed to the so-called objective sociology, avoided confronting the two nightmares of Marxism:

What, then, are Marxism's nightmares? There are at least two. Implicit in its repression of idealism and utopianism, as well as in its sublimation of millenarianism into scientism, there is the lurking fear that it is not a truly 'scientific socialism,' not a theory about society or of the objective conditions that will change it, but only another disguise of the political will, an old utopian project masquerading as new science. In other words, one nightmare of Marxism is that it is another religion of the oppressed – a revolutionary messianism, as Georg Lukács once described his own Marxism. This nightmare broke into the theorizing of Critical Marxism, which is nucleated with utopianism, and, at the political level, emerged openly in Maoism... Yet there is another Marxist nightmare, an even deeper dragon of the mind that stirs fitfully within it. It is, most basically, this: Marxism emerged in a society whose middle classes had proudly insisted that private property and those having it were the foundation of civilization itself... (Gouldner, 1980: 381)

At the end of the day, however, Gouldner served an important role in the development of a more critical sociology. His analysis of sociology to that point, with its reliance on a Parsonian structural functionalism, had come to an end and opened the doors to a more critical assault on mainstream sociology in America. 'Alvin Gouldner who correctly diagnosed the coming crisis of Western sociology had prefigured the Marxist assault' (Burawoy, 2003: 196).

THE CRITICAL TURN TO MARX IN SOCIOLOGY

The social radicalism of the 1960s gave voice to opposition scholarship. As Burawoy notes, '(r)eversing the prevailing wisdom, we tried to demonstrate that Marxism was the true science while sociology was but ideology' (2005: 314). The political movements of the era – civil rights, women's movements, anti-Vietnam War movements, anti-colonial struggles, student movements, farm worker movements – energized young academics who rejected conventional wisdom as exemplified by academic sociology (represented by the American Sociological Association) and sought ways to understand the world in order to transform rather than apologize for its institutions and processes. These movements put conventional and consensus sociology in a position to have to defend its illusionary and somewhat fabricated views of society. Burawoy points out that

[s]ociology, after all, was still in the hands of a messianic professoriate, who, when the ghettos were in flames and the napalm bombs were falling, were celebrating the undying virtues of 'America' – its liberal democracy, its openness, its economic dynamism, its affluence, exalting its model as 'the first new nation'. (2005: 315)

During the 1969 meeting of the American Sociological Association a 'Sociology Liberation Movement' emerged to challenge the discipline by organizing a schedule of radical activities to coincide with the convention in San Francisco¹ preceded that year by the Berkeley Conference of Radical Sociologists June

21–23. Organizing themselves into several collectives, they began publishing the journal *Insurgent Sociologist*, later becoming *Critical Sociology*.

What followed was a reinvigoration of a Marxist sociology, one that was predicated on understanding how capitalism developed, explored the contradictory nature of capitalist reproduction, and plotted the emergence of an emancipatory alternative to a capitalist society. In detailing what a Marxist sociology looks like, Burawoy and Wright (2006) identify three fundamental theses, derived from an understanding of causal mechanisms at work, informing Marxist theory: non-sustainability of capitalism; intensification of anti-capitalist class struggle; and the natural transition to socialism. They argue what is central to sociological Marxism is the concept of class as exploitation and what followed are several threads which have shaped Marxist sociological inquiries. In no particular order, they are class analysis, labor process, world-systems theory, Marxist feminism, and racial formations. What follows is a brief examination of each.

Perhaps the quintessential work in American Marxism is the inquiry into class analysis, a central focus of Marx. How does the structure of society change in response to changing forces and relations of production? Central to this question are aspects of exploitation, legitimation, the potential for and failure of meaningful social change, and in general the class structure in advanced capitalism. Rejecting Marx, Weber (1978) rejected the general thesis of class struggle and class contradictions in society and history. Weber's distinction between class and strata has produced a rich literature on social stratification, for example. The result was a tradition of research in US sociology that at best ignored and at worst dismissed class conflict by focusing on consumption-based models of status attainment.

In his work on class, Wright brought Marxism back to sociology, first in his outline of Marxism as a scientific method of inquiry and the importance of analyzing class to understand the transformative struggles in the social movements of the time (Wright, 1979), and later, as he expounded on the results of empirical studies on the nature of class structure (Wright, 1985). Wright's work posited on the nature of class structure in contemporary capitalism (comparing Sweden and the USA, for example), related class structure and class consciousness, and offered an advance on Marxian class analysis in the form of his contradictory class locations to explain why class struggle took on new forms. Even as he began to speculate on how capitalism might be transformed (Wright, 2010), his work set the stage for sociological work informed by Marx and his theories, and never lost the focus on trying to understand the mechanisms and consequences of class exploitation.

The nature of work under capitalism was a core focus of Marxist research. The seminal work by Harry Braverman at the start of the 1970s (1974/1998) brought into sharp relief the distinction in Marx between labor and labor power, how the division of labor mattered, and the nature and role of management under capitalism. Braverman turned scientific management and the use of technology on its head by detailing how the organization of work promoted the immiseration of the

working class. This was closely followed by Burawoy's (1982) qualitative investigation of how workers accommodated and resisted capitalism in manufacturing plants. He outlined how to bring Marxism to sociology through a criticism of industrial sociology by building a theory of the capitalist labor processes. As his title anticipates, Burawoy argued for the relative autonomy of the labor process to explain both accommodation (consent) and struggle in the manufacturing plant. As the form of capitalist production changed, so too did the contours of class consciousness and class struggle.

Marx stated that colonial expansion was the underpinning of capitalist development. Farming and food production in the colonies served to replace decreased agricultural production as a result of the enclosures in England. The colonies also served as a way to dispose of the population made surplus to the needs of production. Without the cotton grown in India, Egypt and the US South replacing wool, textile manufacturing in the UK and Northern Europe could not develop. The pioneering work of Wallerstein (1974) and Frank (1978) introduced world systems and dependency research to push sociological inquiry, informed by Marx's notions of class structure and the state, beyond the normal confines of the nineteenth and twentieth centuries.

The four-volume work by Immanuel Wallerstein (1974) charted a course that showed capitalism was not simply the product of late-nineteenth-century Europe but rather a system that encompassed the entire world economy originating in the sixteenth century. Wallerstein focuses on the emerging division of labor starting in 1450, the rise of the nation state and the growth of empire, and the creation of a colonial periphery serving the needs of modern capitalist development. He outlines the importance of mercantile expansion and competition among the economies within the European core. This work was taken up by scholars like Chase-Dunn (1998), Arrighi and Silver (1999) and Arrighi (2003), who used world-system theories to explain current changes in Western capitalism, how capitalist competition created hegemonic powers, and the nature of governance and the reproduction of the core-periphery hierarchy. Arrighi (2003) uses this framework to place the newly emerging global dominance of Asia into an historical, world-system context.

Frank's (1978) work explored the relationship of advanced capitalism to the underdevelopment of the rest of the world, providing an analysis of international exploitation that called upon Marx. Countries that at the time were labeled 'less developed' (or LDCs) were struggling precisely because of the nature of international economic relationships rooted in the working of capitalism. The upshot was the development of underdevelopment. Others, like Evans (1979), expanded on these ideas to explore the nature of national elites and their association with national and international capital. Through the influence of Marx, US sociology increasingly questioned the role of American society in the rest of the world, and this research provided insights into the decades of national liberation struggles against capitalist political and economic control.

The social unrest of the 1960s included a feminist challenge to patriarchy, and the effort to theorize gender and class. As Gottfried (1998) points out, many feminists called for the rethinking of what patriarchy is and how it operates. Hartmann (1979) initiates this focus in her reflections on both the importance and inadequacies of Marxism to understand patriarchy. Calling it an 'unhappy marriage', Hartmann seeks to find the material conditions which might explain gender relations yet rejects a class essentialist analysis. This prompted a wider discussion on the limitations of Marxism for understanding patriarchy (Sargent, 1981). Seeking to apply notions of gender to the organization of work, Acker (1989, 1990) posits that gender is implicit in social organization and patriarchy is reproduced alongside rather than as a product of capitalist social relations. Marx is generally silent with regard to gender, and Marxist feminist sociologists have worked to fill that gap. Giménez (2000: 18) seeks to re-center feminist analysis on Marxism, arguing that the women's movement produced four main currents: liberal (for economic and political equality), radical (with patriarchy as the main cause of oppression), socialist (critical of both capitalism and Marxism) and Marxist (developing 'the potential of Marxist theory to understand the capitalist sources of the oppression of women').

In the end, Giménez (2019) brings the focus of feminist analysis back to Marxism by stressing the connection between capitalism, on one hand, and the oppression of women, on the other. For her the key is to understand the role gender and capitalism play in framing and ensuring social reproduction – whether relying on the unpaid labor of women in the household or the ability to devalue the care work performed by women. This connection between capitalism and gender is further explored by Brewer (2003), who analyses Black feminist interventions, especially Black revolutionary nationalism of the 1960s and 1970s. She seeks to articulate a class/gender/race analysis. The early inquiry by feminists often ignored race, and Brewer sought to connect capitalism and class analysis within a complex relationship that intersected race, gender, and sexuality as correlates of class oppression. To Brewer, the development of class antagonism under capitalism emerges together with, rather than results in, racism and patriarchy. In this way, Brewer (2010) also rejects a class essentialist orientation as she unpacks the role race, gender and sexuality play alongside class conflict in political moments central to emancipatory efforts.

As noted above, Dubois (1935/1992) turned to a Marxist analysis of work in the post-Civil War period, explaining the differences in how the white worker and Black worker experienced the period of reconstruction. Merging a Marxist class analysis with the importance of race outside of the capitalist frame, Dubois set the stage for what followed. For instance, Marable (1983) rejected the Weberian frame of race-based poverty, one that argued the problem was the failure of Black America to create a middle class to lead the economic ascendance of the urban poor and rejected the social-psychological and sociological tropes of a 'culture of poverty' (Potts, 2010) that condemned the Black community from one generation

to the next. It was not the failure to succeed under capitalism that was to blame, Marable argued, but rather that capitalism actively perpetuates the second-class status of Black Americans. Implicitly borrowing from the world-systems language of core-periphery, he outlined how the Black majority represented a domestic periphery while the small Black elite occupied the core. Marable was informed by a Marxist analysis of class exploitation and the growing literature on patriarchy, enabling him to expound on the exploitation of Black women at home and in the workplace. Black poverty was the by-product of capitalism with an overlay of racism; in short, as the title of his 1983 book, *How Capitalism Underdeveloped Black America*, proclaims.

To escape the biological and physical anthropological explanations of different racial outcomes, Omi and Winant (1986) developed a racial-formation theory which took sociology in a new direction, one which focused on the lived experience of the Black community. The theory posits that race cannot be defined with any clarity or consistency; rather, it is fluid depending on who is under discussion and when those discussions take place. Because there are differences in what is meant by race, social policy and programs are inconsistent and at times ineffective. The disparity of racial constructions is reflected institutionally, interpersonally and globally. To tackle the problem, Omi and Winant explored how concepts of race changed over time to create different forms of racial stratification. Theirs is a socio-historical examination to explore how society's racial categories are created, transformed and in some cases destroyed. Ultimately, they situate racial representation within social structures and, echoing Marx's understanding of social forces, identify race as a process connected to how society is organized and ruled.

These projects informed by the work of Marx also inform each other. World-systems development of core-periphery makes its way into discussions of racism and capitalism in the USA. Class analysis enters into efforts to understand how capitalism intersects with patriarchy as systems for the oppression of women. Labor process informs research on the conditions of work in early developments of the global economy. The overlap of race, gender, migration and class is reflected in Glenn (2010), who sees social reproduction as dependent upon the labor activities essential for maintaining individuals, families and communities. She focuses on the work of racial(ized) ethnic women performing domestic service in the homes of White women (Glenn, 1992: 3), implicitly a resource that enables White women to engage in gender politics. Both Glenn and Romero (1992) demonstrate how women migrating from the Global South (Wallerstein's periphery) perform low-paid care work for rich White women in the Global North (core). The Marxism of Giménez and Hartmann resonates with the expropriation of the labor of ethnic migrants needed to ensure social reproduction.

The importance of Marx to US sociology despite Giddens' (1971) dismissal of renewed efforts by sociologists to engage with Marx, especially during the second half of the twentieth century, is two-fold. First, by returning to Marx

sociologists challenged the hegemonic view of society informed by the work of Durkheim (social psychology, norms, social Darwinism) and Weber (social stratification, bureaucracy, rationalization) and disrupted the narrow (and, as some argued, apologetic) describing American society. The discipline was forced to respond, as witnessed by the emergence of a range of sections within the American Sociological Association: Marxist Sociology; Labor and Labor Movements; Racial and Ethnic Minorities; Political Economy of the World-System; Race, Gender and Class; Sociology of Sexualities, to name the most obvious. Clearly, the range of concerns introduced or supported by the work of Marx led to a profound reorientation within the discipline. As Burawoy points out,

stratification gave way to class analysis and later more broadly to the study of inequality, conditions of liberal democracy gave way to studies of states and revolution, social psychological adaptation to work gave way to theories of alienation and the transformation of work, sex roles gave way to gender domination, value consensus turned into the diffusion of ruling ideologies through school and media, irrational collective behavior became the politics of social movements. (2005: 316)

Second, the changes continue. As Burawoy notes, all of these different uses of Marx were efforts at transforming a closed institution, the academy, and so, as he puts it, this reflected a narrow agenda seeking to replace mainstream sociology with Marxism. He now advocates a turn to public sociology, one that works to change society and not the discipline. Anticipating Wright's work (2010), he strives for 'a *real utopia*, that is a utopia based on the existing world' (Burawoy, 2005: 325).

The University

Roderick A. Ferguson

INTRODUCTION

In the introduction to their 2000 anthology *A Thousand Flowers: Social Struggles Against Structural Adjustment in African Universities*, Silvia Federici, George Caffentzis, and Ousseina Alidou argue, ‘We believe that despite its present limits, the “right to study” is still one of the most important commons we have. It is certainly one that many generations have fought for, as demonstrated by the struggles of students and teachers in Africa today’ (2000: xv). We might use the authors’ remarks to frame the history of Marxist engagements with the university as a field of study and as an institution situated within and responding to the larger political-economic environment. Federici et al.’s assertion provides an appropriate opening for examining the various ways in which the university has been approached as a site of social struggle that implicates state and capital. In doing so, this entry attempts to show how the terms of social struggles for the academy as well as the definition of political economy have been contested matters, especially among critics of the university and its role in society.

In general, Marxist frameworks have addressed the university as an institution not disconnected from but intimately connected to the dynamics of political economy and to social struggles within and outside its walls. Those frameworks have differed in terms of how the nature of political economy has been conceptualized – that is, whether or not capitalism is primarily constituted along economic lines or shaped by extra- or non-economic social forces such as race and colonialism.

In addition, frameworks have also differed according to the social struggles that impact the university and its relationship to capitalism – that is, whether those insurgent movements are squarely focused on economic issues or whether they articulate social exigencies that include but are not limited to the economic.

The first section of the chapter examines some of the literature that situates analyses of the university as a political-economic entity within conventionally Marxist framings that emphasize explicitly or implicitly the primacy of economic relations. The next section then looks at analyses that understand the university as part of a political economy constituted by capital's engagement with histories of race, colonialism, imperialism, and migration. The work in this section promotes a rethinking of the 'publics' that lay claim to the university and the social struggles that engage it. In doing so, this entry attempts to show that the university has been the site of divisions that have come to constitute Marxist hermeneutics, divisions concerning the primary or relational nature of the economic and the identity of 'the public'.

THE UNIVERSITY IN THE PRIMACY OF THE ECONOMIC

The dominant Marxist mode for analyzing the university presumes the primacy of economic relations in explaining changes to universities as institutions. Hence, this section addresses those analyses that attempt to situate higher education within the political and economic transformations that affect universities and the nations that house them. Any survey of the literature must begin here since this mode of analysis provides a platform for invoking and reconsidering Marxist preoccupations around the potential of capitalist economic formations to overtake cultural institutions like the university.

In *The University in Ruins*, Bill Readings (1999) argues, for instance, that the global economy was changing the character of the modern Western university itself. Readings understood globalization to be a kind of Americanization – that is, a social condition characterized by 'the generalized imposition of the rule of the cash-nexus in place of the notion of national identity as determinant of all aspects of investment in social life. "Americanization", that is, implies the end of national culture' (1999: 3). Rather than defining Americanization as the imposition of American national culture on the rest of the world, Readings uses the category to argue that the ideologies of contemporary global capital were displacing the authority of national culture in those institutions that were designed to promote the authority of national culture – universities. Americanization hailed the primacy of the economic as a mode of valuation over the national as the generator of social coherency.

For Readings, Americanization spells the end of the university as the ideological location for producing national culture. For many scholars, such as Dominick LaCapra, Readings' emphasis on capital's power to disembed the Western

university from its national moorings was a sign of the book's indebtedness to what LaCapra addresses as a certain version of Marxism. LaCapra argued, for instance, 'One may of course ... see a more openly "dialectical" Marx in the idea of dereferentialization, like capitalism that destroys older relations, simultaneously opens up new spaces' (LaCapra, 1998: 37). Invoking a narrative of the destruction of the old, Readings argues, 'The current shift in the role of the University is, above all, determined by the decline of the national cultural mission that has up to now provided its *raison d'être*' (1999: 3). This shift, he contends, caused a fundamental change in the mission and character of Western universities: 'In short, the University is becoming a different kind of institution, one that is no longer linked to the destiny of the nation-state by virtue of its role as producer, protector, and inculcator of an idea of national culture' (1999: 3). As an institution that breaks with the project of producing and extending national culture, the university joins the global corporation as an institution that severs ideological ties with the nation-state. In doing so, it becomes a purely administrative apparatus, unencumbered by any ideological responsibility to the nation-state or its people:

The University thus shifts from being an ideological apparatus of the nation-state to being a relatively independent bureaucratic system ... The University is thus analogous to a number of other institutions – such as national airline carriers – that face massive reductions in foreseeable funding from increasingly weakened states, which are no longer the privileged sites of investment of popular will. (Readings, 1999: 14)

For Readings that disconnection can be observed in the emerging 'watchword' of the new university – 'excellence'. Discussing the term, Readings argues, 'The notion of excellence, functioning less to permit visual observation than to permit exhaustive accounting, works to tie the University into a similar net of bureaucratic institutions. "Excellence", that is, functions to allow the University to understand itself solely in terms of the structure of corporate administration' (Readings, 1999: 29). Excellence, Readings suggested, empties social practices of all ideological substance, reducing institutional life within the university to pure bureaucracy. As an empty ideal, it could be used as a criterion for assessing faculty proposals for research support¹ just as much as it could be dispatched to judge the efficiency of a parking structure (Readings, 1999: 24). As Readings put it:

Its very lack of reference allows excellence to function as a principle of translatability between radically different idioms: parking services and research grants can each be excellent, and their excellence is not dependent on any specific qualities or effects that they share. (1999: 24)

In *Academic Capitalism: Politics, Policies, and the Entrepreneurial University*, Sheila Slaughter and Larry L. Leslie (1999) assess the ways that capital and universities were articulated in relation to one another. Like Readings, they argue that global capitalism in the late twentieth century destabilized patterns and assumptions about the nature of university research, education, and study that

were put in place during the nineteenth century's industrial period. Incorporating an analysis of the policy transformations that affected universities in the USA, Canada, and Australia, they contend that the destabilization of university practices can be seen through changes to public support for universities, university research and training, and the socialization of university faculty. With regard to public support, they assert that globalization impacted universities by putting an end to the block grant as a source of governmental support. The result of the move meant that universities had to rely more on external funds for support. Administrators and faculty would be encouraged to find support from external corporate and private entities.

In terms of research, this move from state to external support would place value on market-based versus curiosity-based research. Within these changes, professors have been compelled to court external donors for funding. In doing so, academics have been pressured to become part of 'an environment in which faculty and professional staff expend their human capital stocks increasingly in competitive situations' (Slaughter and Leslie, 1999: 9). In doing so, university research and training has increasingly conformed to the needs of the market rather than the needs and interests of professors or the communities outside universities. This causes a seismic change in the historic *raison d'être* of university research. As Slaughter and Leslie put it:

The freedom of professors to pursue curiosity-driven research was curtailed by withdrawal of more or less automatic funding to support this activity and by the increased targeting of R&D [Research and Development] funds for commercial research. (1999: 211)

The shift from curiosity-based research to market-driven projects has demanded an ideological transformation in the way that academics conceive of themselves. As Slaughter and Leslie state, 'In these situations, university employees are simultaneously employed by the public sector and increasingly autonomous from the public, corporate body. They are academics who act as capitalists from within the public sector; they are state-subsidized entrepreneurs' (1999: 9). This produces a situation in which faculty autonomy is degraded and faculty are encouraged to reduce their self-conceptions to market imperatives even as faculty members are ostensibly working within public institutions.

In their article "'Cognitive Capitalism" and the Rat Race: How Capital Measures Immaterial Labour in British Universities' (2009), Massimo De Angelis and David Harvie point to the ways that capital has attempted 'to measure immaterial labour and thus (re)impose value and the law of value', a move that impacts British universities by attempting to align academic labor with market values. Drawing on Michael Hardt and Antonio Negri's *Empire*, De Angelis and Harvie go on to argue, 'In Britain, all new policy is designed to "push through" the Empire of neoliberal markets in ways that simultaneously attempt to bypass and silence a left opposition that lacks any alternative project'. Describing this phenomenon, they write:

In higher education, this 'pushing through' takes a number of forms, including: artificial scarcity of resources; greater competition across HE workers (including students); changes in syllabi towards an 'education' subordinated to the needs of business; transformation of the nature and modalities of academic work; and the imposition of constraints that limit the forms of social cooperation. (De Angelis and Harvie, 2009: 7)

As the article demonstrates, shaping the public university into an institution beholden to market forces turns it into a site of profound contradictions between the espousal of public ideals and the pursuit of market values.

Like Slaughter and Leslie, the activist scholar Andrew Ross (2009) notes the ways in which universities have been reshaped by the global economy, especially as private US universities respond to the 'rough justice of the market' by erecting campuses in China, Singapore, and Abu Dhabi, phenomena that produce the conditions of precarity for workers in those countries. As Ross argues:

Few examples illustrate this better than the rush, in recent years, to establish overseas programs and branch campuses. Since 9/11, the pace of offshoring has surged and is being pursued across the entire spectrum of higher-education institutions – from the ballooning for-profit sectors and online diploma mills to land-grant universities and the most elite, ivied colleges. (Ross, 2009: 189)

For Ross, this is a moment in which both economy and academy are changing rather than an instance in which the economy is completely determining the character of the academy.

Turning his attention to how the state is reshaped in the moment of the state's declension and capital's augmentation, the Marxist geographer David Harvey has addressed this erosion of state interests in education as a contemporary contradiction for capitalism. As he argues:

[Capital] needs certain infrastructures. It needs physical infrastructures, which, are long lasting – highways, roads, ports, things of that kind, which take long-term capital investment. By the same token, it also needs long-term capital investment in education, because the qualities of the labor force become an increasingly significant problem for capital over time, far more so than in Marx's time. You want a well-trained, educated labor force. And also you need it from the standpoint of the renewal of bourgeois society, that there be a great deal of innovation, and research universities became centers of innovation, (Harvey, 2017)

As the state withdraws from creating a bourgeois class and the economic innovations that have historically come with it, the state also presents a fundamental problem for capital. Harvey argues:

Of course one of the crazy things I think of now is that there's a lot of cutting back funding of higher education, when actually tremendous investment in higher education in the 1960s created an environment which to this day, provides a good deal of background to why the United States still remains so strong in the global economy. (Harvey, 2017)

Withdrawing from education, produces a 'structure of education, which is undermining what capital really needs' (Harvey, 2017).

In Stanley Aronowitz's (2005) *The Knowledge Factory: Dismantling the Corporate University and Creating True Higher Learning*, Aronowitz also takes up the subject of the US university at the point where it evacuates its historic ideological mission. For Aronowitz, this can be seen in the university's abandonment of learning. As he says, 'It is becoming harder to find a place where learning, as opposed to "education" and "training", is the main goal' (Aronowitz, 2005: 1). Distinguishing between training and education, on the one hand, and learning, on the other, he writes, 'Training prepares the student in the knowledges that constitute an occupation or a particular set of skills. Education prepares the student to take her place in a society in a manner consistent with its values and beliefs' (2005: 1). Here the university becomes the place that socializes students into profession and specialization. This socialization into profession and socialization is also a way of socializing students into the reigning societal norms. As he puts it, 'Whatever content the school delivers, the point is to help the student adapt to the prevailing order, not assimilate its values in terms of her own priorities and interests. Education is successful when the student identifies with social and cultural authorities' (2005: 1). In doing so the university decreases the opportunities whereby students engage in learning, that is, critically confronting institutional and societal norms.

For Aronowitz, it is not simply students who are interpellated into the social order. The faculty is pressed to conform as well. As he argues in relation to professors in the social and natural sciences, 'The social sciences have increasingly veered toward the natural sciences in their self-conscious subordination to the prevailing order. Their preoccupation with questions of research methods by which to measure public opinion have made them part of the barometric orientation of American politics' (2005: 4). I'm interested in this notion of the 'barometric orientation of American politics'. What does it imply? It implies that the role of the academic is simply to gauge the atmospheric pressure of the social order and thereby figure out how to adjust to that pressure. In this institutional ethos, academic fields produce tools for reproducing rather than confronting the status quo.

The university's degraded status as an entity tasked with producing critical reflection and alternative knowledges is produced by and makes way for its involvement with the market. Noting the ways in which this involvement changes the character of universities, Aronowitz states: 'Far from the image of an ivory tower where, monk-like, scholars ponder the stars and other distant things, the universities tend to mirror the rest of society' (2005: 11). As agents of social reproduction, universities have increasingly become entities to reproduce the practices of capitalist institutions. As he puts it,

Some have become big businesses, employing thousands and collecting millions in tuition fees, receiving grants from government and private sources, and, for a select few, raising billions in huge endowments. In some cities and towns, the resident private university or college is the area's largest landlord, housing students and faculty and, in some instances, collecting rents for ordinary or slum dwellings. (2005: 11)

Similar to Aronowitz, in his 2008 book *How the University Works: Higher Education and the Low Wage Nation*, Marc Bousquet demonstrates how the university's attempts to correspond to corporate management has had catastrophic effects. As he argues, 'Campus administrations have steadily diverged from the ideals of faculty governance, collegiality, and professional self-determination. Instead they have embraced the values and practices of corporate management' (Bousquet, 2008: 1). Embracing corporate management has resulted in the hyper-exploitation of contingent academic labor, making the degradation of ideals and practices of faculty governance, collegiality, and professional self-determination the condition for the universities corresponding with corporate management. This correspondence has produced conditions of unprecedented precariousness for contingent academic labor. As Bousquet states, 'Like Walmart employees, the majority female contingent academic workforce relies on a patchwork of other sources of income, including such forms of public assistance as food stamps and unemployment compensation' (2008: 3). In terms of students, the academy's convergence with corporations produces a situation in which the costs of education in terms of tuition dollars continues to rise, 'despite the tens of billions saved on faculty wages by substituting a throwaway workforce' (2008: 3).

According to Harvey (2017), the rising cost of higher education – coupled with the withdrawal of state support – produces the conditions for rising student debt as well as an emerging profile of capital in relation to education. As he argues:

The general problem of the circulation of capital is that the circulation of debt has become more and more the crux of what's going on within the capitalist economy ... And so you've now got the indebtedness of a student population. (Harvey, 2017)

Indebtedness also becomes a way of managing possible insurgencies. As Harvey (2017) states, 'And this forecloses on the future. And in a way, it's a form of social control in the same way about housing debt that it was said in the 1930s that debt encumbered homeowners don't go on strike. So debt encumbered students don't rock the boat'.

Periodizing the US university's relationship to the managerial cultures differently, Christopher Newfield (2004), in *Ivy and Industry: Business and the Making of the American University, 1880–1980*, argues that the managerial ethos took up residence in US universities long before the advent of contemporary globalization. Newfield shows how the corporation and the university came of age together in the late nineteenth century with the rise of the 'multidivisional corporation, the factory labor system, and large-scale bureaucratic management' (Newfield, 2004: 3). As such, the US university was not on the sidelines while business developed and matured. As he puts it, 'the research university has played a central role in establishing corporate capitalism and two of its major pillars, commercial technology and organizational management' (2004: 3).

Because of the US university's ideals of truth and academic freedom, its participation in corporate capitalism engendered certain contradictions. On the one

hand, the university helped to inform the character of industrial capital and, on the other, it defined itself as independent from industry, an independence that it managed to practice with some degree of distinction. As Newfield states, even with the university's participation in the development of corporate capitalism, it has 'also remained a major, if partial, outsider to this business system, having sought to support free enquiry and the pursuit of truth independently of what the market will buy' (2004: 3).

This contradiction between a humanistic current and a corporate one would shape the identity of the US middle class, a middle class formed out of what Newfield calls an aesthetic relationship to labor and a corporate focus on management. Defining this relationship, he states:

[Humanism] expresses central aspects of American middle-class identity, one proper to what later came to be called the professional managerial class (PMC). As such, humanism came to express this middle-class's sense of its difference from – and its superiority to – other classes: the university types were not labor, and they were not masters either, not those great capitalists and other sovereigns who followed their financial self-interest rather than science and truth. (2004: 46)

The university's investments in both aesthetic and corporate cultures, Newfield suggests, helped the US middle class to define itself against workers and managers, thereby shaping class subjectivities and antagonisms.

In his 2008 *Unmaking the Public University: The Forty Year Assault on the Middle Class*, Newfield continued his interest in class formations, turning his attention to the ideological changes that the US university went through in the late twentieth century, transformations that would help to roll back the gains made by an ethnically and racially heterogeneous middle class. Defining that middle class, he emphasizes the racial, ethnic, and class heterogeneity of that class, which is made up of 'Chicano hunger strikers, the children of blue collar and service workers, of low-income shopkeepers – the full range of socioeconomic positions and family incomes who have had contact with higher education because of the public university system that was built throughout the twentieth century' (Newfield, 2008: 2). Newfield's book investigates the political and institutional changes that devastated a democratic vision for the middle class and curtailed social opportunities within the USA. Newfield uses the figure of the middle class

[t]o refer to the numerical majority of the population whose contact with college was interwoven with the mainstream and politically powerful idea that this majority was to have interesting work, economic security, and the ability to lead satisfying and insightful lives in which personal and collective social development advanced side by side. (2008: 3)

In *Unmaking the Public University* (2008), Newfield applies the argument about the middle-class's humanism in *Ivy and Industry* (2004) to a socially diverse US middle class that would be the culmination of the university's humanistic ideals. The withdrawal of local and federal support from college's universities necessarily

devastates, Newfield argues, the vitality of those ideals and the socially diverse middle class that embodied that vitality.

Turning the tide against public support for colleges and universities and consequently against the US middle class was not produced by economic means alone. Indeed, in the US context, it required an ideological assault in the form of the US culture wars. As Newfield states, ‘The culture wars have coincided with the majority’s economic decline for the simple reason that these wars propelled the decline by reducing the public importance and economic claims of the American university and its graduates’ (2008: 6). Refuting those arguments, Newfield argued that the ‘culture wars were economic wars’ (2008: 6) and that imagining them as separate obscured the changed nature of the US middle class. In addition, separating the cultural from the economic had dire effects on a revived middle class that had come of age through diversities of race, gender, and sexuality. As he states, ‘The culture-war strategy was a kind of intellectual neutron-bomb, eroding the social and cultural foundations of a growing, politically powerful, economically entitled, and racially diversifying middle class, while leaving its technical capacities intact’ (2008: 6). The culture wars were therefore efforts to both discredit intellectual engagements with race, colonialism, feminism, sexuality, etc. and invalidate the class formations that those engagements helped usher into visibility.

We might see Newfield’s argument here as an engagement with and extension of Gramscian engagements with culture. Just as Gramsci would argue that culture articulates with political and social struggle, Newfield would argue that the articulations of culture in the US setting would articulate with efforts to enable a change in the social and ideological character of the US middle class. Alternatively, the culture wars would be part of a larger offensive involving economic retrenchment to diminish the position of a newly constituted middle class.

The works discussed in this section address the ways in which changes to the western university have attempted to use the university’s relationship to capital as a means of assessing the changes to academic life, corporate capitalism, and national culture. The relationship between these entities has typically been framed in purely economic terms, and save for Newfield, the texts discussed in this section presume a social body differentiated primarily by class and profession. In the next section we will consider texts that represent an epistemological shift of sorts where matters of the university and the social world are concerned.

THE UNIVERSITY IN THE HISTORIES OF DIFFERENCE

Newfield’s *Unmaking the Public University* (2008) provides a bridge to the works discussed in this section because of its assumptions about the interactions between universities and minoritized populations and what those interactions

mean for how we approach the university as an object of inquiry. Whereas the previous section's work primarily presumed a student body, faculty, and social world differentiated only by class and occupation, the works in this section apprehend academic institutions and the societies that house them as social formations differentiated by race, class, gender, and sexuality. Apprehended as such, the works place academic institutions and their constituencies within histories of racial segregation, empire, slavery, colonialism, and neocolonialism. Indeed, as Gurminder Bhambra, Dalia Gebrial, and Kerem Nişancioğlu argue in their introduction to *Decolonising the University* (2018): 'Taking colonialism as a global project as the starting point, it becomes difficult to turn away from the Western university as a key site through which colonialism – and colonial knowledge in particular – is produced, consecrated, institutionalised and naturalised' (Bhambra et al., 2018: 5). Pointing to the specific forms of knowledge produced within universities, they go on to state, 'It was in the university that colonial intellectuals developed theories of racism, popularised discourses that bolstered support for colonial endeavours and provided ethical and intellectual grounds for the dispossession, oppression and domination of colonised subjects' (2018: 5). In the spirit of likeminded arguments, the works reviewed in this section promote the idea that thinking the university means accounting for its articulation through various modes and histories of difference.

An early model of this could be seen in *A Thousand Flowers* (2000) by Federici, Caffentzis and Alidou. The volume analyzes how African universities were impacted by structural adjustment policies of the World Bank.² The book's introduction, for example, argues:

By the mid-1980s ... as country after country adopted the structural adjustment programs (SAP) imposed by the World Bank and the International Monetary Fund (IMF), presumably to stimulate economic recovery, the African educational system entered an historic crisis. All funds to public education were cut; many teachers and other academic staff were retrenched, and wages were frozen. (2000: xi)

By focusing on the World Bank's policies and their relationship to African universities, the editors show that supranational policies that were ostensibly supposed to promote the autonomy and wellbeing of African universities and societies actually ended up devastating them. Moreover, the policies also rolled back the gains of the anticolonial era. As the authors state, 'As a result [of SAPs], in a few years, the existence of what had been one of the main conquests of the anticolonial struggle – the development of an African educational system – was seriously undermined' (2000: ix).

Federici et al. published the book while members of the Committee for Academic Freedom in Africa (CAFA). This is significant and in many ways representative as it emphasizes how social struggles by minoritized populations that both capture and go beyond class struggle have characterized work that presumes the embeddedness of the university within histories of social difference. As for its own history, CAFA was formed by academics in North America and

Africa to call attention to the repression of students and faculty in African universities and to expose how African governments and international institutions such as the World Bank and the IMF promoted that repression. The group's main objectives were:

- to provide a support structure capable of responding promptly to emergency situations on African campuses;
- to mobilize teachers' unions and other academic organizations in North America on behalf of African colleagues and students;
- to reframe the terms of the debate surrounding the crisis of education in Africa. (2000: xii)

CAFA and the many student struggles on African campuses from the mid 1980s to the late 1990s reframed the terms of the debate by drawing attention to how the World Bank and the IMF were compromising the autonomy of African universities. Much of that reframing meant displacing the narrative that blamed the failure of African universities on dysfunction and corruption carried out by various African governments. As they argued:

Although the state is the immediate perpetrator, the ultimate responsibility for many violations of academic rights on the African campuses is born by international financial institutions and, more specifically, by the policy of 'adjustment' adopted by Washington and the European Union in the 1980s, that calls for the virtual recolonization of Africa's educational systems. (2000: xiii)

In turning their attention to international financial institutions, they rebutted arguments that reduce the problems of African universities to the stranglehold that African nations have on academic freedom, a notion that assumes that western entities are the purveyors rather than the inhibitors of academic freedom in Africa. In addition, they implicitly rejected a racist argument birthed in the colonial era that African nations are by dint of culture unfit for governance. Also, by focusing on international financial institutions, the authors show how colonization has a second life after so-called independence, finding new vitality through the monetary policies of western financial institutions.

The editors also used their critique as a way of tying the neoimperial practices of the World Bank and the IMF to the labor question in Africa. As they said, 'The attack on the universities is part of a broader attack on the place of Africa in the international division of labor, on the value of African workers, and on the capacity of Africans to achieve self-determination, the still unrealized goal of the anti-colonial struggle' (2000: xiii). Their assessment revises the conventional Marxist category of labor, a convention that presents labor as 'labour pure and simple, abstract labour; absolutely indifferent to its particular specificity' (Marx, 1977: 296). The authors revise that notion by considering the specificities of African labor and its relationship to African universities. For instance, describing the circumstances of African faculty members in the 1980s and 1990s because of the ways that SAP had deteriorated working conditions in universities, Federici wrote:

Exemplary of this situation are the material conditions presently in effect at the University of Dar es Salaam, where *the average academic wage now provides at best for three days of subsistence* and even the most minimal material conditions of intellectual production (pens, paper, books) are beyond the reach of the majority of faculty and students. (Federici, 2000b: 19–20)

Those circumstances produce the particularities of African intellectual labor. Noting the particular response to the devastations wrought by IMF and World Bank policies, Federici argued, ‘As a result thousands of African teachers have been forced to either migrate to America or Europe, [or] abandon their jobs in search of alternatives to “academic starvation”’ (2000b: 20). The alternatives to migrating were for faculty to rely on low-wage labor in the region such as bartering and marketing. Rather than the circumstances of African intellectual labor resembling that of all other intellectual labor, it was shaped by the particular economies and exigencies that shaped life on the continent.

The specificity of those urgencies also arose from the histories of colonization on the continent. As Federici notes, the introduction of SAP’s produced the conditions for the recolonization of Africa, one achieved through the ‘demonetization of the continent’ (2000b: 19) and the ‘defunding of African academic institutions. This is instrumental to their takeover by international agencies, who can thus organize and reshape Africa’s academic life for their own purposes’ (2000b: 20). According to Ousseina Alidou, this defunding – at least in the context of the Republic of Niger – is a strategy of neoliberal globalization that promotes ‘practical training’ and the suppression of arts and sciences. This has produced a hierarchy of knowledge formations in that country, one in which students in medicine and agronomy have received financial support while students from disciplines deemed ‘less practical’ by the World Bank and the IMF have been left by the wayside (Alidou, 2000).

Students and faculty did not simply stand by in the face of the SAP’s adopted by their governments and academic institutions, but consistently mounted protests against the efforts to recolonize the continent and its educational systems. These protests were consistently met with violence by university administrations and national governments. As Federici and George Caffentzis state:

In country after country, demonstration after demonstration, in its slogans, flyers and position papers the African student movement has shown a remarkable homogeneity of demands. ‘NO to starving and studying’, ‘NO to tuition fees’, ‘NO to cuts in books and stationary’, ‘NO to the elimination of grants and allowances’, ‘NO to Structural Adjustment, to corrupt leaders, and the recolonization of Africa’. (2000: 115–16)

The protests demonstrated the ways in which knowledge formations on the continent were caught up in the economic agendas of the IMF and the World Bank. Moreover, the protests revealed the ways that student movements pointed to the links between those economic agendas and their effects on academic life. In her assessment of the importance of student movements to struggles against SAPs, Federici wrote, ‘While still a numerical minority, African students have undergone a process of proletarianization, in the wake of Structural Adjustment, that places their concerns and struggles on a continuum with those of other workers’

(Federici, 2000a: 89). Federici would also note the central role that student struggles were playing in challenging the recolonization of the continent, arguing ‘African student struggles against SAP are an essential part of the resistance to the World Bank’s takeover of African resources and decision making’ (2000a: 89). Federici pointed to the international significance of African student movements for the accessibility of university education globally, writing, ‘African student struggles are also an integral part of the international movement against the escalating cost of education, that is putting schooling, almost at any level, out of reach for the majority of the people worldwide’ (2000a: 89).

In my 2012, *The Reorder of Things: The University and Its Pedagogies of Minority Difference*, I attempted to draw on the history of US student movements to retheorize the university’s relationship to state and capital. I did this by challenging the notion that the university was simply the hostage of state processes or the reproduction of capitalist ones. Instead, I argued that US colleges and universities provided state and capital with models de-radicalizing and incorporating forms of minority difference, forms that were worked out through student struggles on US campuses in the 1960s and 1970s. In this way, institutions of higher education provided state and capital with models for managing student protest and oppositional articulations of minority difference. These models would then be used in marketing strategies by corporations and in civil rights laws that were denuded of their original radical intentions. *The Reorder of Things* argued that this configuration in which student struggles were incorporated into the assertions of state and capital produced a mode of power that would use the affirmation of minority difference as proof of state, capital, and academy’s benevolence and its ability to incorporate and satisfy the terms of radical social change. Rather than read power’s incorporation of minority difference as the only way to articulate minority difference, the book suggested that minority difference must be articulated in ways that disrupt power’s grip, an articulation that would have to be the objective of critical engagements within and outside the academy.

The text *The Imperial University: Academic Repression and Scholarly Dissent* (Chatterjee and Maira, 2014a) also took up the issue of the management of critical intellectual production around issues of race and empire by university systems, state, and capital as well. In their introduction, Piya Chatterjee and Sunaina Maira (2014b) connect issues of privatization to state violence and the suppression of oppositional knowledge on and off campuses by arguing:

[t]he growing privatization of the public university ... has demonstrated the ways in which the gates of access to public higher education are increasingly closed and the more subtle ways in which dissident scholarly and pedagogical work (and their institutional locations) is delegitimized and – in particular instances – censored at both public and private institutions. (Chatterjee and Maira, 2014b: 6)

Focusing their analysis on the ways in which the 9/11 attacks affected US colleges and universities, they go on to write that the response to those attacks exacerbated the contradictions that have constituted US academic institutions:

'The 9/11 attacks and the crises of late capitalism in the global North have intensified the crisis of repression in the United States and also the ongoing restructuring of the academy – as well as resistance to that process – here as well as in the global south' (2014b: 6).

In the context of the 9/11 attacks, the authors write that struggles over culture are part of contentions over the continuing authority of the nation-state. Locating that authority within the university's status as a liberal institution, Chatterjee and Maira aim to excavate 'the ways in which the academy's role in supporting state policies is crucial even – and especially – as a presumably liberal institution' (2014b: 7). For them, the university's liberal veneer is connected to the hegemony that the US nation-state enjoys. As they argue, 'Indeed, it is precisely the support of the liberal class that is always critical for the maintenance of "benevolent empire"' (2014b: 7). Liberal ideology – produced and promoted within the US academy – becomes a key component of the US military complex: 'As US military and overseas interventions are increasingly framed as humanitarian wars – to save oppressed others and rescue victimized women – it is liberal ideologies of gender, sexuality, religion, pluralism, and democracy that are key to uphold' (2014b: 7). The volume thus uses the university to demonstrate that the struggle over culture is a struggle over how the state is represented. As Chatterjee and Maira contend, 'The university is a key battleground in these culture wars and in producing as well as contesting knowledges about the state of the nation' (2014b: 7).

The work in this section engages the university as a means of observing academic labor as a socially and geographically heterogeneous formation and to observe the university as an institution shaped by histories of colonialism, slavery, and migration as well as discourses of race, sexuality, and gender. The research discussed attempts to assess how constituencies differentiated by race, ethnicity, religion, migration, gender, sexuality, disability, and so on encounter and produce knowledge in ways that do not conform to models that presume a universal or abstract encounter. As such, the ideas that arise out of such formations presume analyses very different from those that assume that the university, state, and capital are only differentiated along axes of class. In addition, the work in this section engages social movements as ways to evaluate challenges to the university's relationship with capitalist economic formations and with state violence.

Class struggle is not the only mechanism for calling power into question. Relatedly, to understand the university we need to assess the itineraries of power not only in terms of economy but also in terms of knowledge formations. As such, the analysis of the university becomes a means to assess the status of knowledge, dominant and oppositional. The materialist inquiry into the university is currently the location for a contention over abstract and universalist framings of the university, and for advancing theorizations of the university as an institution shaped by socially diverse struggles over the relationships between state, capital, and academy.

Notes

- 1 Readings (1999: 23) tells the story of how 'the Office of Research and University Graduate Studies at Indiana University at Bloomington explains that in its summer Faculty Fellowship Program "Excellence of the proposed scholarship is the major criterion employed in the evaluation procedure"'.

PART VII

Inquiries and Debates

This page intentionally left blank

Intersectionality

Ashley J. Bohrer

WHAT IS INTERSECTIONALITY?

Intersectionality is a term that brings together a variety of positions on the relationships between modes of oppression and identity in the contemporary world. Primarily developed by black women and women of color who found a variety of anti-racist, feminist, and anti-capitalist theories and activist organizations insufficient to explain or respond to their oppression, intersectionality as a theory is based in the analyses, experiences, activism, and identities of women of color.

As such, intersectionality is itself an internally varied set of engagements. Intersectionality has been called a ‘buzzword’ (Davis, 2008), has been portrayed as holding theoretical hegemony (Mann, 2012: 60), and has been described as the ‘most important theoretical contribution that women’s studies has made’ (McCall, 2005: 1771). But for all its ubiquity, intersectionality seems to be little understood, or understood only in the vaguest and broadest sense. All of the major book-length projects on the history and theory of intersectionality remark that for all of the widespread familiarity with intersectionality, its central arguments, debates, and conceptual innovations remain misrepresented and misunderstood, when they are not completely ignored (Carastathis, 2016; Collins and Bilge, 2016; Hancock, 2016; May, 2015). In the words of Cho et al., the bulk of ‘what circulates as critical debate about what intersectionality is or does reflects a lack of engagement with both originating and contemporary literatures on intersectionality’ (2013: 788).

It is thus important not to conflate widespread awareness of the term with an adequate conceptualization of its meaning. In order to understand ‘intersectionality’ it is particularly important to take stock of the central debates and disagreements that inform it. As a vast and varied field, and a term put to a variety of uses, understanding the central debates in intersectionality is crucial to parsing its uses, abuses, and analytic power, as well as to framing potential critiques on firm and generous ground.

There is some debate about what exactly intersectionality is: some argue that it is a full-blown theory of oppression (Cho, 2013), that it is a theory of representation (Geerts and van der Tuin, 2013; Severs et al., 2016), that it is a critique of representation (Carastathis, 2016: 117–20), that it is a field of study (Cho et al., 2013), that it is a methodology (Cho, 2013: 385; McCall, 2005), that it is an ‘analytical and political orientation’ (May, 2015: 3), ‘a provisional concept’ (Carastathis, 2016; Crenshaw, 1991: 1244–5n9), an ‘analytical framework’ (Jordan-Zachary, 2007: 255), that it is both an ‘ontology’ and an ‘epistemology’ (Hancock, 2016). Sometimes, over the course of even a particular author’s work, multiple definitions might be used, and it should be noted that some conceive of these different registers of intersectionality as complementary rather than mutually exclusive.

The history of intersectionality is one that is also debated and contested. While there is broad consensus that the term ‘intersectionality’ was first used by critical legal scholar Kimberlé Crenshaw, the metaphor of ‘intersections’ to describe the operation and experiences of multiple modalities of oppression had been circulating in US women of color feminisms for at least a decade prior to Crenshaw’s articulation. Crenshaw herself first used it in a presentation at the Chicago Legal Symposium in 1988; her talk was published in 1989. It was used by Gloria Anzaldúa and Cherrie Moraga in 1980, when they sent the following interview question to Barbara and Beverly Smith: ‘How do race and class intersect in the women’s movement?’ (quoted in Hancock, 2016: 97). Bonnie Thornton Dill used the phrase ‘intersecting structures of race, gender, and class’ in her 1979 dissertation and in an article in 1983 (Dill, 1983). Patricia Hill Collins (1990) is widely credited with having developed a theory of what would later be called intersectionality in her landmark text *Black Feminist Thought* even though Collins uses the term ‘matrix of domination’ rather than ‘intersections’ to name her conceptualization of the interaction between race, gender, class, and sexuality; the revised 2000 edition of the same text includes ‘intersections’ and ‘intersectionality’ frequently and throughout.

Because intersectionality is a heterogeneous term, the discussion that follows seeks to elucidate some broad principles of alignment about what constitutes intersectionality, recognizing that these principles of alignment are neither universal nor exhaustive. In order to generate this list, I have drawn on a number of leading intersectionality scholars’ understandings of what the term refers to, keeping in mind that these definitions are contested.

In the first place, intersectionality emphasizes the inseparability of oppressions and critique accounts that embrace ‘single-axis’ thinking. One of the key components of intersectionality is of the mutually constructed character of oppressions. In the words of Ange-Marie Hancock, one of the key contentions of intersectionality is ‘the idea that analytical categories like “race”, “gender”, “class” and the hegemonic practices associated with them (racism, sexism, classism, to which imperialism and homophobia certainly could be added) are mutually constitutive, not conceptually distinct’ (2016: 71). In the 10th anniversary edition of *Black Feminist Thought*, Patricia Hill Collins explains that intersectionality is an ‘analysis claiming that systems of race, social class, gender, sexuality, ethnicity, and age form mutually constructing features of social organization which shape Black women’s experiences and in turn are shaped by Black women’ (2008: 299). According to Alison Bailey, ‘Race and gender should be conceptualized not as “race+gender”, instead they should be thought of in terms of “gendered racism” or “how gender is racialized”. It makes sense to talk about capitalist patriarchies rather than capitalism and patriarchy’ (2009: 17). Vivian May argues that ‘Intersectionality also is not a cumulative or arithmetical identity formula (race + gender + class + sexuality + disability + citizenship status, and so on, as if these were sequential, separate factors)’ (2015: 22). According to Nira Yuval-Davis, from an intersectional perspective, ‘social divisions [are] constituted by each other in concrete ways, enmeshed in each other, although they ... are also irreducible to each other’ (Guidroz and Berger, 2009: 65). Crenshaw explains that ‘by tracing... categories to their intersections, I hope to suggest a methodology that will ultimately disrupt the tendency to see race and gender as exclusive or separable’ (1991: 1244n9). This means that intersectionality is distinct from a ‘triple’ or ‘multiple jeopardy’ approach. While the discourses of double, triple, and multiple jeopardy were important precursor conceptualizations of oppression that deeply affected the genesis of intersectionality, the latter’s conceptualization of oppressions and categories of identity as mutually constructed constitutes a significant difference between it and the jeopardy approaches. Indeed, as we will see, many Marxist criticisms of intersectionality have wrongly conflated intersectionality with an additive ‘multiple jeopardy’ approach.

Second, another key component of intersectionality is the claim that oppressions cannot be ranked. Audre Lorde (1982) famously called this approach the ‘hierarchy of oppressions’ and Elizabeth Martínez (1983) famously named it ‘Oppression Olympics’. In this sense, intersectionality rejects theories of oppression and identity that situation one (or more) axes of oppression or categories of experience as primary. The rejection of primacy entails two claims: no one oppression is *more important* (ontologically, experientially, politically) than the others, and no one oppression *unilaterally causes* the others. While oppressions are conceived as interlocking and mutually constituting, none are conceived as epiphenomenal of the others. This claim means politically, for

both theory and activism, that ‘solving’ the problems of oppression, exploitation, marginalization, or exclusion in one axis will not magically solve the others, and moreover, combined with the non-additive conceptualization described above, means specifically that no particular kind of oppression can be solved without solving all of the others. This claim is predicated on two additional claims: a) that oppressions are *experienced* as compounding and inseparable and b) that oppressions are *ontologically* constructed in relation to one another.

Third, in many of the accounts above, intersectionality requires thinking about multiple registers of oppression simultaneously and in conjunction with one another. While intersectionality is often portrayed as an analysis located exclusively or primarily at the level of individual identity, theorists of intersectionality argue that it is important to conceptualize oppression not only at the individual level, but also at the structural, representational, and discursive levels as well. It is interesting that Crenshaw specifically argues that intersectionality is not ‘some new, totalizing theory of identity’ (1991: 1244). Highlighting this aspect of intersectionality scholarship, Hancock explains intersectionality thus: intersectionality ‘identifies the hegemonic (ideas, cultures, and ideologies), structural (social institutions), disciplinary (bureaucratic hierarchies and administrative practices), and interpersonal (routinized interactions among individuals) playing fields upon which race, gender, class, and other categories or traditions of difference interact to produce society’ (2007: 74). In particular, intersectionality is interested in thinking intersections not only in *each* of these domains, but in thinking about the ways in which these levels or domains themselves influence, constitute, and interact with one another in producing the social field.

Fourth, intersectionality takes identity as an important aspect in political organizing and theorizing. While many have caricatured identity politics, intersectionality theorists conceive of identity as multi-pronged, group-based, historically constituted, and heterogeneous. Nikol Alexander-Floyd explains that, in intersectionality, ‘identity politics [is] centered on complex, negotiated understandings of group interests’ rather than on individual identities (2012: 11). These ‘negotiated’ conceptions of group-based identity politics signify the shifting, historically situated nature of oppressions, precisely the opposite of the ahistoricism and naturalization of identity of which intersectionality theorists are accused. As Vivian May argues, this gross misreading of intersectionality is itself embroiled in a politics of knowledge production, one that ignores the theoretical sensitivity and nuance that these theories elaborate:

Pitting context versus identity ignores how intersectionality posits identity as located within, navigating across, and shaped by social structures. A more thorough reading of the literature, in any period of intersectionality’s genealogy, substantiates that a ‘both/and’ approach to (multiple) identities contextualized within myriad social structures and cognizant of relational power dynamics within and between groups is a basic premise of intersectionality. (May, 2014: 103)

An important corollary of this argument rejects a simplified, 'pure' notion of identity politics (Hancock, 2016: 140–6). Theorists of intersectionality were particularly concerned with understanding identity and oppression in ways that accounted for the multiplicity of social locations one inhabits and accounting for heterogeneity within groups. For example, Patricia Hills Collins' *Black Feminist Thought* was specifically concerned with understanding and highlighting the multiplicity of responses, theories, and experiences of Black women. Many other such examples of the anti-categorical approach to intersectionality specifically argue that because of the complexity of social life, there are neither 'pure victims' nor 'pure oppressors', but rather a 'permeability of the binary between oppressed and oppressor' (Hancock, 2016: 114). May thus argues that a politics of coalition is integral to the definition of intersectionality, which she defines as encompassing 'a radical political orientation grounded in solidarity, rather than sameness' (2015: 12). It is in this sense that Crenshaw and Carastathis argue that identities should themselves be conceived as coalitions (Carastathis, 2016; Crenshaw, 1991).

Fifth, intersectionality is indeed a theoretical orientation, but it is indexed to thinking about power within social movements and activist spaces. Intersectionality developed not only as a theory in academic spaces, but also in and through activism and organizing. Many of the texts that formed the intellectual inheritance of intersectionality were first composed and circulated through newsletters, zines, and conferences that were associated with national, regional, and local activist organizations like the Third World Women's Alliance, the National Black Women's Organization, the National Domestic Workers Alliance, the Black Women's Alliance, the National Black Feminist Organization, the National Alliance of Black Feminists, and feminist groups within other organizations, like the Student Nonviolent Coordinating Committee. Moreover, many of the writers of these texts who were themselves academics worked out the theories through conversations, questions, and problems they encountered in their organizing. Crenshaw specifically notes that her understanding of intersectionality came out of her activist work. Many intersectionality theorists were themselves in a variety of struggles, including but not limited to those about 'sterilization abuse, abortion rights, battered women, rape, and health care' (Combahee River Collective, 1979: 371).

Sixth, intersectionality is both an account of power and a critique of power. This is the sense in which intersectionality is an ontology: it explains how power operates in the contemporary world. It is in this sense that intersectionality illuminates 'the workings of power, which is understood as both pervasive and oppressive... at all levels of social relations' (Dill and Zambrana, 2009: 11). But it is not a neutral, disinterested account of that power; rather, it is also a critique of the way that power operates. It is, in this sense, both descriptive and normative, offering an account of the world and a critique of the world as it exists. In this sense, intersectionality is both descriptive and normative.

While there is some criticism that intersectionality focuses primarily on race, gender, and class as the paradigmatic oppressions to be investigated, many scholars of intersectionality have called for and developed theories that focus specifically on ability (Erevelles and Minear, 2010), national origin, particularly in respect to colonialism and imperialism (Lugones, 2003), incarceration status (Golash-Boza, 2016; Ocen, 2013), immigration status (Grosfoguel et al., 2015; Romero, 2008), religion (Singh, 2015; Wadsworth, 2008), and others. Indeed, Crenshaw herself, who focused specifically on race and gender, noted that her focus on those factors is not meant to suggest that they are the only relevant ones; rather, ‘factors [she] address[es] only in part or not at all, such as class or sexuality, are often as critical’ to intersectional analyses. Her ‘focus on race and gender only highlights the need to account for multiple grounds of identity when considering how the social world is constructed’ (Crenshaw, 1991: 1244–5). While in certain accounts of intersectionality, sexuality has dropped out of many analyses as a primary node of consideration (Nash, 2011), sexuality was an important aspect of early intersectionality theory (Combahee River Collective, 1979; Lugones, 1990; Smith and Smith, 1983). Some have levied a similar charge against intersectionality’s understandings of class, but many of the foundational texts of intersectionality took class as a primary mode of oppression. A fuller discussion of the relationship of intersectionality to class and capitalism will be explored in the second section.

MARXISM AND INTERSECTIONALITY’S HISTORY

It is useful to remember Crenshaw introduced the term ‘intersectionality’ specifically to speak about a labor issue: in Crenshaw’s article, ‘intersectionality’ refers to ‘the various way[s] in which race and gender interact to shape the multiple dimensions of Black women’s employment experiences’ (1989: 139). While Crenshaw herself does not explicitly speak about capitalism, recognizing the labor roots of intersectionality might help Marxists ground and orient an analysis of it.

Many of the intellectual precursors of intersectionality were committed Marxists and/or socialists. The initial publication of the Combahee River Collective’s ‘A Black Feminist Statement’ appeared in a volume collected by Marxist–feminist Zillah Eisenstein (Combahee River Collective, 1979). Carastathis notes that ‘Black Communist feminists are its [intersectionality’s] unacknowledged historical precursors’, while also noting that many Marxists’ attempts to integrate intersectionality into Marxism have ‘problematically minimized or rejected the central claim that oppressions cannot be hierarchized’ (2016: 56).

In particular, both Katheryn Gines and Eric S. McDuffie recuperate the history of black women communists as founding the often unacknowledged intellectual precursors of intersectionality and include Claudia Jones, Louise Thompson

Patterson, Beulah Richards, Ida B. Wells, and others in this genealogy (Gines, 2014; McDuffie, 2011).

Hancock notes that attention to capitalism and its intertwining with both slavery and colonialism formed central aspects of intersectionality's analysis of how oppression, inequality, exploitation, and injustice were organized in the contemporary world; she notes that 'While more recent intersectionality scholarship has been criticized for neglecting class, the more complicated history of intersectionality suggests that it has instead fallen out of the discussion of intersectionality among the interpretive community, a different dilemma worth wrangling with on its own terms' (Hancock, 2016: 44).

Though intersectionality is a theory that is substantially different from the additive conception of oppressions given in a double, triple, or multiple jeopardy analysis, the latter was nonetheless an important influence on and intellectual precursor to intersectionality (Carastathis, 2016; Collins and Bilge, 2016; Grzanka, 2014; Hancock, 2016; May 2015). Francis Beal, the author of the influential 'Double Jeopardy' (1970), specifically attributes the intensity and specificity of Black women's oppression to the 'superexploitation' of the 'capitalist system'. Beal was a member of the Third World Women's Alliance (TWWA), a women of color activist organization specifically aimed at eliminating the intertwined systems of capitalism, imperialism, and the oppression of women of color. The newspaper of the TWWA was called *Triple Jeopardy* to reflect these concerns and this anti-capitalist orientation. Deborah King's article on multiple jeopardy also argued that capitalism and class-based exploitation were primary nodes in the construction of oppression (King, 1988).

In addition to these texts, which form a significant basis of intersectional thinking, many theorists of intersectionality are specifically concerned with capitalism as a substantive system that causes, structures, and forms the matrix of domination that intersectionality seeks to critique. In order to illustrate this, what follows in the rest of this section is a brief survey of intersectional engagements with class and capitalism.

Perhaps the most famous and often cited example of anti-capitalist intersectionality is the Combahee River Collective's 'A Black Feminist Statement'. They write:

The most general statement of our politics at the present time would be that we are actively committed to struggling against racial, sexual, heterosexual, and class oppression and see as our particular task the development of integrated analysis and practice based upon the fact that the major systems of oppression are interlocking. The synthesis of these oppressions creates the conditions of our lives. (Combahee River Collective, 1979: 362)

They specifically articulate an analysis of oppression that understands the ways that race, gender, class, and sexuality can neither be separated in experience nor in structure, arguing that there is 'racial-sexual oppression which is neither solely racial nor solely sexual' (Combahee River Collective, 1979: 365). In order to

combat this matrix of domination, the Combahee River Collective specifically embraces a form of socialism that takes not only class, but race, gender, and sexuality as structuring aspects of exploitation and oppression:

We realize that the liberation of all oppressed peoples necessitates the destruction of the political-economic systems of capitalism and imperialism as well as patriarchy. We are socialists because we believe that work must be organized for the collective benefit of those who do the work and create the products, and not for the profit of the bosses. Material resources must be equally distributed among those who create these resources. We are not convinced, however, that a socialist revolution that is not also a feminist and anti-racist revolution will guarantee our liberation. We have arrived at the necessity for developing an understanding of class relationships that takes into account the specific class position of Black women who are generally marginal in the labor force, while at this particular time some of us are temporarily viewed as doubly desirable tokens at white-collar and professional levels. We need to articulate the real class situation of persons who are not merely raceless, sexless workers, but for whom racial and sexual oppression are significant determinants in their working/economic lives. Although we are in essential agreement with Marx's theory as it applied to the very specific economic relationships he analyzed, we know that his analysis must be extended further in order for us to understand our specific economic situation as Black women. (Combahee River Collective, 1979: 366)

In this articulation, the Combahee River Collective explains that traditional Marxist analyses that have ignored, marginalized, or misunderstood the central importance of race, gender, and sexuality to the system of capitalism are insufficient, but they conceive of socialism as a project that can be 'extended' in order to adequately conceptualize them. In particular, race, gender, and sexuality cannot be simply 'added' to class in this extension as mere epiphenomena of class relations that will be magically solved through thinking about class. Collective member and one of the authors of the 'Black Feminist Statement', Beverly Smith specifically argued against a Marxism that conceives of class as ontologically primary in this sense, critiquing 'Marxists who say "Well, when class oppression and racism end, definitely the oppression of women and lesbians will end"' (Smith and Smith, 1983: 122–3). What is needed, then, is not just a mere conservation of already existing Marxism with the additions of other forces of oppression, but a full extension of the foundational concepts of Marxism to think about the ways in which race, gender, and sexuality permeate all moments of capitalist exploitation. In this sense, the Combahee River Collective's statement should be read both as a contribution to Marxism and as a critique of many dominant trends of Marxism.

While Patricia Hill Collins' focus has not exclusively been on capitalism or class, it is important to remember that her analysis is completely suffused with an analysis of both. In *Black Feminist Thought*, Collins continually refers to 'economic exploitation' and black women's status as 'economically exploited workers' as essential to the 'creation and perpetuation of capitalist class relations' (2008: 51). While the object of her analysis is not only capitalism, *Black Feminist Thought* is so suffused with a structural critique of capitalism at every turn that it should be rightly read as an anti-capitalist text in its own right.

Angela Davis, author of over a dozen books and countless articles, is another thinker who is foundational to both Marxism and intersectionality. While much of Davis' early work does not use the term 'intersectionality', she has more recently explained that she views her own work as being intersectional, and as contributing to the tradition of intersectionality (Davis and West, 2016: 38). She specifically highlights the TWWA and its newspaper *Triple Jeopardy* as one of the theoretical anchors in her conceptualization of intersectionality and of her own work. In speaking about the history of her own work, Davis comments, 'I think that the whole notion of intersectionality that has characterized the kind of feminisms we're talking about, that we cannot simply look at gender in isolation from race, from class, from sexuality, from nationality, from ability, from a whole range of other issues' (2016: 65–6). While many of Davis' seminal texts – like *Women, Race and Class* (1983), *Are Prisons Obsolete?* (2003), and *Blues Legacies and Black Feminism* (1999) – do not use the term intersectionality, and thus have been often left out of many genealogies of intersectionality, Davis' comments here and her constant attention to the interwoven dynamics of race, gender, class, and sexuality reveal her work to be touchstones of both intersectional and Marxist traditions.

bell hooks, another foundationally important intersectionality theorist, explicitly names the matrix of domination 'white supremacist capitalist patriarchy' throughout her work (1999, 2004: 17; 2014). hooks (n.d) argues that a gender analysis is crucial to ending capitalism, just as an anti-capitalist orientation is central to ending gender oppression: 'I think that what we see globally is that there have been incredible struggles to combat capitalism that haven't resulted in an end to patriarchy at all'. In responding to a question about whether a specifically Marxist critique of capitalism was central to her work, hooks replies, 'Absolutely. I think Marxist thought...is very crucial to educating ourselves for political consciousness... A class rooted analysis is where I begin in all my work' (hooks, n.d.).

Audre Lorde, in her seminal article 'Age, Race, Class, and Sex: Women Redefining Difference', specifically draws attention to the 'white male heterosexual capitalist' structure of the world (Lorde, n.d.). She explains that part of the way in which age, race, and sex are connected to capitalism is by using the language of surplus population – a term that Marx used and many contemporary Marxists have used in order to describe how race and gender organize and are organized by capitalism on a structural level: 'In a society where the good is defined in terms of profit rather than in terms of human need, there must always be some group of people who, through systematized oppression, can be made to feel surplus, to occupy the place of the dehumanized inferior' (Lorde, n.d.: 114). She continues, 'Institutionalized rejection of difference is an absolute necessity in a profit economy which needs outsiders as surplus people' (Lorde, n.d.: 115). She once described herself as a 'Black lesbian feminist socialist mother warrior poet'. Some have argued that it makes the most sense to describe Lorde's project as a 'Queer Black Marxism' (Holcomb, 2014).

What this brief and partial survey demonstrates is that, far from intersectionality theorists conceiving of themselves as universally opposed to Marxism, many of the key thinkers of intersectionality have themselves identified as Marxists, socialists, and anti-capitalists, arguing for the centrality of class and capitalism in intersectionality.

MARXIST ENGAGEMENTS WITH INTERSECTIONALITY

Despite the shared genealogy of Marxism and intersectionality, much of the scholarship of both traditions has positioned these bodies of work as opposed to one another, rather than as sharing vital commitments, textual bases, and critical analyses. This section focuses on a series of frequent criticisms of intersectionality in Marxist circles: that intersectionality is postmodern, that it is essentially reformist and/or liberal, that it misunderstands the fundamental nature of class, that it lacks a causal explanation of oppression, and that it fundamentally impedes political attempts at solidarity. I turn to intersectionality's responses to each criticism.

Identity Politics

In a widely read and distributed pamphlet, Eve Mitchell alleges that the focus of intersectionality on identity politics constitutes a reinforcement of specifically capitalist ideas of individuality. Responding specifically to bell hooks' iteration of the critique of the homogeneity of experience so frequent in non-intersectional analyses, Mitchell writes:

hooks is correct to say that basing an entire politics on one particular experience, or a set of particular differences, under capitalism is problematic. However, intersectionality theory replicates this problem by simply adding particular moments, or determinant points; hooks goes on to argue for race and class inclusion in a feminist analysis. Similarly, theories of an 'interlocking matrix of oppressions,' simply create a list of naturalized identities, abstracted from their material and historical context. This methodology is just as ahistorical and antisocial as Betty Friedan's. (Mitchell, 2014)

This selection highlights two related but slightly different criticisms. In the first place, Mitchell's critique is representative of a frequent criticism of what we might call 'mathematical' intersectionality theory;¹ these are the theories that conceive of the multiple axes of oppression as additive or multiplicative, using concepts like 'triple jeopardy' to explain the position of working-class women of color who experience class, gender, and race-based oppressions. While there are certainly some intersectional theorists who deploy this framework, many intersectional theorists themselves have argued against additive and multiplicative models for their failure to highlight the mutual constitution of the structures of domination. In one example of an intersectional critique of this language,

Deborah King (1988) decries what she terms the ‘pop-bead approach’ where oppressions are considered separate and then added together, arguing that by considering these systems as wholly distinct, these frameworks revive the tendency to hierarchize oppressions. As this same intervention is made by many other intersectionality theorists, Mitchell’s (and others’) identification of intersectionality with these mathematical models constitutes a straw-man argument, one that refuses to seriously engage with the vast intersectional literature critiquing the very position Mitchell attributes to this framework.

The second but related criticism Mitchell levies concerns the nature of identity as it is discussed by intersectionality. Mitchell worries that identities are conceived as ‘natural’, ‘ahistorical’, and later in this essay, ‘idealistic’ and ‘bourgeois’. Mitchell’s worry about identity politics is rooted in a long history of Marxist criticism. Marxism, as a perspective grounded in historical materialism, generally views identities as effects of structural, material, and historical processes. Hence, accounts of identity that are only descriptive and do not speak about the structures enframing, creating, policing, and maintaining these identities lack, from a Marxist perspective, the crucial and necessary explanatory element of theory that would be grounded in a historical perspective of the power of structures and institutions. Politics of identity that stay only at the level of claiming a social location are seen as overly self-congratulatory and in some ways reaffirm the social cleavages created by dominating structures without necessarily giving an account of the genesis, logic, organization, history, or power of those structures. In this way, certain iterations of identity politics ground themselves in purely individual terms and reduce politics solely to an issue of claiming a position within a social totality. Critics of identity politics, especially those who are engaged not only in theory but also in movement-based activist work, also worry that grounding a politics in identity can have the effect of limiting the possibilities for cross-group coalition building and solidarity.²

While the Marxist critiques offered above do critique certain strands of identity politics, it seems not to be the notion of identity politics embraced by intersectionality theorists. The Combahee River Collective explains identity politics in this way: ‘this focusing upon our own oppression is embodied in the concept of identity politics. We believe that the most profound and potentially most radical politics come directly out of our own identity, as opposed to working to end someone else’s oppression’ (1979). The Combahee River Collective, and many other intersectionality theorists, mobilize their experiences of the simultaneity of oppressions rather as a starting place – not the end goal – of theory and praxis, as a window into the structures of domination from which to speak, interrogate, analyze, and explain.

In fact, intersectionality theorists precisely critique notions of identity politics that signify an endless, congratulatory string of individual identifications, disconnected from structures and histories. In her article on the relationship between intersectionality and postmodernism, Susan Archer Mann (2013) specifically

foregrounds the ways in which this model of identity politics – the one Mitchell critiques – is also the one intersectionality critiques. Mobilizing the work of intersectionality scholars like Patricia Hill Collins, Mann argues that the notion of individual identity politics belongs to the tradition of post-structuralism rather than intersectionality, even though the two are often conflated. In the next subsection, we will see the ways in which intersectionality is often conflated with postmodernism and/or post-structuralism.

Postmodernism

One of the most common critiques of intersectionality from a Marxist position alleges that intersectionality is primarily a postmodern theory. While often in these critiques ‘postmodern’ is neither defined nor is it precisely articulated why postmodernism is an inherently flawed position, many intersectionality theorists specifically differentiate intersectionality from postmodernism. Cho (2013) in particular argues that postmodern understandings of intersectionality significantly distort its key principles. The sharp differentiation between postmodernism and intersectionality is widely shared among scholars of intersectionality (Collins, 2015; Hancock, 2016; May, 2014, 2015; Mann, 2012). Hancock argues that the conflation of intersectionality with postmodernism (e.g. Lykke, 2010) serves a particularly nefarious purpose: by subsuming intersectionality under the aegis of (largely) white Euro-American postmodern theorists, women of color and the content of their writings are effectively de-centered from intersectionality scholarship, a practice Sirma Bilge has called the ‘whitening of intersectionality’ (Bilge, 2014; Hancock, 2016: 2; Lykke, 2010). The genealogy (even as a contested one) of intersectionality derives much more from women of color feminisms than from the theories of Foucault, Butler, or other post-structuralist theories.³

In particular, the charge of postmodernism seems levied at intersectionality’s supposed focus *only* on the individual and experiential elements of oppression and its alleged neglect of structures and institutions. While it is true that many intersectional theorists have critiqued a *singular* focus on structures and a *complete neglect* of individual identities and lived realities, the key texts of intersectionality seek to intervene in discussions of oppression by thinking about the multiplicity of ways in which oppression functions at *both* the personal and the structural levels, as we saw above.

Reformist/Liberalism

One trenchant critique of intersectionality is the ways in which it has been mobilized in service of a reformist project of inclusion under the aegis of multicultural liberalism. In particular Jasbir Puar has been an outspoken critic of intersectionality as merely ‘a way to manage difference in ways that reinforce “liberal

multiculturalism” (2012: 53). While it is certainly true that intersectionality has been used as a tool of reforming institutions rather than subverting them, it is important to note that intersectionality theorists both insist on the radical, revolutionary potential of intersectionality *and* critique its (mis)use and (mis)appropriation when it is not aimed at a total reordering of society. In 1989, Crenshaw clearly argued that ‘problems of exclusion cannot be solved simply by including Black women within an already established analytical structure’ precisely because the structures and institutions of modern life are precisely predicated on the exclusion and oppression of Black women in particular and women of color in general (1989: 140). As Vivian May argues, ‘Some have used or understood intersectionality in ways that align with liberal multiculturalism, reinforce and rationalize state surveillance, further settler colonial logics, or ignore the coloniality of gender’, but ‘doing so undermines its anticolonial impetus and ignores its long-standing focus on the (settler) state’s founding brutalities and ongoing abuses’ (2015: 231). In this sense, it may be important to critique liberal, multicultural appropriations of intersectionality, but this misuse should not be construed to faithfully *represent* the theoretical aims or political orientation of intersectionality itself.

Class, Classism, and Capitalism

Another enduring criticism of intersectionality is the persistence of the term ‘classism’ in intersectionality, which is used in some intersectional work in place of capitalism or exploitation. Theorists like Martha Gimenez take the persistence of the term ‘classism’ to denote a variant of class-based elitism that, for them, does not fully grasp the systematic nature of class relations as a fundamental, material cleavage organizing society. She writes, ‘Class is not simply another ideology legitimating oppression; it denotes exploitative relations between people mediated by their relations to the means of production’ (Gimenez, 2001: 24). It is from this perspective that Gimenez and others argue against equating class with other forms of oppression like those of race, gender, or sexuality. From this perspective class is fundamentally organized in a different way than the others. A variant of this perspective maintains that oppression and exploitation are themselves different structures and require different analyses. Martha Gimenez continues, ‘To argue, then, that class is fundamental is not to “reduce” gender or racial oppression to class, but to acknowledge that the underlying basic and “nameless” power at the root of what happens in social interactions grounded in “intersectionality” is class power’ (2001).

In response to this, intersectionality scholars have argued that these accounts replay the very formations and theoretical commitments that intersectionality was invented to critique. Irene Gedalof explains the problem with class-first understandings of power, inequality, and oppression as having two different, but related problems:

[T]his hierarchizing of entitlement claims effectively pits class against the 'equality strands', in two related ways. It defines class as something we all have, while gender, race, ethnicity and sexuality are reduced to 'the politics of identity', a kind of special pleading. And it undoes the possibility of any kind of intersectional understanding of these categories of difference, by de-linking the socio-economic from the gendered, sexualized and racialized ways in which socio-economic positioning is lived, and situating it solely in the undifferentiated space of 'class'. Class then becomes a way of stabilizing sameness. (Gedalof, 2013: 129)

In this way, Gedalof argues that actually understanding the contemporary and historical operations of class *requires* an intersectional approach that can understand intra-class distinctions, hierarchies, and inequalities.

Linda Martín Alcoff argues that there are never 'pure' class issues that do not intersect with race, gender, and sexuality. She explains:

[T]here are demands of skilled or unskilled workers, of the trades or the service professions, of migrant workers, of women workers, of immigrant workers, and so on. Sometimes these groups can make common cause, but the very project of doing so will require a clear understanding of how identities mediate class relations to produce specific workplace hierarchies and conflicts of interest. Class reductionists argue here that conflicts will dissolve if we can only wean ourselves from our identity attachments. It is in just this way that the left colludes with the right in portraying ethnic group politics today as special interest agendas with opportunistic leaders who never take into account the common good. (Alcoff, 2011: 74)

In this sense, part of intersectionality's argument is that, in order to be doing good, careful, deep-class analysis, an intersectional frame is required.

Causation and Intersectionality

One of the frequent critiques of intersectionality argues that intersectionality provides a fine descriptive account of the world, but that it flounders at providing a causal one.

Broadly, this is the critique most often offered by Marxists who conceive of Marxism and intersectionality to be complementary approaches.

Sharon Smith argues that because intersectionality (supposedly) has no account of exploitation or the genesis of oppression, it 'needs' Marxism';⁴ it is inadequate on its own to ground this account of how and why oppression and exploitation happen.⁵ A similar criticism is levied by Martha Gimenez, who argues that intersectionality has 'taken for granted categories of analysis whose meaning apparently remains invariant in all theoretical frameworks and contexts' rather than providing a causal, structural, or historical account of these categories (2001: 21). McNally and Ferguson (2015) expand this critique, arguing that intersectionality lacks 'any coherent explanation of how and why' intersections are organized in some ways rather than others. It would take us too far afield here to reconstruct in detail all of the various intersectional histories and histories of intersectional oppression that have been written. However, it is important to note that intersectionality is not merely a theory of the contemporary, but is also a perspective that has produced its own historical scholarship, looking to answer precisely the

question of how intersectional oppression has been produced (Lugones, 2007; McClintock, 1995; McWhorter, 2009). It is important to note that, in many of these accounts, capitalism plays an important, structural role, even if it does not play a unilateral or universal role, as colonization, Christian supremacy, pre-existing gender and sexual ideologies, organized resistances, diseases, technologies, and non-European ideas, histories, religions, and customs also exert causal force in these histories.

Solidarity, Separatism, and Sectarianism

Yet another set of criticisms revolve around the idea that because of intersectionality's focus on differences, it cannot ground broad movements of solidarity. This kind of criticism is exemplified by Kevin Anderson, who writes the following:

It was often said we should avoid any kind of class reductionism or essentialism in which gender and race are subsumed under the category of class. At most, it was said, movements around race, gender, sexuality, or class can intersect with each other, but cannot easily coalesce into a single movement against the power structure and the capitalist system that, according to Marxists, stands behind it. Thus, the actual intersectionality of these social movements – as opposed to their separateness – was usually seen as rather limited, both as reality and as possibility. Saying otherwise ran the danger of falling into the abyss of reductionism or essentialism. (Anderson, n.d.)

Anderson's critique is a common one of intersectionality and, indeed, of many theories of social justice grounded in experiences or theories that critique universalization as the ground of political struggle. From the perspective of intersectionality, however, contesting universalizing narratives seems not to mean a rejection of working across differences; working in coalition is an explicit and central part of intersectionality's commitment to social justice organizing. In these arguments, often critiques of reductionism (which takes aim at those who want to fold multiple movements together *under the banner* of one issue's superiority) and essentialism (which takes aim at the severability of categories of identity and systems of oppression) are conflated with an injunction against coalition building. While many intersectionality theorists have analyzed the dangers of coalition building across power differentials, according to those theorists, these critiques are meant to strengthen the possibility of coalition building, not reject it (Lugones, 2003; Sandoval, 2000). On this issue, it is helpful to turn to the long history of intersectionality theorizing that is specifically about coalition, solidarity, and inter-issue connections that was explored above as a central tenet of intersectionality. Combahee River Collective member Barbara Smith has responded to criticisms like this one by saying:

I have often wished I could spread the word that a movement committed to fighting sexual, racial economic and heterosexist oppression, not to mention one which opposes imperialism, anti-Semitism, the oppressions visited upon the physically disabled, the old and the young, at the same time that it challenges militarism and imminent nuclear destruction is the very opposite of narrow. (Smith, 2001: 150)

In order to build broad coalitions across differences, Audre Lorde argues that it is important to reconceptualize how coalitions and organizing are often assumed to rest upon finding a solid base of sameness from which to organize:

Being women together was not enough. We were different. Being gay-girls together was not enough. We were different... Being Black dykes together was not enough. We were different... It was a while before we came to realize that our place was the very house of difference rather than any one particular difference. (Lorde, 1982: 226)

From Lorde's perspective, and from many intersectional theorists' perspectives, coalition is indeed difficult and potentially impossible if coalitions are imagined as the 'lowest common denominator' between groups; intersectionality's work on coalition building thinks of coalition building not from sameness, but from solidarity, foregrounding as centrally important the ways in which systems of oppression and exploitation work precisely by working differentially, that is, by not impacting all groups in the same way. In this sense, coalitions are necessary and important by intersectional standards in order to organize against the various, differential ways in which oppression and exploitation are organized, rather than denying that those differences exist. From an intersectional perspective, understanding the differential operations and organizations of oppression is the foundation of all effective coalitions and effective activism rather than the condition of their impossibility.

CONCLUSION: INTERSECTIONALITY AND/OR MARXISM?

The debate between Marxism and intersectionality has intensified in recent years. The sheer range of positions on this conjunction were recently highlighted by a Special Issue of the Marxist journal *Historical Materialism* (Kumar et al., 2018). This is far from the only context in which the question of what Marxism's relationship to intersectionality is and should be.

As should be clear from some of the foregoing discussion, some (e.g. Belkhir, Gimenez) argue that intersectionality is such a flawed theory that it has nothing to offer a robust Marxism.

But others advance a more nuanced or conciliatory position that allows for some kind of rapprochement between these approaches. As noted above, there are those, like Sharon Smith, who argue that intersectionality holds promising insights, but only when folded into a Marxist account of capitalism. In another version of this argument, intersectionality may indeed hold important insights, but fundamentally, certain trends in Marxist theory are potentially better positioned to generate these insights autonomously, casting intersectionality as redundant to the work on race, gender, and sexuality already being accomplished in certain trends within Marxist theory, like social reproduction. McNally and Ferguson conclude,

While intersectionality theory has raised important questions, and generated important insights, it tends to flounder at explaining *why* these multiple oppressions exist and are

reproduced throughout late capitalism, and at accounting for the *how* of their interaction. Because its approach is holistic and unitary, social reproduction theory is, we think, potentially better equipped in these areas. (McNally and Ferguson, 2015)

In both cases, and in many similar claims, intersectionality and Marxism are only integrateable in a single direction – if intersectional insights are incorporated into Marxism (rather than vice versa).

But there are other scholars who see a different path forward, one in which Marxism and intersectionality can come together in deep and complicated ways to inform and push each other forward, outside of the imperative to subordinate one theory to the other. In what I have elsewhere called the ‘equi-primordially’ of Marxism and intersectionality as theories for explaining and changing the world (Bohrer, 2019), this is the path of intersectional Marxism or Marxist intersectionality. This approach recognizes the differences of the two theories as a difference of emphasis rather than as a fundamental incompatibility. Rather, this approach identifies and locates how both oppression and exploitation remain fundamental to capitalism’s reproduction, materially and ideologically, pulling from both traditions to give deep and nuanced critiques that might bring to bear a new world from the ashes of the old.

Notes

- 1 The descriptor ‘mathematical’ comes from Deborah King’s analysis of intersectionality. She writes: ‘most applications of the concepts of triple jeopardy have been overly simplistic in assuming that the relationships among the various discriminations are merely additive. These relationships are interpreted as equivalent to the mathematical equation, racism plus sexism plus classism equals triple jeopardy. In this instance, each discrimination has a single, direct, and independent effect on status, wherein the relative contribution of each is readily apparent’ (King, 1988).
- 2 It is interesting to note that these kinds of arguments were precisely those made by many mainstream Marxists *against* the development of Marxist feminism.
- 3 However, it is important to note that Crenshaw ‘consider[s] intersectionality a provisional concept linking contemporary politics to postmodern theory’, even though what exactly Crenshaw means by ‘postmodern theory’ and the exact nature of this linkage remains unexplored in her article (1991: 1244n9).
- 4 Sharon Smith, “A Marxist Case for Intersectionality,” *Socialist Worker*, August 1, 2017, <https://socialistworker.org/2017/08/01/a-marxist-case-for-intersectionality>.
- 5 While Smith does not explicitly call race, gender, or sexuality epiphenomenal on class exploitation, in a flowery turn of phrase, she suggests that racism, homophobia, and sexism can disappear ‘in a matter of days’ when workers join together in a strike, suggesting that she conceives of fighting class exploitation sufficient to tackle gender-, race-, and sexuality-based oppressions, something that, as we saw above, was clearly rejected by intersectionality theorists.

Black Marxism

Asad Haider

It is rare to find the word 'Marxism' modified by a term that designates racial or ethnic categories. When it is modified by a national designation (as in, for example, 'Italian Marxism'), this is meant to situate it geographically, and not to propose that it provides a theory of national particularity (say, 'Italian Marxism' as the theory of 'Italian-ness').

What, then, do we refer to when we say 'Black Marxism'? It is difficult to be comfortable with the kind of common-sense proposition that Black Marxism is Marxism generated by Black people. Given that we do not generally refer to the historic figures of the European socialist tradition as 'White Marxists', inserting the modifier 'Black' as an indication of the identity of a given Marxist would be at best eccentric and at worst the indication of a racist double standard.

Yet it would appear to be moving too quickly to dismiss the term as such, since simply in attempting to define it we have already encountered major analytic questions which are central for Marxism of any variation. We may sum these questions up in the difficult relationship between the categories of 'race' and 'nation'. Often the figures who are cited as examples of 'Black Marxism' are situated geographically in the USA, and their work is generally invoked in order to inquire into the meaning of race, or perhaps the relation between 'race' and 'class'. But both of these criteria beg the question. Even though we have already used the term 'Black' to indicate a variant of Marxism, we have not explained how it came to function socially as a 'racial' category, and we have not explained how this racial category is connected to particular national origins.

This is significant because there is a serious weakness in many Marxist attempts to provide a theory of the relation between race and capitalism. Ellen Meiksins Wood, for example, has written: 'Capitalism is conceivable without racial divisions, but not, by definition, without class' (2002: 276). This is a remarkable claim. It proposes that we can *conceive* of a capitalism which is entirely separate from its actual history, and formulate a definition against which reality can be measured. For Wood, since the essence of capitalism is obscured by the sheer multiplicity of cases in which it appears, it becomes necessary to carve away all the contingent historical excess and construct an ideal model in the mind. According to this epistemological procedure, the relation of capitalism to race is to be determined at the level of the model, and at this level it turns out that race is of secondary importance to class.

THE BLACK RADICAL TRADITION

Faced with this simultaneously idealist and economic discourse, it is clear that it is vitally necessary to recover a 'Black Marxism'. Given the difficulties of definition, Cedric Robinson's book *Black Marxism* (2000) is an indispensable point of reference. But Robinson's book poses new challenges, because it does not actually present us with 'Black Marxism'. In fact, it could even be read as proposing the impossibility of such a category, in favor of what Robinson calls the 'Black Radical Tradition'.

In order to define the Black Radical Tradition, Robinson has to trace an astonishing sweep of world history. He proposes that the Black Radical Tradition has its roots in the collective resistance of New World slaves, a resistance which, according to Robinson, was based on an epistemology that 'granted supremacy to metaphysics not the material'. This epistemology is central to the Black Radical Tradition, because it 'was a revolutionary consciousness that proceeded from the whole historical experience of Black people and not merely from the social formations of capitalist slavery or the relations of production of colonialism' (Robinson, 2000: 169). Therefore the starting point of the investigation has to be the forms of thought through which a self-consciousness of this historical experience could be constituted. This logical structure is one also described by Hegel, in which the standpoint of investigation appears as the result, 'in which it reaches its beginning again and returns into itself'. The beginning is only a beginning for the subject who thinks, while thinking is 'a circle that goes back into itself' (Hegel, 1991a: 41). In other words, world history has to be interpreted on the basis of the epistemology of the Black Radical Tradition, but it is also the self-consciousness of this history which generates that epistemology.

This is possible because the Black Radical Tradition is also a philosophy of history. It has a telos towards which, Robinson argues, it still tends: 'the continuing development of a collective consciousness informed by the historical struggles

for liberation and motivated by the shared sense of obligation to preserve the collective being, the ontological totality' (Robinson, 2000: 171). History matters because it is the 'shared past' of a people and thus 'the basis of consciousness, of knowing, of being'. The collective consciousness belongs specifically to a people, a particular people with a particular history. It emerges, Robinson writes, from the struggle of Black people, and consists of 'the collective wisdom which is a synthesis of culture and the experience of that struggle' (Robinson, 2000: xxv).

DEFINING RACIAL CAPITALISM

According to the epistemology of the Black Radical Tradition, the force against which it struggles can be identified as 'racial capitalism'. Black resistance was based, Robinson writes, on 'the Africanity of our consciousness – some epistemological measure culturally embedded in our minds that deemed that the racial capitalism we have been witness to was an unacceptable standard of human conduct' (2000: 308).

'Racial capitalism' is one of Robinson's most frequently invoked formulations. It appears to better describe the history of capitalist development, which, as Marx himself vividly described, was characterized by the plunder of the colonies and the brutality of slavery.

However, we have to read closely, because Robinson has not merely modified a Marxian account of capitalism with an indication that racial oppression was one of its developmental determinants. His argument is far more original. Racial capitalism is a category that is specifically advanced within the epistemology of the Black Radical Tradition. From this vantage point, one which privileges the cultural and metaphysical, the confrontation of an African consciousness with racial capitalism is a kind of clash of civilizations, since racial capitalism expresses the character of Western civilization itself.

What, then, characterizes Western civilization, and how can its expression as racial capitalism be explained by cultural and metaphysical causes rather than material ones? Robinson explains this in terms of a system of 'racialism' which precedes capitalism and categorizes the diverse populations of Europe, distinguished by regional, cultural, and linguistic differences. The nation is an illusory category; it confuses the structure of the bureaucratic state with the real history of particular identities and social structures that constituted European society. With the emergence of capitalism, Robinson argues, there is a deepening of racialism: 'The tendency of European civilization through capitalism was thus not to homogenize but to differentiate – to exaggerate regional, subcultural, and dialectical differences into "racial" ones' (2000: 26). Thus, as capitalism developed:

racialism and its permutations persisted, rooted not in a particular era but in the civilization itself... As an enduring principle of European social order, the effects of racialism were

bound to appear in the social expression of every strata of every European society no matter the structures upon which they were formed. (Robinson, 2000: 28)

There is a continuity of racialism across particular historical epochs. Racialism fundamentally *affects* social, political, and economic forms specific to a given historical period. It cannot be said to have been *determined* by them. Against the reduction of historical explanation to material factors, Robinson argues:

Racialism insinuated not only medieval, feudal, and capitalist social structures, forms of property, and modes of production, but as well the very values and traditions of consciousness through which the peoples of these ages came to understand their worlds and their experiences. Western culture, constituting the structure from which European consciousness was appropriated, the structure in which social identities and perceptions were grounded in the past, transmitted a racialism that adapted to the political and material exigencies of the moment. (Robinson, 2000: 66)

Capitalism is then only one moment in the development of European racialism, which starts at ‘the very beginnings of European civilization’ – according to Robinson, ‘literally the reappearance of urban life at the end of the first Christian millennium’ (Robinson, 2000: 66). Given the importance Robinson attaches to the cultural and the metaphysical, we are faced with a fundamental question: does the category of ‘racialism’ provide a cultural and metaphysical explanation for the origin of capitalism itself?

The most conservative interpretation of Robinson’s theory would be that he argues for two parallel processes: a continuous transformation of feudalism towards capitalism, with the seeds of capitalism growing within feudal society, and the continuous development of racialism, which stretches back to the existence of discrete groupings of European barbarians. Thus, as capitalism ascends as a full-fledged world system within an environment permeated by racialism, it is fundamentally shaped by it. This interpretation implies distinct, neighboring dynamics of racialism and capitalism. Its purview is to describe the continuity of each of these dynamics over transitional periods, and the effect of one upon the other, rather than determining either a historical totality or the specificity of particular instances.

The more radical interpretation of Robinson’s theory would be not only that racial division precedes and shapes capitalism, but that in fact racialism is the autonomous and primary cause for what emerges as ‘racial capitalism’. That is, the tendency to divide people into hierarchically organized groups is manifested in the hierarchies of capitalism, which always have a specifically racial character. This interpretation is as logically consistent as the first, but appears to be more aligned with the radicalism of Robinson’s argument, because it does not posit a capitalism which is *independent* from racialism and yet *affected* by it; rather, it demonstrates the foundational character of racialism. Once again we have the continuity of causal factors across history, but instead of two separate and internally consistent factors we now have one overarching factor which is the final cause.¹

RACIALISM AND ITS DISCONTENTS

From the outset, Robinson argues, European society is based on an internal racial ordering which extends into the medieval and feudal periods, and develops an external ordering with the Mediterranean encounter with Islam. This tendency forms the basis of a capitalist world system when it incorporates African, Asian, and indigenous people into the world market, and culminates with ‘the dialectic of colonialism, plantocratic slavery, and resistance from the sixteenth century forward, and the formations of industrial labor and labor reserves’ (Robinson, 2000: 67).

But Robinson also insists on a *non-dialectical* logic of contradiction. Despite offering us an epistemology that can be used to understand Western civilization, the Black Radical Tradition cannot be seen as that civilization’s self-understanding. Robinson writes:

Black radicalism is a negation of Western civilization, but not in the direct sense of a simple dialectical negation... it is a specifically African response to an oppression emergent from the immediate determinants of European development in the modern era and framed by orders of human exploitation woven into the interstices of European social life from the inception of Western civilization. (Robinson, 2000: 72–3)

In other words, history for Robinson is not the externalization and alienation of a single originary spiritual principle, but rather the clash of opposing principles, and their antagonistic development on the basis of their self-contained origins.

Hegel explains world history as the succession of particular *national* spirits, the *spirit of a people* as it is built up objectively in the state, and which depends on the cultural formation of its self-consciousness:

It is the concrete spirit of a people which we have distinctly to recognise, and since it is Spirit it can only be comprehended spiritually, that is, by thought... But for spirit, the highest attainment is self-knowledge... This it must and is also destined to accomplish; but the accomplishment is at the same time its dissolution, and the rise of another spirit, another world-historical people, another epoch of Universal History. (Hegel, 1991b: 71)

So, while for Hegel the particularity of a culture and its national expression join the development of a Universal History, Robinson’s philosophy of history provides a relative comparison of the different spiritual principles of different peoples, whose relations to one another are not progressive.² Capitalism is the product of European civilization: the expression of the unified spiritual principle of the plurality of European races. Paradoxically, this unitary spiritual principle is itself racial differentiation, and racial capitalism is its manifestation.

Robinson shows us the racial character of Hegel’s Absolute Spirit, which is ultimately the constitution of the history of Europe as a spiritual unity. However, Robinson seeks not to correct Hegel’s false universalism with a ‘real’ universalism, but rather to oppose the White Absolute Spirit with a unitary Black Radical

Tradition, which aspires not to Universal History but to the internal consistency of its own community. What has not been determined is how separate spiritual principles emerge – what distinguishes the peoples who embody incompatible principles, if it is not race. Region, culture, and language may be decisive, but we have not yet resolved the question by asserting that European civilization exaggerates them while the Black Radical Tradition does not.

METAPHYSICS AND MATERIALISM

The Black Radical Tradition is the non-dialectical negation of racial capitalism. Its origin is the spiritual principle of African civilization. Racial capitalism provokes a clash of civilizations, and the Black Radical Tradition is produced by the clash. This constitutes a non-dialectical negation because the negation of Western civilization is not immanent to that civilization itself; it is the expression of the African spirit which is external to it and precedes it.

In this sense with the title *Black Marxism* Robinson seeks to present us with an irresolvable tension, because while Black people throughout history have often represented their political struggles within the language of Marxism, there is no commensurability between Marxism itself and the Black Radical Tradition. While the Black Radical Tradition was constituted as the negation of Western civilization by African consciousness, Marxism remains locked within the civilizational logic which generated it: ‘at its epistemological substratum, Marxism is a Western construction – a conceptualization of human affairs and historical development that is emergent from the historical experiences of European peoples mediated, in turn, through their civilization, their social orders, and their cultures’ (Robinson, 2000: 2).

However, this poses an important question about the civilizational character of a *spiritualist* theory. Any spiritualist theory will have a profound affinity with pre-Marxist European thought, as we have seen with reference to Hegel. However, Robinson’s salutary efforts in superseding a mechanical materialism – precisely what Hegel did with the philosophy of the European Enlightenment – have left to the side Marx’s materialism, which was not simply a return from Hegel’s idealism to the materialism of the eighteenth century, but an original proposal. Based on a critique of idealism, Marx launched a research program which remains incomplete, and thus remains available for adaptation and translation.³

So, as we try to define Black Marxism, we will have to identify a specific epistemological and conceptual basis – a materialist method which can address the questions Robinson posed so powerfully with the notion of racial capitalism. Black Marxism will have to be defined in terms which are not racial and which are also not the expression of a spiritual character. It will function as a theory insofar as it can produce concepts that are able to grasp the historical phenomena that Robinson describes in considerable detail, including the incorporation of

African slave labor into global capitalist development, the formation of racial categories from this differentiated labor market, and the ongoing resistance of the racialized population to oppression.

While the term ‘racial capitalism’ identifies profoundly important characteristics of the historical development of the world market and its recomposition of the global population, it raises questions about the consequences of the adjectival supplement. Does the term imply the existence of a *non-racial capitalism* – that is, a capitalism which did not emerge and develop within a world market that incorporated racial slavery? This cannot be possible, because there is no such capitalism, except as a fictitious a posteriori construct; it would mean conceiving of an idealist model along the lines of Wood.

If we proceed further along these lines we encounter a historiographical dilemma. By explaining capitalism as the expression of an underlying civilizational logic, we have now obscured the contingent origins of capitalist social relations. Our explanation of capitalism will end up being a teleological one – precisely the kind of teleology implied by the vulgar Marxist narrative of a progressive history determined by the development of the forces of production. But, as Stuart Hall has argued, ‘the study of racially-structured social formations’ (1980: 305) requires a richer conception of causality:

In particular social formations, especially in periods of ‘transition,’ social formations themselves may be an ‘articulated combination’ of different modes with specified, shifting terms of hierarchical ordering between them... The scientific analysis of any specific social formation depends on the correct grasping of its principle of articulation: the ‘fits’ between different instances, different periods and epochs, indeed different periodicities, e.g., times, histories. (Hall, 1980: 326)

Hall goes on to warn against ‘extrapolating a common and universal structure to racism, which remains essentially the same, outside of its specific historical location’. Instead, a theory of race must ‘begin from a rigorous application of... the premise of historical specificity’, dealing not with ‘a general feature of human societies, but with historically-specific racisms’. It is a method which begins ‘with an assumption of difference, of specificity rather than of a unitary, trans-historical or universal “structure”’. The existence of racism in ‘pre-capitalist social formations’, rather than leading to a transhistorical theory, requires us ‘to show how thoroughly racism is reorganized and rearticulated with the relations of new modes of production’ (Hall, 1980: 336–7).

‘BLACK MARXISTS’

Black Marxism, then, will have to provide a materialist account of the cultural forms of resistance that Robinson underlines with the notion of the Black Radical Tradition. This will certainly not mean reducing any cultural activity to an economic base. Rather, it will mean grasping the articulation of different

determining factors, taking into account the structuring factor in particular instances without reducing the entire historical process to the unitary development of a single factor, whether it is cultural or economic.

When it comes to the study of culture, this means attentiveness to points of differentiation and discontinuity. Cornel West argued in a 1988 review that while ‘Robinson is right to accentuate the non-European sources of Black resistance’, he ‘fails to give historically specific and socially pertinent accounts of the precise nature of those sources’. Robinson’s

allusions to the cosmological and moral dimensions of African cultures are fine, yet they prove insufficient if we are to grasp the complex relations between communities, resistance, and commitment in the intersections between Black and White peoples... The ultimate danger here is to fall prey to a romantic, idealized conception of a monolithic and homogeneous African past free of social contradictions, cultural blindnesses, and economic injustices. (West, 1988: 53–4)

These tensions are visible in Robinson’s account of Black radical intellectuals in *Black Marxism*: W. E. B. Du Bois, C. L. R. James, and Richard Wright. In his review West identified these readings as the ‘most controversial’ aspect of the book, arguing that the work of these writers was not easily assimilable into the Black Radical Tradition as Robinson understood it, and was thus in fact ‘highly ambiguous and equivocal in relation to Robinson’s project’ (1988: 54).

Robinson sets out to establish with his close readings how these figures reoriented themselves from within Marxism towards the Black Radical Tradition. In the case of Du Bois and James, this makes the crucial point that over the course of their lives, they drew fundamental lessons from Black mass movements. However, they also grew more and more resolute in their commitment to Marxism, in alignment with other Marxists on an international level who also sought to assert the primacy of mass movements. Wright, given his fraught relationship to Communism, is a different case, but like the others, he displays a complex relation to both Marxism and the Black Radical Tradition. As Paul Gilroy put it in *The Black Atlantic*, Wright ‘was neither an affiliate of western metaphysics who just happened to be Black nor an ethnic African-American whose essential African identity asserted itself to animate his comprehensive critique of western radicalism’ (1993: 186).⁴ Indeed, part of what fundamentally characterizes these figures is their hybrid association with European culture. Robinson makes note of this hybridity, but what remains underdetermined is the extent to which Black radical intellectuals – like radical intellectuals in Asia and Latin America – refracted Marxism through local conditions and constitutively transformed it on a global scale (2000: 182–3).

In order to locate Black Marxism, we have to shift our concepts and reopen the archives, beginning with specific cases rather than general philosophies of history. Here we will focus on a highly specific phenomenon which results from the encounter between the communist revolutionary project and the aftermath of racial slavery. What we can discern in this specific phenomenon is not a general

opposition between a cohesive European Marxism and an equally cohesive Black Radical Tradition, each representing an alternate mode of politics. What we see is rather the taking up of the global revolutionary project against capitalism by Black revolutionaries, who adapted and innovated a theory which, like all materialist theories, did not reveal the essence of a totality but produced concepts that could grasp discrete phenomena.

A comprehensive account of 'Black Marxism' might focus on the figures Robinson studies, though limiting ourselves to these cases would be somewhat arbitrary. But any study will have to be somewhat restrictive, given the sheer volume of cases. We will instead try to identify the protocols of a productive rereading by narrowing in on a particular case, whose local specificity is also the site of its global significance, rather than accounting for the totality of world history. Our case will be a theory almost universally condemned – falsely – as a Euro-Marxist imposition on Black Americans.⁵

THE BLACK BELT THESIS

The 'Black Belt thesis', canonized by the Communist International in 1928, proposed that the soil stretching from East Texas to Virginia, with its heartland in the prairies of Alabama and Mississippi, constituted a Black nation. The argument that Black people had the right to self-determination in the Black Belt underpinned a major initiative by the Communist Party USA (CPUSA) to attack white supremacy.⁶ Claudia Jones, Trinidadian immigrant and member of the National Committee of the CPUSA, argued in 1946 that the Communist Party had been an 'initiator and vanguard' of struggles against racism precisely because of its 'understanding of the Negro question as a *national* question, that is, as the question of a nation oppressed by American imperialism' (Jones, 2011: 62).

However, this theoretical argument is frequently viewed as unfortunate Marxist baggage, if not a foreign imposition by Russian agents. A prevailing view holds that the Black Belt thesis should simply be discarded, while we reframe the Communist Party's actual practice as an anticipation of contemporary multiculturalism. My argument here is quite simply that those who advanced and defended the Black Belt thesis should be understood as theorists of Black Marxism. Their significance was not only in representing Black membership in the Communist Party, but also in contributing to the political and social theory of Marxism – specifically, in theorizing the formation of nation-states and the global working class within the process of uneven capitalist development.⁷

The Black Belt thesis was formulated by Harry Haywood, the son of emancipated slaves, who by lineage and personal history would appear to be an ideal candidate for Robinson's 'Black Radical Tradition'.⁸ Haywood joined the Communist Party through the mediation of the African Blood Brotherhood, one

of the first organizations to advance a socialist conception of Black nationalism. The white-dominated labor movement, along with the Socialist Party, either excluded Black workers outright or refused to acknowledge that lynching and segregation constituted unique conditions of struggle. The Communist Party, nourished by the anti-colonial internationalism of the Bolshevik Revolution, provided a space for Black members to advance a new kind of analysis. But this was not easily achieved. Haywood recalls in his autobiography *Black Bolshevik* the challenge he faced in attempting to recruit Black friends to the Party (1978: 136–8). Their reflexive suspicion of ‘white’ organizations was impossible to dismiss, and it meant steep competition with the two dominant political tendencies of the Black movement: on the one hand, the democratic reform movements represented by the National Association for the Advancement of Colored People (NAACP), led by a ‘Talented Tenth’ that would demand recognition as citizens within the existing framework of American society; and on the other, the nationalism of Marcus Garvey, which called for the uplift of the race through separation from white people and a return to an African homeland:

Haywood travelled to Moscow in the 1920s to study at the Communist University of the Toilers of the East and the Lenin School, where in collaboration with a Soviet expert in African studies named Nikolai Nasanov he drafted the 1928 Comintern Resolution on the Negro Question, which would be reinforced by a second resolution in 1930. The radical move of these resolutions was to bring the problem of racism out of a provincial American framework towards a global conception of the *national* question provoked by the struggles of minority groups in Europe and beyond. As Haywood wrote in 1933:

In the present epoch of imperialism and proletarian revolution the Negro question in the United States must be considered as part of the national colonial problem, or, in other words, it is part of the general world-wide problem of freedom of the oppressed and dependent peoples from the shackles of imperialism. (Haywood, 1933: 889)

The Bolshevik analysis of the national question understood the struggle for self-determination as an attack on the foundations of imperialism, rather than the abstract right of an organic community. Nations were understood as historically constituted phenomena, which *composed* a given community rather than naming a pre-existing one. The subjugation of minorities in the form of *national oppression* gave rise to the demand to be able to speak their own language, to learn their own history in school, to move freely through their native lands. But the justice of these demands could not be used to rationalize an essentialist and separatist politics, which would cut off each national community from the struggle against the common imperialist enemy. The demand for self-determination had to be taken up by a *multi-national* organization (Haywood, 1975: 17–25).

By ‘importing’ this analysis to the US context, the Black Belt thesis performed a *theoretical and political intervention* into the dominant tendencies of the Black movement, showing that its demands could not be met within the existing social structure, since racism was continually reproduced by the location of the American nation-state in the global imperialist chain.

THE SHADOW OF THE PLANTATION

The Black Belt thesis argued that the history of racism and the struggle against it was territorially grounded in the American South. A certain optimistic and Eurocentric analysis of capitalism centers it on the category of free wage labor – the juridically free and mobile worker who enters into a voluntary contract with the owner of the means of production on the marketplace. Marx showed that even this exemplary figure of liberalism concealed relations of force and exploitation.

But, as Heide Gerstenberger (2014) puts it, ‘the actual history of capitalism does not support the assumption that the full legal and political autonomy of laborers is a fundamental requirement for capitalist forms of exploitation’. The Black Belt thesis set out from the recognition that, during the period of capitalism’s emergence and initial rapid growth, free wage labor only encompassed a marginal portion of the populations incorporated into the capitalist world market. Various forms of *forced* labor were widespread throughout the colonial world, meeting the demand for cotton, coffee, and sugar in Industrial Revolution England.

In the American economy of the early nineteenth century, the slave plantation was the core of the economic dynamism of the South. The American plantation, Haywood wrote in his book *Negro Liberation*, was:

a hybrid of two systems, classic slave economy and modern capitalism, combining the worst features of both. It was sired by a capitalist commodity-producing society, developed under its wing and subjected to its market relationships. Then, as now, the nature of the planter’s crop, its price and his returns were determined by the capitalist market. (Haywood, 1948: 49–60)

The so-called ‘race’ problem, Haywood argued, was the result of ‘the social strictures imposed upon the Negro under the economic survivals of slavery, with the extra-economic element of racial coercion’ (1948: 44). Its continued existence was manifested in the ‘curious anomaly of a virtual serfdom in the very heart of the most highly industrialized country in the world’ (Haywood, 1948: 11). That is, Black sharecropping was a ‘hybrid form, combining the most primitive features of capitalism with survivals of chattel slavery in the exploitation of the soil cultivator’. The ‘capitalist features’ of this form were ‘expressed in the “contract” between tenant and the landowner in which they confront one another ostensibly as legal equals’. But, ultimately, ‘what determines the real character of the relation between the sharecropper and the planter... is the fact that these relations rest upon an elaborate system of Negro subjugation already inherent in the historical origin of the sharecropping form’ (Haywood, 1948: 35–6). Jim Crow, lynching, Klan terror, sharecropping, and debt peonage allowed ‘the former slaveholders to maintain the old slave relations under the new conditions of legal emancipation’ (Haywood, 1948: 37).

The Great Migration, which tipped the balance of the Black population towards cities and the North, was a form of resistance to these survivals of slavery, a line of flight which deprived capital of an artificially cheapened labor force. Haywood wrote:

Let us not forget that outmigrations from the Deep South area of historic Negro concentration have been a result of the sharpest forms of oppression which dominate this area. The great outmigrations coincide with periods of industrial boom, and register the 'flight' of those elements of the population who are able to break away from a backward, depressed agricultural area in response to the needs of capitalist-industrialist expansion, and were drawn into urban centers of industry. (Haywood, 1975: 24)⁹

The conditions of the agricultural areas resulted from 'the presence in abundance of cheap and unfree labor in the plantation regions', which tended 'to make mechanization unprofitable' (Haywood, 1948: 114). But it was precisely the presence of contemporary capitalist forms, which were capable of capturing and reactivating the seemingly residual forms of slavery, that accounted for the articulation of instances of the social formation in an uneven temporality:

[I]t must not be forgotten that in the South, mechanization proceeds within the framework of a semi-feudal agrarian set-up, controlled by finance capital which, along with capitalistic forms, tends to promote and perpetuate the old and out-moded relics of slavery in the exploitation of the mass of the basic soil tillers. (Haywood, 1948: 113–4).

However, as its ability to use extra-economic coercion to increase productivity declined, capital had no choice but to turn to the mechanization of agriculture, which in its turn dispossessed Black sharecroppers, driving even greater populations to Northern cities where they were followed by what Haywood called 'the shadow of the plantation' (1948: 70). In the North, Black wage labor encountered the same dynamics on the factory floor and in the city streets. One is reminded of the famous line of Malcolm X: 'As long as you're South of the Canadian border, you're South'. A single Black industrial worker would be compelled by racist management to do the work of several white workers, in increasingly unsafe conditions. Factory automation usually meant Black unemployment, leading to the close connection of class struggle in the factories to the urban rebellions.¹⁰ These ongoing struggles showed that the juridical freedom of wage labor is not the product of a guaranteed historical evolution; it only appears when the working class resists the force and coercion imposed upon it.

RACE AND NATION

The territorial constitution of wage labor and the shadow of the plantation explain why the displacement and flight of the Black population did not lead to assimilation, but instead to the growth of organized, militant nationalism in the Northern cities. But it also shifts the historical basis of this nationalism away from an essentialized notion of race. By locating the Black nation in the Southern territory,

the Black Belt thesis demonstrated the basis of racial oppression in the slave mode of production. The progressive potential of Black nationalism was based on resistance to the regime of forced labor that originated in the American South – not on the plenitude of a racial community, as Garvey's return to Africa implied.

For Haywood, the Garvey movement represented a grassroots alternative to reformist integrationism; it resonated with the nationalist undercurrent of the Black masses, which, according to Haywood, arose 'from the soil of Black super-exploitation and oppression in the United States' (1978: 230). Because Garveyism opened the way to a rejection of white society as it existed, rather than inclusion within it, it attracted a rank and file from the 'submerged Black peasantry' that had recently migrated (Haywood, 1978: 103).¹¹ But it also attracted the businessmen of the ghetto, looking to protect their 'meager markets' from the 'encroachments of predatory white corporate interests'. Because this mass movement included 'various classes and social groupings with conflicting interests, tendencies and motives, all gathered under the unifying banner of national liberation', it had a fundamentally contradictory character. While the rank and file saw the Black nationalist state as 'the fulfillment of their yearnings for land and freedom', the elite leadership sought to establish a 'Black controlled economy' within which they could 'exploit their own masses free from the overwhelming competition of dominant white capital' (Haywood, 1978: 109–10).¹²

Garveyism attempted to resolve these class contradictions with an *ideology of race*, and this ideology represented an organizational practice of *separatism*. The utopian projection of exodus to Africa gave separatism a basis in an imagined organic community that preceded American history. In this way Black separatism *inverted* the ideology of race that had accompanied white domination. The concept of national oppression was an attempt to break out of the quagmire: race could not be taken as a pre-given category, a real, substantial attribute which then became the *object* of racial prejudice. A theory of racial oppression had to explain the constitution of the very phenomenon of race, rather than assuming its existence.

In a 1930 attempt to formulate such a theory, Haywood wrote: 'Race, as a social question, exist[s] only for the ideologists of the bourgeoisie and in the minds of those deluded by them'. The basic move of this ideology was to imbue 'differences within the human species, such as color of skin, texture of hair, etc.' with 'a social meaning', and on this basis claim 'the existence in nature of master and slave races'. This did not mean, however, that race was simply an illusion. Race theories arose to provide a moral justification for colonial policies, and thereby took on real political forms which perpetuated the underlying relation of exploitation. By cultivating hatred and resentment between the populations of the oppressed and oppressor nations, the ideology of race prevented the emergence of a unified global challenge to imperialism (Haywood, 1930: 695–6).

This ideology took a specific form in the history of the USA, due to two demographic factors. The first was migration. Recently arrived immigrants were subjected to special exploitation, while native-born American workers enjoyed greater privileges and were organized in exclusionary, chauvinist craft unions. But this

differentiation tended to disappear as European immigrants were integrated over the course of generations. The second factor was African slavery, which made it possible to root labor market differentiation in visible physical difference. As Haywood wrote:

The peculiar historical development of American capitalism bound up as it was with the development of cotton production and the necessary utilization of Negro slave labor, contributed to the early rise of racial theories. The moral sanctioning of the brutal system of slavery necessitated the exclusion of the Negro slave from the human category. (Haywood, 1930: 698)

Since Black people and white people lived side by side in the USA, without the more rigid geographical, cultural, and linguistic divisions that characterized the relations of European colonialism, the race factor became a central pillar of the dominant ideology. The American nation came to be defined in terms of *whiteness*, with physical difference in skin color transcending intra-European hierarchies among immigrants, carried by oppressed nationalities from Ireland, Southern Italy, and the Russian Empire. It was no surprise, then, that the Black nationalist response would also root itself in racial ideology. Even reformist integrationism was susceptible to this trap. By viewing the problem of racism as a matter of prejudice, due to instinctive hatred on the part of whites, it reduced the entire economic and social structure of racism to its ideological representation. The liberal reformist theory was thus unable to recognize the political antagonism between Black self-determination and the shadow of the plantation – it could only see the elimination of *prejudice*, through education and philanthropy.

With its critique of racial ideology, the Black Belt thesis affirmed the need for *autonomous* Black organization while still steering clear of separatism. Black autonomy was a response to specific political conjuncture, not a necessary outgrowth of the organic unity of an essentialized Blackness. Crucially, this meant that Black autonomy did not exempt white workers from taking up the struggle against white chauvinism.

THE MEANING OF SELF-DETERMINATION

According to the Black Belt thesis, the ultimate trajectory of the nationalist impulse is not separatism, but a unified struggle of the whole working class against a common enemy. This implied a unique programmatic diversity: it meant, first of all, demanding Black self-determination and Black party leadership; and second, revolutionizing white attitudes and compelling whites to take up the struggle against white chauvinism. But it also meant attacking the exploitation of white workers, farmers, sharecroppers, and migrants that was underpinned and reproduced by the survivals of slavery. In fact, by framing the problem in terms of national oppression rather than race, it became possible to show that the effects of white supremacy also consisted in the exploitation of the white poor. As Claudia Jones wrote: ‘The community in which the Negro people are a majority is neither racial nor tribal; it is composed of a significant minority of whites as

well' (2011: 63). A section called 'Degradation of Whites' in *Negro Liberation* spells this out in detail: 'It is not accidental', Haywood wrote, 'that where the Negroes are most oppressed, the position of the whites is also most degraded'. He went on to describe 'the staggering price of "white supremacy" in terms of health, living and cultural standards of the great masses of southern whites'. Indeed, 'white supremacy' was 'synonymous with the most outrageous poverty and misery of the southern white people' (Haywood, 1948: 66–7).

It followed that the demand for Black self-government was not the special interest of a racial group. As Haywood wrote, it 'represents the basic interests of the impoverished white minority of the region whose backwardness and distress are anchored in the oppression of the Negro masses, since they can be freed only through uncompromising support for the full rights of the Negro people' (1948: 166). Jones argued that the theory of the 'Negro question' as a national question made it possible to teach 'white workers to fight for Negro rights in their own self-interest, to understand that to fight against white chauvinism is to fight against imperialist ideologies and practices of America's ruling class' (2011: 62).

We should pause for a moment to appreciate the complexity and subtlety of this argument. It rejects the notion that there is a cohesive and unitary interest of an organic Black community, because that notion is itself based on an inversion of the white supremacist ideology of race, and because it obscures the objective conflict between the majority of Black people and the Black elite. Yet it is just as vehement in rejecting the economistic and social-democratic view that by advancing the interests of white workers, the problem of Black oppression will automatically be solved. In fact, not even the economic interests of white workers can be represented outside of a struggle for Black liberation. As Haywood put it, 'The slogan of self-determination is a slogan of unity. Its overriding purpose was and still is to unite the white and Black exploited masses, working and oppressed people of all nationalities' (1978: 279).

CONCLUSION

The Black Belt thesis anticipated that a mass struggle by Black labor would explode in the South, and that this struggle would demand the juridical freedom denied by the shadow of the plantation. The struggle would proceed to rediscover the demand for self-determination – the slogan of Black Power, which surged forth in the long march between Memphis and Jackson and echoed in the uprisings of Newark and Detroit. These movements would once again encounter the ideology of race and its material correlates: organizational separatism and the class interests of the reformist Black bourgeoisie.¹³

These are the dilemmas we inherit today. The Black Belt thesis does not represent a solution to our contemporary problems; but in our search for 'Black

Marxism', it represents an indispensable moment of theoretical and practical innovation. The project of universal emancipation that the Black Belt thesis sought to ground is not yet complete – and completing it today requires us to identify and defend Black Marxism.

Notes

- 1 See Robinson's (2007) *Forgeries of Memory and Meaning* for a supplement to the theory of racialism – in the sense that Robinson appears to add a subsidiary development of an already comprehensively developed theory, but at the same time arrives at an unresolved question which is logically anterior to that theory, and thus unsettles the totality.
- 2 However, in *The Anthropology of Marxism*, Robinson universalizes a certain spirit, which he associates with socialism but not Marxism: 'Both in the West and the world beyond, the socialist impulse will survive Marxism's conceits just as earlier it persevered the repressions of the Church and secular authorities. The warrant for such an assertion, I have argued, is located in history and the persistence of the human spirit' (2001: 157).
- 3 Robinson argues in *The Anthropology of Marxism* that Marxism is little more than a variant of a materialism running from Ionian philosophy to eighteenth-century political economy (2001: 24–31); he also vehemently de-emphasizes Hegel's idealism (2001: 86–101). As a result, the discontinuities within Marx's thought become hard to see, just as much as Marx's complicated relation with his predecessors. Robinson's affinity with pre-Marxist European thought is elaborated explicitly in this book.
- 4 Gilroy's overall framework for studying the work of Black radical intellectuals can be usefully compared to Robinson's, as Robin D. G. Kelley does in his preface to *Black Marxism* (Kelley, 2000: xviii–xx).
- 5 The standard argument is reproduced in *Black Marxism* (Robinson, 2000: 208–28).
- 6 The classic work on this topic, Robin D. G. Kelley's *Hammer and Hoe*, productively applied Robinson's perspective to a specific and delimited field of historical research, as he recounts in the preface to the 25th anniversary edition (Kelley, 2015: xii–xiii). See also Kelley (1994).
- 7 I do not have the space here to consider later formulations of the Black Belt thesis, notably that of Nelson Peery, an original contribution that deserves study; see Peery (1975).
- 8 See Robinson's characterization of Richard Wright's roots in the 'Black peasantry of the American South', which Haywood shared; and his description of the class origins of Black Marxists, which cannot be applied to Haywood (Robinson, 2000: 288–9). Interestingly, Haywood's personal encounters with Wright, documented in the latter's work, are often cited as evidence of the dogmatism and sectarianism of the CPUSA. The obvious reference here is the character called 'Buddy Nealson' in *Black Boy*, though *Native Son* also contains a general criticism of the Party.
- 9 See also Haywood (1948: 16–20).
- 10 These points were powerfully made by the League of Revolutionary Black Workers, who were deeply influenced by Haywood; see Georgakas and Surkin (1998).
- 11 On Garveyism's mass character and its political influence, see Robinson (2007) and Kelley (1994; 2002).
- 12 See also Haywood (1948: 197–204).
- 13 See Haywood (1975, 1978: 628–44).

Digitality and Racial Capitalism

Jonathan Beller

INTRODUCTION: RACIAL CAPITALISM AS WORLD COMPUTER

Taking the notion that capital was always a computer as a starting point, I understand the history of the commodification of life as an inexorably brutal process of encrypting the world's myriad qualities as quantities (Beller, 2021). Formal and informal techniques, from racialization and double-entry bookkeeping to the rise of information technologies and discrete state machines, further imposed and extended the tyranny of racial capital's relentless calculus of profit. By means of the violent colonization of almost all social spaces, categories, and representations – where today language, image, music, and communication all pass through a computational substrate that is an outgrowth of fixed capital – all or nearly all expressivity has been captured in the dialectic of massive capital accumulation, on the one side, and radical dispossession, on the other. Currently the money-likeness of expression – visible as 'likes' and in other attention metrics that treat attention and affect as currency – is symptomatic of *the financialization of daily life* (Martin, 2015).

We observe that nearly all expression, no matter what its valence, is conscripted by algorithms of profit that intensify inequality by being put in the service of racial capitalism. Consequently, we are experiencing a near-apocalyptic, world-scale failure to be able to address global crises including migration for reparations, mass incarceration, genocide, militarism, climate racism, pandemic, anti-Blackness, extinction, and other geopolitical and psycho-somatic ills. The colonization of

semiotics by racial capital has rendered all ‘democratic’ modes of governance outmoded save those organized for the violent purpose of extracting profits for the enfranchised. Culturally, democratized extraction takes the form of a kind of fractal fascism. An understanding that informationalized semiotic practices function analogously to financial derivatives may allow for a reimagining of the relationship between language, visuality, and that other economic medium, namely money, in an attempt to reprogram economy and therefore the creation and distribution of value – and thus, also, the aforementioned politics and potentials of representation. In what would amount to an end to postmodernism understood as the cultural logic of late capitalism, our revolutionary politics require, as did the communisms of the early twentieth century, a new type of economic program. In the age of computation, putting political economy back on the table implies a reprogramming of our cultural logics as economic media for the radical redress of the ills of exploitation and for the democratization of the distribution of the world social product. Sustainable communism requires the decolonization of abstraction and the remaking of the protocols of social practice that give rise to real abstraction.

Below we will more narrowly address the issues of money, race, and information as ‘real abstraction’, and their role in computational racial capitalism. First we note the overarching argument for what is necessarily a larger study:

- 1 Commodification inaugurates the global transformation of qualities into quantities and gives rise to the world computer.
- 2 ‘Information’ is not a naturally occurring reality but emerges in the footprint of price and is always a means to posit the price of a possible or actual product.
- 3 The general formula for capital, $M-C-M'$ (where M is money, C is commodity, and M' is more money) can be re-written $M-I-M'$, where I is information.
- 4 ‘Labor’, attention, cognition, metabolism, and life converge as ‘informatic labor’ whose purpose, with respect to capital, is to create state changes in the virtual universal Turing machine that is the world computer – racial capital’s relentless, granular, and planetary computation of its accounts.
- 5 Semiotics, representation, and categories of social difference function as financial derivatives – as wagers on the volatile economic value of their underliers and as means of structuring risk for capital.
- 6 Only a direct engagement with the computational colonization of the lifeworld through a reprogramming (remaking) of the material processes of abstraction that constitute real abstraction can secure victory for the progressive movements of our times – in the form of a definitive step out of and away from racial capitalism. Such a definitive movement requires an occupation and decolonization of information, and therefore of computation, and therefore of money. Only through a remaking of social relations at the molecular level of their calculus, informed by struggle against oppression, can the beauty of living and the fugitive legacies of creativity, community, and care prevail.

COMPUTATIONAL RACIAL CAPITALISM

The mode of comprehension, analysis, and transformation proposed here will require an expanded notion of *racial capitalism*. It interrogates the existence of

deep continuities and long-term emergences – what one could correctly call algorithms of extractive violence – in the history of capitalism. These *algorithms of violence* include the reading and writing of code(s) on bodies, their surveillance and overcoding by informatic abstraction. Such algorithms are executed *on the flesh* (Spillers, 1987); and they are executed by means of codification processes that violently impose both a metaphysical and physical reformatting of bodies. Executable code is imposed through social categories of race, gender, religion, and property, and in the form of ideologies, psychologies, communication theories, game theories, cultural practices, and quantities of money – these abstractions work their ways into, and are indeed imposed by, the machines of calculation. It is a continuous process of unmaking and remaking using all means available; it is violently inscribed on bodies. Sylvia Wynter, in her post-Rodney King piece ‘No Humans Involved: An Open Letter to My Colleagues’, writes:

Both W. E. B. Du Bois and Elsa Goveia have emphasized the way in which the code of ‘Race’ or the Color Line, functions to systemically *predetermine* the sharply unequal re-distribution of the collectively produced global resources; and, therefore, the correlation of the racial ranking rule with the Rich/Poor rule. Goveia pointed out that all American societies are integrated on the basis of a central cultural belief in which all *share*. This belief, that of the genetic-racial inferiority of Black people to *all others*, functions to enable our social hierarchies, including those of rich and poor determined directly by the economic system, to be perceived as having been as pre-determined by ‘that great crap game called life,’ as have also ostensibly been the invariant hierarchy between White and Black. Consequently in the Caribbean and Latin America, within the terms of this socio-symbolic calculus, to be ‘rich’ was also to be ‘White,’ to be poor was also to be ‘Black’. (Wynter, 1994: 52)

‘To be “rich” was also to be “White,” to be poor was to be “Black”’. The real abstraction imposed by executable code – the ‘code of “Race”’ that ‘functions to systematically *predetermine* the structurally unequal redistribution of global resources’ is beholden to mediating capitalist exchange while embarking on a radical reformatting of ontology. This reformatting, the supposed result of ‘that great crap game called life’, brutally correlates ‘race’ and value, but not as a metaphor and not entirely by chance, while racial capitalism embarks on imposing this calculus globally. Racial abstraction is endemic to what we will further explore as ‘real abstraction’; the evacuation of quality by abstract categories is, as we shall see in more detail, a ‘necessary’ correlate to a world overrun by the calculus of money. Such algorithms of violence encode social difference, and although they may begin as heuristics (‘rules of thumb’), they are none the less crucial to the calculated and calculating expansion of racial capital. Its processes and processing structures the meanings that can be ascribed to – and, as importantly, what can be done to – those of us whose data profiles constitute us as ‘illegal’, ‘Mexican’, ‘Black’, ‘Gypsy’, ‘Jew’, and a lexicon of thousands of other actionable signs.

This codification process draws from the histories of slavery, colonialism, state formation, genocide, gender oppression, religious pogroms, and normativity, as well as from the militarization and policing and the apparatuses of calculation

that have developed within states and parastates in their own biometric pursuit of capital-power – their violent destruction and remaking of the world in accord with its protocol. The *internalization* of these codes, including the struggles with them and the ways in which they license and/or foreclose various actions, exists in a recursive relationship to their perilous refinement. Their analysis, a code-breaking of sorts, will therefore demand some drastic modifications in many of the various anticapitalist, antistate warrior-stances practiced to date, particularly in a large number of their European and US incarnations that until very recently remained blind to their own imperial violence and are too often complicit with hegemonic codes of masculine, unraced agency, imperialist nationalism, and default liberal assumptions in relation to questions of race, gender, sexuality, coloniality, and other forms of historically institutionalized oppression.

The analytic – *computational racial capital* – would identify the field of operations that emerges around the embryonic form of the commodity and co-articulates with racial abstraction to formalize its code, code that serves as an operating system for the virtual machine here hypostasized as ‘the world computer’, by inscribing itself on bodies and everything else. The commodity, the analysis of which famously begins volume 1 of Marx’s *Capital*, expressed the dual being and indeed dual registration of the humanly informed object as both quality of matter and quantity of exchange-value, along with the global generalization of this form: ‘The wealth of societies in which the capitalist mode of production prevails appears as an immense collection of commodities’ (Marx, 1990: 125). Commodities were (and still are, with some modifications to terms in the definition to be discussed below) ‘humanly’ informed materials with a use-value and an exchange-value – ‘humanly’ informed material qualities indexed by abstract quantities. As a heuristic device, ‘computational racial capital’ analyzes the convergence between what, on the one side, often appeared as universal – the economic, abstract, and machinic operating systems of global production and reproduction endemic to the commodity-form and its calculus – and what, on another side, sometimes appeared as particular or even incidental – racism, colonialism, slavery, imperialism, gender (engendering), and racialization.

The concept ‘computational racial capital’ organizes this dramaturgy of analytically reunifying elements that were never materially separate in light of the study that the late Cedric Robinson conducted and recorded as *Black Marxism*. For Robinson, as:

[t]he development, organization and expansion of capitalist society pursued essentially racial directions, so too did social ideology. As a material force, then, it could be expected that racialism would inevitably permeate the social structures emergent from capitalism. I have used the term ‘racial capitalism’ to refer to the development and to the subsequent structure as an historical agency. (Robinson, 1983: 2–3)

Here we take what Robinson saw as ‘civilizational racism’, and its central role in the development of capital, as axiomatic, and argue that this role extends to

and deeply into capitalist calculation and machinery during the entire period in which the world economic system seems to have moved from the paradigm of the commodity to a paradigm of information.

‘Computational racial capitalism’ would thus understand the generalization of computation as an extension of capital logics and practices that include and indeed require the economic *calculus* of the dialectics of social difference. These differences, both economic and semiotic, would include those plied by slavery, anti-Blackness, and other forms of racism during the past centuries. *Computation therefore must be recognized not as a mere technical emergence but as the practical result of an ongoing and bloody struggle between the would-have-it-alls and the to-be-dispossessed.* Developed both consciously and unconsciously, computational racial capitalism is, when seen in the light of ongoing racialization and value extraction, ‘the subsequent structure as an historical agency’. The racial logic of computation must be pursued when considering finance, surveillance, population management, policing, social systems, social media, or any of the vast suite of computational protocols plying difference for capital. The local instance of computation, a specific 1 or 0, may seem value neutral, a matter as indifferent as lead for a bullet or uranium for a bomb. But we are looking at computation as the modality of a world-system.

Computation emerges as the result of struggles that informed ‘class struggle’ in all its forms, recognized or not by the often spotty tradition(s) of Marxism, including those struggles specific to the antagonisms of colonialism, slavery, imperialism, and white supremacist heteropatriarchal capitalism more generally. It is the *result* of struggles indexed by race, gender, sexuality, nationality, and ethnicity, along with additional terms indexing social differentiation too numerous to incant here but that together form a lexicon and a grammar of extractive oppression – and, as we have said and as must always be remembered, also of struggle. The lexicon includes compressions that result in many of history’s abstractions including a perhaps singularly pointed abstraction: ‘a history whose shorthand is race’ (Spillers, 1987: 142; Bhandar, Chapter 13, this *Handbook*). The grammar for that lexicon depends upon the deployment and execution of forms of differentiating abstraction that are lived – lived processes of abstraction and lived abstraction organized by the increasingly complex and variegated calculus of profit and thus of domination.

INFORMATION AS REAL ABSTRACTION

‘Real abstraction’, then, emerges not just as money in Alfred Sohn-Rethel’s sense, but as the codification of race, gender, sexuality, geography, credit, and time – and gives rise to a ‘grammar’, in Hortense Spillers’ (1987) use of the term, that not only structures meaning and redounds to the deepest crevices of being smelted by social practices, but also, and not incidentally, price differentials

indexed to social difference. ‘Real abstraction’, as Sohn-Rethel spent his life deciphering, takes place ‘behind our backs’ as the practical and historical working out of the exchange of equivalents within the process of the exchange of goods. For him, the development of the money-form, of the real abstraction that is money, is Exhibit A of the abstraction process mediating object exchange. This capacity for abstraction, realized first in ‘the money commodity’ and then as money, provided the template for further abstraction, not least in the conceptual formations of Western philosophy itself (Sohn-Rethel, 1978; Lange, Chapter 32, this *Handbook*). Sohn-Rethel develops this argument that practices of exchange precede the abstraction of value in *Intellectual and Manual Labor*, where he provides the full quotation of the crucial passage from Marx:

Men do not therefore bring the product of their labour into relation with each other as value because they see these objects merely as the material integuments of homogeneous human labour. The reverse is true: by equating their different products to each other in exchange as values, they equate their different kinds of labour as human labour. They do this without being aware of it. (Marx, 1990: 166, in Sohn-Rethel, 1978: 32)

Here is Sohn-Rethel’s commentary:

People become aware of the exchange abstraction only when they come face to face with the result which their own actions have engendered ‘behind their backs’ as Marx says. In money the exchange abstraction achieves concentrated representation, but a mere functional one – embodied in a coin. It is not recognizable in its true identity as abstract form, but disguised as a thing one carries about in one’s pocket, hands out to others, or receives from them. Marx says explicitly that the value abstraction never assumes a representation as such, since the only expression it ever finds is the equation of one commodity with the use-value of another. The gold or silver or other matter which lends to money its palpable and visible body is merely a metaphor of the value abstraction it embodies, not this abstraction itself. (Sohn-Rethel, 1978: 33–4)

Exchange-value is ‘in our heads’ but is not the creation of any individual. Alongside use-value it is the other, abstract component of the ‘double being’ of the commodity-form. Like Norbert Wiener’s (1989) definition of information but, strictly speaking, emerging long before the idea of information proper, real abstraction is ‘neither matter nor energy’. There is not an atom of matter in exchange-value, or, as Marx puts it, ‘Not an atom of matter enters into the objectivity of commodities as values; in this it is the direct opposite of the coarsely sensuous objectivity of commodities as physical objects’ (1990: 138). And a bit further on, ‘So far no chemist has ever discovered exchange-value in a pearl or diamond’ (1990: 177).

But unlike in Wiener’s naturalist definition of information, exchange-value *is* an index of a social relation, an historical outcome. Indeed, exchange-value is ‘something purely social’ (1990: 149). It indexes ‘abstract universal labor time’, a third term that forms – first in practice and then as money – the basis of comparison between two ostensibly incomparable and therefore incommensurable commodities, and, because common to both, renders them quantitatively

commensurable. This distinction between the social basis of exchange-value and the ostensibly universal character of information should give us pause. As we shall have occasion to observe, information, as it is today (mis)understood, is thought to be a naturally occurring additional property of things – neither matter nor energy – rather than a domain of expression constituted by means of a technological and economic repression of its social dimension. Notably, Sohn-Rethel ‘set[s] out to argue that the abstractness operating in exchange and reflected in value does nevertheless find an identical expression, namely the abstract intellect, or the so-called “pure understanding” – the cognitive source of scientific knowledge’ (1978: 34). For him, it gives rise to the abstract capacities of the subject of philosophy as well as the quantitative capacities of the subject of science and mathematics, which in the twentieth century move toward a paradigm of information. Echoing Sohn-Rethel, we could say then that information is in our machines but not the creation of any individual machine. *Not an atom of matter enters into information, though, like value, it is platformed on matter and requires energy for creation.* This thesis will take on particular importance as we consider social differences whose descriptors, it turns out, are executable in a computational sense, at least from the point of view of financial calculus, but platformed on matter, and indeed, on living matter, on life.

Beyond the intention of any individual, abstraction as ‘exchange-value’ in ‘money’ occurs in and as the process and processing of exchange in accord with an emerging standard. This standard, which economists call ‘exchange-value’, is based in Marx on abstract universal labor time (the historically variable, socially necessary average time required to produce a commodity); it persists alongside and within the specific qualities of the commodity (its use-value) and creates the commodity’s dual being. Though without chemical or material basis, this standard, exchange-value, is a social relation – a social relation as an abstraction – that inheres in the commodity-form itself and is formalized with the rise of the money commodity. The money commodity, in becoming a general equivalent, standardizes and thus renders fully quantifiable the exchange-value of commodities – exchange-values denominated in quantities of money.

The quantification of value in a measure of money is an abstraction enabled by money itself which, as we have seen, is a real abstraction. It is a calculation that has occurred behind our backs, and indeed produces what Hayek (1945) identifies as the price signal. When we recognize the differences in wages among people who are raced, gendered, nationed, and classed by various matrices of valuation, we also recognize that the calculus performed by and as real abstraction includes racial abstraction and gender abstraction. It is part of the calculus of capital that provides it with an account of and discounts on the rate of exchange with the labor power of marked people(s) – by discounting people(s) (Beller, 2017; see also Bhandar and Toscano, 2015: 8–17). Racial abstraction provides capital with an index that measures a deviation from the average value of human life (itself historically driven down by the falling rate of profit). In this,

computational racial capitalism is not merely a heuristic or a metaphor for the processes of a virtual machine; it is an historical-material condition.

INFORMATION AND SOCIAL DIFFERENCE

As we shall see, and as is obvious at least in the general case to anyone who has thought seriously about it, whiteness (and the fascist masculinity endemic to it) is today not only operating where one finds ‘race’: it is operating everywhere in the imperium where it can be imagined (by some) that race is *not* a factor – in medicine, in science, in statistics, in computation, in information. As I wrote – resituating Bateson’s (1972) definition of information – in *The Message Is Murder* (Beller, 2017), information is not merely ‘a difference that makes a difference’; it is a difference that makes a *social* difference. This slight difference in expression situates information historically. While in keeping with some of Bateson’s far-reaching ideas regarding an ecology of mind (‘If I am right, the whole thinking about what we are and what other people are has got to be restructured’ (Bateson, 1972: 468)) – ideas that problematize any distinction between inside and outside while making him dubious of any thought that presupposes sovereign subjectivity – my interpolation of ‘social’ in his formulation ‘a difference that makes a social difference’ shifts the emphasis somewhat by insisting on the always already socio-historicity of any possible knowledge. Bateson believed that his understanding of information and systems ecology promised a new mode of thinking that he himself (as a bourgeois, twentieth-century white man) did not feel capable of really embodying. Thus our interpolation, in keeping with Bateson but made compatible with Marx, is designed to ‘transform... the problem of knowledge into one of social theory’ (Postone, 2003: 216). Such a transformation situates knowledge and now also information in the socio-historical milieu, the ‘ecology’ of racial capitalism, and therein finds its historical conditions of possibility.

Here we advance that argument for the ultimately determining instance of social difference (and up the ante for the bet against whiteness) by proposing that information is itself the elaboration of real abstraction, of abstraction that results from collective practices of economic exchange and therefore from the general management of value as a social relation. I argue that, set out in logical sequence, information is posited by, then posits, and then presupposes the human processes of exchange that Sohn-Rethel, following Marx, argues are the practices that first give rise to the money-form and to real abstraction. For Sohn-Rethel, the result of the activities of comparison, adequation, and trading of specific things that have qualities – which as noted are, strictly speaking, incomparable – resulted over time in a process of finding a relation of equivalence and then general equivalence indexed to abstract labor time, what was in effect socially average human labor time. Exchange-value was a quantitative measure of that abstract

time – the average socially necessary time to create commodity X denominated in money. This real abstraction was no one's invention but was the practical result of exchange – of people's activity – and thus emerged as a non-conscious result that nonetheless interceded on conscious process. Consequently, real abstraction was for Sohn-Rethel also the precursor to conceptual abstraction, including philosophy, science, and mathematics. He writes:

The essence of commodity abstraction, however, is that it is not thought-induced; it does not originate in men's minds but in their actions. And yet this does not give 'abstraction' a merely metaphorical meaning. It is abstraction in its precise, literal sense. The economic concept of value resulting from it is characterized by a complete absence of quality, a differentiation purely by quantity and by applicability to every kind of commodity and service which can occur on the market. These qualities of the economic value abstraction indeed display a striking similarity with fundamental categories of quantifying natural science without, admittedly, the slightest inner relationship between these heterogeneous spheres being as yet recognizable. While the concepts of natural science are thought abstractions, the economic concept of value is a real one. It exists nowhere other than in the human mind but it does not spring from it. Rather it is purely social in character, arising in the spatio-temporal sphere of human interrelations. It is not people who originate these abstractions but their actions. 'They do this without being aware of it'. (Sohn-Rethel, 1978: 20, quoting Marx, 1990: 166; at the end, italics mine)

The practical rise of a form of abstraction indifferent to particular qualities is key here and is to be understood as a precursor to the content-indifferent abstractions of a variety of types including information and racial abstraction. As Simmel notes in *The Philosophy of Money*, law, intellectuality, and money 'have the power to lay down forms and directions to which they are content indifferent' (1986: 441–2). Without doubt, such abstractions informed the racial categories of the humanism of Ernest Renan, Roger Caillois, and others so brilliantly excoriated by Aimé Césaire (1972) in his *Discourse on Colonialism*. We add here the hypothesis that the rise of information as the content-indifferent assignation of numerical index to any social relation whatever is a development of the abstraction necessary for economic exchange to persist under the intensive 'developmental' pressure of global racial capitalism. Information is derived from the increasingly complex things that people do through and as exchange, and as such is both precursor of and corollary to financialization – the social conditions that sustain what is fetishistically apprehended as 'finance capital' and its seeming capacity to derive wealth from pure speculation and risk management in ways that (incorrectly) appear fully detached from labor and labor time.

In this light, information reveals itself as neither naturally occurring nor the creation of anyone in particular but, in keeping with Sohn-Rethel's Marxian formulation of real abstraction, is invented 'behind our backs' as a result of 'man's' practical activity. Information enables a complexification and further generalization of what will turn out to be monetary media, media that would be adequate to, and indeed are adequate (from the perspective of capital) to contemporary forms of exchange and global differentiation – what people do when they interact with one another in what is now the social factory. In brief, information is the extension of

a monetary calculus adequate to the increasingly abstract character of social relations and social exigencies. It is an interstitial, materially platformed calculative fabric that through its coordinated capillary actions orchestrates social practice and provides interface for the uptake of value production. Once this idea is fully grasped, it becomes pointless to look for any other origin to the information age.

Just as for Marx there is not a single atom of matter in exchange-value (1990: 138), we say that there is not a single atom of matter in information. 'All the phenomena of the universe, whether produced by the hand of man or indeed by the universal laws of physics, are not to be conceived as acts of creation but solely as a reordering of matter' (Pietro Verri, 1771, cited in Marx, 1990: 133; note 13). Value is the socially valid *informing* of matter; so too is information. Economy then is society's matter compiler and – in rough simultaneity with the advent of 'man', 'history', and 'the world market' – 'exchange-value' emerges as a quantitative measure of the social value of material state changes indexed to human labor posited as 'abstract universal labor time'. Marx's famous example of the simple wooden table in Chapter 1 of *Capital*, Volume 1, which 'transcends sensuousness' when leaving the clear-cut framework of use-value and becoming a commodity and thus an exchange-value, registers as 'fetishism', the 'metaphysical subtleties', 'theological niceties', and 'grotesque ideas' (1990: 163), endemic in the table's computability as value. In brief, just as discrete states of matter embodying value as a network of commodities mediated by markets and tied to labor give rise historically to the discrete state *machine*, otherwise known as the computer, exchange-value gives rise to computable information and then to computation itself, becoming interoperable with it.

Even before the rise of information proper, exchange-value operates as information (and thus necessarily information processing) – and then, as synthetic finance and contemporary forms of computer-mediated accounting and production readily testify, by means of it. Computation is the extension, development, and formalization of the calculus of exchange-value – the ramification of its fetish character – and becomes, in spirit and in practice, a command control layer for the management of the profitable calculus of value. Platformed on states of matter, information – which is not matter but rather *difference* between and among states of matter – extends, grammatizes, and granularizes the calculus of value. Commodities and computation thus run the same basic operating system – state changes in matter driven by human practices – the value of which in any given state is expressed in the context of an informatic network and indexed to labor time. As such, information is the processing power of money itself and is inexorably beholden to abstract labor time and thus to racial capitalism. It is, in brief, an outgrowth of the money-form. The cost of computation, the arrival at a discrete state, is a derivative operation, indicating an investment, that is explicitly a risk on the future value of an underlier, that is, on value itself.

This argument for understanding the social as the ultimate referent and ground for any and all information is not content to serve as a mere heuristic for cultural

theorists to express a modicum of suspicion with respect to truth claims backed by statistics and information. It is a thoroughgoing indictment of information as a *technique* of value extraction, racialization, and instrumental social differentiation. As a first approximation, actually existing information, like actually existing money, can indeed be said to be the root of all evil – in as much as the fact of its existence is a symptom of a far more complex historical process. The fatal problem, of course, is that your metabolism (and mine) can no longer easily extend into the future without access to both. I develop this idea here to say that *everywhere computation operates, so too does racial capitalism* – at least until proven otherwise. The repressive apparatus of capital clearly *assumes* this role for information, even if it does so at a level that most often exceeds ordinary default ‘human’ (white) understanding: the net systemic result to date of the number crunch of ‘the world computer’ is a hierarchy of valuations inseparable from the violence of racialization and its attendant dispossession, and inseparable again from what Ruth Wilson Gilmore in her classic and statistically attuned definition of racism calls ‘the state-sanctioned or extralegal production and exploitation of group-differentiated vulnerability to premature death’ (2007:28). Today, we argue, no calculation, networked as it is with the world computer, is fully separable from informatics and its basis in racial capitalism, the results of which include climate racism, the planet of slums and so many other structural failures. We will argue for this logical and also horrific history of abstraction in more detail below as we explore the interoperability of digital systems and their colonization of the semiotic, corporeal, and material domains. The global learning curve of revolutionary praxis must attend to this modal innovation of systemic oppression, an oppression which is at once beyond all calculation and one with it.

COMMODIFICATION AND DIGITAL CULTURE

The fundamental premise of this discussion is that what we today call digitization began more than seven centuries ago with commodification, that is, with wage labor and the rise of private property along with money of account. Private property was not the cause but the result of alienated labor (though later the relationship became reciprocal). In Marx’s words: ‘[P]rivate property appears to be the source, the cause of alienated labour, it is really its consequence, just as the gods in the beginning are not the cause but the effect of man’s intellectual confusion. Later this relationship becomes reciprocal’ (Marx and Engels, 1978: 79). The alienation of labor and the accumulation of value as private property are of a piece: private property, for Marx, is no more natural than avarice. Some seven centuries ago, the commodity-form, which allowed for the denomination of use-values in terms of exchange-value, and wage labor, which denominated human creativity in terms of the same exchange-value quantified by means of the money commodity (e.g. gold), inaugurated the universalizing conversion of all

qualities into quantities. This emergence, indexing quantities of money to amounts of abstract universal labor time, like that of private property itself, was a result of man's 'practical activity' (Marx and Engels, 1978: 76).

We might call this emerging domination of production, exchange, and social life by the money commodity and its capacity to mediate a quantifiable yet content-indifferent value-form present in all other commodities Digital Culture 1.0 (DC1). As materials and persons recursively passed through the expanding production cycles of capital and were increasingly caught in the warp of private accumulation enabled by the institution of capital's unequal exchange with labor by means of the wage (itself an abstraction machine, a calculus), and of private property's systems of accounts, so began an incipient digitization of the life world through the generalized inscription of all existing use-values and of all imaginable use-values in terms of quantities of exchange-value. Money's operating system permeated the world. Under capitalist expansion and its highly varied methods of accounting, qualities were increasingly treated quantitatively, and therefore become supplemental to and subjugated by the calculus of profit. The rest is world history. It is also the history of the intensive *development* of real abstraction – the rise from social exchange of money-denominated numbers indexing social activity and social relations attained increasingly complex forms.

Without doubt, capital was not and is not the only organizational force that gives form and systematicity to inequality – racism is 'civilizational', as Cedric Robinson argues, and forms of gender oppression clearly predate capitalism – but capital expansion depended upon utilizing existing inequalities, developing new ones, and legitimating that development. Legitimation of difference is a means to monetization. This is not to say that racism was not and is not often its own motivation. However, to abstract here from Robinson's vastly understudied work, capitalism was not only always racial capitalism, it was also always a *social difference engine*. It operated by means of differentiation, abstraction, and exploitative extraction: the imposition of fungible units and forms, as well as the excision, stifling, and oppression of counterclaims to the law of value.

As Marxist feminism and Black Marxism have shown, and as white Marxism has resisted, the value-form always was and yet remains raced and gendered. Indeed, it depends upon the fungibility of these abstracting categories and their disbursements of rights and claims. Capital offers recognition through remuneration to some types of labor while depending upon other forms of coerced (enslaved, feminized, or otherwise discounted) socially mandated labor (domestic labor, indentured servitude, disposable) and upon a large, often deadly, gray area stretching along social differentiation ranging from full citizenship to second- and third-class citizenship to social death to murder for its expansion and generalization. Put another way, money – as vanishing mediator of exchange by means of value abstraction – was also a system of representation. The money commodity, in being able to represent value, was also an instrument for the enforcing of systemic bias. Its very circulation and pricing mechanisms legitimated hierarchies of

social differentiations as it utilized them and their capacity to format the social. This systemic bias of the 'content-indifferent' money-form became increasingly true with sovereign monies.

Monetary systems of representation, invisible, pure, or natural as they may seem thanks to their ability to deracinate quantities *for all 'practical' purposes*, are nonetheless always platformed in an instance of the social order. This platform, for example, can be the sovereign state, the interstate system, an institutionally and ideologically upheld regime of truth, or distributed computation. These platforms have their advantages in that by assuming and naturalizing their institutionality and thus their sovereignty, they can compress heterogeneous values into information. Price, as Hayek theorized at the dawn of the computer age, condensed social complexity into a single number and rendered other considerations external and/or redundant. All social signals were collapsed into the 'telecommunications' of the price signal that, like Shannon's mathematical theory of communication (fundamental to the transcoding of language to number and precursor to computer-mediated communication), was 'content-indifferent' (Hayek, 1945: 519–30; Shannon, 1948). The argument here is that such content indifference depends not just on monetary abstraction but on a matrix of abstraction – including commodity abstraction, racial abstraction, and gender abstraction. Moreover, these forms of abstraction impose lived abstraction on social relations that have themselves become abstract (in time that itself has become abstract (Postone, 2003: 186–225)), while naturalizing or otherwise normalizing, and thus enforcing, their platform sovereignty. The media of content indifference have cutting edges. Such cuts are everywhere felt; here we must assemble them and interrogate their digitality to decode their deeper logic and their grounding in violence.

We observe that within the economy of DC1, and certainly within that of contemporary digital culture – or Digital Culture 2.0 (DC2), in which the digital computer or discrete state machine becomes the primary medium of social exchange – the quantification process, like everything else that might matter in economics, always passes through 'monetization'. That is, everything else that will matter will pass through monetization if its capillary processes in science, engineering, mathematics, informatics, war, housekeeping, cottage industry, demography, and every other domain are to be valorized and thus assured both continuing relevance and, thereby, an existence fully conferred. Some platform somewhere will find interest in extracting your information, and you must 'consent' to survive. Quantified processes as well as the quantification process itself must provide an ROI (return on investment) to databanks, computers, and cloud computers. Such a rationale is rigorously applied both to human processes and to human-machine processes in an intensive development of metrics and systems of account. This development of vertical and horizontal cybernetic and informatic integration around the requisites of the value-form must be clearly understood as 'the computational mode of production'. It options and optimizes value extraction

and, in what may be a surprising result, has rendered social processes themselves as investible derivatives – financial positions that structure risk in relation to the volatility of valuation. This generalization of a direct relation of cybersocial processes to finance is accomplished vis-à-vis computation and results in derivative conditions, or what, following Randy Martin’s (2015) understanding of both the financialization of daily life and the social derivative, I sometimes refer to as ‘the derivative condition’.

‘HUMAN CAPITAL’ AND THE DERIVATIVE CONDITION

Nowhere perhaps is this general and thoroughgoing recasting of the character and calculus of interactive nodes by capital more clearly stated – at least early on – than in Foucault’s analysis of ‘human capital’, in his lectures on neoliberalism, *The Birth of Biopolitics* (2008). There, recapitulating Irving Fisher, Foucault asks, ‘What is a wage?’ – and replies, ‘It is an income’. He continues: ‘How can we define an income? An income is quite simply the product or return on a capital. Conversely we will call “capital” everything that in one way or another can be a source of future income’ (2008: 224). From this brilliant and (for the humanist) devastating treatment of the wage, which becomes merely, that is, generically, ‘an earnings stream’ (2008: 224), Foucault remarks upon the shift of economics from an analysis of ‘process’ to the analysis of ‘activity’: ‘Economics should not consist in the study of these mechanisms [production, exchange, or consumption data], but in the nature and consequences of what they [economists] call substitutable choices’ (2008: 224). And, quoting Lionel Robbins: ‘Economics is the science of human behavior as a relationship between ends and scarce means which have mutually exclusive uses’ (2008: 224). Thus, the worker becomes an entrepreneur of the self who manages his human capital, ‘being for himself his own capital, being for himself his own producer, being for himself the source of earnings’ (2008: 226). The wage becomes an income stream derived from the risk taken with one’s own human capital. As a structured form of risk management, the wage becomes a derivative position on the activity of a network:

So we arrive at the idea that the wage is nothing other than the remuneration, the income allocated to a certain capital in as much as the ability-machine of which the income cannot be separated from the human individual who is the bearer. How is this capital made up? It is at this point that the reintroduction of labor or work into the field of economic analysis will make it possible, through a sort of acceleration or extension, to move on to the economic analysis of elements which had previously totally escaped it. (Foucault, 2008: 226)

This ‘reintroduction of labor or work’ allows Foucault to take the formerly social elements – education, healthcare, parenting, genetic make-up – as variables in the composability of human capital that can then be submitted to cost–benefit analysis. ‘What type of stimuli, form of life, and relationship with parents,

adults, and others can be crystallized into human capital? ... Migration is an investment; the migrant is an investor. He is an entrepreneur of himself who incurs expense by investing to obtain some kind of improvement' (2008: 230). Foucault thus identifies in the rise of neoliberalism and the shift to the analysis of human capital 'the internal rationality, the strategic programming of individual's activities' (2008: 230). Here we may observe the generalization of a computational economic calculus to the neoliberal subject – an 'internal rationality', a 'strategic programming' bent on ROI. This optimization strategy is of course not the sole province of the individual and is, even in Foucault's analysis, transposed from an understanding of the corporation and the firm. Indeed, just as with corporate or investment bank management, social and now digital composability allows for multiple strategic programs to compete for the processing power of the 'ability machine' under the worker's charge, making the worker the entrepreneur of the self, a portfolio manager engaging in relationships that are always posited as contractual or informal forms of risk. For reasons that will become apparent later on, we could say that the worker manages a portfolio of derivatives and is themselves a derivative in as much as they derive an income stream from a composable financial architecture designed for the timely management of contingent claims.

Here we glimpse an element of the social processes that will be formalized as a credit system acutely attuned to social difference, aspects of which are rigorously explored in Ivan Ascher's *Portfolio Society* (2018), and also as forms of derivative finance that allow for exposure to the volatility of underliers by means of structured obligation and the off-loading of risk rather than traditional forms of ownership. We understand these ramifications of the price system and its emerging complexity in and as synthetic finance in terms of the further development of a banking, credit, and financial system by informatics which seeks the capability of representing anything whatever (that is, anything that counts for or can be counted by capital) and of assessing risk on the modes of accounting in the form of credit scores, interest rates, liquidity premiums, or other predictors of ROI. These informatic and computational assessments indexed to race, gender, area code, age, and a million other data points formalize contracts referring to such risk indices in the content-indifferent systems language not only of digital computation but of money. As we shall see, in these terms at least, any representation as information is a capital investment, and information is a form of money, indeed a *development* of money. Its operations by means of quantification, shot through sociality and through what we understand as computation (ubiquitous computing), continue to ramify every and all appreciable appearance with ever greater resolution and granularity to this day.

Foucault casts the neoliberal insight as a response to both Marx and classical economics which, because of their theoretical standpoints, only perceive labor as abstract rather than in 'its specification, its qualitative modulations and the economic effects of these modulations' (2008: 222). With this corrective to what, for

him, is Marxism's coarse optic, Foucault seems to embrace neoliberal rationality (and the individualization of agency) as the price of rendering his analysis, and of describing the economic approach elevated to the high level of discernment involved in and necessary to making 'substitutable choices'. It is as if 'the scribe of power', as Edward Said once called Foucault, did not register contradiction, ontology, or a teleology in neoliberalization, and was agnostic at best on metaphysics, ethics, and the revolutionary goals of social movements. His mode of analysis – his sublime comprehension, which looks at the world synchronically and lucidly tells it like it is – demurs and indeed refuses the production of an outside, of a space of appeal, of an alternative to history, and registers only what can be represented in the representational terms that an 'episteme', here that of neoliberalism, provides. This is the great power but also the political failing of Foucault, the writer, who will not deign to work in the name of anything but, in telling it like it is, would rather put on the mantle of an episteme and be the master of names. In this, Foucault seems tacitly but fully to accept the subjugation of competing traditions, alternate analytic strategies, and discrepant futures by the dominant discourses he so astutely mimes.

RACE, INFORMATICS, AND THE VIOLENCE OF ABSTRACTION

By contrast to Foucault's mimesis of neoliberalism we wish to stress here *the historically contested processes of social differentiation*. The sublime of the cultural dominant cannot be allowed to stand nor can criticism embrace the antiseptic aesthetics of fascism. We understand real abstraction as a result of the practical and practiced computation of social difference begun in the exchange of distinct objects possessing incommensurable qualities (objects that would, over time, become commodities) and developing over time into money, finance, mathematics, statistics, communication, and computation. In other words, we understand that the status quo, elaborated by this abstraction process, everywhere testifies to the dominion of the avatars of capital's AI – the alienated processing power of what has been called our species. But, in understanding the development of real abstraction as a monetary and informatic calculus, that not only indexed value to 'human' labor but also created gradients expressed in currencies and wages (and much else) that discounted the 'humanity' of many workers, we will take our inspiration from the struggles of the global oppressed and endeavor to understand how our efforts might provide a currently existing, antiracist, anti-heteropatriarchal, anticapitalist, decolonial emergence with insight and opportunity in its *refusal* of objectivity, fungibility, and racial capitalist abstraction – its refusal of what in an earlier time might have been considered the realism imposed by capitalist domination, but today would have to be called the hegemony of the deconstructive state.

In this view, the calculative process itself, as an abstraction feeding on and creating abstractions, is limited in discernment, collapsing as it does difference

into the executed computation performed as exchange. Difference is lost in differentiation; information provides an instrumental approach to life by collapsing its dimensions. Life becomes more abstract when a computation resulting in exchange is taken as a sign and then as a reference for future exchange. In this *programmatically* abstraction, computation as monetization and monetization as computation have totalizing and universalizing tendencies. But the entire process and processing is nonetheless materially tied to the qualitative, concrete specificity being processed – and it is here, in its radical exclusion of a diverse remainder from its methods of account, that we may discern the violence of abstraction. The scaling of real abstraction in capitalism, its formalization in material process that will include institutions and computational machines, never exhausts difference or annihilates conflict even as it shears off noise, reduces variance, and renders objects, money, commodities, and people fungible. Such contradictions are endemic, unresolved, and – under racial capitalism – irresolvable. ‘Private property’, Marx taught us, is ‘not the cause but the effect’ of alienated labor (Marx and Engels, 1978: 79), and, as with private property, so too with ‘digitality’, ‘race’, and ‘information’.

Of course, the properties of private property, as well as the ways in which matter is informed by what was called labor, are in a process of transformation. Consider the expansion of alienated labor to processes of generating information that utilize attention, cognition, perception, and metabolism. The collapse of the product of all such alienated activities into information, information’s ‘monoculture’ (Steuer, 2019), is the general elaboration of real (monetary) abstraction and wages, and as such implies the shift in the mode of production that we call computational. Understanding information not as a discovery but as an invention, a *technique*, reveals that its capacity for conversion accomplishes the injection of a socio-historically mediated system of valuation into any domain whatever. As an invisible hand with infinite digits, what information announces the universal generalization of ever more granular accounting. In this, it is – in itself and in what it enables – the development of the logistical dynamism of the money-form, its calculus of all things differentiable: skin color, nose size, carbon emissions, property.

Because of the generalization of socio-cybernetics, a calculus of risk and reward now accompanies all knowing. And all unknowing. All appearing, and all disappearing. Information serves as an instrumental proposal for the universality of accounting and for rendering accountable; it serves as the medium of computational racial capital – the means to generate an income stream through a cybernetic interface with any phenomenon whatever. The rest is technology, which is to say, social relations, or, more precisely, the abstraction and reification of social relations and their sedimentation and automation in machinery that is fixed capital. Despite the acknowledgment that information is ‘neither matter nor energy’, as Norbert Wiener (1989) wrote, it has nonetheless been assumed – incorrectly – to be an effect of things’ mere or sheer existence, an ontological

component of things. Here we argue that information is a real abstraction, in short, a consequence of what people have done and do when they produce and exchange their goods, when, historically, they compile matter to combat the falling rate of profit and thereby ‘innovate’ to arbitrage the cost of labor. Information is not, as has been long held, a natural property of things. Information is precisely an extension of the logic of property, a social result, *a capitalizing way of doing and knowing*, that is now intelligible as *a derivative instrument indexed to an underlier* – a generalized means for the pricing of investible risk in a field of contingencies that has its local meaning in the marketplace and an overall consequence that is beyond all price.

Syed Mustafa Ali’s scholarship further demonstrates the consilience of white supremacy and informatics. In a significant essay, ‘Race: The Difference That Makes a Difference’ (2013), Ali wagers that ‘cybernetics and informatics should be considered racial formations and the allegedly “abstract” and impartial/neutral stance associated with them should be understood as masking the operation of racism or white supremacy’ (2013: 102). Turning to the work of Charles Mills (1997) on the systemic and contractual aspects of racism allows Ali to consider both the conscious and non- or unconscious aspect of the racism endemic to the function of information:

While sympathetic to cognitive accounts of racism, Mills insists that racism can – and *does* – exist in a purely structural (or pattern-based) capacity, that is, in terms of differentially-embedded power relations that are at least not explicitly intentional, that is, dependent on consciousness for their continued existence. ... On Mills’s view, racism – more precisely, global white supremacy – is a political system, a particular power structure of formal or informal rule, socioeconomic privilege, and norms for the differential distribution of material wealth and opportunities, benefits and burdens, rights and duties. Crucially, Mills maintains that white supremacy can be theorized as a ‘contract’ between whites – a Racial Contract – which he proceeds to define as follows: ‘The Racial Contract is that set of formal or informal agreements or meta-agreements (higher-level contracts about contracts, which set the limits of the contract’s validity) between the members of one subset of humans, henceforth designated by (shifting) “racial” (phenotypical/genealogical/cultural) criteria C1, C2, C3... as “white”, and coextensive (making due allowance for gender differentiation) with the class of full persons, to categorize the remaining subset of humans as “nonwhite” and of a different and inferior moral status, subpersons, so that they have a subordinate civil standing in the white or white-ruled polities the whites either already inhabit or establish or in transactions as aliens with these polities, and the moral and juridical rules normally regulating the behavior of whites in their dealing with one another either do not apply at all in dealings with nonwhites or apply only in a qualified form (depending in part on changing historical circumstances and what particular variety of nonwhite is involved), but in any case the general purpose of the Contract is always the differential privileging of the whites as a group with respect to the nonwhites as a group, the exploitation of their bodies, land, and resources, and the denial of equal socioeconomic opportunities to them. All whites are beneficiaries of the Contract, though some whites are not signatories’. (Mills, 1997: 11, cited in Ali, 2013: 99–100)

Ali concludes:

To the extent that information is concerned with differences that make a difference (Bateson 1972) and involves a process of *informing* – that is, transmission of meaning (von Bayer

2003) – which can turn out to be a process of *mis/dis*informing, it might be argued that the ‘signing’ (establishment) and subsequent ‘re-signing’ (maintenance, expansion and refinement) of the Racial Contract of white supremacy constitute informational processes. (Ali, 2013: 100)

We have argued this here and something more. The global institutionalization and formalization of white supremacist programming in racial capitalism, wherein ‘the Racial Contract of white supremacy’ is written, signed, and re-signed, is not an incidental outcome of informatics; rather, it constitutes the material history of the rise of information and its foundation in social difference and in profitable social differentiation. Ali’s ‘critical information theory’ of race deepens our exploration of the co-evolution of racial abstraction and information. Indeed, the consilience of information and race as real abstractions can be even more powerfully observed when racialization, the ‘signing’ and ‘re-signing’ of the racial contract inherent in the ongoing development of code, is considered in the context of both labor and financialization.

As the emergence of codes and contracts that can be formally and informally applied in the profitable organization of dissymmetrical exchange between labor and capital, ‘the Racial Contract of white supremacy’ generates data and management requisites that become formalized as what Safiya Umoja Noble calls ‘algorithms of oppression’ (Noble, 2018) and Ruha Benjamin calls ‘the new Jim Code’ (Benjamin, 2019). Computation is invested in and vested by racial capitalism and the resultant fractal fascism of computational racial capitalism is in our faces every day. Its development occurs in lockstep with oppression. These algorithms, formal and informal, are not incidental emergences in a general system of computing that can also be used to run the economy. They are rather foundational and decisive strategies of emergence and control – evolving codes that would include, for example, the southern ‘black codes’ prevalent in the USA post-1865 – that seemingly automate and render autonomous so many types of binding contracts.

These ‘contracts’, vertically and horizontally integrated planet-wide, are a fundamental part of the still developing extractive paradigms of computational racial capitalism and its profitable management of value extraction and dispossession through strategies of social differentiation that allow for the creation of tranches that must be inhabited and if possible survived. Additionally, information *processing* has become the paradigmatic uptake for what elsewhere I have called informatic labor and the programmable image, in which denizens of racial capitalism provide additional information to platforms for capital accumulation in exchange for currencies that allow us to survive. This computational colonization of the semiotic domain further renders semiosis productive for capital, while demanding the resigning of its code: minimally, a utilization of and participation in the logistical capacities of racial capitalism. These contracts, and all the others expressed as information and platformed on the virtual machine of the world computer, function through the build out of real abstractions by means of informationalization,

turning money into finance, value into risk, and bodies into races and genders to the point where, in the bloodless halls of Google, everything appears (and disappears) in a content-indifferent common denominator: information. A result toward which we, who inhabit the bloodied world, cannot remain indifferent.

Race, Imperialism and International Development

Kalpana Wilson

INTRODUCTION: RE-ENGAGING WITH MARXISM AS A METHODOLOGY OF THE GLOBAL SOUTH

Imperialism...the root cause of racialism. It is the ideology which upholds colonial rule and exploitation. It preaches the 'superiority' of the white race whose 'destiny' it is to rule over those with coloured skins, and to treat them with contempt. It is the ideology which breeds Fascism... (Claudia Jones, 1958, cited in Boyce Davis, 2008: 87)

Many of those engaged in the debate present the debate as though Marxism is a European phenomenon and black people who are responding to it must of necessity be alienated because the alienation of race must enter into the discussion. They seem not to take into account that already that methodology and ideology have been utilised, internalised, domesticated, in large parts of the world that are not European. (Walter Rodney, 1975)

This chapter addresses the concept of international development, understood broadly as incorporating the whole complex of unequal material relationships and processes which structure engagement between the global South and the global North, as well as providing the primary discursive framework within which these relationships have been constructed for more than 60 years. 'Development' is inextricable from the rapidly shifting and mutating operations of global capital, and should be understood in relation to concepts of imperialism, rather than, as in dominant development discourses, as an alternative which renders these concepts invisible (Wilson, 2012). In contrast to the tendency within an influential section of Western Marxist thinking to view racism as

epiphenomenal to capitalism (Tilley and Shilliam, 2018), a contemporary Marxist engagement with development and imperialism, I suggest, must engage with the inextricable relationship between race and capital. Further, it must consider the materiality of race – which is always already gendered – in a global context. In order to do this, I argue, the starting point must be an engagement with Marxism as a theory and practice which has primarily been developed outside Europe and North America and is deeply rooted in the conditions and contradictions of lived experiences in Africa, Asia, Latin America and the Caribbean.

RACE AND RACISM IN INTERNATIONAL DEVELOPMENT

Despite its affirmation by increasing numbers of writers (see, for example, Kothari, 2006; Wilson, 2012; Rivas, 2018; Pailey, 2020; Patel, 2020; Pierre, 2020), talking about racism in development is still a matter of breaking ‘a determining silence, which both masks and marks its centrality to the development project’ (White, 2002). One reason for this is the overwhelming whiteness of development institutions and organizations (see, for example, Heron, 2007; De Jong, 2017; Rivas, 2018; Pailey, 2020). Another is the sustained failure to understand racism as global (Wilson, 2012; Pierre, 2013). Thus even those development scholars who recognize the centrality of race to social formations such as the USA, the UK, South Africa or Brazil are often unable to comprehend it as operating globally and structuring the global inequalities and patterns of exploitation and accumulation within which development is embedded. As a result, discussion of racism in development, whether within academic or ‘practitioner’ fora, is afflicted with a perpetual sense of novelty. This is despite the fact that almost a century has passed since W. E. B. Du Bois wrote about the global ‘color-line’ (1925) and almost 50 years have passed since Guyanese Marxist scholar and activist Walter Rodney wrote *How Europe Underdeveloped Africa* (1972), which brilliantly explains how the whole edifice of European capitalism was built upon the profits of Atlantic slavery and colonialism, and how this was inextricable from processes of extraction and impoverishment, and the destruction of diverse livelihoods and thriving cities and industries across Africa.

The year 2020 saw Black Lives Matter protestors once again making these connections in practice. The targeting of statues of slave traders like Edward Colston and colonial white supremacists like Rhodes and Churchill in Britain reflects the fact that this movement is linking murderous police racism in North America, the UK and Europe with how the violence of race and white supremacy has been historically, and remains today embedded in global structures of capital accumulation.

As this indicates, any analysis of how racism shapes development must go beyond the exposure of colonial legacies, important though those are, and recognize contemporary material processes and structures. Development interventions

operate to continue the transfer of resources to the global North on a massive scale. For example, the current moment is seeing a new wave of colonialism with corporate landgrab and extraction of people's labour and resources from Africa. Central to this are global development initiatives like the New Alliance for Food Security and Nutrition, and the Alliance for Green Revolution in Africa (Global Justice Now, 2014). In the name of fighting hunger and promoting 'climate-smart agriculture' these initiatives are forcibly transferring land to corporates for export crops like palm oil and biofuels, using racist colonial myths of the land as empty. They are compelling changes to seed laws which mean that indigenous agricultural knowledge is both criminalized and appropriated, while requiring the use of chemical fertilizers and pesticides which cause harms amounting to slow death (Shaw and Wilson, 2019). At the same time, the people being targeted for this plunder of their land, labour and knowledge continue to be represented through colonial racialized tropes as the perpetual recipients of aid from Britain and the West (Johnson, 2020).

It has also been striking that the UK Black Lives Matter protests, in particular, have had a particular focus on the violence of racialized imperial borders. Among those whose murders were remembered and grieved by the protestors were Joy Gardner, who was bound and suffocated to death by police and immigration officials in front of her five-year-old son in 1993; Jimmy Mubenga, who was killed by G4S employees aboard a plane while being deported to Angola in 2010; and the many who have died as a result of the Windrush 'scandal'. In the era of the Sustainable Development Goals, development is geared towards containment, and the shoring up of these deadly borders, preventing migration while continuing the unhindered flow of resources and profits to the global North. More generally, 'Sustainable Development' implies the sustaining of massive racialized global inequalities, most explicitly through population policies (Wilson, 2017a). Reflecting the wider embedding in development of Malthusian and eugenicist ideologies which shift responsibility for the effects of capitalist accumulation onto racialized populations, population growth in the global South is now constructed within development discourses as the cause of climate change, conflict, migration and terrorism (Hendrixson, 2004; Sasser, 2018). Despite the preoccupation with numbers in population discourses, the 'migrants and refugees' in these constructions are clearly far from disembodied statistics, but rather are racialized and gendered bodies who are by definition excludable: both through the policing of national borders, and by extension through the policing of the borders of the category 'human' itself (Wynter, 2003), to which these discourses contribute.

In a field dominated by 'philanthrocapitalists' like the Bill and Melinda Gates Foundation (Birn, 2014; McGoey, 2015), racialized women and adolescent girls are understood as dangerous reproductive bodies marked by 'excessive' fertility which needs to be managed and controlled. Currently, through development initiatives like FP2020/30 (Family Planning 2020/30) which are promoted in the name of reproductive rights, women in low-income households in Africa and

Asia are pushed to adopt long-acting hormonal contraceptives in conditions where they have no access to the medical follow-up required (Bendix et al., 2019; Baker-Medard and Sasser, 2020), and in some contexts also face coercive mass sterilization (Wilson, 2018).

These are just some of many forms of often fatal embodied racialized violence in development, which are always also gendered and in which states and dominant classes in the global South frequently collude. In October 2020 Black Lives Matter protestors were on the streets of London again, this time in solidarity with the wave of mass protests in Nigeria against the brutality of the Special Anti-Robbery Squad (SARS), a notorious unit of the Nigerian police. As the scope of protests in Nigeria widened beyond #EndSARS, protestors in the UK too, many of them young British members of the Nigerian diaspora, highlighted the oppressive structures and class character of the postcolonial Nigerian state, linking the violence of the Nigerian state to its history of British colonialism (and ongoing British police and military training) and to its contemporary interdependence with Shell, Chevron and other oil companies and their continuing imperialist plunder.

DECOLONIAL APPROACHES TO RACE AND DEVELOPMENT

With a shift from postcolonial critiques of development to interventions influenced by decolonial thinking, which locates coloniality not only in discursive legacies, but in a material and ontological present (Lugones, 2007; Mignolo, 2011; Rivera Cusicanqui, 2012;¹ Tuck and Yang, 2012; Rutazibwa, 2020), some aspects of these contemporary material processes are now being recognized in recent discussions of race and international development.

Yet much of this work is framed in opposition to a Marxism equated with a reductionist strand in Western Marxist thinking in which race and class are viewed as competing and mutually exclusive frameworks for understanding the world, and the capitalist workplace represented as the only locus of revolutionary struggle. This leads to its characterization as a Eurocentric ideology which must be rejected by a decolonial project. I argue that, ironically, this is based on a neglect of the preeminent location of the development of Marxism as both theory and practice in the global South, and an overwhelming preoccupation with the US experience as global. Marxist scholars and activists in the global South who engaged in their own debates rather than primarily with North American and European academia (where much postcolonial and decolonial theory has emerged) are therefore ignored even as non-Western epistemologies are ostensibly valorized. More broadly, it reflects the failure to recognize Marxism as a methodology which, in Rodney's words, has been 'utilised, internalised, domesticated, in large parts of the world that are not European' (1975: n.p.).

Without engagement with this, the critical decolonial discussion of race and global capitalism, imperialism and development has tended to take two, apparently divergent but in practice sometimes overlapping, directions.

Reworking Postdevelopment

One of these directions involves a reworking of earlier postdevelopment approaches, in attempting to identify and isolate indigenous epistemologies and worldviews. This approach inevitably risks many of the pitfalls of racialized idealization and essentialization, which are themselves deeply embedded in colonialism. Once again this approach raises the spectre of ‘authenticity’, and, like its colonial predecessors, claims for itself the power to identify who and what is ‘authentic’. This possibility was in fact indicated by Escobar in his seminal postdevelopment text *Encountering Development* (1995). Escobar warns against the romanticization of knowledges and practices constructed as ‘local’ and ‘traditional’ and the elision of the inequalities, histories and power relations which shape them, arguing that ‘one must be careful not to naturalise “traditional” worlds, that is, valorize as innocent and “natural” an order produced by history....These orders can also be interpreted in terms of specific effects of power and meaning. The “local” moreover, is neither unconnected nor unconstructed, as is thought at times’ (1995: 170; see also Ziai’s distinction between ‘sceptical’ and ‘conservative’ postdevelopment thinking (2004, 2015)). It also tends to reproduce postdevelopment’s failure to engage with demands for development, conceived in multiple ways, articulated by poor and marginalized groups, as well as the neglect within postdevelopment scholarship of the transition from developmentalism to neoliberalism as the dominant development approach and its material and discursive implications (Wilson, 2017b).

The concept of ‘decolonizing’ is currently in certain contexts being delinked from agendas of social justice and incorporated into right-wing neoliberal discourses.

This is the case for India’s upper-caste Hindu supremacist project, which is not only itself colonial in origin, but today is inseparable from the corporate-driven predatory neoliberal version of ‘development’ pursued by the Narendra Modi government and (as I discuss later in this chapter) the strengthening of imperialist accumulation processes.

In the Indian context, conservative forces have long mobilized notions of ‘inauthenticity’ in attempts to discredit transformative politics such as those of Marxism and feminism as ‘alien’ (Narayan, 1994); in recent years we have seen right-wing Hindu nationalist ideologues explicitly weaponizing the ideas of postdevelopment theorists like Ashis Nandy (Juluri, 2013; Shah, 2015). Most recently the core Hindu supremacist organization, the Rashtriya Swayamsevak Sangh (RSS) (a paramilitary organization formed in the 1920s which was modelled on European fascist parties and seeks to create a Hindu state in which

Muslims, Christians and other minorities are reduced to second-class citizenship), has begun invoking 'decolonization' in reference to their promotion of Hindu supremacist, exclusivist nationalist ideas, as in a recent RSS conference titled 'Decolonisation of Indian Mind' (Sharma, 2017).

A significant aspect of South Asia's history has been the colonial engagement with the caste system, and the incorporation of dominant Brahmin understandings of caste into rigid colonial systems of enumeration and racialized categorization (Guha, 1998). Yet as Hindutva ideas gain prominence it has become increasingly important to explicitly distinguish this understanding from that in which caste itself is claimed to be an 'Orientalist' construction, rather than a material lived pre-colonial, colonial and postcolonial reality. This 'revisionist' history is increasingly mobilized in order to deny caste oppression and delegitimize the struggles of those who challenge caste. As Shalini Sharma writes, according to the scholars of the Hindu right

ideas of the caste system, and its barbarity and unfairness, were the products of proselytizing Christianity, missionaries and their colonial counterparts whose main intention was, and still is...to Christianise or 'break up' India....What is most challenging about the writings and sayings of the Hindutva revisionist scholars is the way in which they root their findings and claims in post-colonial scholarship...often in unacknowledged ways. But whenever they reference the 'colonial construction of knowledge' you can be sure that [they] are nodding and winking at the consensus existing in the conventional literature, in which we are all steeped, about the impact of the west on the legal and social customs of the imagined 'East'. (Sharma, 2017)

Further, it must be recognized that understandings of modernity as potentially liberating have been central to Ambedkarite thought, which inspires ongoing Dalit movements against caste (Teltumbde and Yengde, 2018). More broadly, this underlines one of the key challenges we need to negotiate in adopting decolonial approaches to development – that of the danger of potentially delegitimizing the demands of people's movements for equality – and indeed for development, albeit conceived and understood in multiple ways.

Embracing the State in the Global South

The other direction – which is prevalent especially in work developed in a critical relationship with the discipline of international relations – is arguably less critical of notions of modernity, as it involves an embrace of the state in the global South, with little or no recognition of its class character and how this relates to and works to sustain imperialism, a relationship which has been a major preoccupation of Third World Marxists located in the global South.

This celebratory approach to postcolonial states and leaderships often involves either eliding the presence of Marxist thinkers at the centre of anti-colonial struggles, and therefore inevitably failing to engage with their ideas, or retrospectively minimizing the differences between the politics of national liberation and

that of postcolonial nationalism and non-alignment. The latter can mean selectively excluding the actual ideas of Marxists. For example, in the case of Walter Rodney, a recent article in this vein (Klug, 2020) barely acknowledges Rodney's Marxism and significantly plays down the sharp contradictions between his vision for national liberation and social transformation and that of leaders like Jamaica's Michael Manley and Tanzania's Julius Nyerere who espoused the New International Economic Order (NIEO), arguing that 'In retrospect... the distance between the NIEO and its Marxist critics narrows in comparison to the gulf that separates these visions from the dominant strands in international economic debate today' (Klug, 2020: n.p.)

Yet these differences were not only, as suggested here, a matter of 'silence on class inequalities within the states of the decolonizing world' (Klug, 2020: n.p.) among advocates of the former, but represented a significantly different understanding of imperialism (see, for example, Wilson, 2013; Okoth, 2019, 2020).

Critiques of Good Governance Discourses

Scholars with a critical focus on inter-state relations have powerfully delineated the racialized disavowal of African sovereignty in international relations (Grovoqui, 2001). This has paved the way, for example, for significant critiques of the turn to 'good governance' by the dominant development institutions which emerged in the 1990s. 'Good governance' was understood to be constructed in opposition to a racialized trope of 'corruption' assumed to be essentially and exceptionally African, which is reproduced and embedded in the discourses of the World Bank and other development institutions (Gruffydd Jones, 2015), in turn legitimizing ongoing resource extraction and appropriation (Pierre, 2020). But this focus also inevitably neglects several key aspects of this conjuncture whose analysis has been undertaken primarily by African Marxists – in particular, the specific class character of states, the extent of popular resistance to policies benefitting global capital, and the shift from developmentalism to extractive neoliberalism as the dominant mode of development intervention.

The turn to the good governance discourse in the 1990s was simultaneously a response to resistance to capital and racialized imperialism – in the form of widespread popular opposition to the structural adjustment policies of the 1980s – and a strategy to extend and deepen processes of capital accumulation.

During the Cold War period from the 1950s to 1980s, systematic corruption and large-scale expropriation of resources by unelected rulers in states in Africa, as elsewhere in the global South, was inseparable from the extensive military assistance and aid provided by Western donor governments to those regimes seen as strategic allies, and from the reproduction of colonial structures of extraction and accumulation.

It was African left and anti-imperialist thinkers and movements confronting these regimes who articulated cogent critiques of this corruption, which they

placed in the context of a much wider Marxist analysis of the role of the dominant classes and their patterns of accumulation in supporting and furthering the interests of imperialism in the post-independence era. In these analyses, corruption was an inevitable by-product of the failure to transform structurally dependent, primary export-based colonial economies (Babu, 1981, 1982; Iyayi, 1986; Rodney, 1972; Zack-Williams, 2018). Corruption was also theorized as a form of 'primitive accumulation' in the context of the absence of structural transformation of the economy (see, for example, Iyayi, 1986 on Nigeria²) and this was invariably understood as inseparable from ongoing imperialist plunder.

A. M. Babu argued that

[t]he politicians and bureaucrats in underdeveloped countries who supervise this exploitation and plunder are not themselves underdeveloped. They enjoy as high a standard of living as their counterparts in the developed capitalist countries; and through bribery and corruption, some enjoy even higher standards. They have therefore developed a vested interest in the system which they are reluctant to change, whatever they say to the contrary. There is also emerging a new group of local millionaires who benefit from this exploitation and plunder of their people by their foreign masters; they also take advantage of the economic chaos which the system has brought about. Both groups are developing material bases for reproducing themselves as a class whose vested interest is inextricably bound to neo-colonialism. (Babu, 2002[1982]: 268)

These analyses form part of extensive Marxist work seeking to theorize the nature of the state and the ruling classes in postcolonial African contexts, which are rarely referenced in Northern-based critical engagements with development. For example, the Dar es Salaam debates of the late 1970s (see Tandon, 1982) explored questions of class formation, the state and contemporary imperialism. Sharp (2019) provides a recent discussion of the emergence in the late 1960s and 1970s of the University of Dar es Salaam as an intellectual and political hub which drew Marxists from across Africa and beyond (including Walter Rodney), although this account, framed in terms of 'subaltern geographies', once again tends to downplay the contradictions between the class analysis of Marxist scholar activists and the 'African Socialist' approach of Nyerere (see Babu, 1981).

The corruption of neocolonial elites was also frequently satirized – one example being Ousmane Sembene's classic film *Xala* (1975), a scathing critique of the post-independence rulers in Senegal in which the methods adopted by imperialist capital to maintain their dominance via this new class are the paradigmatic example of bribery.

Development institutions and donor governments continued to support notoriously corrupt leaders like Kenya's Moi and Zaire's Mobutu during the 1980s. The notion of 'good governance' in fact makes its first appearance in the World Bank's highly influential 1989 report 'Sub-Saharan Africa: From Crisis to Sustainable Growth' (Abrahamsen, 2000). The report was produced in the context of both the end of the Cold War and incontrovertible evidence of growing poverty, unemployment, worsening levels of child nutrition and overall economic crisis across

the continent after a decade of IMF-dictated economic reforms and structural adjustment policies, as well as growing popular protests against neoliberal policies in many African countries. Manji and O’Coill point out that

[b]etween 1976 and 1992 there were 146 protests against IMF supported austerity measures in 39 countries around the world. These took the form of political demonstrations, strikes and riots. They took place almost exclusively in cities and they reached a peak in the mid 1980s. In many cases, the immediate response of governments was brute force. Demonstrations were violently suppressed, strikes declared illegal, universities were closed, and trade unions, student organisations, popular organisations, and political parties also became the target of repressive legislation or actions. (Manji and O’Coill, 2002: 10)

By the 1990s these protests were taking the form of demands for democratic change: ‘the decisive pressure...came from within Africa and this was very much precipitated by the economic crisis...the collapsing infrastructure, the deteriorating economic situations, the falling standard of living and the absence of political space to express some of these concerns’ (Zack-Williams, 2001: 217).

The World Bank report was thus a strategic intervention which aimed to shift responsibility for the crisis to internal factors through a new dual focus on problems of governance and of population growth, and in the process reiterated a commitment to the core principles of neoliberalism and globalized capital accumulation.

As Mkandawire and Soludo noted

Championed largely by Africanists based in North American universities and immediately embraced by the World Bank as it developed its political-economic analysis of African policy-making, this view takes as its starting point the claim that the postcolonial African state, by its very nature and definition, is at the heart of the economic and governance crises pervading the continent. (Mkandawire and Soludo, 1998: 24)

These ideas quickly became part of a donor consensus and gained a new prominence in the repertoire of racialized representations of ‘Africa’, shot through with deep-rooted racialized colonial constructions of Africans and African rulers in particular as innately lazy, greedy, cruel and given to excess of all kinds, and African people as in need of the protection of benevolent and civilized external trusteeship. The resurgence of this trope also reflected and reinforced the silencing of analysis of the specific class alignments and international affiliations of these regimes, in favour of racialized narratives of African exceptionalism.

James Thuo Gathii highlights the proliferation of epithets used to describe the essentialized ‘African state’ which emerged in this period: “kleptocratic” state; “vassal” state; “vampire” state; “receiver” state, “prostrate” state, “fictitious” state, “collapsed” state, “predatory” state, “parasitic” state, “neo-patrimonial” state, “lame leviathan” and so on’ (1999: 68). Corrupt, self-seeking African leaders were contrasted in this discourse with incorruptible, accountable and compassionate Western institutions; chaos and conflict with order and stability; despotism with democracy. As Gabay argues, this racialized binary persists in recent ‘optimistic’ neoliberal narratives of ‘Africa rising’ in which, he suggests,

Africans too are now represented as capable of acquiring whiteness in the form of 'individualism, materialism, rationalized bureaucracy and deregulated entrepreneurialism' (2018: 242).

This racialized discourse also served to obscure the evidence that corruption is not only intrinsic to capitalism, but, under some conditions, may allow it to operate and develop more effectively. Earlier, this observation had been strategically mobilized to legitimize US support for corrupt dictatorships, but subsequently it became the preserve of more critical commentators on neoliberal globalization. The key question for domestic capitalist development, some have argued, is not the presence or absence of corruption, but rather whether the capital accumulated through corruption was reinvested in the national economy, or siphoned out to bank accounts in Europe (Moore, 1999: 79; Grovogui, 2002; Chang, 2007: 164), thus strengthening processes of imperialist capital accumulation. This then returns us to the questions about the nature of postcolonial ruling classes and their insertion into global processes of imperialism which were addressed by African Marxist commentators earlier.

Much has been written about the extent to which colonialism in sub-Saharan Africa has shaped contemporary political structures and practices (see, for example, Rodney, 1972; Mamdani, 1996; Mbembe, 2001; Grovogui, 2002). In particular, the role of indirect rule through native authorities in institutionalizing what Mamdani (1996) has termed 'decentralized despotism' and in inscribing violence and coercion, ethnic essentialism and forms of plunder within the post-independence polity has been extensively analysed. Under indirect rule, chiefs were expected to retain some part of the taxes extracted from the people on behalf of the colonial state, and to conspicuously consume the wealth they thus accumulated: both extortion and embezzlement were thus institutionalized (Mamdani, 1996). Further, late colonial manoeuvres secured ongoing outflows of resources including tax-theft: in the case of Malawi, for example, as Chelwa (2016) explains, the country

has a 60 year old colonial-era Tax Treaty with the U.K. that makes it easy for U.K. companies to limit their tax obligations in Malawi. The treaty was 'negotiated' in 1955 when Malawi was not even Malawi yet. Malawi (or Nyasaland, as it was known then) was represented in the negotiations, not by a Malawian, but by Geoffrey Francis Taylor Colby, a U.K. appointed Governor of Nyasaland. (Chelwa, 2016)

As a number of scholars have noted, these historically contextualized accounts were rejected within good governance discourses, which drew instead on racialized characterizations of 'African politics' which either evoked an ahistorical notion of 'African' culture or, increasingly as the governance agenda gained ground, went further in pathologizing African politics as innately venal. As Grovogui argues, 'these scholarly works and chronopolitical narratives ...naturalize as culture all forms of politics, including the regional manifestations of global processes and local responses to such historical processes' (2001: 442).

The flip side of this ‘Africanization’ of corruption in development discourse was that ‘developed’ states (and IFIs) – as well as corporate capital and international NGOs – were free from any scrutiny of their governance practices, and assumed to be the model to which African governance must aspire³.

Wengraf (2017) notes that a United Nations report from 2016 on governance and corruption in Africa acknowledges that

anti-corruption projects and initiatives all focus on cleaning up corruption in the public sector, which is often regarded as incompetent, inefficient and corrupt, while the private sector is portrayed as efficient, reliable and less corrupt. This view has been influenced by neo-liberal economic perspectives, which argue that the private sector is the main engine of economic growth and perceive Governments as being obtrusive. (Wengraf, 2017)

She suggests that

this narrative shift is likely a response to the staggeringly high levels of corruption and criminality by Western and other non-African firms. In a high-profile example, the oil-services company Halliburton was convicted by a Nigerian court for corruption carried out while none other than former U.S. vice president Dick Cheney was at the helm. In a report on ‘cross-border corruption in Africa’ between 1995 and 2014, virtually all cases (99.5 percent) involved non-African firms. (Wengraf, 2017)

The externalization and racialization of the financial practices defined as ‘corrupt’ has a long colonial history. Its genealogy can be traced to the early years of the East India Company. In 1787 the British House of Commons impeached Warren Hastings on charges of having engaged in corruption and bribery on a massive scale during his tenure as the Governor-General of Bengal from 1772–85. Eight years later, in 1795, the British House of Lords acquitted Warren Hastings of all charges. Hastings’ defence centred upon the assumption that ‘arbitrary power’, corruption and despotism were part of the ‘constitution of Asia’ and therefore as Governor-General he had been obliged to conform to these forms of governance. Edmund Burke, who led the prosecution, condemned this as the rule of ‘geographical morality’ (Robins, 2006: 134), but it was Hastings’ view of ‘Asiatic’ morality which informed subsequent moves undertaken by the new Governor-General Lord Cornwallis to curb corruption. In an early step towards the explicitly racialized hierarchies and racial segregation which were to increasingly characterize British colonial rule during the nineteenth century, these involved embarking on the ‘Europeanization of the (civil) services in India’ and purging the administration of Indians, who were considered incapable of honesty. Cornwallis notoriously remarked: ‘every native of India, I verily believe, is corrupt’ (Robins, 2006: 137).

As this suggests, the very practices that facilitated the plunder that laid the foundations of the European Industrial Revolution, and that have remained central to capitalist forms of accumulation, were externalized and projected onto the non-European other. This process was of course inseparable from the construction of notions of ‘justice’ and ‘fair play’ as uniquely British which was consolidated

during the course of the nineteenth century and is now being invoked as part of the 'legacy' of empire. Even more broadly, the racialization of corruption coincided with the consolidation of the central trope of capitalism: that of capitalist markets as free, fair, impersonal and objective, and the accompanying assumption that injustice can only arise through interference in the operation of such markets.

Hastings' principle of 'geographical morality' was re-invoked by ideologues of US capital throughout the Cold War period, who argued that different 'cultural practices' in relation to business justified kickbacks and other forms of bribery and extortion engaged in by Western corporations in their dealings with Third World governments (see Ala'i, 2000 for a discussion of this). With the consolidation of neoliberalism, however, its core assumptions of a racialized hierarchy of affinity with liberal morality were incorporated into the good governance model.

This discourse facilitated an unprecedented degree of involvement – by donor governments as well as international financial institutions, directly and via NGO networks – in the day-to-day decision making of ostensibly sovereign states. As Graham Harrison argues, 'rather than conceptualizing donor power as a strong external force on the state, it would be more useful to conceive of donors as *part of the state itself*' (2001: 669, emphasis in original; see also Owusu, 2003). The governance architecture, which was underpinned by the World Bank's Heavily Indebted Poor Countries (HIPC) scheme introduced in 1996, 'enabled the expansion of neoliberal social practice and facilitated increasingly ambitious discourses of social engineering – away from macroeconomic recalibrating "shocks"...and towards deeper social transitions' (Harrison, 2010: 42–3).

The World Bank's evident preoccupation with producing elites with a world-view and a transformative agenda compatible with the demands of globalized metropolitan capital – what the Bank's 1997 report described as 'competent and reputable technocrats' such as 'Chile's group of high-level advisers – the Chicago boys – and Indonesia's Berkeley mafia and Thailand's gang of four', who would be rewarded with large salaries, 'recognition, appreciation, prestige and awards' as they implemented structural reform (World Bank, 1997) – reflects obvious continuities with modernization models, as well as with the earlier colonial strategies from which they emerged. One is reminded irresistibly of Macaulay's view of the purpose of colonial education in India, 'to form a class who may be interpreters between us and the millions whom we govern, a class of persons Indian in blood and colour, but English in tastes, in opinions, in morals and in intellect' (Macaulay, 1835).

At the same time, and apparently contradictorily, by constructing the state and existing forms of social provision as an alien imposition, and capitalism as consonant with 'indigenous African values' (Abrahamsen, 2000: 49–51), the World Bank's governance discourse attempts to distance itself from the 'Westernizing' project of developmentalism and claims to be reinstating and nurturing authentic 'African' traditions. Where the European colonial powers selectively valorized the authoritarian and coercive aspects of social power within the multiplicity of

social formations they encountered in Africa in order to consolidate Indirect Rule (Mamdani, 1996), the World Bank seized upon elements of 'indigenous' entrepreneurship and petty capitalism to both legitimize and extend the contemporary imperialist extractivist project. The 1989 World Bank report cited instances of 'Africa's market tradition' at some length (World Bank, 1989); this was further elaborated in the 1997 report, which referred to 'traditions' of entrepreneurship and self-help as those characteristics of 'African' societies which a good governance approach would promote.

Postdevelopment and postcolonial critiques have long highlighted the Eurocentrism of a monolithic developmentalism based on planning and characterized by 'the construction of roads, hydroelectric projects, schools, hospitals and factories' (White, 2006: 56). But this does little to address the decisive shift from the 'developmental state' to the unmediated capital accumulation of neoliberal 'development' models which, by contrast, have involved the destruction of such public services and infrastructure, and entail unplanned and untrammelled incursions by footloose corporate capital seeking to extract and export resources. It is the latter which is sought to be repackaged as consonant with 'indigenous' values, selectively chosen and reconstructed for their compatibility with neoliberal models.

This is one example of the capacity for neoliberal discourses of development to selectively appropriate elements of postdevelopment and postcolonial critiques, a phenomenon which further underlines the need for a nuanced and critical approach to the use of the concept of indigenous knowledge.

As discussed earlier, the recent experience of India epitomizes this, with the rise to power of a far-right Hindu supremacist 'family' of organizations promoting an ideology which it claims to be rooted in ancient knowledge systems, but which is in fact colonial in origin (Thapar, 2016), and its symbiotic relationship with neoliberal capitalism (Gopalakrishnan, 2008). If the last quarter-century has seen all the main political parties in India adopt neoliberal policies, it is the Hindu supremacist BJP that has embraced neoliberalism, both ideologically and in practice, in its most unadulterated form.

Deregulation and privatization under the Modi regime which has been in power nationally since 2014 (and in the state of Gujarat since 2001) has been inseparable from so-called 'crony capitalism' in which Indian billionaire corporate leaders close to the prime minister have benefitted extensively (Varadarajan, 2014). While this takes place in an atmosphere of febrile hypernationalism, in which minorities and dissenters are demonized and persecuted as 'anti-nationals' by the state, and India's own colonial occupation of Kashmir has been intensified, these policies have deepened the processes of imperialist extraction in which these Indian corporations are themselves increasingly actors, and consolidated the control of transnational capital over the Indian economy. Thus, for example, measures by the Modi government have sought to facilitate increased foreign corporate funding of political parties (PTI, 2018), while the depredations

of extractivist corporates like Adani both within India and elsewhere are underpinned by British finance capital (Bharadia, 2020).

RACIAL CAPITALISM

Recent work adopting Cedric Robinson's theorization of racial capitalism (Robinson, 1983) has been more productively engaged with Marxism. Here too, however, interventions have been very much addressed to a mainstream Marxist 'other' assumed to be located in North America or Europe, and these interventions as well as responses and refutations have by and large neglected the work of Marxist thinkers outside the global North. I will briefly indicate two examples of this neglect and its implications.

Primitive Accumulation

Firstly, the notion of primitive accumulation in the form of transatlantic slavery as not only predating but integral to capitalism has been central to the debate relating to racial capitalism in the USA. Specifically, it is argued that Marxists have been unable to recognize this, characterizing slavery as only a vestige of pre-capitalist relations or, at best, a prelude to capitalism (Robinson, 1983; Singh, 2016; Issar, 2021).

As Singh compellingly argues, this has generated

a political imagination that separates race, sex, and gender domination from capitalist exploitation...Ironically, this way of understanding anticapitalist struggle not only presents an impediment to the kind of solidarity required in a world characterized by 'intimate and plural relationships to capital.' It also forfeits a powerful analytic discernible within Marx's oeuvre that conceives capitalism as a machine whose productive expansion also rests upon expanding fields of appropriation and dispossession. (Singh, 2016: 29)

So how could engagement with 'Third World' Marxist thinkers allow us to overcome this apparent polarization?

Needless to say, it was anti-imperialist Marxist political economists, predominantly located in the global South, who actually established and mapped the central role of Atlantic slavery and early colonialism, and the huge transfer of resources to the global North involved in these processes, in creating the conditions for the development of capitalism in Europe in a tradition stretching from the pioneering work of Eric Williams (1944) and Rajani Palme Dutt (1940) to Walter Rodney's seminal *How Europe Underdeveloped Africa* (1972) to the continuing work of the Indian economist Utsa Patnaik (1972, 2006, 2017). Through analysing the impact of the enslavement and transportation of millions of people, the direct appropriation of resources, the extraction of surpluses through taxation, exploitation and unequal trade, and the shift of resources away from productive

activities and enforced deindustrialization which accompanied European incursions, these writers have also demonstrated the inseparable economic relation between the development of capitalism in the global North and the structures and conditions associated with what are now called ‘developing’ countries in the global South.⁴

But the sustenance of expanded reproduction of capital by forms of so-called ‘primitive’ accumulation was also considered to be ongoing under postcolonial imperialism by Third World Marxists. This evidently extends beyond a generic ‘dependency theory’ usually cited in histories of development thought.

For some the focus was on fundamentally unequal global relations of exchange which extended and reproduced colonial structures of extraction and accumulation by metropolitan capital. A key example is the extensive work of Samir Amin, which advocated ‘delinking’ from these processes (1977). Significantly, it was Amin who pioneered the term Eurocentrism both to refer to a contemporary extractive core-periphery world system, as well as later to elaborate a historical materialist approach which critiques European imperialist claims that its culture forms the universal grounds for modernity (Amin, 1989).

For other Marxist thinkers like the Zanzibari revolutionary and economist A. M. Babu, however, it was important to establish that this imperialist extraction or looting was located primarily at the level of production and labour – but, crucially, the analysis of this highlighted the capitalist production of global racialized difference among labourers and the role of imperialist finance capital

[T]he cheap labour in neocolonies helps to create a colossal return to the capital...invested. For instance, in developed capitalist countries the average return to capital is about 5% while in our countries it ranges from 40% to 200% as in gold mining and petroleum. Thus, the huge transfer of wealth from the neocolonies to the metropolitan countries takes place through the exploitation of our workers and the looting of our peasants.... (Babu, 2002 [1982]: 268)

These analyses were highly influential among Marxists in Africa, Asia and Latin America and the Caribbean long before the current phase of neoliberal globalization in which elements of comparable processes impacted labour in the global North too, as outlined in Harvey’s well-known formulation of accumulation by dispossession (Harvey, 2004).

Unfree Labour

Further, it has been argued that, at the level of production relations, Marxism has limited its analysis of capitalism to the struggle between the bourgeoisie and ‘free’ labourers, arguing that capitalism and unfree labour are incompatible. Again, while this does characterize the reductionist tendencies of much Western Marxist thinking, Marxists located in the global South have from the outset of necessity engaged in depth with multiple forms of unfree labour. Their work

predates by several decades the refocusing on forms of unfree labour under capitalism by Marxists whose work and research is located in the global North, in response to the emergence of phenomena such as so-called 'modern slavery' under neoliberal capitalism (Rioux et al., 2020).

An example of this is India's mode of production debate and its extended aftermath, a debate which took place in large part though not exclusively in the pages of the renowned Indian journal *Economic and Political Weekly*. Some participants in the debate (Bhaduri, 1973; Prasad, 1974) identified the persistence of semi-feudalism in the relationship between sharecropping tenants and landlords, whose power had been transformed and reinforced by colonialism (Bagchi, 1976), while others, focusing on regions of agrarian transformation under the US-backed so-called Green Revolution, observed initially that forms of labour previously regarded as pre-capitalist had persisted or been reinforced in a wide variety of regions witnessing technological change and expanded reproduction in agriculture; and later that employers in these regions were developing new strategies of control over labour, such as new forms of debt and formal contracts for labourers lasting unprecedentedly long periods of up to five years (Bhalla, 1976; Rudra, 1987; Srivastava, 1989; Breman, 1993). Caste oppression and violence which shaped these relations, and the mutating but ever present relationships between caste and class, are inescapable but also notably under-theorized in these debates (Omvedt, 1982).

Forms of Struggle Beyond Capital–Labour Relations

Secondly and relatedly, Marxism is critiqued for not providing the scope for recognizing the significance and potential of sources of resistance to capital which transcend the strict capital–labour relation and the capitalist workplace. This, it is argued, makes a meaningful Marxist anti-racist politics impossible.

This is perhaps the most Eurocentric of the critiques articulated by contemporary engagements with the Black Radical approach.

On the one hand, it is certainly the case, for example, that a reductionist and essentializing understanding of Marxism, within which racism is considered (at best) as an ideology which misleads and weakens the working class (Tilley and Shilliam, 2018), and self-organizing by racialized communities as a divisive 'identity politics', has continued to characterize the British left. This has persisted despite the interventions of Marxists who sought to use a historical materialist method to theorize material processes of racialization, notably of course Stuart Hall, whose early work compellingly identified race as 'the modality in which class is lived' (1978, 1980), and A. Sivanandan, whose seminal theorization of 'Race, Class and the State' ([1976]2008) mapped the inextricable connections between capital, race, colonialism and migration regimes in Britain.

On the other hand, however, questions of anti-colonial and anti-racist consciousness, of the key role of peasants and other non-proletarian classes, and of

the building of multi-class alliances against imperialism have animated almost every instance of actually existing Marxist-led revolutions and national liberation struggles, from China to Cuba to Guinea-Bissau and Angola, not to mention revolutionary movements within postcolonial states from Naxalbari onwards. The lack of engagement with the work of Amílcar Cabral, for example, or the perpetual disavowal of Fanon's self-identification as a Marxist (of which more below) ironically reinscribe the dominance of worldviews shaped by their location in Western, Anglophone academia, within which US experiences are increasingly universalized (Okoth, 2020).

IMPERIALISM AND RACE

This becomes even more marked when we consider the many explicit engagements by 'Third World' Marxist scholar activists with racism and racialization, for example in debates concerning African identities and Pan-Africanism. Kenyan writer Ngũgĩ wa Thiong'o's classic *Decolonising the Mind* (1986) refers to the beginning in 1968 of "The great Nairobi literature debate" on the teaching of literature in Universities and schools' where the central question posed was 'why can't African literatures be at the centre so we can look at other cultures in relation to it?' Underlying this was the question of 'what would be the centre? And what would be the periphery...?' (Ngũgĩ, 1986: 90). While *Decolonising the Mind* puts forward many of the ideas that shape today's decolonial politics, it is framed in explicitly Marxist terms, noting the significance of the national and class base (1986: 103–4) and highlighting the class aspect of the focus on oral tradition – its 'peasant and worker heritage' (1986: 95). Ngũgĩ puts forward a vision of Pan-Africanism consistent with the 'political nationalist' anti-imperialist strand of Pan-Africanism identified by Babu (2002). Pan-African literature for Ngũgĩ included North African literature and links with the African diaspora and the wider 'Third World' including Asia and Latin America' (1986: 98).

Among Marxist anti-colonial leaders and intellectuals, it was in the writings and speeches of Amílcar Cabral that new approaches to culture and identity, developed collectively in the course of anti-colonial struggle, were most fully elaborated (Robinson, 1981; Manji and Fletcher, 2013). Directly challenging racialized constructions of Africa as outside history, Cabral defined culture as 'the vigorous manifestation, on the ideological or idealist level, of the material and historical reality of the society that is dominated' (cited in Gruffydd Jones, 2020: 10). Arguing that colonial violence was always in part an (ultimately futile) attempt to destroy culture and the historical memories and 'seed of opposition' it contains, he asserted that '[f]or as long as part of that people have a cultural life, foreign domination cannot be assured of its perpetuation' (Robinson, 1981: 51). At the same time, critiquing Senghor's 'Negritude', Cabral put forward

a dynamic understanding of the culture of the colonized as inextricable from struggle: ‘while culture comprises many aspects, it “... grows deeper through the people’s struggle, and not through songs, poems or folklore. ...”’(Manji, 2017: 6). Gruffydd Jones further notes that

referring to Fanon’s argument that the liberation struggle was in itself an expression of culture, Cabral and [Mario Pinto de] Andrade argued that the collective struggle of a people to regain control over historical development is therefore “necessarily an act of culture... the organized political expression of the struggling people’s culture.” Second, the liberation struggle is in itself a vehicle for the forging of a new unified culture. (Gruffydd Jones, 2020: 10)

The contemporary tendency of selective engagement with Fanon’s own seminal work on race, as Annie Olaloku-Teriba has argued, leads to an inability to recognize his location in, and contribution to, anti-imperialist Marxist thinking

Today, the prevalent engagement with [*Black Skin White Masks*], instead of [*Wretched of the Earth* and *Studies on a Dying Colonialism*], has produced readings which extract Fanon from the context of struggle which animated his work. This leads people to treat him as simply a theorist of race, rather than a revolutionary who saw race as a technology of imperialism. (Olaloku-Teriba, 2016)

These understandings came to characterize wider thinking in this period. Describing the First Solidarity Conference of the Peoples of Africa, Asia and Latin America in Havana, in 1966, Gruffydd Jones (2020) describes how ‘the conference resolutions identified imperialism as the central and shared enemy of liberation movements and oppressed peoples around the world, including within the United States itself’, putting forward a ‘radical discourse with regard to race’. Mahler further argues that ‘the Tricontinental articulates its critique of a global system of imperialism through a critique of racial inequality but simultaneously takes a radically inclusive stance that attempts to destabilize racial essentialisms’ (Mahler, 2018, cited in Gruffydd Jones, 2020).

This highlights that what has come to be known (largely to its critics) as ‘political blackness’, referring to the collectivity based on shared experiences of racism and colonialism which people of African, Caribbean and South Asian heritage historically used to organize against racism in Britain from the 1970s onwards, and currently understood as unique to the UK context, has a much longer genealogy embedded in anti-colonial and anti-imperialist struggles in the global South as well as the anti-racist struggles in the global North which saw them as inextricable from their own experiences.

As a starting point for thinking about this, it is important to remember the Haitian revolutionary understanding of a black republic highlighted by Anthony Bogues: ‘The Haitian revolution proclaimed, “the Haitians shall henceforward be known only by the generic appellation of Blacks.”’ Haitian citizenship was thus equated with blackness, and only citizens could own property. Within this understanding, not only the colonial hierarchies of ‘race’, but the meaning of ‘race’ itself was redefined – white people could be, and some were, ‘naturalised

by the government', but this citizenship was linked to 'a positive identification with blackness' (Bogues, 2013: 233–4).

Olaloku-Teriba (2016) describes how in the USA in the 1960s and 1970s, the Black Panther Party sought 'to integrate the antagonism between blackness and whiteness into a broader theory of racial dynamics ...By reframing the black/white antagonism within the context of a broader critique of the USA's imperialism, intercommunalism conceived of blackness as historically contingent and aspired to the abolition of race altogether'. She further notes that 'The Black Panther Party lent both their name and Ten Point Programme model to... the Dalit Panthers, the "politically-black" British Black Panther movement and the Puerto Rican Young Lords Party' (Olaloku-Teriba, 2016; see also Elnaiem and Dosemeci, 2020).

This current of thinking about racism and imperialism which has both utilized and developed Marxism as a method for understanding, and changing, the world, is however not a mere historical remnant, but continues, for example, in the anti-imperialist transnational solidarities embedded in abolition feminist work such as that of Angela Davis, Beth Richie and Ruth Wilson Gilmore. As part of the building of sustained people's movements in opposition to fascist regimes aligned with neoliberal capital across the world, it is perhaps more urgently needed than ever.

Notes

- 1 Although her work is increasingly recognized as highly influential in this body of work, Silvia Rivera Cusicanqui in fact rejects the 'decolonial' label.
- 2 A similar analysis of accumulation in Bihar, India was developed by A. N. Das (1992).
- 3 This was recently expertly satirized in a viral twitter thread on the 2020 US elections by Kenyan commentator Patrick Gathara.
- 4 This extensive literature includes Williams (1944); Palme Dutt ([1940]1970); Patnaik (1972, 2017); Rodney (1972); Amin (1977); Blackburn (1998); Davis (2001). Although it encompasses a range of theoretical positions and indeed debates, it has nearly all been elaborated within the broad framework of Marxist political economy.

Advertising and Race

Anandi Ramamurthy

INTRODUCTION

This essay will explore advertising as a cultural form, one that is intrinsically tied to capitalism in its imperialist phase and is driven by the search for both raw materials and the need to create new markets. ‘Modern advertising’, as Raymond Williams asserted:

belongs to the system of market-control which, at its full development, includes the growth of tariffs and privileged areas, cartel-quotas, trade campaigns, price-fixing by manufacturers, and that form of economic imperialism which assured certain markets overseas by political control of their territories. (Williams, 1980: 178)

The political control of territories to which Williams refers was consolidated by racist thought and practice, which can be traced in advertising’s cultural representations. A Marxist critique of advertising must therefore consider the racialised regime of representations that are presented in this cultural form. I focus here on Anglo-American advertising in English.

The historical and contemporary relationship between race and capital can be traced through racialised slavery during which the black body was literally marked as a commodity (see Marques, Chapter 14 and Haider, Chapter 58, this *Handbook*). This process continued during European colonialism, by which the wealth of former colonised nations was extracted through taxation, exploitation and unequal trade, processes of forced de-industrialisation and the forcible integration

of nations into global markets on unequal terms. It enabled the development of European industrial capital to create the structures and conditions in the Global South that exist today (Blackburn, 1998; Dawson, 2016; Ntobi, 2016; Tharoor, 2017; Williams, 1945). These structures of exploitation developed alongside the emergence of Enlightenment ideas of individual freedom and universal humanism, which were centred around a series of binaries that structured who and what was considered civilised and uncivilised – reason vs emotion, culture vs nature, science vs superstition. Through these principles Enlightenment thought legitimated multiple exclusions by which only white, property-owning men were recognised as fully ‘rational’ and ‘human’ and therefore entitled to a full range of rights. These ideas we shall see were easily incorporated in advertising practices from the eighteenth century onwards to legitimate slavery, colonial rule and a racial division between the consumer and producer of goods.

In investigating the link between advertising and imperialism, the essay will consider the various methodological strategies that have been used by scholars to develop a critical understanding of the impact of advertising and promotional culture in our contemporary world to highlight the ideological role advertising has played in promoting racialised ideologies that support imperialism’s pasts and presents. It will look at the ways in which the representation of Africans and Asians in advertising have frequently been employed to represent the economic and political interests of companies and to consolidate the wider interests of colonialism and imperialism. This focus on political and material contexts challenges the liberal critique of advertising as simply duping the consumer as well as the liberal critique of racism as one that can be challenged through the eradication of negative stereotypes. It will explore both historical and contemporary advertising to interpret the ideological meanings within promotional strategies which place the commodity at the centre of an imperialist and racialised world. While advertising is no longer discrete in the twenty-first century and film and popular culture are used to communicate commercial messages as well as consolidate ideas around ‘race’ and commodity culture, I will focus here on advertisements as a distinct cultural form to frame the scope of the chapter.

CRITICAL ADVERTISING SCHOLARSHIP AND ‘RACE’

The first social histories of advertising were written by American scholars and explored the rise of advertising in the early twentieth century as a conscious craft to shift the perception of citizens from thinking of themselves as solely workers to identifying also as consumers. The planned nature of this process has been highlighted by both Roland Marchand and Stuart Ewen, who viewed the rising influence of the advertising industry as part and parcel of the development of industrial capitalist production: ‘An economy organised for efficient production through economies of scale... also needed a “high velocity of flow” in the purchase of

goods by consumers' (Marchand, 1985: 2). In this climate, as Ewen outlined: 'It became imperative to invest the laborer with a financial power and a psychic desire to consume' (1976: 25). Ewen outlines how advertising was consciously and systematically used to promote the idea of the worker *as* consumer. He highlights the way in which exponents of Taylorism in the domestic sphere, such as the home economist Mrs Christine Frederick, proclaimed consumption as a gift to the world; see her '*Selling Mrs Consumer*':

Consumptionism is the name given to the new doctrine; and it is admitted today to be the greatest idea that America has to give to the world; the idea that workmen and masses be looked upon not simply as workers and producers, but as consumers.... Pay them more, sell them more, prosper more is the equation. (Frederick, 1929, quoted in Ewen, 1976: 27)

For Mrs Christine Frederick this 'consumptionism' was an expression of modernity and a marker of American superiority. And as Marchand and Ewen identify, advertisers embraced this image of consumerism and exploited it to create anxieties and demands for products such as *Listerine* that people would never have previously bought. Yet neither scholar effectively considers the racialisation of the worker/consumer in these advertisements. While white American workers were sold products that they did not need as part of a world of fantasy in which goods were represented as offering emotional satisfaction and status, a wider symbolic system in the 1920s distinguished white American workers from both African American workers and those living and working in European-controlled colonies. Through advertising the archetypal white American worker was represented as modern and as such as 'civilised' in contrast to others, despite the fact that the consumerism promoted in these products could only be supported through the exploitation of black and colonial labour upon which the development of this new group of workers/consumers rested. 'The benedictions of consumerism in the imperial centre came along with underdevelopment at the colonial periphery' (Hund, 2013: 32). The whiteness with which the image of consumption was constructed in the 1920s and 1930s even led to maids in American advertisements in the 1920s to be represented as white 'French Maids', even though African Americans made up 39% of the domestic servant workforce (Marchand, 1985: 202).

While these social historians focus on the advertising industry, its social impact and its psychological strategies, a rising number of cultural critics in the 1970s set out not just to explore the psychological dimension of advertising's persuasion, but to evaluate its wider ideological power. For Roland Barthes, Judith Williamson and later Robert Goldman, semiotics offered a way to dissect and decode the messages embedded that were not simply about selling, but about constructing the idea of a consumer society as natural and eternal (Barthes, 1972, 1977; Goldman, 1992; Williamson, 1979). Barthes suggested advertising was a form of myth and Williamson outlined the ways in which the viewer was implicated in the production of these myths, offering examples of how ideas about

history, labour and culture were mythologised and depoliticised through advertising imagery. Goldman later outlined the way in which commodity culture permeated the way we see ourselves.

None of them however fully explore the racialised regime of representation within advertising. Discussions of race and racism in advertising have tended to focus on the reproduction of wider stereotypes in cultural representations (Pieterse, 1992). Even Raymond Williams, who recognised the imperialist context in which advertising is produced, never elaborates on the impact of this context for advertising's ideological power. Moreover, Leiss et al. *Social Communication in Advertising* (1986) offers no reference to racialised divisions of labour and its impact on advertising. Building on the work of semioticians and cultural historians, Sut Jhally (1991) has sought to employ a Marxist understanding of labour to argue that television viewers are not only involved in actively creating symbolic meaning, but also generate profit for the media through the 'labour' of watching advertising. Jhally, although acutely aware of the contradiction between what is presented in advertising and the context of production, does not interrogate the way in which the actual material interests of specific companies impact on the representations they produce. His contextual and discursive approach highlights the way in which commodities have become increasingly personified and human emotions commodified, influencing the way in which we think about ourselves. Dazzling, Happiness and Beautiful are now the names of perfumes calling out to consumers to acquire such qualities through consumption (Ramamurthy, 2015: 248). By the end of the twentieth century citizens were no longer conceived as both workers and consumers as envisaged by Mrs Christine Frederick but *entirely* constructed through the world of consumption.

There is no question that advertising and the wider promotional culture by which we are surrounded in the Global North has changed how we perceive commodities. The analysis of advertising by the above scholars has increased our understanding of the ways in which the commodification of human emotions is central to promotional campaigns by major corporates such as Coca Cola and Nike. Coke, for example, suggests we can literally 'open happiness' through drinking Coca Cola. While these practices suggest that advertising does indeed hide 'the real and full meaning of production' behind 'the empty appearance in exchange' (Jhally, 1991: 50), such semiotic and discursive analyses should not preclude an analysis of advertisements which address the wider political and economic interests of the advertising industry. As early as 1979 Don Slater argued that the analysis of ideology should not be separate from the analysis of the economic, but rather the task is 'to analyse how the economic, institutional, ideological and political forces, strategies and dynamics have constructed the social relations within which material cultural practices are carried out' (Slater, 1983: 305).

If we understand the exploitation of 'race' as an ideology central to the development and consolidation of European and American capital, this intersection must be centrally considered in understanding the ideological power of

advertising that is employed to sell the goods made through this exploitation. In the remainder of this essay I will consider how an analysis of the representation of people of colour in advertising is integral to a Marxist critique of advertising. I will highlight the ways in which, through the representation of people of colour, the requirements of capital can be seen to be referenced within ‘the empty appearance of exchange’. This position challenges the Derridean idea of a free play of signifiers with an ‘indefinite referral of signifier to signified’ (Derrida, 1978: 25). As Hall has argued, the meanings in messages are not endless, but restricted by the encoding process, which includes the institutional structures, patterns and interests at play (Hall, 1980). How are the ideological interests of specific companies manifested in the racialised images they produce? How are the requirements of contemporary capitalism reinforced and consolidated in the texts that we see?

In developing a methodology to explore advertising and its racialised representations, it is essential to adopt a methodological heterogeneity to fully explore the exploitation of the black presence within promotional culture, its link to company and corporate interests and the frequent naturalisation of the consumer as white, although there are shifts within this binary. A racialised presence can be seen to invariably point to the contemporary needs of capital and the ways in which ideologies of race and capital intersect.

ADVERTISING SPECTACLES AND THE NATURALISATION OF CAPITALIST RELATIONS

It is significant that Marx began his critique of *Capital* by analysing the nature of the commodity, the forms of value in it and the two-fold character of labour embedded there. Marx wrote this critique of commodity relations during a period when the commodity became increasingly ‘the centrepiece of everyday life, the focal point of all representation, the dead centre of the modern world’ (Marx 2003; Richards, 1990: 1). The first part of *Capital* was written while Marx was living in London, observing the spectacle produced by the Great Exhibition of 1851, which was not simply a homage to the commodity, but a homage to Empire, and the new commodities exhibited acted as symbols of imperial greatness and modernity. ‘It transformed wide sections of the population into supporters of imperialism and allowed commodity holders and exhibition organisers “to sell imperialism to the domestic public”’ (Hund, 2013: 27).

Thus, when late-nineteenth-century advertisers began to develop their brands it is not surprising that many made every effort to associate their products with the ideologies of Empire. The rise of commodity culture in this sense was integrally related to the exploitation and annexation of former colonial territories. If the site of the Exhibition, the Crystal Palace, ‘radiated the light of an incipient consumer culture’ it was because ‘it was a cultural imperialism made manifest’

(Hund, 2013: 29). The colonial expansion of European powers not only sought control over raw materials essential for the commodities being produced in the factories of Europe, but by the late nineteenth century companies also employed the commodity as a signifier of their own superiority and a method to civilise in their promotional culture (Richards, 1990).

From the earliest developments of branding, racial hierarchies were not only reinforced and naturalised, but were used to represent colonial ideologies with vigour. Developing during the colonial era, the image of Africa and Asia in advertising was employed at strategic moments in Victorian advertising to not only consolidate a generalised racial supremacy, but also to promote specific company interests as well as endorse government policy and specific forms of colonial administration (Ramamurthy, 2003). To consume was to be civilised and prove one's superiority. Being a British consumer was to perform imperialist dispositions. Ordinary customers embraced and participated in this construction. One British soldier who saw the words 'Pears Soap is Best' inscribed on a rock in Khartoum even wrote to the company to suggest an advertisement which the company subsequently produced with the slogan 'The formula for British conquest', eliding the spread of commodity relations with imperial expansion (Ramamurthy, 2003: 39–40).

SELLING IMPERIAL RULE

Pears Soap became infamous in imperial promotion in the 1880s and 1890s. The image of the black child being washed white in one advertisement was reproduced in countless publications and was circulated so widely that it can be found repeatedly in major collections of ephemera. This image was first published during the Berlin conference of 1884–5, when the European powers sat to agree, with no African present, the way they would divide Africa and its resources between themselves. The production of such an image at the moment of the Berlin Conference suggests Lever Brothers' symbolic support for a government policy of formal intervention in Africa. Interpreted in Pears advertising through an image of playful instruction it affirmed the ideas of 'the white man's burden' (Ramamurthy, 2003: 26–8). The innocence of the image, the picture of camaraderie between the white and black child denied the brutality of colonisation and suggests African complicity with the annexation of vast tracts of land to European control. The instruction which the white child offers justifies the new political system as one of support for Africa's development, a development that is visualised as being attained through literally being washed white, although it is a whiteness that is constructed as always incomplete, since as McClintock has argued, the head – 'for Victorians the seat of rational individuality and self-consciousness – remains stubbornly black' (1995: 214), legitimising the need for European intervention.

Apart from this overt celebration of the European carving up of Africa that the image offers, soap advertising's repeated use of the image of a black child

over the following decade also reflected the interests that Lever Brothers and other soap manufacturers had in the extraction of resources from West Africa, where palm oil and palm kernel oil were identified as being in abundance. The repeated use of the image of the black child did not simply reflect an interest in West Africa, but also saw the company engage in political debates about forms of colonial rule. While policies of native land tenure eventually developed to support small-scale peasant farming in West Africa, Lever was in favour of plantation production which would enable him to have more secure control over the raw materials he required for his soap empire. By constantly representing Africans as not just childlike but as irresponsible infants unable to govern themselves, Lever Brothers were engaging in debates over the form of colonial rule that should be adopted in the region, which during the 1890s was still being contested. In Lord Lever's opinion, 'a native cannot organise. He cannot even run a wooding post on the river satisfactorily. You only have to compare one run by a native with one run by a European to prove that' (1927: 312). The desire for direct control over production meant that soap advertising repeatedly represented Africans as completely incompetent and irresponsible children who needed to be instructed (Ramamurthy, 2003: 24–60).

In contrast to the soap firms, cocoa manufacturers who began to make use of cocoa produced in West Africa in the 1900s favoured a form of colonial policy that would eventually be adopted in West Africa: indirect rule. The commitment to a differing form of colonial policy was promoted in cocoa advertisements from 1906 onwards, which employed the image of the African boy happily sharing cocoa with the countries of Europe. These new ads appeared after a scandal over slave-grown cocoa from the islands of Sao Tome and Principe from which Cadbury's and other cocoa firms wished to distance themselves. For the cocoa firms, colonial rule was envisioned as a form of exchange (however unequal) rather than simply a process of direct control and instruction. Within this 'partnership', Africans as producers of raw material were envisioned as 'free' to share their produce with European consumers. Cadbury's position represented the ideas of a group known as 'The Third Party', which argued for a benevolent relationship between coloniser and colonised in which 'native rulers' should be delegated 'such responsibility as they are fit to exercise'. These attitudes can be seen as promoted through Cadbury's advertising where a black child in one image even sits on the same mat as a white girl, to whom he offers a cup of cocoa. While represented as sharing the same mat (which we can read as a metaphor for the world), the African boy looks over to the girl to seek her approval. It is she who decides what is appropriate for him and the resources of the world (symbolised by the cup of cocoa) remain for her consumption.

While symbolically represented as the producer and owner of raw materials, the African child in Fry's advertisements, while embodying the product as his own, literally pours what is frequently represented as abundant (trivialising his labour) into the cups of Europe in assent to this colonial 'partnership'

(Ramamurthy, 2003: 70–7). The cocoa advertisements never acknowledge the actual labour undertaken by African peasants in producing the cocoa beans. This was less because of the denial of labour that is usual in advertising through its focus on visualising consumption, and more as a result of the dismissal of African industry so pervasive in racialised colonial attitudes. As one governor of the Gold Coast, Hugh Clifford, suggested: ‘cocoa is notoriously one of the least exacting forms of permanent cultivation known to mankind’. ‘The natives’, according to Clifford, would never have undertaken it otherwise, ‘or any task of the sort that made a more severe demand on their physical energies’ (Lugard, 1965: 399–400). The representation of the black boy, as infantilised or as the happy-go-lucky ‘sambo’ caricature, can therefore be seen to have been used strategically during the colonial period at particular moments to reveal not just the political and ideological interests of companies but also their approach to global governance.

While huge changes took place in advertising as a practice during the mid-to-late twentieth century, with work often franchised to agencies outside of corporations, it is easy to assume that the purpose for which people of colour were represented in advertising shifted positively in the era of national liberations and civil rights struggles. Anti-colonial and anti-racist struggles undoubtedly forced

Figure 61.1 Cadbury's cocoa advertisement c 1900, courtesy of Cadbury's and MDLZ

corporations to change the kinds of representations that they had circulated during the colonial period and the image of the colonised increasingly began to disappear on consumer goods in the UK during the 1950s. However, corporate firms with economic interests in the former colonies continued to construct racialised representations that were used to bolster the economic and political interests of capital. In the 1960s, for example, corporations created images of themselves as benevolent organisations industrialising the Global South with representations of dams and railway lines circulated to suggest firms such as English Electric or Associated Electric Industries were 'bringing a better life'. In these corporate images, the black man is no longer the worker serving the interests of Europe, but is rather framed as an individual reaping the benefit of western science and development; or is figured as a simple, leisured individual dependent on western productivity for his/her needs. In all the advertisements the corporate firm was framed as a benefactor aiding processes of development. Such images did not employ explicitly degrading stereotypes of black people but maintained the colonial ideology of the white man's burden as well as the belief in capitalism as developing an 'underdeveloped' world, legitimating these emerging multinationals' economic influence in former colonised nations. In one 1958 advertisement the Cold War conflict is made explicit with a text that asserts 'Rival ideologies are competing for the future of the world, the one that wins will be that which offers more people a better life', juxtaposed with the image of an African man looking contemplatively at an English Electric engine powering the Johannesburg Mail, projecting the improved conditions of life as belonging to western capitalist development. The colonial and racialised ideologies of 'the white man's burden' and of Africans as lacking intellect and industry were not challenged in these images, which continued to maintain hegemonic structures that suited the new imperialist phase of neo-colonialism (Nkrumah, 1965; Ramamurthy, 2003: 173–213).

SELLING NEO-LIBERAL MULTICULTURALISM

The parasitic ability to transform representations in the wake of dissent can be seen as advertising's 'ability to shore up hegemony and sustain imperialism through successive phases of Cold War decolonisation and neo-liberal globalisation' (Ramamurthy and Wilson, 2013: 73). The resistance to racism from both anti-imperialist struggles as well as the civil rights and anti-racist movements in the USA and Europe in the 1960s had a significant impact on representation and advertisers were forced to address some of the core concerns of dehumanisation and humiliation that previous advertisements had consolidated.

In the USA, during the Cold War, Melamed has argued that the development of a liberal race paradigm 'recognised racial inequality as a problem' and 'secured a liberal symbolic framework for race reform centred in abstract equality, market individualism and inclusive civic nationalism', one that recognised race equality as

a nationally recognised social value in the USA (Melamed, 2006: 2). For African Americans, the Black is Beautiful campaign was a powerful force in challenging potential internalised racism and self-hate felt by the black community as a consequence of the brutality of slavery. Malcolm X asked, 'Who taught you to hate yourself?' (Malcolm X, 1962) to encourage a critique of the origins of internalised racism, in the struggle to be represented as human and not rendered invisible. Civil rights discourses in the USA during the 1960s often treated the question of media representations as separate from those of political and economic rights. 'What Negro consumers want now is recognition of their humanity and an industry wide respect for the Negro image' argued the Congress for Racial Equality (CORE) (quoted in Chambers, 2008: 120). In 1963 they even appealed directly to the Coca Cola company, for example, to include blacks in their advertisements, suggesting a boycott may be a possibility if no change was made. Coca Cola, in fear of a boycott, responded (Pendergrast, 1993: 286). The civil rights movement's campaign for a wider range of imagery established a black presence within the American dream but the racialised political economy of the production of goods remained unchallenged. While CORE persuaded Coca Cola to create images with black people drinking the product in the 1960s, the labour conditions for agricultural workers on its Minute Maid orange farms in Florida remained deplorable, with living spaces being described as 'slave quarters' in the NBC documentary *Migrant* screened in 1970 (Gottlieb and Joshi, 2010: 14–15).

The ability of corporations 'to shore up hegemony and sustain imperialism' can be seen in Coke's production of one of the most iconic multicultural advertisements of the 1970s. Coca Cola's 1971 'I'd like to buy the world a Coke' ad, which was screened worldwide, has been described as one of the most successful global advertising campaigns. While the adoption of multicultural imagery can be seen as part of a general shift in cultural representations, the company's embracing of images of diversity also suited its economic development interests. By 1970 Coke's export sales exceeded domestic sales of the product and the overseas opportunities appeared 'limitless' according to one researcher (Pendergrast, 1993: 296, 308). In this context, we can read Coke's 'I'd like to buy the world a coke' as a visualisation of the company's vision for global expansion rather than an innocent image of potential global harmony. The link between representation and commercial interests is also marked by the absence of Arabs in the ad, since the Arab Boycott of Coca Cola, as a result of its investments in Israel in 1966, had made the market in the Middle East impossible to develop. The peace-loving, hippy feel of the ad, therefore, not only hid the many conflicts Coke was having in various parts of the globe, from its brutal refusal to recognise unions in its Italian bottling plants to conflicts with the Federal Trade Commission in the USA, but also acted to serve a global expansionist vision.

The use of multicultural imagery to represent a corporation's interest in hegemonic globalisation was employed successfully again in Benetton's United Colours campaign, which flooded magazines and billboards during the late 1980s.

Deliberately adopting the idea of a ‘united nations’, with photographs of smiling young people from all over the world wearing colourful Benetton jumpers, Benetton’s pervasive 1980s advertising circulated during the period when the firm shifted from being a predominantly Italian firm to one with increasing global sales. In 1983 Benetton’s export sales exceeded its domestic market and in 1984 the firm employed Olivero Toscani to transform its image (Ramamurthy, 2015: 283). The result was the United Colours of Benetton campaign, which presented the firm as supposedly forward-looking through an image of multiculturalism.

Benetton’s advertising from this period has been accused of essentialising ethnic and racial difference, with African models deliberately chosen as very dark skinned and European models as invariably blond, constructing such differences as tropes for consumption (Back and Quaade, 1993). Celia Lury has argued that ‘the production of difference has become a means by which global companies such as Benetton can lay a proprietary claim to goodness itself’ (2000: 147). She highlights the adoption of difference, whether it be colour, culture, geography or national identity in Benetton images, as embraced to represent the diverse splendour of the globe but one in which all these categories are reduced to a ‘choice’ in the marketplace. Taking the logic of multiculturalism in the context of global capitalism and its history of colonialism to its conclusion, Žižek argues:

Multiculturalism is a racism which empties its own position of all positive content (the multiculturalist is not a direct racist, he doesn’t oppose to the Other the *particular* values of his own culture), but nonetheless retains this position as the privileged *empty point of universality* from which one is able to appreciate (and depreciate) properly other particular cultures – the multiculturalist respect for the Other’s specificity is the very form of asserting one’s own superiority. (Žižek, 1997: 44)

Benetton’s images of ‘racial harmony’, I would argue, can be seen as structured to maintain white supremacy, not only through the performance of difference, but by ignoring the dynamics of power within which the images operate and reinscribing colonial and racist tropes such as that of the white man’s burden or the stereotype of black criminality. If we simply look at repeated images of white and black hands in Benetton marketing, we can witness the way in which the white hand is often framed as ‘giver’ or as ‘adult’, in contrast to the black hand, which is frequently structured as ‘receiver’ of white benevolence and goods or as ‘child’ (Ramamurthy, 2003: 219).

When we consider Benetton’s organisational structure we can also understand their advertising and marketing strategy as a clear communication of the company’s organisational form and as a consolidation of a neo-liberal multiculturalism that rests on the exploitation of both labour in the Global South as well as migrant labour in European metropolises, which relies on the normalisation of racialised inequalities. Benetton’s images should not be simply recognised as operating in a general context, but as working to directly preserve the interests of this newly launched global firm. In the 1980s, Benetton began to develop a

Figure 61.2 Hands (Anandi Ramamurthy 2020)

system they described as ‘flexibility in manufacturing’, which allowed the company to respond quickly to changing fashion trends and demands. The system encouraged a computerised technology that increased exploitative labour relations through systems of subcontracting, creating precarity for textile workers in the Global South as well as for sweatshop workers living in the Global North, many of which are immigrant women (Kim and Chung, 2005: 72; Mitter, 1986; Ramamurthy, 2015: 284). Benetton’s images also constructed ideological hegemonies to applaud capitalism as an ideal. The images that Lury (2000) notes as representing diverse nationalisms did not just simply reduce nations to commodifiable and essentialised tropes but held clear ideological significations. Produced during the period of Perestroika, some advertisements presented capitalism (represented as America) as gentle and kind through gendered images of blonde, blue-eyed girls with soft curls, in contrast to the USSR, which was figured as an angry and hard-nosed boy complete with paper aeroplane to suggest the USSR as the aggressor in the arms race (Ramamurthy, 1997). In another instance of

ideological signification a young Chinese boy dressed in blue is carefully positioned with Mao's little red book upside down (Channel 4, 1988). As Giroux (1993) argues, these images should be read as containing a violence at their core.

'POST-RACIAL' RACISMS

Let us consider some recent advertisements in the USA which address issues of migration and multiculturalism to explore the continued potential for reflecting on the ways in which a company's employment of racialised representations may continue to intersect with their commercial and political interests. The year 2016 saw major political rifts emerge with the election of President Trump and a marked rise in national chauvinism and racisms in both the USA and Europe. Trump's declared desire to build a wall between Mexico and the USA was met with outrage by liberals but gained him support amongst conservatives eager to lay the blame for economic hardship on the most vulnerable.

In this context it is surprising that any company would engage with an issue so fraught with conflict in their advertising. Yet in the USA, Budweiser and 84 Lumber issued Superbowl advertisements that referenced immigration in 2017. Budweiser reflected back on European immigration to America in the nineteenth century, linking such migration to the American dream's idea of success through perseverance. 84 Lumber focused on the arduous migration journey of a Mexican mother and her child to America. The visualisation of Trump's wall at the end of the commercial, which opens up for the two with the tag line 'The will to succeed is always welcome here', elides migration as a fundamental ingredient of the American dream, reinforced by the child who collects rubbish on the journey to make a dream catcher, a metaphoric nod to the Democrats Dreamers programme which gives children of undocumented migrants the chance to apply for residency status. 84 Lumber's narrative of Hispanic migration elides with the commercial requirements of the US construction industry in which Hispanics make up 30% of blue-collar workers on US construction sites, making the 'economic exploitation of undocumented workers ... a cornerstone of the non-union construction industry's low wage business strategy'. It has led to the high rate of deaths amongst migrant workers who carry out some of the most dangerous tasks while being paid the lowest wages (Center for Construction Research and Training, 2010: 4). While the commercials by Budweiser and 84 Lumber caused controversy and racist responses online, the companies' assertion of the essential need for migration and the free movement of goods highlights a wider structural requirement for the accumulation of capital in the era of globalisation. Such companies, while espousing a commitment to freedom of movement, rely precisely on migrant workers' undocumented status, which allows for their intensified exploitation. It is significant that the 84 Lumber advertisement does not contest the Republican political policy of building a wall, but rather visualises an open door for the 'worthy'

immigrant, maintaining the liberal race paradigm's division of 'good black'/'bad black' and 'good immigrant'/'bad immigrant' (Pieterse, 1992: 203–4).

The failure to challenge the racism of gross exploitation in the production of goods means that within consumption discourses the focus is framed around avoiding offence. Witness H&M's unequivocal apology for the offence they caused through online marketing that placed a black child in a sweatshirt that read 'coolest monkey in the jungle' and a white child in one that said 'survival expert'. It led to the ransacking of H&M stores in South Africa with the 'gaff' covered in media worldwide. Some have suggested that such productions are deliberate strategies by companies to employ black outrage to profile their brands (White, 2019). H&M's response to the outrage was to take part in the conference 'Pathways to anti-racism', where they were pitched as intending to 'share insights about the interventions that they have employed following their racist hoodie advert'. The neo-liberal construction of racism as a psychological programme of recovery for each individual ignores the racialised and structural inequalities upon which neo-liberal capitalism flourishes.

Anti-racism itself has been appropriated within 'diversity marketing' commodity discourses. Without interpreting advertising imagery with reference to the production context of commodities, it is impossible to fully appreciate the absurdity of designs such as Nike's Equality range in 2017. Using sound visualisations of Martin Luther King's 'I have a dream' speech, Nike produced graphics for shoes sold during Black History Month. Six months previously, however, Nike ceased to allow the independent NGO Worker Rights Consortium access to factories to check on labour standards in factories globally (Gearhart, 2017). Their footwear continues to be produced in factories where labour rights are undermined, wages are desperately low and health and safety conditions are disregarded. The absurdity of consuming one's way out of racism must be understood through the failure to challenge the exploitation of the Global South (whose populations are primarily people of colour) by the Global North, whose populations are largely white (Willis, 1990). Neo-liberal discourses around race have been further consolidated since 2008 as right-wing 'post-racial society' narratives have gained ground, cutting off discussion about structural inequalities, political and social inequity and imperialist wars in favour of personal responsibilities (Edwards & Ramamurthy 2017; Squires, 2014).

REPRESENTING BLACK LABOUR

I have focused so far on the use of people of colour in advertising by corporations representing ideological support for imperialism's political policies and practices. In this final section I will return to focus on a core issue for advertising as a whole – the mystification of labour relations, to consider the ways in which the image of the non-white body contradicts simplistic arguments about ads as

simply hiding labour relations. The non-white body framed as a labouring body through literature and the arts, during both slavery and colonialism, permitted the representation of labour in advertising without acknowledgement of exploitation. The naturalisation of this image enabled the repeated and uncontested use of the image of the black slave and of colonised labour on tropical products throughout the colonial era and beyond and enabled these workers to appear as exotic icons rather than as the visibility of exploitation.

Tea advertising both during the colonial period and beyond provides a particularly strong example of the image of the colonial subject as born to labour, enabling the representation of labour without shattering the fetishised world of the commodity (Ramamurthy, 2003). In tea advertising we can also see the way in which the female labouring subject was often elided with romantic images of the plantation defined as 'garden', a space that has both been idealised and represented as a space of transgression in western culture. The visualisation of the worker as feminised enabled the reconstruction of the 'tea garden' as a domestic space in Lipton's advertising, from the 1920s onwards. The frequent reorganisation of the space of the plantation into a visual manifestation of a heterotopian space of 'garden'/exotic landscape, along with the traditional invisibilisation of women's domestic work (Daniels, 1987), which enabled a conflation of the worker/planter with the consumer through images of the exotic 'belle', diminished the visibility of exploitation on the plantation (Ramamurthy, 2012). By evoking an image of domesticity and traditional femininity these images turn the experience of plantation labour into a ghost-like one at the very moment that it is visualised. Although tea advertising retained the image of the female tea picker into the 1980s, the majority of images of plantation labour in the Global South disappeared in commodity advertising during the 1960s, when anti-colonial struggles gained ground.

The association of workers in the Global South as natural labourers however re-emerged on fair-trade advertising when their image could act as an affirmation of the ethical consciousness of the consumer in the Global North. It has been argued that the appearance of workers on fair-trade advertising during the 1990s was an act of de-fetishisation, since fair trade aims to change market relations, to advertise the conditions of production explicitly, in order to make transparent the relations under which commodities are exchanged (Hudson and Hudson, 2003). Yet I would argue these images do not de-fetishise commodities, but act instead to fetishise the form of labour, to transform 'the unveiled concrete labour itself into a commodity' (Varul, 2008: 660).

Kalpana Wilson has highlighted the way in which the visualisation of Third World workers in charity advertising has also affirmed the racialised and gendered hierarchies in neo-liberal attitudes to development where women are represented as positive and asserting agency despite the limitations of their lot. Wilson has noted how 'the use of the concept of "agency" in these texts frequently has the effect of reassuring us that women do in fact exercise choice in situations where structural

constraints mean that women are simply “choosing” survival’ (2011: 317; see also Chapter 60, this *Handbook*). Wilson has commented on the way in which images in Oxfam Unwrapped and fair-trade chocolate advertising represent the smiling subjects, usually women, as empowered by their own labour – as “participating ... hardworking, industrious and self-determined” subject(s)’, undermining our understanding of their exploitation (Wilson, 2011: 324).

In much fair-trade advertising and packaging the smiling worker assents to our consumption. Affect is crucial in our reception of these images. Workers’ smiles enable an affective bond between producer and consumer (Ramamurthy, 2012). Their smiles affirm their contentment with their conditions. Our pleasure, even hedonism, in consumption can be excused by a feeling that we are morally ‘good’ in our fair-trade choice (Littler, 2009: 30). The Fairtrade Foundation’s campaigning images in 2011–12, for example, depicted producers and consumers smiling together. Inequality is here reframed as difference. Both smile as broadly as each other, suggesting through juxtaposition their mutual contentment. Smiling, which has been discussed in literature on race, gender and oppression, is often an important affective action, as Marilyn Frye has highlighted:

It is often a requirement upon oppressed people that we smile and be cheerful. If we comply, we signal our docility and our acquiescence in our situation. We need not, then, be taken note of. We acquiesce in being made invisible, in our occupying no space. We participate in our own erasure. (Frye, 1983: 2-3)

Fair-trade advertising and publicity promoting trade on the basis of fairness requires workers to perform their contentment for our consumption, just as the colonial worker did. This performance of emotional labour, as Rothschild notes:

Figure 61.3 The smiling worker

requires one to induce or suppress feeling in order to sustain the outward countenance that produces the proper state of mind in others. This kind of labour calls for a coordination of mind and feeling, and it sometimes draws on a source of self that we honor as deep and integral to our individuality. (quoted in Chong, 2009: 1)

The necessary performance of this emotional labour asks us to consider: ‘at what price can subjects speak the truth about themselves?’ (Foucault, 1983).

The drive to represent corporations as benevolent has become increasingly sophisticated, with companies suggesting themselves as partners in the moves for social inclusion and social justice, through both ‘fair trade’ being adopted as a purchasing choice by all major corporations, as well as through corporate social responsibility programmes in which corporations carry out acts of charity. Adopting the same smiling faces of workers from the Global South as those found in the images of the Fairtrade Foundation, corporate fair trade has sometimes rearticulated racist tropes in the bid to hide the exploitation of agricultural labour. Cadbury’s fair-trade Zingolo advertisement, for example, depicts a cocoa farm in which the beans mysteriously pick themselves while the local population sing and dance in reverence to the produce and, by inference, the Cadbury’s corporation. In corporate social responsibility PR, labour is again mystified, while both absent and present.¹ Coke’s Happiness is Home project presents the company as fulfilling individual dreams of seeing family by harnessing personal stories of separation caused by the impact of neo-liberal globalisation that are resolved through the company’s gestures of goodwill. While representing migrant workers across the world, with some even depicted at work, the exploitation of workers in Coke factories is pushed aside by the company’s benevolent act of buying a plane ticket for five Filipino workers to visit their families, white-washing the exploitation faced by migrant workers through the employment and business practices of the very corporations that fail to enable regular family reunification.² These viral videos present an example of the way in which promotional culture today does not always erase the meaning of production but modifies and frames it in ways to suggest corporate benevolence.

The Fetishisation and Mystification of Factory Labour

The racialised nature of the above representations can only be fully appreciated when we compare it to the representation of labour (or lack of) more widely in advertising. While colonial advertising depicted African and Asian labour as a natural part of the imperial family and fair-trade advertisements promote the image of the worker – always from the Global South – assenting to their own exploitation, the labour depicted in these images is always agricultural labour, frequently framed in idyllic natural environments. The imperial division of labour, with the colonies perceived as the natural producers of raw material and European metropolises as the centre of industrial production, has meant that industrial labour has been rarely represented or when it has, it is fetishised,

sometimes even through the visualisation of peasant/agricultural scenes. In her essay 'Great history that photographs mislaid', Williamson notes this fetishisation. She analyses a Lancia advertisement in which the car is placed in an Italian vineyard surrounded by happy peasants. Williamson asks: 'Who made this car? Has it just emerged new and gleaming from the soil, How can a car even exist in the feudal relations?' (Williamson, 1979).

In contemporary advertising, factories and highly mechanised labour environments, in particular, are rarely represented. When they are, they are usually places of fantasy, such as in the McCain Oven Chips 'Chip perfection' TV commercial from 2011 or the Coke 'Happiness factory' commercial from 2006. These narratives frequently push the worker into the background, fetishising the technological and digital environment and in the process denying the exploitation and alienation experienced by the factory workers. One such recent advertisement is Amazon's 2017 Christmas advertisement 'Give 60', in which a young, busy, white female consumer buys a gift for a young girl from the Amazon website, while travelling on a bus.³ The alienation of contemporary western life that leaves us purchasing gifts online and sending gifts to loved ones that we neither touch nor wrap is transformed as an emotional exchange in this advertisement through a video that personifies and in this process fetishises the Amazon box, as it travels through one of the company's automated warehouses (renamed by Amazon as 'fulfilment centres'). Here, workers in the Global North (including many migrant workers) operate in the background of the warehouse, out of focus or in the shadows, their presence diminished in order to effectively transfer humanity and feeling from people to commodities. The harsh working conditions of the Amazon worker are erased by the smooth-running machines. The automated nature of this factory situates it as representative of work in the Global North. In earlier advertisements a racialised division of labour in Empire Marketing Board images of the 1920s represented white workers as the operators of machines to distinguish them from colonised labourers: the producers of raw material in the British Empire (Ramamurthy, 2003). Here racialisation is implicit through the only individualised Amazon worker, the driver at the end of the narrative, being white. The exploitation of factory labour in the Amazon image is mystified and denied in two ways. Firstly, the labour of workers who have produced the goods and the conditions of their work are erased through the perfect and neat packages that travel with ease on the digitised conveyor belts. Secondly, the workers in the warehouse itself are diminished through the animation of the inanimate boxes to suggest humanity and love as transferred through the purchase of goods between consumers. The exploitation of Amazon workers, many of whom are migrant workers, and their exhaustion and experience of physical pain due to the relatively harsh working conditions are erased in the video (Osbourne, 2016). The boxes' Amazon smiles literally sing to us and to each other 'give a little bit of your love to me'. Human emotions and experience are thus transferred from people to goods, centring the commodity and the corporation as both benevolent and the pivot of contemporary human life.

CONCLUSION

It is clear that advertising not only acts to structure commodities as the centre of our social worlds, but also reproduces supportive ideologies of race, gender and class to service the accumulation of capital. From the late nineteenth century when the first consumer societies developed we have seen the ways in which advertising harnessed racialised ideologies to consolidate corporate interests. These representations not only reflected wider ideas that circulated in society, but can be seen to have acted to consolidate racialised ideas that supported the specific interest of major firms.

It is crucial for a critical analysis of advertising's ideological impact to investigate the material context within which advertising images operate so as to understand the economic and political interests that these images serve. Here, I have identified not only the entanglement between racist ideologies and capitalist development during the period of Empire, but also their continued entanglement in the post-independence and neo-liberal era. I have also identified the way in which the gendered divisions of labour intersect with racialised ideologies to naturalise racial hierarchies and represent the Global South as born to labour, an image that is further consolidated through the frequent representation of women's domestic labour, which has been historically naturalised as outside of the realm of exploitation.

While advertisements fetishise commodities to make them appear 'mist-enveloped' and to carry properties that an inanimate object can never have, the analysis above makes clear that the real is not simply 'hidden by the imaginary' (Jhally, 1991), but that advertising naturalises forms of exploitation to often represent exploitative social and economic relations as benign. As such the real is not so much entirely hidden as reframed as 'natural', normalised and legitimated, to deflect from the violence of contemporary global relations that maintain the exploitation of the Global South by the Global North. This is made possible and acceptable through racism. Neo-liberal multiculturalism has created imagery that suggests the possibility of equality at the point of consumption, yet such advertising often essentialises difference and only works through erasing knowledge of the persistent structural inequalities that make such a possibility farcical. In fair-trade advertising the workers of the Global South are even employed to authentically assent and be happy in their exploitation and their position outside of conspicuous consumption.

It is not useful to suggest a reform to advertising, as advertising as a cultural form is tied to the system that we wish to see destroyed. The value of looking critically at advertising images is that they permit us to see the ways in which material interests directly impact on representation. The social, cultural and political meanings advocated in advertisements can never contradict an advertiser's economic interests. In the main, these social and cultural meanings naturalise capitalism as benign. We can see the ways in which commodities are fetishised and

take on human characteristics, changing the way we view ourselves and others. We can also trace the way in which racialised practices are central to exploitation under capitalism and these practices impact on regimes of representation. Such racialised regimes of representation intersect with gendered hierarchies. It is also clear that capitalism in its imperialist phase remains adaptable and parasitic, able to absorb and deflect dissent through shifting our focus from structural inequalities to questions of personal difference and transformation. Through the enactment of racialised and gendered hierarchies advertising even naturalises inequality as ‘difference’, enabling corporations to be framed as benevolent and benign.

Dependency Theory and Indigenous Politics

Andrew Curley

INTRODUCTION

When we think of Marxism in Indian Country, we can't overlook dependency theory. For years, it was the critical framework that told the story of Indigenous incorporation into practices and processes of global capitalism. This scholarship was contemporary and historical. It talked about tribal workers, government officials, and community activists. It described literal tons of coal flowing out for pennies flowing in. It highlighted how colonialism and capitalism moved and reshaped Indigenous places as dependent on (and shaped by) a core economy. This framework accounted for local elites and global forces. It was complex scholarship, with both sweeping historical narrative and charts and graphs. It was also nation-specific, focusing on the particular experiences of the Navajo, the Choctaw, the Pawnee, the Cheyenne, or the Crow – names lost in frameworks that speak of colonization as a story of settlers and Natives.

Today's critical research focuses on settler-colonialism and the settler-colonial state as its object of analysis. It is the colonial state to which we ascribe the project of Native elimination. This is not Indigenous-centered research, as Native scholars are starting to point out (Snelgrove et al., 2014). What is more, it reduces complex interactions into simple dichotomies, binaries with static logics. Ironically, this chapter focuses on dependency theory as a way forward in telling the history of Indigenous peoples – to complement these other critical approaches with more emphasis on Marx's core concepts of political economy.

During fieldwork in the Navajo Nation in 2013, I asked everyday Diné people why they felt the tribe continued to support a coal economy despite decades of environmental risks, bad faith contracts, and increasing concerns over climate change. To the people I spoke with, the structuring dynamics were not hard to figure out. The Navajo Nation had been made dependent on the coal industry and thus subservient to it. People on the ground described it as such. They held their leaders largely responsible, as the quote at the top of the page indicates. Without a plan, without a critique, the forces of capitalism, the Wiindigo economy,¹ come knocking at the door.

Yet, in academic circles, scholarship has long moved beyond what has been called 'dependency theory'. By 2013, dependency theory was passé. Critics claimed it straightjacketed individual agency, or was deceptively incorporative of central assumptions of modernization theory (Escobar, 1995; Scott, 1995). It was not attuned to Indigenous ontology and implied a developmentalist logic. This chapter argues that, despite its critiques, dependency theory maintains on-the-ground relevance for tribal people in describing and understanding their economies. Dependency theory is Marxist in origin and highlights the unevenness of capitalistic incorporation in space and time during the later expansion of global capitalism (Mezzadra, 2011).

Importantly, dependency theory is a twentieth-century argument, reflecting the state of the world during neocolonialism. It explained the economic integration of places and nations from decolonialization in the 1950s and 1960s until the advent of neoliberalism in the early 1980s. This was an age of development, when the USA and its Western allies actively promoted the recolonization of the Third World with market integration. The theory designed to destroy traditional economies was modernization theory, largely presented in overly simplistic ways by politically powerful economists. Dependency theory flipped modernization theory on its head, arguing that traditional economy had already been destroyed, and largely by colonial practices.

Currently there is a resurgence of Marxist interest in Native communities, but this new scholarship is more activist than analytical in nature. While we find in activist work a real possibility of changing the world, we often lose the opportunity to understand the world's contradictions and complexities in depth. In this chapter, I focus on the use of dependency theory in Native North America, which was meant to expose the hidden and structuring forces of capitalism in Indian Country. This scholarship is a rich blend of theoretical critique and empirical analysis, but is generally neglected. As we will see, the advantage of dependency theory in Native North America is its ability to account for colonialism and political economy.

Since dependency theory fell out of favor among academics in the 1980s, settler-colonialism and settler-colonial theory have largely replaced it as the critical interpretation of Indigenous/colonial relations in North America. Settler-colonial theory inherits critiques of the structuralism shared by dependency theory but

adds a few new problems of its own. Indigenous and White scholars using ‘settler-colonialism’ have largely replaced the structural arguments of dependency theory with a focus on land dispossession and the elimination of the Native. Settler-colonialism highlights an underlying unshakeable colonial edifice that is essential to the identities of colonial states. Settler-colonialism is a structure not an event, a structure bent on the elimination of the Native (Wolfe, 2006).

What is lost is the importance of events. For Marx, capitalism wasn’t just a structure, it was world-changing force expanded violently through and despite political structures. It was one bloody event after the next, each with its own internal conflict and contradiction. Land dispossession only accounts for some of the historical forces at work. The incorporation of land, people, and places into global capitalism is the larger story. The elimination of the Native was foundational for this project for a time, but the colonial state has moved on. In some unusual cases, Indigenous nations have regained some land from those stolen in the past. Tribal nations have found selective forms of recognition, despite settler cunning (Coulthard, 2014; Simpson, 2014).

In the US state of Arizona, for example, where I carry out my research, the two largest reservations in the country are to be found: the Navajo Nation, at 17.5 million acres, has expanded since its original treaty with the federal government in 1868 (Kelley and Francis, 2019); similarly, the Tohono O’odham Nation, along the US–Mexico border, has only expanded in size along within the imperial nation of the USA while disappearing in Mexico (Gentry et al., 2019). In other words, Indigenous nations are not all the same. They are neither homogenous externally nor uniform internally. The ways in which they are incorporated into capitalism are unique, particular, and serve different kinds of capitalistic purposes. Whereas the settler once sought to push Indigenous peoples off the land, the colonial state now intends to recognize Indigenous land claims in very narrow and often violently transformative ways. The goal is not simply the elimination of the Native, but also the expansion of capitalism.

Dependency theory is not the only thing. But it is a successful Marxist framework with a legacy in Indigenous communities that we can revamp, retool, and repurpose.

A BRIEF HISTORY OF DEPENDENCY THEORY

Dependency theory emerged during the era of decolonization following the end of the Second World War. Independence movements in Africa, Asia, and the Caribbean struggled against the collapsing colonial infrastructures of Great Britain, France, and Portugal. The USA quickly filled the void (Chomsky, 2003). The world polarized into the capitalist First World and the communist Second World. The Third World, newly independent nations in parts of Africa, Asia, and the Pacific, sought a different path (Prashad, 2008). They formed the

Non-Aligned Movement and leaned toward mixed economies, repurposing colonial political and physical infrastructure toward the welfare of the nation, sometimes calling these policies socialist.

In Africa, Southeast Asia, the Middle East, and Latin America, the USA backed military dictatorships, undermined democratically elected leaders, and even sponsored targeted assassinations. US foreign policy aligned with violent right-wing groups to challenge Soviet influence (often more imagined than real) and extend the reach of international capitalism – what would become the global division of labor in the age of neoliberalism. This forced many independent leaders to pessimistically reassess global possibilities. Global capitalism, after the Second World War, was the basis for what Ghana's first president Kwame Nkrumah called 'neocolonialism' (Nkrumah, 1965).

In neocolonialism, former colonies ostensibly gained political independence, but maintained economic dependence on the former colonizing nations (Rist, 2002: 109–22). Dependency theory developed as a thesis among Latin American economists who worked to explain how their nations struggled to emerge from penury despite continued integration within international capitalism. Accordingly, the more newly independent nations were incorporated into global capitalism, the poorer they became. The lack of development progress, increasing class stratification, and indigence forced many to reassess the promises of capitalism.

For cocoa growers in Ghana or coffee farmers in Tanzania, political independence changed little. Postcolonial economies were built on the same practices of commodity production that defined the colonial period. National elites replaced colonial elites. But the colonial project remained intact. Fanon (2008) understood this colonialism as a psychological and ideological problem among national elites who blindly accepted the racism and rendering of inferiority of the modernization narrative at the costs of the nation's laboring classes. The paternalistic apparatus of the colonial administrator disappeared, but in his stead, the missionaries of markets, agriculture extension officers, coffee buyers, traders, and investors replaced paternalism with artificial opportunism. They filled the heads of elites with promises of modernity.

With his 1966 essay in the *Monthly Review*, 'The Development of Underdevelopment', economist Andre Gunder Frank successfully translated ideas circulating in the global South into Anglophone scholarship. He had worked as an economist in Brazil and left after a US-sponsored military coup in 1964. The main thesis of the article, which remains useful today, is that the formal practices of development led to its opposite, underdevelopment. Shortly afterward, a flurry of dependency scholarship was published. Sociologists, economists, and historians gravitated to the allure of a theory that spoke to the way peasant and Indigenous communities throughout the world were impacted by the expansion of global capitalism. In the 1970s, Latin American economist Theotônio dos Santos published 'The Structure of Dependence' in the *American Economic Review* in which he described the relationship between imperialism, colonialism, and economic

integration in broad, but useful language (Dos Santos, 1970). It was widely cited and helped to establish the theoretical language and focus of dependency theory, moving beyond questions of market integration to consider what one country's economy does for the benefit of another's. Dos Santos defined dependency as 'a situation in which the economy of certain countries is conditioned by the development and expansion of another economy to which the former is subjected' (1970: 231).² Economists Fernando Henrique Cardoso and Enzo Faletto wrote *Dependency and Development in Latin America*, in which they argued that the history of development in Latin America has focused on exports for the benefit of the global North and at the expense of national development (Cardoso and Faletto, 1979).

These approaches had different, sometimes opposite, understandings of how capitalism worked (Apter, 1987). Some writers, like the future neoliberal President of Brazil, Fernando Henrique Cardoso, assumed that development was desired, just implemented poorly and at the expense of Latin American nationalism. This was an elite, settler vantage point. Cardoso and others preserved the project of state-driven development, but wanted it to support local elites and not 'foreign' ones. This conservative rendition of dependency theory has echoes in Trump's 'America first' and was preceded by Cardoso's conservative politics in later years.

It is ultimately misleading to take 'dependency theory' to refer to a unified theoretical framework. Rather, it covers an interlocking series of descriptions and analyses of relations between former colonizers and their territories that borrowed from Keynesian ideas of national economies, development and modernization theory, and Marxist historical materialism.

Dependency theory was part of an international critique of postwar development and the legacies of colonialism (Wilson, Chapter 60, this *Handbook*). The initial connections that economists made between the 'metropole' and its 'satellites' were eventually incorporated into world-systems theory.³ Alongside the rise of peasant studies, dependency theory joined new ways of approaching Marxist scholarship that diverged from the rigidity of official communist doctrine.⁴ Marxism responded to the cultural revolution of the 1960s by abandoning its epistemological quest for social laws in favor of historical inquiry, alongside fresh critiques of political economy (Thompson, 1978).

Dependency theory also became part of the New Left's critique of US imperialism and global capitalism. The disproportionate violence inflicted by the USA on Vietnam exposed a violence inherent in the maintenance of the global capitalist world order. The conflict was billed in the USA as an anti-communist crusade. But this narrative convinced fewer and fewer people as the body bags piled up. Dependency theory provided a framework and explanation for the developed world's harsh treatment of the developing world. It helped highlight the colonial origins of the capitalist world order and the violent transformative power of capitalism on the planet. It became a powerful critique of global

capitalism at an important period in its history. Emerging from Mexico, Brazil, and Africa in the 1950s, only a few years following the end of European global hegemony, dependency theory started a conversation on the neocolonial character of global capitalism.

USEFUL ANALYTICAL FEATURES OF DEPENDENCY THEORY FOR THE PRESENT

Dependency theory focused on the transfer of wealth between developing nations (satellites) and developed nations (metropolises). It tried to explain the uneven terms of trade between commodity-producing countries in the global South and consumer nations in the global North. For example, when a national economy was organized around cash-crop production, such as cocoa in Ghana, coffee in Tanzania, coal in the Navajo Nation, this encouraged government officials to maintain this industry at all costs. The industry's relative importance for jobs and revenues increased its political power. It was this dynamic that Diné interviewees highlighted when they described the Navajo Nation as dependent on the coal industry. In the course of my research, coal accounted for nearly 25% of the tribal budget – that is, a salient feature of the Navajo economy (Curley, 2018).

In the 1960s, dependency theory's main intervention was to challenge the linear narrative of modernization theory, with its assumption that participation in capitalism eventually improved the social and economic conditions of 'underdeveloped' states (Rist, 2002). W. W. Rostow described this process as a literal 'takeoff', when societies were granted the preconditions of capitalism in order to gain and expand economic momentum exponentially (Rostow, 1990). For Rostow, the destruction of traditional societies was key for the creation of the preconditions for capitalism. This destruction was described in his famous work, *The Stages of Economic Growth*, passively and euphemistically as outside interventions. But, historically, these were violent acts, including genocide. As a Kennedy advisor, Rostow had political influence and helped shape US foreign policy during the 1960s. Rostow's assumptions were fairly common at the time and reflected decades of development thinking for federal officials working within reservations.

Modernization theory assumed that reservations, just like 'underdeveloped' states, were in need of development. Dependency theory argued that attempts to modernize Indigenous communities underdeveloped them. This is where the thesis proved particularly useful for the Navajo Nation. The movement from subsistence to wage-labor resulted in a loss of independence and sense of economic dependency among Diné people and explains why the word itself, 'dependency', comes up so often among community members when they talk about the coal economy and the Navajo Nation's relationship to it.

Dependency theorists ranged widely in how they understood and characterized the history that led to a community's underdevelopment, whether in terms of the naked exploitation of resources in the interest of global elites or, at best, as holding developing economies back by encouraging just one sector, as in the 'resource curse' thesis (Murshed, 2018). As mentioned earlier, two popular books in dependency theory that epitomize this range were *Capitalism and Underdevelopment* (1967) by Andre Gunder Frank and *Dependency and Development in Latin America* (1979) by Cardoso and Enzo Faletto. These books advanced very different understandings of the development problem, the former building foundationally on Marx's historical materialism while the latter incorporated key assumptions of modernization theory into its analysis, especially concerning the goal of creating a national economy that served local elites. As dependency gave way to world-systems, like ska and rock-steady to reggae, some key features were lost. The site-specific and comparative aspects of dependency became lost in the grand narrative of world-systems. We had a harder time seeing exactly how the Navajo Nation contributed to the rise of Phoenix and capitalism in the Southwest. The specific commodities were less important, the global system of capitalism took prime interest.

Incorporation is not only a material process, of transferring surplus wealth from one place to the next, it is also a relational process that puts places in structuring arrangements. The dynamics between town and country, rural and urban was an original point in the dependency theory thesis later blurred when capitalism was understood as a transfer of people and wealth over centuries and at a 'world-scale'. The world-scale, world-economy, and world-systems analysis followed capitalism from its origins in Europe to colonization across the globe. This remains a useful history, but importantly it failed to address racialization as a key feature of global capitalism. In *Black Marxism*, Cedric Robinson (1983) identified the importance of race and racism in the violent construction of capitalism. Today racial capitalism is an important area of research to understand how capitalism becomes reliant on race (Pulido, 2016; Beller, Chapter 44 and Bhandar, Chapter 13, this *Handbook*). Indigenous critiques based in settler colonial frameworks point out that colonialism and land dispossession were fundamental to the expansion of capitalism (Coulthard, 2014). Settler-colonialism was thus a better starting point for thinking about the origin of capitalism than the enclosure of the English commons.

However, world-systems approaches emphasized the role of the larger global system in order to explain the emergence of capitalism across the planet. In this context, complex and localized relationships took on tenuous connections to ideas of 'the global'. Although capitalism assumes a global character, its particular manifestations remain unique configurations of people and places, with diverse motivations, legal-political systems, and traditions of resistance to capital incorporation.

World-systems and dependency theories relied too much on broad categories such as 'society', 'economy', 'development', and 'underdevelopment'. Ideas

such as ‘underdevelopment’ remain hard to empirically demonstrate and theoretically defend. These concepts have the effect of simplifying complex economic problems and providing a misleading directionality to capital movement. Critics eventually argued that dependency theory could not account for the ‘economic successes’ of former colonies, that it tended to overstate the case for underdevelopment, thus missing important new industries like casinos in Indian Country (Wilkins, 1993). Because ‘dependency theory’ extended Marx’s critique of ‘so-called primitive accumulation’ to former colonies in Africa and Latin America, the particulars of each colonial experience made it difficult to universalize. In an early critique, Fernando Henrique Cardoso identified some of the over deterministic quality of the Marxian approach to what he called ‘dependency studies’, showing that scholars in this field tended to group unique historical conjunctures into typologies (Cardoso, 1977). But he acknowledged that the framework allowed for us to think about these ‘dependent’ relationships in new ways. It spurred ‘the sociological imagination’. ‘Thanks to these [dependency] theories... attention was called to a thematic frame that ceased to see development on the capitalist periphery as a “mere” consequence of accumulation of capital in the center, and began dealing with the historical form that this process acquired in dependent societies’ (1977: 19).

DEPENDENCY THEORY IN INDIAN COUNTRY

Indigenous peoples’ experience within the rise and expansion of capitalism has not been a pleasant one. Tribes have had their lands stolen, lives lost, and futures undermined. It is difficult to summarize the unique integrations of different Indigenous nations into regional and worldwide capitalism. Development around Indigenous communities was premised on the idea that Indigenous peoples were premodern and in need of intervention. Although this racist pretext is less overt today, it remains an operating justification for federal oversight over Indigenous lands. The so-called ‘Marshall Trilogy’ (1823–32) limited Indigenous sovereignty to ‘domestic’ and ‘dependent’ US authority (Wilkins and Lomawaima, 2001; Williams Jr, 2005). The language of assimilation and extinguishment of the nineteenth century was replaced with development and nation-building in the twentieth century, but the structural *de jure* racialization of Indigenous peoples as subordinate to US authority remains intact.

Under modernization theory, the underdevelopment of Indigenous nations within the USA was understood as a lack of political and economic integration into US capitalism and a product of overly socialistic economic policy (Gilbreath, 1973; Miller, 2012). Dependency theory reverses this presumption. It assumes that tribal social, economic, and legal ‘underdevelopment’ is the consequence of histories of forceful integration into colonial and capitalist structures, not a lack of it. This was an important insight and one that has real consequences for tribal

economic and political planning today. Dependency theory is a historical account of how capitalism comes to dominate a people and a place. Dependency theory exposes the forceful variegated displacement and destruction of Indigenous economies in favor of exploitative arrangements. It is an account of economic structuring attentive to the legal and political barriers preventing Indigenous freedoms and self-sufficiency.

Among Indigenous nations in the USA, researchers and scholars have used dependency theory effectively to account for the integration of reservation spaces into US capitalism. Focusing on the uneven terms of trade for resource-exporting tribes like the Navajo Nation, Roxanne Dunbar-Ortiz and Lorraine Ruffing highlighted the movement of surplus value from the periphery (Diné lands) to the core (Peabody coal) (Dunbar-Ortiz, 1979). In a different vein, historian Richard White (1983) wrote an ambitious comparative study on the roots of dependency for the Diné, Choctaw, and Pawnee. He focused on the notion of primitive accumulation and the original undermining of the subsistent economies for Indigenous cultures and nations. More scholarship focused on this question, including world-systems writers like Thomas Hall (1989) and theorists of resistance to settler-colonialism like Glen Coulthard (2014).

Because of the colonial limitations placed on reservation spaces, but with special exception for mineral-lease contracting, many Indigenous nations leaned on the sale of uranium, coal, oil, natural gas, and other 'natural resources' for jobs and revenues. This history alone is hard to appreciate in settler-colonial narratives that insinuate possession of land alone is key to the expansion of global capitalism. Using Marx, we understand capitalism is not just an act of blunt dispossession, but one of cunning incorporation. Indigenous nations actively participate in exploitative economies and questions even when nominal control over the land is possible. In this era of neoliberalism, globalization is simply a euphemism for deregulation. Reservations were first part of this experiment, existing in a third space of sovereignty, to use Kevin Bruyneel's framework (Bruyneel, 2007), that sits between periphery and semi-periphery, but never part of the core.

The presence of mineral development on tribal lands rendered landscapes toxic. Coal-mining tribes like the Navajo Nation, Crow, and Northern Cheyenne became places where economic dependency was clearest (Allison, 2015). Native and non-Native scholars used dependency theory to account for the primitive accumulation of Indigenous subsistent economies. They called this form of colonization 'internal colonization', noting that it was a method by which Indigenous lands were pillaged while under the territorial claims of the USA (Hall and Snipp, 1988; Snipp, 1988; Weiss, 1984).

Much of this critical work was published in the late 1970s into the mid 1980s. Within Diné studies, or scholarship published on the Navajo people, dependency theory was first used in 1979 to describe unequal terms of trade in the tribe's selling of coal (Dunbar-Ortiz, 1979). Richard White linked Diné underdevelopment to the violent undermining of the tribe's traditional economy of

sheep and agriculture during a period known as 'livestock reduction' in the 1930s (White, 1983). The following year, Lawrence Weiss wrote a Marxist history of Navajo incorporation into capitalism in which he followed in the footsteps of Dunbar-Ortiz and White (1984). This presaged more recent work on 'wastelanding', which describes the Navajo reservation as a place that colonial interests can exploit and render into wastelands for the benefit of the broader US public (understood in terms of core-periphery dynamics) (Voyles, 2015).

Critiques of capitalist incorporation faded in the late 1980s. Starting then, research in Indian Country focused on environmental contamination and 'nation-building'. Some scholars, finding the critiques of capitalism too deterministic and failing to meet the immediate needs of tribal governments, worked constructively on policy-related research that could offer pathways for tribes to integrate their economies more successfully into colonialism and capitalism (Cornell and Kalt, 1992). The nation-building literature identified political reforms, such as the establishment of constitutions and independent judiciaries, that tribes could undertake in order to improve economic performances (Cornell and Kalt, 2000; Jorgensen, 2007; Lemont, 2006).

Indigenous critics of colonialism used language like 'radioactive colonialism' and 'the militarization of Indian Country' to focus on how colonial institutions destroyed the land and made cultural maintenance unsustainable (Gedicks, 1993; LaDuke 1992, 1999). They moved from a focus on political economy toward questions of colonialism, human rights, and environmental sustainability.

In the late 1980s and early 1990s, critics focused on three aspects of dependency theory they felt limited its usefulness: 1) calling reservations underdeveloped perpetuates racist frameworks; 2) dependency could not account for economic success in Indian Country; and 3) dependency denied a focus on human agency in understanding the history of capitalistic incorporation.

Ward Churchill argued against the use of dependency theory when accounting for the incorporation for Native people. His argument was rather simplistic. He said Marxism and Marxists used pejorative concepts and categories that described Indigenous peoples as primitive (Churchill, 1983: 84). Churchill targeted the term 'underdeveloped' in particular as a problematic way to understand Indigenous homelands.

In another criticism, Lumbee scholar David Wilkins wrote that dependency theory failed to address the complicated and unique political spaces of reservations that also included stories of economic successes (1993). Finally, labor historian Colleen O'Neill, whose work focuses on the Navajo Nation, argued that dependency theory denies Indigenous people 'agency'. O'Neill (2005) wrote that the theory overdetermined how Indigenous people entered into capitalist relations.

Its shortcomings notwithstanding, critics of dependency theory focused too much on superficial issues, such as Churchill's critique of the term 'underdeveloped', which he misread as racist. Underdevelopment is a modernization-theory

framing that Gunder Frank used ironically to critique assumptions that the traditional economy and not capitalism are the cause of penury in Indigenous spaces. Gunder Frank ultimately critiques the dual-economy thesis that suggests parts of the economy are formally incorporated into capitalist processes while others are left in 'traditional' or informal sectors. Dependency theorists use economic categories like underdevelopment to undermine them, not to argue that these places are underdeveloped and in need of development. On the contrary, their argument is that underdevelopment is a depoliticizing conceit, a fraud by economic historians, to hide the violent and bloody history of Indigenous dispossession. You have to recall the play on words, the development of *underdevelopment*, to get the fuller meaning of the critique.

The implication of thinking of traditional economies as premodern and unimpacted by capitalism is to invite further capitalist intervention, either to destroy the traditional economy or to 'formalize' it through microloans and other initiatives popular in contemporary development circles. Dependency theory articulated the coloniality of economic relationships, where settler communities benefit from the forceful and often purposeful underdevelopment of Indigenous peoples and homelands. Although Churchill and others offered similar kinds of critiques when discussing the history of uranium mining within Indigenous communities, they could not adequately address important features of capitalist development. Missing from the critical narratives of post-Marxist scholarship are explanations for why Indigenous peoples actively participate in industries harmful to people and the environment. Indigenous labor is left in the background of Churchill and LaDuke's idea of radioactive colonialism. Environmental contamination becomes a blunt colonial act that hardly accounts for how this industry actually enters reservation communities in the first place, through the guile of modernization theory, development, and promises of progress.

More often than not, Indigenous leaders agreed to the terms of mining contracts, even if it is later alleged that they did not know what they were doing. Dependency theory helps us understand how mining contracts embedded the reproduction of colonial relations within new forms of colonialism. The power of capital to subvert the independence of postcolonial political institutions was understood as early as 1965 by Kwame Nkrumah in Ghana, the first president of the first independent nation in Africa following decolonization (Amin and McDonagh, 1973; Nkrumah, 1965). This is a point that Dunbar-Ortiz and Ruffing brought to understandings of the coal industry in the Navajo Nation, and which Churchill abandoned in the early 1980s with little justification beyond disagreements with the tone of the terminology.

Marx's notion of primitive accumulation explains both the undermining of subsistence economies and the emergence of wage-laborers for burgeoning industries. For example, Gunder Frank discussed how capitalist expansion into Latin America invented what colonialists there refer to there as 'the Indian Problem', or the extreme penury of the continent's Indigenous peoples (1967).

On the other hand, Colleen O'Neill (2005) provides one of the best analyses of reservation labor but prematurely dismisses dependency theory in the beginning of her book on account of it not dealing with 'agency' well enough. To a large extent, I agree with O'Neill's understanding of Indigenous labor, which follows the transformation of Indigenous notions of work and identity into new regimes of wage-labor (Curley, 2019; Hosmer et al., 2004). However, I think there is an ongoing misunderstanding of what dependency theory and other structural theories say about human agency, which was why scholars such as O'Neill avoided the term. Structuralism does not deny a people's ability to make spontaneous choices and move in unpredictable directions and defy expectations. Rather, it puts emphasis on what constrains people's full realization of their agency, namely the conditions of capitalism. It is important to highlight the histories of colonial land thefts, duplicitous deals, and active social engineering designed around fantastical ideas of development inherent in US federal-Indian law. These structuring legal, political, and economic forces constrain Indigenous self-determination and liberation. Dependency theory helps us understand how development and underdevelopment shape power dynamics between Indigenous and settler communities. It forces us to account for how so-called developed and underdeveloped places are connected and *essentially* related. Dependency theory in particular explains the failed results of capitalism in Indian Country, emphasizing colonial restraints rather than a people's inability to do capitalism well. It helps us to understand the failure of development projects beyond narratives of tribal 'corruption', economic 'brain drain', or explanations that point to the failure of weak tribal institutions in need of constitutionalism and independent judiciaries.

REVISITING DEPENDENCY THEORY IN INDIAN COUNTRY

Dependency theory is able to articulate the political and economic linkages between people and places and therefore help us understand how one place prospers at another's expense. This is an original insight of Marx in his historical account of the origins of capitalism in his account of 'primitive accumulation' in England and one that dependency theorists, world-systems analysis, and other critical frameworks were able to extend into histories of colonialism and capitalism across the world. Critics rightly point out that Marx and others fail adequately to address racialization as an instrument of colonial-capital dispossession. In *Black Marxism*, Cedric Robinson (1983) was able to amend Marxist historical analysis to better theorize the roles of slavery, racialization, and colonialism in the expansion of capitalism. Similarly, Glen Coulthard (2014) argues stolen Indigenous land was fundamental for capital accumulation and the rise of the most powerful states in the world economy, such as the USA and the UK.

Today settler-colonialism is the dominant critical framework accounting for US colonialism and Indigenous resistance to it. It argues that Indigenous land

dispossession is constitutive of the identity and function of settler-states and that the political superstructure dominating Indigenous nations is one of violent replacement and elimination. This structure is not an event in the distant past, but a continuing structure in effect today. Settler colonialism is used to explain Indigenous incorporation into colonial and imperial states. As Lorenzo Veracini wrote, the settler-colonial present is a specific form of domination (Veracini, 2015). But domination is focused on state repression with occasional mention of the economic forces driving it. It fails to account for alternative colonial arrangements that might find it useful to keep Natives on the land with limited forms of authority, such as the authority to sign mineral leases and (not) regulate their environments.

Scholarship that focuses on the political economy of colonial incorporation of Indigenous lands only refers to settler colonialism in passing, not referencing or needing its specific framework of domination. For example, Winona LaDuke and Deb Cowen write that infrastructure serves as the 'spine' of settler colonial possibilities, writing:

We consider the Wiindigo in its invasion of Indigenous territory without consent, in its deepening of our collective dependence on fossil fuel extraction, and in its extension of settler political economy. (LaDuke and Cowen, 2020: 253)

But the Wiindigo does more than talk about replacement of Natives by settlers. It does not limit questions of incorporation to one of blunt dispossession and elimination, but of incorporation, feigned sovereignty, moments of recognition, and reworking of colonial law in favor of one capitalist interest over another. Dependency theory helps us to account for actual economies and how Indigenous peoples are incorporated.

After 50 years, dependency theory remains a useful framework for understanding the colonial incorporation of Indigenous peoples into capitalist economies. The active relationship between settler communities and colonized spaces (such as reservations) remains crucial for understanding social change and underdevelopment among Indigenous peoples and their homelands. It is useful to focus on the particulars of the regional and national incorporation of Indigenous peoples and places into a capitalist economy. Understanding the history of capitalism on a world-scale has been tremendously helpful but misses the unique configurations of regional colonial and capitalist incorporations of Indigenous places which are not always covered by a world-historical explanation.

For example, in the case of the Navajo Nation it is hard to understand the impact of coal on tribal lands and people without knowing the specificity with how coal and coal infrastructure was brought to the Navajo Nation in order to allow for Phoenix (Arizona) to gain access to energy and water (Needham, 2014), leading to economic dependency on this resource. Understanding how the US federal government, regional utilities, and the political elite created the conditions through which the Navajo Nation could act and affirm its role in a

regional energy economy is important for knowing how the tribal economy works and sets its priorities. Dependency frameworks always relate Navajo economic choices to direct predatory economies without having analytically to buttress global capitalism.

Nonetheless, considering the history of capitalist incorporation of the Navajo Nation into the expanding empire of the USA helps us to understand how underdevelopment occurred in the reservation and how dependency works within Indian Country. These ideas are useful for understanding and highlighting the history of colonialism and capitalism across the world and among Indigenous communities in particular. Modernization frameworks fail to address the independence of tribes prior to colonization, the Diné people's ability to live on the land sustainably for thousands of years, and to remain prosperous until colonization (Denetdale, 2007; Yazzie, 2018). Colonialists and developmentalists arrogantly assumed Indigenous economies were undeveloped and in need of intervention. It was the intervention that trapped us into colonial-capitalist relationships. Dependency theory puts this ongoing relationship and its predatory characteristics into focus. This helps us to understand contemporary capitalist formations, like the rise and fall of the Navajo coal economy.

CONCLUSION

Dependency theory continues to operate as a valid critique of the expansion and maintenance of capitalist relations in different sites across the planet. Critics have pointed out that it uses language that can be interpreted as pejorative, such as 'underdevelopment', that it fails to account for economic successes in Indigenous communities, and that it denies or undermines Indigenous agency – at times ignoring ontological and epistemological assumptions in development and modernization thinking. But as a critical theory, dependency theory is meant to challenge the racist and colonial narratives of modernization theory. We might continue to ask ontological and epistemic questions about what it means to be developed without abandoning the usefulness of being able to highlight how core economies incorporate and render dependent peripheral economies.

Dependency theory articulates how capitalistic pressures regularly work to limit what tribes can do despite Indigenous challenges. We can build on the work on Indigenous scholars who challenge assumptions of modernization and 'the politics of recognition' (Coulthard, 2014; Simpson 2014), state-formation (Nadasdy, 2017), settler-colonialism (Wolfe, 2006), and racial capitalism. We can move toward a dependency theory that is spatial, rather than merely economic in focus. For the Navajo Nation, colonial displacement of communities onto reservations, under restrictions of federal-Indian law and domestic dependent relations; the killing of Diné sheep and the restriction of subsistence economies; the development and modernization impetus under the guise of progress while the

USA strategically invested in water and energy infrastructure to benefit Phoenix – all of these in combination and over time rendered the Navajo Nation dependent and underdeveloped. Critical scholars and researchers offered these explanations as early as 40 years ago, while Indigenous community members have vocalized this idea for as long if not longer.

For Indigenous peoples, dependency theory offers a renewed understanding of poverty and displacement as a consequence of capitalist incorporation instead of a lack of capitalism – is the alternative explanation. The value of historicizing capitalism is to identify the specific structuring mechanisms that incorporate tribes into regional, national, and global economies in ways that have undermined Indigenous sovereignty and self-determination. Dependency theory brings critical histories of capitalism into understandings of colonialization. It puts at the center of analysis the structuring interrelation between core and peripheral economies. It shows the unique ways and circumstances through which colonialism undermined, destroyed, and transformed Indigenous peoples, places, and practices.

Notes

- 1 'For the Ojibwe, history and legends are passed down orally. There are the stories of Wiindigo, a giant monster, a cannibal, who killed and ate our people. Colonization was our Wiindigo'. Bezhigobinesikwe Elaine Fleming, 'Nanaboozhoo and the Wiindigo' (2017), quoted in LaDuke and Cowen (2020: 243).
- 2 In a 1977 review and critique of dependency theory, Fernando Henrique Cardoso – a proponent of the theory – credited Gunder Frank and others with popularizing it in North America, but this strand of critique existed in intellectual circles within Latin America many years before 1960 (Cardoso, 1977).
- 3 It is instructive to read Gunder Frank's account on the development of dependency theory as an intellectual project in response to conventional economics and critiques to these coming from Latin America. What is clear is that there is not a straight lineage from one writer to the next on the development of this scholarship, but it emerged as a conversation in which each iteration offered new points. There was a 'reformist' approach to dependency theory and a more 'radical' take according to this account. Radical, in this account, gestured toward what would become 'world-systems theory'. See: <http://rrojasdatabank.info/agfrank/underdev.html>. Last accessed 5/20/17.
- 4 David Gilbert shows how the New Left dealt with the ideological and theoretical baggage of the Old Left during the height of the US anti-war movement in the 1960s. He recalls one of the early influences for him and other student organizers for understanding the nature of US imperialism was Frank's essay in *Monthly Review* on the underdevelopment of development (Gilbert, 2012).

The Primitive

Miri Davidson

INTRODUCTION

Marx wrote in 1842 that ‘just as each century has its own nature, so it produces its own primitives’ (Marx in Krader, 1974: 203). In doing so, he recognized that any conception of the state of nature, and of the ‘natural men’ that populated it, was little more than a reflection of the social relations dominant at the moment of its production.¹ But if the primitive has always been a mystification of one form or another, it is one that has had a powerful hold over the Marxist imagination. Visions of primitive communism bracket Marx’s historical dialectic, representing an egalitarian and liberated form of social life at the origin of human history and also, if in a ‘higher’ form, its end (Marx, 2018b: 102). The figure of the primitive stands not only *before* and in a certain sense *after* capitalism, but outside of it: removed both spatially and temporally from the mediations of capitalist modernity, the primitive has captured the Marxist imagination as a romantic exemplar of non-alienated social life and non-appropriative relations with nature. As such, it is a deeply contradictory figure: the primitive ‘lack[s] all that represses us’ in modern society (Augé, 1979: 24), yet for this very reason it circumvents the dialectic meant to take us out of this repression. Opposing term for term the qualities said to characterize the proletariat – rationalism, productivism and genericity – the primitive has represented, for evolutionist strands of Marxism, all those precapitalist vestiges to be cleared away for history proper to begin.

It is in the context of this evolutionist view of world history that the primitive has operated as a figure of differentiation important in the organization of racial capitalism (Robinson, 1983; see Bhandar, Chapter 13, this *Handbook*). Used to refer simultaneously to peoples on the peripheries of commodity economy and to a prehistory from which all of humanity is seen to derive, the category of the primitive is at the very heart of the evolutionist ideology that arranges different social and cultural formations as stages along a linear developmental trajectory. Historically, those to whom the label 'primitive' has been affixed have been exploited and subjugated in a variety of ways depending on the modes of power (Chatterjee, 1982) and production (Banaji, 2011) dominant in the given setting. The history of indigenous and anticolonial thinkers writing in, alongside and against the grain of the Marxist tradition is a history of making sense of and challenging these dynamics (see Curley, Chapter 62 and Mascot, Chapter 52, this *Handbook*). Some of this work leaves the door open to a certain self-conscious reclamation of the idea of the primitive or primitivity for political and aesthetic purposes; some deconstructs its operation at the phenomenological, psychic and material levels; most seeks to dismantle the category of the primitive altogether while keeping an eye fixed on the role it continues to play, even while the term is no longer used, in a world still mired in the logic of race.

In light of the ubiquity of the critique of the category of the primitive, it is important not to lose sight of the way this category has been reproduced in the history of the encounter between European anthropology and the political left.² With this in mind, this chapter focuses on three moments in which the category of 'primitive societies', delimited here to its appearance in European and mainly French anthropology, has forced a shift in the key schemata and political principles of the Marxist tradition. Each moment brings into view the fragility of the category of the primitive, which threatens to collapse at any moment into a variety of other categories – whether the peasant, precapitalist or domestic community; the indigenous, native or colonized people; or the natural, self-sustaining or subsistence economy (to name only a few possibilities). But each moment also brings into view a certain function that the primitive has played *as* primitive – that is, as an incredibly malleable social-scientific category with a principal function, much like the figure of the savage, of presenting a 'living negation or inverted image of civilised Western humanity' (Toscano, 2019: 9).

First, this chapter examines Marx's own turn to primitive societies and to the question of the Russian commune during the last decade of his life, forcing him to clarify and revise his evolutionary theory of history. Second, it turns to the efforts made by Claude Meillassoux from the early 1960s to reconsider the role played by so-called primitive or 'self-sustaining' societies in the neocolonial circuits of world capitalism, which in turn drove the concept of reproductive labour into the foreground. Third, it examines a concurrent movement of what is here termed 'left-libertarian primitivism', which, through the work of Pierre Clastres, Cornelius Castoriadis and Jean Baudrillard, constituted an intervention

into questions of political philosophy: as ‘societies against the state’, primitive societies represented a speculative inversion in relation to the problems of transition, mediation and power that preoccupied Marxism after Stalin.

In each of these moments, the primitive gestures to the limits of Marxism: its wild (*‘sauvage’*) exterior, and the political and theoretical possibilities it has been unable to think. Much like the discipline of anthropology, the primitive raises questions about the scope and aims of the Marxist project. Is Marxism to be understood as a critical theory of capitalism or does it have a wider, anti-civilizational remit? The primitive, saturated with racist tropes and exoticist fantasies, has become a ‘pariah figure’ for many decades (Etherington, 2017: xii). But in an era which provides plentiful reasons to doubt the virtues of industrial civilization, it is little surprise to see latent primitivisms begin to bloom again in certain quarters. In this situation, Marxism overlooks its past and continuing encounters with the primitive to its detriment.

BETWEEN EVOLUTIONISM AND PRIMITIVE COMMUNISM: THE LATE MARX

In Marx’s *Pre-Capitalist Economic Formations* (1964), that section of the *Grundrisse* known as the *Formen*, we encounter not so much concrete primitive society but rather an abstract notion of primitivity expressed in the adjectives *ursprüngliche* (‘original’) and *naturwüchsig* (‘as grown up in nature’). In this text, primitivity signifies a spontaneous or ‘naïve’ (1964: 69) state of being prior to humans’ separation from nature, in which natural conditions of production ‘constitute, as it were, a prolongation of [man’s] body’ (1964: 89), and from which the course of world history plays out as a progressive departure. As a figure for this (non-historical) origin of history, the primitive brings into relief the mediations of history – from private property to the *polis* – and the forms of alienation to which they correspond.

If in the *Formen* primitivity constitutes the point of departure for mankind’s evolutionary trajectory, this trajectory appears in reverse in Marx’s late writings. In his *Ethnological Notebooks* (1972) as well as various letters written in the years before his death, primitivity appears not simply as a condition to be overcome, but as a kernel of non-alienated social being to be defended and revitalized. Marx’s change of heart takes place in the context of debates on Russian revolutionary strategy, which then pivoted on the question of the Russian peasant commune (*obshchina*). While in 1868 Marx had celebrated the decline of the *obshchina* – he wrote gladly of ‘all that trash coming now to its end’ – by 1881 he appeared to have radically changed his views (quoted by Shanin, 2018: 15). In a reply to the Menshevik revolutionary Vera Zasulich, who had asked for his views on the *obshchina*, Marx was unambiguous: ‘The commune is the fulcrum for social regeneration in Russia’, he wrote – provided the various forces besieging

it were held in check (2018a: 124). This position obliged Marx to clarify for Zasulich the account of primitive accumulation he had provided in the first volume of *Capital*. There, he had described the process of expropriation of peasants from their land in terms of an ‘historical inevitability’. Here, he emphasized that such inevitability was ‘expressly restricted to *the countries of Western Europe*’ (2018a: 124). This appeared to be a radical break with his former evolutionism and, above all, with the conviction that each country was to pass through the capitalist mode of production as a condition for socialist development.

Marx’s several drafts of the letter to Zasulich (2018b) testify to his struggle over what place to give precapitalist social forms, especially those underpinned by communal property, in relation to socialist strategy. They reveal a close attention to the interdependence of capitalist and precapitalist forces in a fully connected global system, and the differential developmental trajectories this interdependence made possible. ‘Precisely because it is contemporaneous with capitalist production’, he wrote, ‘the rural commune may appropriate all its positive achievements without undergoing its frightful vicissitudes’ (2018b: 106). The nonsynchronous character of Russia’s development could work to its advantage: nothing prevented the communal elements of the *obshchina* from coexisting alongside capitalist technological and scientific developments. Anticipating derision from the ‘Russian admirers of capitalism’ who doubted the possibility of such a developmental leap, Marx posed the rejoinder:

Did Russia have to undergo a long Western-style incubation of mechanical industry before it could make use of machinery, steamships, railways, etc.? Let them also explain how they managed to introduce, in the twinkling of an eye, that whole machinery of exchange (banks, credit companies, etc.) which was the work of centuries in the West. (Marx, 2018b: 106)

In the course of Russia’s contorted development, stages had long been skipped. From the vantage point of the amalgam of capitalist and non-capitalist forms that comprised contemporary Russia, the peasant commune appeared less as a survival from a vanished past than as a living foundation onto which modern techniques and technologies could be grafted. Marx’s evolutionism would then resemble less an immanent organic unfolding than an untimely *bricolage*, torn by opposing interests. As a number of commentators have noted, these letters throw into doubt the notion that Marx viewed history as universal in the sense of a *unilinear* procession, on the part of each country or region, through a series of necessary stages (Anderson, 2010; Tomba, 2012; Harootunian, 2015; Shanin, 2018). More likely, Marx conceived the theory of necessary stages at the level of *world history as a whole*. Universal history refers for Marx, then, to the condition of the already interdependent world system: capitalism, through its universalizing powers, had drawn the diverse trajectories of societies across the world into a single, combined process.

In the last decade of his life, Marx was not only preoccupied with the Russian commune but with forms of communal property and social organization across

the world, as evident in his intricate notes on primitive social structures and institutions contained in the *Ethnological Notebooks* (1972). The bulk of the latter were made up of Marx's citations from Lewis Henry Morgan's *Ancient Society*, which propounded the American anthropologist's own three-stage theory, running from savagery to barbarism to civilization, each stage determined by the dominant mode of subsistence. Morgan made a strong impression on Marx; he makes his way into the Zasluch drafts, where Marx cites his claim that socialism 'will be a revival, in a superior form, of an archaic social type', adding that 'we should not, then, be too frightened by the word "archaic"' (2018b: 107).

The archaic social type in question was what Morgan had called the *gens*, a Roman term for the kinship organization sometimes known as the clan, but which Morgan 'discovered', as Engels put it in his *Origin of the Family, Private Property and the State*, in its original form among the Indians of North America (Engels, 1972: 71). The *gens* was the basis for the social order of all peoples in the barbarian stage, which encompassed Native Americans as well as Greeks and Romans. Engels' *Origin* is, for the most part, an exposition of its nature. The original *gens* was matrilineal – members had a common ancestral mother, and had to seek marital partners outside their own *gens* – but, more importantly for Engels, it was *matriarchal*. Women held supremacy in matters in and outside of the household; the power of the democratically elected male chiefs was not coercive. Disputes were resolved collectively, land was held in common and wealth did not accumulate. 'All are equal and free – the women included', Engels wrote (1972: 159).

While Engels describes *Origin* as a 'bequest' to Marx based on his Morgan notebooks, the two departed in certain respects on the subject of evolutionism and primitive communism. Even in the sprawling *Ethnological Notebooks*, Marx's reading of the *gens* appears to have remained close to his assessment of the *obshchina*: both were riven by contradictions. Rana Dunayevskaya, one of the first to grasp the significance of Marx's later writings on ethnography, argues that his dialectical reading of Morgan departs significantly from Engels' evolutionary reading in *Origin*. For Marx, she argues, antagonism and duality are present throughout a period of transition, 'whereas Engels always seems to have antagonisms only at the end, as if class society came in very nearly full blown after the communal form was destroyed and private property was established' (Dunayevskaya, 2015: 180).

It is true that Engels, whose *Origin* is written in a somewhat polemical tenor, depicts the *gens* as undisturbed by hierarchy or any coercive apparatus at all: 'a wonderful constitution it is, this gentile constitution, in all its childlike simplicity! No soldiers, no gendarmes or police, no nobles, kings, regents, prefects, or judges, no prisons, or lawsuits – and everything takes its orderly course' (1972: 159). In this respect, Engels' descriptions of primitive communism follow the formula of negative determination that, as Alberto Toscano has observed (2019), has structured depictions of the primitive since the early modern era. Dunayevskaya

argued that for Marx, by contrast, concrete primitive communal forms were always already *historical* forms, and hence contained within themselves the seeds of social differentiation. While Marx's *Ethnological Notebooks* had demonstrated his interest in the questions of caste and hierarchy within the primitive commune, discounting these emergent differentiations had left Engels without an explanation for the commune's eventual dissolution. His account of 'the world-historical defeat of the female sex' was accordingly, for Dunayevskaya, both grandiose and empty (2015: 184).

Marx was no primitivist. 'Of course, primitive collective production stemmed from the weakness of the isolated individual', he wrote in one of the drafts to Zasulich, 'not from socialisation of the means of production' (2018b: 108). To see a role for primitive communal forms in socialist transformation did not mean envisioning an Arcadian return or positing an abstract reunification of humanity and nature. We should not overlook his emphatic qualification in the statement that communism was to found 'a *higher form* of the archaic type of property' (2018b: 102). Yet Marx's writings on the primitive commune should equally make us doubt that any unproblematic vision of progress underlies his philosophy of history. His detailed investigations into Iroquois federations, the radical democracy of indigenous Australians and the revolutionary potential of the Russian peasantry – 'primitive communities had *incomparably greater vitality* than the Semitic, Greek, Roman and *a fortiori* the modern capitalist societies', he wrote in the *Notebooks* – instead seem to testify to a deepening disaffection with modernizing narratives (see Rosemont, 1989). At the very least, they make evident Marx's tactical attention to the fruits that non-contemporaneity might yield.

RELATIONS OF REPRODUCTION: CLAUDE MEILLASSOUX'S ECONOMIC ANTHROPOLOGY

For Marx, the primitive represented a problem for theory, forcing him to reassess his most foundational assumptions about the movement of history. Yet his most significant writings on primitive societies – in the *Grundrisse*, the letters to Zasulich and the *Ethnological Notebooks* – were not published until after the Second World War. In their absence, Engels' *Origin* remained 'the Marxist bible on primitive societies' (Descola, 1981: 395). Engels' portrayal of primitive societies as classless and internally non-contradictory obliged him to explain the transition from the primitive state through unfounded biological evolutionism or mechanical ideas of technological advancement. Engels' *Origin* had therefore, without necessarily intending to, placed primitive societies within the sphere of natural history, while human history ('History' proper) was reserved for societies which had seen the emergence of class. In the writings of Kautsky and Plekhanov, the mechanistic approach of Engels' *Origin* became the dominant paradigm for explaining history as such (Bloch, 1983: 99). This tendency was best illustrated

in Plekhanov's writings, in which primitive societies, in Maurice Bloch's words, 'demonstrate materialism at its simplest' (1983: 105). Thus, in the decades following Marx's death, the primitive became less a problem for Marxism than a vehicle for the evolutionist orthodoxy.

Despite the extraordinary aesthetic and cultural movements of the interwar years, which initiated a dialectical encounter of primitivism and Marxism,³ it was not until the mid 1960s that the study of 'primitive societies', within the framework of social anthropology (or *ethnologie* in France), would be considered to be of general importance to the Marxist project. This was due in part to the decolonization struggles unfolding across the African continent, which had convinced a generation of militants that the locus of the coming socialist revolution was the Third World. This was especially the case in France: as the anthropologist Emmanuel Terray recounts, 'I held the obscure conviction that a decisive part of world history would play out there, without a doubt more there than in our societies bogged down in their material and intellectual comfort' (2007: 4). For this set of anthropologists, 'primitive societies' emerged again as an urgent problem for Marxism – something it had to reckon with if it were not to lose its relevance. Could Marxist categories, developed in the analysis of nineteenth-century capitalism, be extended to include those 'primitive societies' under neo-colonial domination? Was 'primitive' history – no longer lodged in the frame of natural history – equally a history of class struggle?

Such questions became the focus for those involved in what was known as economic anthropology, the recognized founder of which was Claude Meillassoux. While Meillassoux criticized the category of the primitive for its indeterminacy, it nevertheless functioned to demarcate the problems specific to his field of study: it was those societies deemed 'primitive' that presented a particular problem for economic anthropology, because their economic functioning was quite incommensurate with commodity economies. Meillassoux, himself a former liberal economist, reflected on the state of the field prior to the 1960s: 'When "primitive" people were not considered as living off myth and religion, they were sparsely granted some sort of backward "primitive capitalism"' (1981: viii). Even Franz Boas, that acclaimed father of cultural relativism, had been unable to interpret phenomena such as the potlatch outside of the ethnocentric terms of financial speculation and the capitalist ethic (Meillassoux, 1978: 128). What passed for economic anthropology, Meillassoux argued, was merely the universalization of the capitalist category of the economy along an obsolete evolutionary trajectory, which defined primitivity in terms of simplicity: "'Primitive economy" is thus represented as a simplified version of a more complex system observed in a modern economy' (1978: 130).

Where ethnographers did not reduce their subjects' economic behaviour to a kind of 'primitive capitalism', Meillassoux argued, it was seen to be governed by an altogether more alien power: that of kinship (1981: vii). Kinship had long been considered to be the 'key to anthropology', capable of unlocking the secret

of primitive social life. Even for certain Marxist anthropologists such as Maurice Godelier, kinship represented 'both infra- and superstructure, the alpha and omega of all explanation regarding primitive societies' (Meillassoux, 1981: 49). Engels himself appeared to have thought kinship – as opposed to production – was the determining factor in primitive societies, writing in a letter to Marx that 'at [the primitive] stage the type of production is less decisive than the degree in which the old blood bonds and the old mutual community of the sexes within the tribe have been dissolved' (quoted in Meillassoux, 1981: 9). For Meillassoux, Engels' letter revealed a truncated conception of the mode of production, 'here reduced to a simple productive activity', where it should instead encompass the 'relations that bind people together for reproduction of life' – thus including kinship relations as a vital part of any production process (1981: 10). Anthropology's foundational axiom, the primacy of kinship, then contained a certain truth. But to grasp this, kinship relations needed to be reconceptualized as *relations of reproduction*. In what Meillassoux called the 'domestic community' (in a not entirely successful effort to displace the category of 'primitive society'), the relations of reproduction were the locus of power and the foundation from which all other social relations were derived. The subordination of women, through strict control over these 'relations of reproduction', lay at the heart of this social system. Thus, Meillassoux argued, 'Marx is therefore right to believe that women probably constituted the first exploited class' (1981: 78).

The functioning of the domestic community was quite foreign to that of societies dominated by commodity exchange. 'Reproduction is the dominant preoccupation of these societies', Meillassoux wrote. 'All their institutions are organised to this purpose' (1981: 38). The surplus generated by production was sufficient to this aim but not more; these were, in other words, 'subsistence' economies. As such, 'within this community only use value emerges', while land was held in common, its access regulated by the community (1981: 3). But if these characteristics made the domestic community a model of equilibrium and seemingly a world unto itself, this did not prevent its capture by the capitalist world system. Indeed, Meillassoux argued that the very persistence of the domestic community was testament to 'an improved form of primitive accumulation' operating through what he called over-exploitation (*surexploitation*) (1981: 110). Periodic migration cycles, a colonial strategy that became widespread in African colonies after the Second World War, allowed the domestic community to be preserved as a means of reproducing the lives of workers – both individually and generationally – in between periods of labour for capitalist firms. Since migration would take place during the dead season, Meillassoux reasoned, the 'capitalist sector' only needed to cover the reproduction of labour-power during the period of direct employment (1981: 95). The worker's long-term reproduction – the reproduction of their life through childhood, sickness and old age – was secured by the domestic community.

Meillassoux's studies of over-exploitation through periodic migration can be set in the context of dependency and world systems theories emerging in the same

era: like Andre Gunder Frank (1969) and Samir Amin (1974), Meillassoux sought to challenge the notion of a dual economy, 'according to which two unconnected sectors, one industrial and the other "traditional", exist side by side in underdeveloped countries', choosing instead to theorize the ways in which their articulation benefitted global capitalism (1981: 98). But Meillassoux departed from Frank and Amin in theorizing what he saw as the distinctively *parasitic* relationship between the capitalist and domestic economies, 'one of which preserves the other to pump its substance and, in so doing, destroys it' (1981: 98). In the long term, periodic migration led to the deterioration of the domestic community. The result was not necessarily full proletarianization. More likely, the deteriorating effects of migration on the domestic community would drive many to the urban centres, where this new would-be proletariat would find itself deprived of the means of social reproduction, which is to say the means of life, altogether.

In these ways, Meillassoux demonstrated that historical materialism was applicable to those societies swept together in the category of 'primitive', but only on condition of a reciprocal action: the study of these 'primitive' societies obliged an internal reconfiguration of certain elements of the classical Marxist schema. This involved a centring of those phenomena deemed to be peripheral to the classical schema – kinship, the family or the relations of reproduction – and, in turn, the decentring of wage labour. For Meillassoux, the secrets of 'primitive' social forms were not contained in those of advanced capitalism, an evolutionary epistemology Marx had appeared to propound in his statement in the *Grundrisse* that 'the anatomy of the man is key to the anatomy of the ape'. Quite the reverse: studying non-commodity economies in West Africa had revealed to Meillassoux the centrality of that most basic institution that lay at the foundations of capitalism: 'it is the family which produces, not only the physical worker, but also this social ingredient essential to the functioning of capitalism and which Marx has called "the free labourer"' (1981: xiii).

Meillassoux's efforts to centre the family in the reproduction of capitalism spoke to an unwitting affinity between Marxist feminism and anthropology, whose major objects of reference – the family on the one hand, and kinship on the other – turned out to be, from certain vantage points, the same thing. Meillassoux's turn to social reproduction coincided with the turn to the same subject in Marxist feminism: Christine Delphy had used the concept of the domestic mode of production in her book *The Main Enemy* (1977), and the Wages for Housework campaign (Federici, 1975) brought the subject of domestic labour into the foreground. Within these debates, Meillassoux was not without his critics. As Maureen Mackintosh (1977) argued, Meillassoux not only failed to engage with any feminist thought in his *Maidens, Meal and Money*, he also took the patriarchal structure of the domestic community as less a problem than a given. For Bridget O'Laughlin (1977), his conception of 'relations of reproduction' offered only confusion, conflating several meanings of the term reproduction and concealing a deep-seated functionalism. To separate production and reproduction as

Meillassoux did ultimately endowed the ‘domestic community’ with a *telos* of procreation – an idea quite incompatible with historical materialism. Bringing kinship and reproductive labour to the foreground need not mean forgetting that ‘the biological reproduction of people is a contingent outcome of the ways in which the production and reproduction of the means of subsistence are socially organized’ (O’Laughlin, 1977: 7). For O’Laughlin, Mackintosh and several other critics, Meillassoux did not succeed in wrenching those societies deemed ‘primitive’ outside of the ahistorical and clock-like universe in which colonial anthropology had placed them. Nevertheless, in foregrounding the essential mediation of communal forms of property with kinship and family relations, and the corresponding role played by gendered labour under capitalism, Meillassoux’s work helped to initiate an important shift in the orientation of Marxist thought.

SOCIETIES AGAINST THE STATE: THE LEFT-LIBERTARIAN PRIMITIVISM OF CLASTRES, CASTORIADIS AND BAUDRILLARD

In the writings of Meillassoux, the figure of the primitive had a primarily *analytical* value, forcing Marxism to expand and revise its categories to account for the uneven ways in which capitalist accumulation unfolded across the world. A very different kind of primitive emerged around the same time, however, in an opposing subdivision of French anthropology. This ‘political anthropology’, whose leading figure was Pierre Clastres, was based not in neocolonial Africa but indigenous Amazonia. The relative isolation of indigenous peoples in the Amazon Basin from the capitalist world system prompted a rather different approach to that of the economic anthropologists: one more interested in the utopian qualities of indigenous social institutions, whose radically anti-modern logics might bring about what Clastres called a ‘Copernican revolution’ in the Eurocentric imaginaries structuring anthropology and political philosophy (1989: 25).

Here, the figure of the primitive had less an analytical than a *speculative* value: by way of the radical contrast they presented, primitive modes of life had the power to unsettle the givenness of modernity’s most fundamental categories. As Marc Augé put it in an acerbic critique of this strand of anthropology: ‘The new savages indeed, if one allows us this expression, are negatively defined. They lack all that represses us: they are without illusions, without power, without complexes and without commerce’ (1979: 24).⁴ Clastres’ writings rendered this contrast particularly acute. According to him, primitive societies (he insisted on the usefulness of the category) were not only isolated from the alienating dynamics of modernity; their whole social fabric was structured to prevent their emergence. Specifically, the political functioning of primitive societies was constructed as a ‘veritable defense mechanism’ against any manifestation of political authority (Clastres, 1989: 46, 44). Since political authority represented the germ of the

state form, primitive society was for Clastres by definition, in a phrase that was also the title of his first collection of essays, a *Society against the State* (1989).

Although Clastres' writings are drawn mostly from his fieldwork with Aché (then known as Guayaki) peoples in Paraguay, they bear the shadow of a seemingly distant problem: the authoritarianism and bureaucratization of the Soviet Union and the stultifying effects of these tendencies on the left in general (see Moyn, 2004). Integrated into the left anti-Soviet milieu from the late 1960s, Clastres shared with political theorists such as Cornelius Castoriadis and Claude Lefort, and anthropologists such as Jacques Lizot and Roger Jaulin, an opposition to the state-centric political projects which appeared to them to dominate the left in the hands of the French Communist Party. For all of these figures, the study of primitive societies represented a path toward a new kind of political theory operating beyond the terms of the state and in the interests of direct democracy and a liberated public sphere, values they considered to have been lost in a vulgarized Marxism. This libertarian primitivism, which had its roots firmly in the left critique of Stalinism but in the case of some of its followers slid progressively toward the right,⁵ played an important ground-clearing role in the development of post-Marxism in France – and, in turn, elsewhere – in the decades to come. It was not, for that reason, external to the fundamental problems of Marxism, nor without importance in highlighting their limits.

For Clastres, Marxism had failed to adequately critique the role of the state and the forms of power to which it corresponded. Viewing the state as a simple excrescence of class society, Marxism overlooked the anteriority of political authority in relation to economic exploitation. 'The first division is not the division into opposed social groups, into the rich and the poor, exploiters and exploited', he claimed. 'The first division, and that which ultimately founds all the others, is the division between those who command and those who obey. That is to say, the State' (2012: 16). Clastres' minimal definition of the State highlighted what he saw as the impenetrable singularity of 'primitive societies': they had no experience of this most basic, embryonic expression of political authority. Or rather, such societies had intentionally resisted any form of coercion that placed the means of violence in the hands of a certain section of society over the rest. If primitive society was a body that 'holds tightly all [its] organs', then the mark of the State was that it had let one of its organs escape: the organ of political power. This organ, external to the social body, spoke for it and acted on behalf of it; it 'knows and says what is in everyone's best interests and puts itself in charge of imposing it' (Clastres, 2012: 168). Primitive societies were therefore 'undivided societies' (Clastres, 1989: 204), because they refused the separation that characterized the kernel of the State form.

Marx (1975) had himself defined the modern state in terms of the separation, or 'abstraction', of the political sphere from the body of society. Separation was essential to the modern state and would not be overcome, as Hegel thought, through the full unfolding of its Idea in the course of world history, but only

by the dissolution of the state form as such. For Marx, both bureaucracy and representative democracy were based on this separation. In the latter, his words come close to those of Clastres: 'The separation of the political state from civil society takes the form of a separation of the deputies from their electors. Society simply deposes elements of itself to become its political existence' (Marx, 1975: 193–4). This argument was developed, much later, by Socialisme ou Barbarie (SouB), the heterodox Trotskyist group led by Castoriadis and Lefort, which had been an early critic of Soviet socialism. SouB argued that representative political structures had led to the hollowing out of the political organizations that had led the Soviet transition to socialism. 'For the first time in history', they argued in their 1949 manifesto statement, 'the class taking power cannot exert this power through "delegation," it cannot entrust its power for any lengthy and enduring period of time to its representatives, to its "State," or to its "Party"' (Socialisme ou Barbarie, 1949: 26). The proletariat was to act as itself, without mediation – the 'consciousness' guiding its action, the authors argued, 'can only be that of the class as a whole' (1949: 26). Accordingly, any successful revolution was not only to seek the abolition of private property; it had to go much deeper into the very texture of social relations to bring about 'the abolition of all fixed and stable distinctions between directors and subordinates [*dirigeants et executants*], in relation to both production and social life in general' (1949: 24).

Clastres was not alone in his mobilization of the figure of the primitive against the forms of 'separation' that he considered to be central to the reification of the State, and equally of production, on the part of Marxism. By the early 1960s, SouB were publishing a long serial text by Castoriadis (under the pseudonym of Paul Cardan) which repudiated 'Marxism', as such, on the basis of its 'sociocentrism' and looked to primitive societies for a new approach to the relationship between base and superstructure (Cardan, 1971). In his early book *The Mirror of Production* (1975), Jean Baudrillard also criticized the 'ethnocentrism' that lay behind Marxism's reification of production as an autonomous sphere of activity. For Baudrillard, separation went to the heart of Marxism's epistemological crisis: in constructing a critique of political economy, and a dialectical theory of history with production at its centre, it had come to reproduce the very categories it had sought to overcome. Labour should have been a mode of activity to be overcome; instead, it had become the very subject of history. The figurehead of Baudrillard's critique was the primitive, which, in its exteriority to the dialectic, represented the last remaining model for political and theoretical radicalism. Primitive societies, Baudrillard argued, exemplified the principle of 'non-separation' (1975: 74): in the 'primitive' world it was not possible to separate the economic from the political, or labour from life, since the social totality was governed by the radically anti-productivist logic of 'symbolic exchange' (1975: 80).

These theorists, most of whom were former Marxists who had begun to distance themselves from the tradition, tended to offer a false choice between libertarian primitivism and an economistic (or even totalitarian) Marxism. Nevertheless,

their critique touched on a key problem of the Marxist theory of history, pivoting on the relationship between means and ends, and contrasting conceptions of the historical dialectic. This was the key theme, as we have seen, of Marx's late writings on the Russian peasant commune; taken together with his ethnographic writings, we can interpret Marx's interest at this stage in his life as revolving around the interpretation of what was to take place between primitive communism and communism in its 'higher' form, which is to say, on what constituted the necessary *mediation* between primitivity and communism.

This problem is as vital for Marxist strategy today as it was in Marx's time. Drawing on the writings of Jacques Camatte, the collective *Endnotes* (2015) have argued that this problem finds itself at the heart of the failure of the labour movement over the twentieth century. The late Marx's 'alternative vision', they write:

seems to us to get closer than any other to the heart of the matter, that is, the primary contradiction of the labour movement: to end all domination supposedly required the extension of one form of domination, namely proletarianization, to the ends of the earth, with all the violence this process necessitated. (*Endnotes*, 2015: 189)

A similar contradiction underlies the question of the state, and of the related contested interpretations of the idea of the dictatorship of the proletariat: at what point are hierarchical, bureaucratic or anti-democratic means subordinate to the ends of ultimate emancipation? The current revival of Clastres' ideas in the field of 'anarchist anthropology' (Graeber, 2004) takes the figure of the primitive to exemplify the need for the construction of forms of life and organization that are non-hierarchical and decentralized, in which means align with ends, and in which the bureaucratizing weight of mediation might be eluded. It remains to be seen, however, whether 'primitive' societies can represent in this current, as they did for Marx as well as for many of the anticolonial thinkers mentioned above, a prompt to rethink Marxist dialectics rather than to abolish them, and a means of entering more deeply into the complexities of history rather than a means of escaping them.

CONCLUSION: DIALECTICS OF THE PRIMITIVE

'Since all the advances of the human race continually move it ever further from its primitive state', Rousseau wrote, 'the more new knowledge we accumulate, the more we deprive ourselves of the means for acquiring the most important knowledge of all. Thus, in a sense, it is by studying man that we have made ourselves incapable of knowing him' (1999: 14). For Rousseau, the primitive is a figure that eludes modern thought: the harder the apparatus of reason tries to grasp it, the harder it fails. As an essentially modern political tradition, Marxism has found itself similarly perplexed by the figure of the primitive. The primitive holds secrets of a life before alienation, but these secrets cannot but be destroyed by the progressive movement of history which has been Marxism's classical horizon.

For Rousseau, the figure of the primitive also held an important epistemological function: it allowed rationality to question itself. In the same way, this figure has enabled Marxism to question itself, and above all to question its theories of history. In revealing the radical non-homogeneity of history, as Ben Etherington argues, the primitive might be described in terms of what Bloch calls the ‘nonsynchronous remnant’ embedded within the capitalist present (Etherington, 2017: xv). Here the primitive is more than a figure of reaction harking back to an idealized past; it also constitutes the material of the revolt which, in Bloch’s words, ‘recalled, sentimentally or romantically, that wholeness and liveliness from which communism draws genuine material against alienation’ (Bloch, 1983: 35). The primitive, as nonsynchronous remnant, is then not *only* a negatively determined figure and a projection of the Western imagination. It is also grounded in a set of positive – that is, historically concrete – forms of life, sociality and struggle. These forms of life and struggle have been, and continue to be, elaborated in indigenous and anticolonial critiques and reclamations of Marxism, which illustrate the political possibilities inherent to the category of the primitive when it operates in dialectical mode (see footnote 2). By opening onto these bodies of thought, the figure of the primitive can function to ‘deprovincialize Marxism’, in Harry Harootunian’s phrase (2015), by recovering its universal scope and by bringing those elements that were once peripheral into the centre, not least a grasp of the unevenness and untimeliness of capitalist modernity.

This is not necessarily the case. The category of the primitive, as well as the primitivisms it tends to unfold (or collapse) into, holds risks in its encounter with Marxism. Rather than generating revolutionary visions of untimeliness, the figure of the primitive can act much in the same way as Lévi-Strauss described myth: as ‘a machine for the suppression of time’ (1964: 24). Rather than tearing open the apparently uniform fabric of world history, the primitive can stand for an abstract desire for *escape* from such history. Primitivism, today as much as ever, often emerges out of a wish to conjure away the capitalist world system by imagining certain societies to persist unaffected by it, sequestered in a space of radical alterity and insulated from world-historical struggle. Underlying this suppression of the historical dimension of the forms of life and social relations associated so inappropriately with the term ‘primitive’ is a desire to shift the terms of the debate from a restricted critique of capitalist political economy to a more general critique of the epistemological and even ontological coordinates of the modern world. In this primitivist universe, the critique of capital begins to look a little too restrictive; one is obliged instead to fashion a critique of civilization.

Yet, as we have seen in discussions of the Anthropocene (e.g. Malm and Hornborg, 2014), shifting the object of critique from capital to that of civilization tends to bring about a dissimulation of class antagonism, leaving in its place the assertion of a natural species trajectory or, worse, an attribution of the crisis to cultural factors. If the political problems with this shift are evident, it is not clear that, under our current apparently ‘civilizational’ crisis, primitivism is set to

decline in its aesthetic and political appeal. In the guise of ontological difference or radical alterity, the primitive has begun to re-emerge as a figure of rupture in the logic of modernity, but often at the cost of its sequestering into an ahistorical universe (e.g. Viveiros de Castro, 2014). In much less benign form, the primitive may well also begin to appear more frequently at the other end of the political spectrum, lingering behind variants of ecofascism or dreams of an ethnostate in which fantasies of natural hierarchy might be allowed to flourish (see, e.g. Chatterjee, 2019). In light of these contradictory projects, the primitive must be grasped as the ambiguous and ideologically mobile figure that it is, and unfolded in all its dialectical and communist possibility.

ACKNOWLEDGEMENT

Special thanks to Simon Barber.

Notes

- 1 The sentence is from Marx's article 'The Philosophical Manifesto of the Historical School of Law'. An alternative translation replaces 'primitives' with 'natural men': 'just as every century has its own peculiar nature, so too it gives birth to its own peculiar natural men'. See Marx (1842).
- 2 This necessarily neglects a whole range of other moments in which the primitive, or closely parallel categories, has played an important role in Marxist thought. We can cite the philosophical and aesthetic uses to which it is put in the work of Adorno and Horkheimer (2002); its political-economic use in relationship to the notion of 'natural economy' in Luxemburg's theory of imperialism (Luxemburg, 2003); and its historiographic reference in the field of peasant studies and the Subaltern School (e.g. Chatterjee, 1982); in addition to its multifarious appearances in the writings of anticolonial thinkers working within or at the limits of the Marxist tradition (e.g. Senghor, 1956; Fanon, 1986; Césaire, 1995) and Marxist theorists of indigenous politics and settler colonialism (e.g. Mariátegui, 1971; Coulthard, 2014; Barber, 2020).
- 3 The Caribbean Surrealist Group; the Négritude movement; the Collège de Sociologie and related diasporic aesthetic movements all held artistic and literary primitivism in tension with an anticolonial sensibility (Richardson, 1996; Rosemont and Kelley, 2009; Wilder, 2015; Etherington, 2017; Frost, 2017).
- 4 The term 'new savages' used across the collection in which Augé's article appears, entitled *Le Sauvage à la mode* ('the fashionable savage'), was a play on the 'new philosophers', with which the political anthropology of Clastres, Robert Jaulin and Jacques Lizot was associated by these critics.
- 5 Among those associates of Clastres who turned, after his death in 1977, toward liberalism included Marcel Gauchet. See Moyn (2005).

Social Movements

Jeffery R. Webber

The egregious depth of disengagement from the study of capitalism in social movement studies is difficult to fully capture and is rarely appreciated. Leaden investigations into resource mobilization, opportunities, and institutions, on the one side, and impenetrable speculations into culture, meaning, and identity, on the other, are the two most visible camps of social movement scholarship, ostensibly at war with one another, but ever more united in their obfuscation of capitalist social relations. The point of this chapter is to signal the necessity of a change in course, and to highlight ways in which such a rerouting might be engineered through a particular reading of Marxism. It outlines the problem of capitalism for social movement studies, and the particular issue of capitalist totality. It suggests that an expansive, processual, historical, and temporal conception of class struggle needs to be at the centre of any adequate Marxist approach to social movements. Connected to the necessity of an expansive understanding of class struggle, it highlights the dialectical relations between production, reproduction, and social reproduction, and how the latest revivals of Marxist feminism might guide us through the morass.

THE PROBLEM OF CAPITALISM

Capitalism re-entered colloquial vocabularies around the world in 2008 with the onset of the worst crisis of the system since the Great Depression. With a three-year

time-lag, a new season of revolt began in 2011. The blood of social protest flowed through the capillaries of the Arab world's revolutions for bread, freedom, and social justice – Tunisia, Egypt, Syria, Libya, Bahrain, Yemen – southern Europe's anti-austerity movements of the squares – Greece, Spain, Portugal – the student movements of Chile and Quebec – the Yellow Vest revolts in France, rebellions in new authoritarian enclaves of the semi-periphery – on the streets of Brazil's major cities and in Turkey's Gezi Park in 2013 – and the recovery of struggle in the USA – Occupy, the Wisconsin protests, and, a few years later, Black Lives Matter, migrant rights struggles, the Dakota Pipeline Access protests, and new politicizing layers around the Bernie Sanders campaign and the explosive growth of the Democratic Socialists of America (DSA). The 2010s have witnessed general strikes in Guadeloupe and Martinique, India, Brazil, South Africa, Colombia, Chile, Algeria, Sudan, South Korea, and France, among others. A militant popular feminism has reignited unevenly across the globe through #MeToo and the International Women's Strike. In 2019, the scale of protests internationally reached a new height, with particularly strong rebellions in Sudan, Hong Kong, Puerto Rico, Ecuador, Colombia, and Chile. Finally, 2020 witnessed what may be the biggest movement in US history in the form of a Black-led, multi-racial uprising against racism and police violence. It is too early to be determine what the wider impact of the COVID-19 pandemic will be on international movement dynamics.

The real-world coupling of system crisis and explosive growth in protest has meant that, after an extended hiatus, attention to the dynamics of capitalism has begun, albeit haltingly, to return to mainstream social movement studies.¹ How has social movement theory weathered these developments? It is only a slight exaggeration to say that the central fault lines in social movement studies today continue to be traceable to the post-Marxist moment of the early 1980s. Writing in the middle of that decade, Jean Cohen characterized the major divide as running through a European 'identity-oriented' approach, on the one hand, and a US 'resource mobilization' or 'strategy' framework, on the other.² The new social movement (NSM) theorists of the identity camp were responding to the emergence of heterogeneous movements in Europe in the late 1970s and early 1980s – ecology, peace, gender, ethnicity, age, neighbourhood, environment, and sexual diversity – which they believed could not be explained or understood using the categories of Marxian analysis. In ostensibly 'post-industrial' European societies, the new movements could not be captured by a focus on the economy or the state. Their domain of contention was, rather, civil society.³ What is more, from their vantage point, Marxist theory had always been reductionist in two senses: (i) economic, because an economic logic determines social formations and political and ideological processes, such that politics and ideology are epiphenomena of the economic realm; and (ii) in terms of class, given that the identity of social actors is derived primarily from their class position.⁴ NSM theorists, by contrast, believed that the heterogeneity of the 'new' movements were concerned more with the 'process of symbolic production and the redefinition of social roles'

than the economy.⁵ Culture, meaning, constructed identities, civil society, and newness were the watchwords of choice, set against class, the economy, the state, and ostensibly traditional social actors, like the working class.⁶

If the empirical and theoretical attention to struggles over multiple forms of oppression was to be welcomed, the theoretical pitfalls of this literature were manifold. Only through a deeply ahistorical lens could gender be seen as ‘new’ and class as ‘old’; only through intense myopia could analysts of social movements forget the crisis tendencies of capitalism, its stagnations and financial panics, or the system’s necessarily uneven reproduction of inequalities at national, regional, and international scales, and how these structural conditions influence the dynamics of any struggle under its sun. Only through distortion and caricature of the historical record of the last century or so could the embrace of Marxism as an emancipatory theory and praxis by multiple oppressed groups themselves, spanning huge swathes of the planet, be willed into invisibility. The identity school, in short, neglected class, capitalism, political economy, and history.⁷

The resource mobilization (RM) or strategy school focused instead on organizations, interests, resources, opportunities, and strategies, on movements as conflicts over goods in a political market, on the instrumental components of collective action, the simultaneity of struggle at the levels of civil society and the state, and the continuities between the constitutive actors of the so-called new and old social movements.⁸ As Gabriel Hetland and Jeff Goodwin point out, there were some in the strategy school, particularly in its early days, who drew on Marxist categories and took the constraining and enabling features of capitalism seriously vis-à-vis movement origin, development, and trajectory.⁹ Such attention faded from view, however, as the strategy school shifted its focus with time to what became known as ‘political opportunity structures’ (POS).¹⁰ The major issue with the POS literature is an excessive focus on short-term change in political institutions, regime types, and the like, without sufficient attention to their imbrication in deep, often longer-term economic transformations issued forth from the operations of global capitalism. Economics is excised from politics and institutions. Hetland and Goodwin point out that Charles Tilly and Sidney Tarrow’s *Contentious Politics*, a paradigmatic case of recent developments in the strategy school and perhaps the most influential reference book in the field, ‘makes no mention whatsoever of capitalism, proletarianisation, class conflict, or political economy generally. This is remarkable for a book explicitly designed to provide undergraduate and graduate students with the analytical tools and procedures they will need to understand social movements, revolutions, nationalist movements, transnational struggles, and “contentious politics” generally’.¹¹ If identity theorists replaced capitalism and class with culture, meaning, and constructed identities, strategy theorists over time abandoned an early interest in capitalism and class in favour of ostensibly autonomous realms of politics, institutions, and opportunities.

What happens to our understanding of popular struggle when we bring capitalism back into the picture? Beverly Silver and Şahan Savaş Karataslı have

recently suggested seven initial analytical building blocks that take us some way in answering that question. First, because the commodification of labour is inherent in capitalism, and because human beings grieve and resist their reduction to commodities, labour struggle is a necessary and perpetual feature of capitalism, leading to variegated forms and scales of political contestation depending on the situation.¹² Second, because the historical development of capitalism introduces recurring organizational transformations of production and consumption, working classes are perpetually made, unmade, and remade across the globe. Such creative and destructive processes vis-à-vis the working classes help to produce different forms of class struggle.¹³ Third, class struggle, broadly understood, is not reducible to the workplace. Rather, unrest associated with labour occurs in the workplace, the labour market, the community, and in national and international politics.¹⁴ Fourth, because capitalism destroys more livelihoods than it creates over time, class conflict associated with a 'relative surplus population', which is heterogeneous in make-up but whose membership shares a common condition of partial or total superfluity vis-à-vis capital accumulation, will likely increase in importance as a secular trend.¹⁵ Fifth, capitalism suffers systematically from an inescapable tension between profitability and legitimacy. Attempts to contain a crisis of legitimacy through improvements in the conditions of the working class can only be sustained for brief intervals and for partial segments of the class as a whole without generating a crisis of profitability. This tension influences, and is influenced by, movement formation and struggle.¹⁶ Sixth, there is interpenetration between labour movements and status-based movements because of the ways that the historical development of capitalism has involved the mobilization by capitalists, states, and/or workers themselves of status-based distinctions among the working class – gender, race, ethnicity, and/or citizenship – to foment division or to gain advantage or protection in the marketplace. *Pace* NSM theory, struggle around status and struggle around class have been and will continue to be irrevocably interconnected.¹⁷ Seventh, and finally, because historical capitalism has been deeply caught up in war-making, and not just profit-making, labour struggle is conditioned by, and in turn conditions, geopolitics and interstate war.¹⁸

Rather than counter-posing culture, meaning, and constructed identities, or politics, institutions, and structural opportunities, to capitalism and class, these building blocks help us to understand how the real dynamics of the primary subject areas of identity and strategy theories are *infused* with capitalist and class content, and cannot be properly grasped without attention to these dynamics.

CAPITALIST TOTALITY

A Marxist approach to social movements has to immediately involve one further issue related to the question of capitalism – totality. And once the question of totality is raised, a method of moving from the abstract to the concrete is required

as we seek out tentative answers. One of the weaknesses of social movement studies in recent decades – with the partial exception of recent work in ‘contentious politics’ – has been a fragmentation of subject matter – this or that particular social movement studied in desolate isolation from other movements, opponents, and the wider environment – and a ruthless division of labour and territorial policing of borders across the myriad academic disciplines; for example, the hiving off of labour studies into a separate area of inquiry from social movements, or the separation of the study of revolution from the study of social movement.

The concept of totality can help overcome this fragmentation and enhance our understanding of movements, just as it can inform activists’ strategy and tactics with regard to connecting existing commonalities, and forging new ones, across seemingly disparate local or sectional conflicts. Totality allows us to name the capitalist system as an overarching enemy that helps to determine the parameters of seemingly fragmented contestations over power in capitalist society: ‘struggles over oil and gas, for example, can connect ecological questions with local concerns over health and safety, economic ones over the ownership of natural resources, cultural conflicts over the meaning of place, and, indeed, the politics of policing’.¹⁹ It is an essential part of the task of Marxism, ‘to trace and highlight the interconnections between specific issues and particular repertoires of action, organisation and understanding within movements and the broader social relations of production that – explicitly or implicitly – they confront’.²⁰

Totality involves a recovery of interest in, and attention to, the relationship between the whole and its internally related parts.²¹ This implies more than the truism that everything is interrelated; it is rather to stress how the conditions of existence of each component part of the whole are a part of – are interior to – the component itself.²² To be part of a totality is to be a constitutive element in a total situation that is subject to processes of social change. This throws light on the complex of determinations of each particular moment, as distinct from seeing each moment in artificial isolation.²³ The notion of totality allows us to capture the multi-layered complexity of capitalism as a mode of production.

‘Opposition to capitalism must handle multiple manifestations, which are, while interlinked, not all of the same order’, Colin Barker has pointed out. ‘Marx himself was explicit about the distinction between different levels of abstraction and concreteness’,²⁴ If, in *Capital*, we encounter an exploration of the capitalist system at the highest level of abstraction, a monumental effort ‘to identify capitalism’s underlying processes, relationships and tendencies of development’, such abstraction is only the first critical step. ‘The whole theoretical movement in Marx’s presentation’, as Barker suggests, ‘involves an expanding spiral, from the “core” of capitalism towards its variegated “surface”. At each step, new “determinations” and complexities are introduced, and Marx’s “cartoon characters” [the capitalist, the labourer, the financier, the landowner] both take on additional features, and face new strategic problems’.²⁵ This holds true for class struggle and social movement. While some basic contours can be charted at a high level of

abstraction, ‘much greater historical concreteness is required ... to explore how people, as Marx puts it, “fight it out” ... “Class issues”, meaning problems arising from capitalism’s underlying character, do, certainly confront political actors, but how these actors respond is “mediated” by a host of concrete particulars’.²⁶

In the movement from the abstract to the concrete, it is crucial not to conceive the whole as an abstraction separate from particular determinations, which are then subordinated to the whole; instead, it is best to understand particular determinations as ‘self-determining aspects of the whole’; in this sense, we can recover ‘the world of diverse and multiple objects’, and, in the words of David McNally:

[r]ecuperate the content of life, the dynamic and contradictory development of universal life forces in and through the complex differentiatedness of actual objects ... Particular determinations are then grasped as constitutive of the wholes of which they are parts, and wholes are understood to be empty and lifeless when conceived in abstraction from their parts. As a result, parts are brought back to life and allowed to express their internal relations with other parts in the generation of a totality ... It follows that determination has become *self-determination*, part of the self-development of living organisms, rather than the external determination of lifeless entities.²⁷

Rather than thinking of social movements in pristine isolation from one another, or reproducing the empty abstraction of a capitalist whole simply determining beforehand the outcome of labour movement in particular settings, we are spurred to think through ‘a whole field of emerging and political and social struggles’, with mutual interaction and overlap, as a whole with many parts moving at different speeds.²⁸

In strategic terms, the implications of thinking through totality in relation to social movement leads us to Marx’s ‘unity of the diverse’, in this case the drawing together of the distinctly oppressed constituent parts of concretely situated working classes into contestational struggle.²⁹ The multi-layered complexity of capitalist totality and its many determinations is mirrored in the multi-layered complexity of dynamic, situated, concretely universal working-class subjects.

CLASS STRUGGLE

A multidimensional approach to class is fundamental if we are to begin to understand the *class dynamics* of innumerable varieties of social movements operative in history and the present; that is to say, if we are to be able to follow through with perhaps the biggest contribution Marxist theory has to offer social movement studies in general. Seeking out the class dynamics of pivotal social movements should not involve bald proclamation of ‘class as a universal category that overrides all its differentiated movements and mediations’, but rather an effort:

[t]o decipher the *concrete* processes of class formation that operate in and through a continually developing and complexly organised set of social relations and differences. We are seeking to decipher the ways in which social struggles that bridge racial, gender, class, urban and rural experiences, produce ‘a complex, multidimensional kind of resistance’.³⁰

‘Our passions do not live apart in locked chambers’, George Eliot reminds us in *Middlemarch*, ‘but, dressed in their small wardrobe of notions, bring their provisions to a common table and mess together, feeding out of the common store according to their appetite’.³¹

Not all Marxist approaches to class are equal to the task of deciphering concrete processes of class formation. In *Karl Marx’s Theory of History: A Defence*, G. A. Cohen produced an admirably lucid and enduring version of a static definition of class common to structuralist strands of Marxist thought in the twentieth century. ‘A person’s class is established by nothing but his objective place in the network of ownership relations’, Cohen argues, ‘however difficult it may be to identify such places neatly. His consciousness, culture, and politics do not enter the *definition* of his class position’.³² Cohen’s argument around class is one of unusual clarity, but is ultimately mistaken, or at least critically impoverished. As McNally suggests, this kind of formulation amounts to lifeless ‘schematism’ in which ‘dynamic relations of becoming are reified in an effort to generate a static taxonomy that captures nothing of the rich and diverse life-processes of social class’.³³ It is not that ‘such approaches capture nothing real’, but that they gravely deplete the Marxian category of class insofar as they are ‘incapable of comprehending class as a complex and dynamic social process whose highest form is self-constitution – the only understanding of class congruent with the mission of the historian (or the serious political activist) to understand its lived reality in historical time’.³⁴

Marx’s method, rising from the abstract to the concrete, meant that he did not proceed with static definitions such as Cohen’s, but rather through the determination of concepts ‘which tend towards the concrete as they are articulated within the totality’.³⁵ Classes are formed through conflictual horizontal dynamics of competitive capital accumulation between different capitals, through the vertical antagonisms of capital and labour in the domains of accumulation and exploitation, and in and through the multiple scales of local, national, regional, and global processes.³⁶ Thinking about class in this way necessitates a departure from mere classification. Instead, it involves, as Daniel Bensaïd argues, understanding class as a ‘system of relations structured by struggle, whose complexity is displayed to the full in the political writings (*Class Struggles in France, The Eighteenth Brumaire, The Civil War in France*), where Marx offers his last word on the subject’.³⁷ In this sense, class cannot be reduced either to a characteristic of individual units, nor even these individual units added up. ‘It is something else’, Bensaïd insists, ‘a relational totality, not a mere sum ... Class exists only in a conflictual relationship with other classes’.³⁸

Cohen wants to remove culture, politics, and consciousness (subjectivity) from the definition of class position (objectivity).³⁹ But being and essence, object and subject are intimately intertwined in the historical development of classes as processes. If class is conceived as consisting of dynamic relations, ‘the subjectivity of consciousness cannot arbitrarily emancipate itself from the structure, any more

than the objectivity of being can be passively detached from consciousness'.⁴⁰ The relationality of classes necessarily escapes any 'mechanical conception of a necessary transition from the in-itself to the for-itself, from the unconscious to the conscious, from the pre-conscious social to the conscious political, with time acting as a neutral go-between. Class consciousness and unconsciousness are intertwined in a pervasive embrace, and both are consistently mistaken'.⁴¹

Fundamentally, class can only be conceived either as a location or a social relation.⁴² Static structural pictures may be useful as a starting point for the determining logic of class relations, but there is a long way still to travel in order to identify how a class 'in itself' becomes a class 'for itself', as Marx understood the movement between an objective class situation and class consciousness, or from social being to social consciousness. Finding one's way through those dark alleyways requires thinking of class as a social-historical process and relationship.⁴³

The centrality of class, for Marx, is rooted in the way that the relations of production and exchange express 'the very structure of the mode of production articulated with other forms of conflictuality'.⁴⁴ In capitalist societies processes of class conflict are built into the 'modes of conflict, resistance, opposition, and struggle that define the terrain on which popular movements operate'.⁴⁵

Seen in this light, it becomes an impossibility to '[grasp] a society sometimes according to class relations, and sometimes according to collective actors engaged in diverse conflicts. In the capitalist mode of production, the class relation constitutes the key that makes it possible to decipher the conflictual dynamic of history'.⁴⁶ Antagonisms that are not reducible to, or straightforward expressions of, the capital – labour relation – racism, sexuality, nationality, gender, ecology – are nonetheless hardly running parallel to class in a state of mutual indifference. For example, the possibility of overcoming the ecological crisis of our times is impossible without a successful struggle to abolish capitalist market imperatives.⁴⁷

In concrete historical analysis, as in political praxis, the appropriate Marxist methodology is not to discover the reducibility-to-class of contradictions which are clearly irreducible to class, but to carefully map 'the mediations and specific articulation of the different contradictions'.⁴⁸ The constitution of class is forged in political praxis. The '*lived reality of the working class*', Asad Haider points out:

[c]ontains white people and people of color, people of all genders and sexualities, the employed and the unemployed – a multitude of people irreducible to a single description. A meaningful common interest between them does not somehow exist by default. We cannot reduce *any* group of people and the multitudes they contain to a single common interest, as though we were reducing a fraction.⁴⁹

Irresolvable 'at the level of abstraction to which the relations of production generally belong', Bensaïd insists, such a cartography of specific mediations:

[o]perates in the nub of the social formation, in concrete struggles – in a word, in the interplay of displacements and condensations in which the conflict finds its particular political expression. At this level, not only class relations, but also the state, the institutional network, and religious and juridical representations come into play.⁵⁰

To return to Haider: 'A common interest is *constituted* by the composition of these multitudes into a group. This is a process of political practice'.⁵¹

One of the richest twentieth-century practitioners of class analysis in its processual sense was, of course, historian E. P. Thompson. 'The working class did not rise like the sun at an appointed time', Thompson famously argues, 'It was present at its own making'.⁵² Here he is firmly asserting the importance of human agency in the class struggle, agency that is however bounded by the logic of a set of class situations that each person enters into involuntarily. Understanding class as a relationship in which the common experiences of real people living in real contexts matter, and which takes place in historical time, means that it 'evades analysis if we attempt to stop it dead at any given moment and anatomise its structure'.⁵³ Thompson has been criticized for neglecting the objective structure of productive relations in favour of a conception of class which centres on consciousness and subjectivity.⁵⁴ However, as David Camfield points out, in Thompson's framework, common experience, human agency, culture, and subjectivity 'are not free-floating. They have a material foundation'.⁵⁵ For Thompson, 'The class experience is largely determined by the productive relations into which men are born – or enter into involuntarily'.⁵⁶

In Thompson's most direct notes on the problem of method in class analysis, he begins by reclaiming class as a *historical* category, as against varieties of structuralist idealism and sociological positivism: 'that is, it is derived from the observation of the social process over time. We know about class because people have repeatedly behaved in class ways'.⁵⁷ From such historical observation general theories of class and class formation emerge that can be used as a starting point for the further exploration of these themes in different societies and different historical periods. So far, so good. The danger, too often manifested in theoretical formulation, however, is the substitution of the new models that have been constructed for the necessary return to further historical investigation of living processes. Once a model of class structure exists, 'it is easy to suppose that class takes place, not as historical process, but inside our heads ... models or structures are theorized that are supposed to give us objective determinants of class: for example, as expressions of differential productive relations'.⁵⁸

In rejecting barren schemas of this kind as the last word, Thompson is, at the same time, careful to stress that he should decisively not be understood to mean that 'such static structural analysis is not both valuable and essential', but that the parameters of this analysis are such that it reveals 'a determining logic (in the sense of both "setting limits" and "exerting pressures" ... and not the historical conclusion or equation – that these productive relations = these class formations'.⁵⁹ These are the 'powerful ordered patterns' that the capitalist system produces irrespective of local historical particularities, patterns which are 'neither steely rails nor mere constellations of circumstance', but rather 'moving limits whose gradients define what is easy and what is difficult at any moment of time'.⁶⁰ Serious class analysis requires 'scrupulous attention' to 'objective

determinations' – or class becomes merely a 'cultural formation' – but inquiry into objective determination is no simple input from which class and class consciousness can be derived as output.⁶¹ Positivist sociological traditions of class analysis have tended, Thompson suggests, to reduce class to the quantitative allocation of sums of individuals to 'this or that relation to the means of production', and in so doing have excised time from the inquiry: 'once again, class as a historical category – the observation of behaviour over time – has been expelled'.⁶²

Finally, Thompson insists on an inversion of common sociological practices of class analysis. Contra structuralist idealism, class struggle is understood as prior to class and class consciousness, such that we cannot begin with static productive relations and then, by way of 'geometric projection', explain class struggle as the result. Such calculations launch us into a 'squalid mess', a sordid embrace of 'endless stupidities of quantitative measurement of classes, or of sophisticated Newtonian Marxism in which classes and class fractions perform their planetary or molecular evolutions'.⁶³ It is a fundamental error to assume classes exist independently from history and contestation, 'and that they struggle *because* they exist, rather than coming into existence out of that struggle'.⁶⁴ In Thompson's brilliant summation:

To put it bluntly: classes do not exist as separate entities, look around, find an enemy class, and then start to struggle. On the contrary, people find themselves in a society structured in determined ways (crucially, but not exclusively, in productive relations), they experience exploitation (or the need to maintain power over those whom they exploit), they identify points of antagonistic interest, they commence to struggle around these issues and in the process of struggling they discover themselves as classes, they come to know this discovery as class-consciousness. Class and class-consciousness are always the last, not the first, stage in the real historical process.⁶⁵

Of course, despite his great insight, Thompson's writings were crippled by an inattention to distinct layers and *complexities* of oppression, not least gender and race.⁶⁶ In an unfortunate departure from his well-nigh hysterical commitment to the *historicization* of the working class, in *The Making of the English Working Class*, Thompson takes for granted, or *naturalizes* the domestic division of labour – one crucial part of the sphere of social reproduction – and in so doing side-lines women, by and large, from working-class historical formation.⁶⁷ Likewise, Thompson passes over the role of racialized minorities in the making of the 'English' working class, expelling them, too, from historical memory.⁶⁸ So long as we are attentive to removing the blinkers that blind us to such historical oppressions and theoretical occlusions, however – Anderson's second protocol – we would do well to retain in our class-struggle approach to social movement study, an appropriately modified and expanded version of Thompson, in which his priorities of history, process, temporality, agency, culture, and subjectivity are taken with deadly seriousness, all within the boundaries of a logic of objective determination. Now to shift gears and turn our attention to some of the more potent current debates on manifestations of class struggle in contemporary capitalism and the appropriate emancipatory working-class strategy to assume in response.

PRODUCTION, REPRODUCTION, AND SOCIAL REPRODUCTION

Class under capitalism is irreducible to the exploitative relationship of the extraction of surplus value from wage-labour by capital that Marx anatomizes at the highest level of abstraction in Volume One of *Capital*.⁶⁹ In Cinzia Arruzza's apt formulation, 'to try to explain what capitalist society is only in terms of surplus-value extraction is like trying to explain the anatomy of the human body by explaining only how the heart works'.⁷⁰ In Volume Two of *Capital*, as Bensaïd emphasizes, the introduction of circulation, and productive and unproductive labour, into the analysis broaches a radically more complex set of social relations than the immediate relation of production interrogated in Volume One. Here, in the second volume, through the sphere of circulation, we come to understand that 'the relation of buying and selling labour-power is no less constitutive of the class relation than the relation of exploitation disclosed in Volume One'.⁷¹ Finally, in Volume Three, reproduction as a whole is introduced as further specificity of the determination of the class relation.⁷² 'The partial determination of classes', outlined in Volumes One and Two, 'at the level of the extraction of surplus-value in the production process and the sale of labour-power in the circulation process', are in Volume Three, 'integrated into the overall dynamic of competition, equalization of the profit rate, the functional specialization of capitals, and the distribution of revenue'.⁷³ The implication is that the classes are determined, in the fullest sense, 'by the combination of the relation of exploitation in production, the wage relation and the productivity/non-productivity of labour in circulation, and the distribution of revenue as a whole'.⁷⁴

We find ourselves back at totality, 'a versatile, contradictory totality, continually in movement, with relations of exploitation and alienation that are constantly in a process of transformation'.⁷⁵ So far, though, we have only specified with any depth production and reproduction, and not the more specific domain of social reproduction, a longstanding concern of some of the best work in Marxist feminist analysis.⁷⁶ That said, two caveats are necessary. Early formulations of social reproduction theory downplayed the importance of race and racism, and the fact that much of the latest work in this current of intellectual production takes race and racism to be foundational to its analysis is no doubt in part a consequence of an engagement with the intellectual and political contributions of Black feminism.⁷⁷ This particular intellectual debt of social reproduction theory extends, too, to the best of intersectional theory, even though many social reproduction theorists ultimately identify limitations to the philosophical foundations of intersectionality.⁷⁸ A second caveat: social reproduction theory is not the first current of feminism to bring to the fore the theoretical and political centrality of socially reproductive labour in the turnover of capitalist social relations. Here, key precursors were the Italian feminists Silvia Federici and Mariarosa Dalla Costa,⁷⁹ even if, once more, much of contemporary social reproduction theory departs from the claim made by the Italian school that socially reproductive labour directly produces value.⁸⁰

Social reproductive labour is the work involved in maintaining and reproducing human life. Under capitalism, most of this labour has been performed, unpaid, by women within the family unit; but portions have also been carried out, to different degrees in different social formations and in different historical periods, by the welfare state or through the market, with variations traceable in part to the strength or weakness of feminist struggle in distinct settings and circumstances.⁸¹ In some definitions, the circuit of social reproduction is not limited to childbirth, child-care, and kin-based maintenance and reproduction of wider human life within the family unit, but also extends outward further to include education, health care, leisure institutions, and care for the elderly.⁸²

Incorporating social reproduction seriously involves a widening of our conception of class relations, class struggle, and the working-class subject beyond the workplace. Such a totalizing conception allows for the elucidation of ‘myriad capillaries of social relations extending between workplace, home, schools, hospitals – a wider social whole, sustained and co-produced by human labor in contradictory yet constitutive ways’.⁸³ One finds, across actually existing societies in the contemporary world, that these social relations are constituted by ‘the chaotic, multi-ethnic, multigendered, differently abled subject that is the global working class’.⁸⁴

Recall that the logic of capitalist accumulation acts as an objective determination across the united spheres of production, reproduction, and social reproduction, in terms of the imposition of constraints, or the setting of limits to behaviour. Recall as well that there is no automaticity in this relation, no mechanistic formula whereby outcomes are predetermined. Rather, capitalism, within the boundaries of its laws of motion, is ‘subject to contingencies, accidents, and conflicts’.⁸⁵ With regard to social reproduction, this suggests that the different forms assumed by the labour of social reproduction in different societies and across distinct time periods – the balance of the market, state, and family in its execution – ‘remains a contingent question that depends on specific historical dynamics and feminist struggles’.⁸⁶ The fact that struggle partially determines the form of labour of social reproduction in capitalist societies has crucial implications for an expanded Marxist sense of class struggle and the class dynamics of multiple movements. This is because it is also true that ‘the way social reproduction functions within a given social formation has an intrinsic relation to the way that production and reproduction of societies are organized in their totality, and therefore to class relations’.⁸⁷ There is an organizing logic to the intersection of these battles and not merely a series of contingent collisions.⁸⁸

A totalizing perspective starts to bring to the foreground the shape of *general* capital, pitted against *labour* in general. The trade union battle in the workplace, or even across a series of workplaces – whether it be for higher wages, healthier and safer conditions, or the slowdown of intensity of the labour process – is on its own a partial battle of specific segments of labour against specific capitalists. *Capital’s* power ‘in general’ requires activity beyond the economic. ‘If we take our lead from Marx himself’, Tithi Bhattacharya points out:

[t]hen it is utterly unclear why *only* the economic struggle for wages and benefits at the workplace must be designated as class struggle. Every social and political movement 'tending' in the direction of gains for the working class as a whole, or of challenge to the power of capital as a whole, must be considered an aspect of class struggle.⁸⁹

What is more, as Rosa Luxemburg suggests in *The Mass Strike*, when class struggle reaches a certain mass pitch, the economic and political moments of resistance tend to reinforce and strengthen each other, even as they open up onto bigger, potentially revolutionary questions of the transformation of state and society writ large – the contest of capital *in general* versus labour *in general*.⁹⁰

CONCLUSION

Social movement scholars departed from an interest in capitalism in the 1980s, and that departure continues to cast a long shadow over the present. The cumulative emptying out of intellectual sophistication and political comprehension was coextensive with transfigurations in the global working class and the dawn of neoliberalism. Developments on the ground were incommunicable in the new language of social movement studies. At the heart of the matter, the terrain of international class struggles was radically reconfigured by the roll-out of neoliberal restructuring, with huge setbacks for the global working class.

Mainstream social movement studies have been ill-equipped to respond theoretically to new developments in class struggle since the 2008 crisis of global capitalism and attendant socio-political change mainly because it has lost an interest in capitalism over several decades. Identity-oriented theorists shifted away from class, economy, and state to culture, meaning, civil society, and constructed identities, while conceptualizing these things in the polarized terms of 'new' and 'old'. Strategy theorists, meanwhile, gradually departed from an early interest in capitalism and state formation, shifting to short-term and fragmented studies of supposedly autonomous politics, institutions, and structural opportunities. Bringing capitalism back into our study of social movements reorients our entire outlook and draws otherwise invisible connections between superficially disparate local movements. The logic of capitalist accumulation infuses the dynamics of all these movements and sets limits on their myriad hopes and aspirations.

Attention to capitalist totality can help to transcend a tendency in social movement studies towards a fragmentation of subject matter and the abandonment of totalizing theory. Politically, it is also important in terms of strategic orientation insofar as it can assist in making visible existing commonalities between distinct movements, and the possibilities of forging new commonalities where none presently exists.

Relatedly, the multidimensional, historical, and processual approach to class struggle offered earlier allows for the insertion into social movement studies of the most important theoretical component of Marxism in this domain; that is, the

stress on *class dynamics* in every movement, as distinct from sometimes thinking in class terms, and otherwise not so much, or not at all. The theory of class-struggle advanced has offered a way of tackling the complexly organized, mediated, and articulated social relations of oppression and exploitation under capitalism, and the forms of resistance they engender. Class struggle is not reducible to the point of production, the domain of surplus value extraction from wage-labour by capital. Instead, the terrain of class struggle extends to the complex battlefields of circulation and reproduction, and over the forms of labour of social reproduction, which in concrete and historical capitalism is always gendered and racialized.

Since the onset of austerity following the early years of the latest crisis in global capitalism, successful defensive – much less offensive – actions of the left have been few and far between. The far right is outpacing our side with alarming efficacy. At the same time, there are important processes of renewal and even effervescence taking place. The moment has come, clearly, to reinvent ourselves, while remaining loyal to our subjugated ancestors. ‘Start all over? Certainly. But not from zero. Not from nothing, from a blank page or a clean slate ... One always begins in the middle’.⁹¹

- 39 For a recent attempt to continue in the broad analytical Marxist tradition of Cohen, and owing significantly to the class theory of Erik Olin Wright, see the recent work of Vivek Chibber. Chibber defends what he calls 'a materialist class analysis', consisting of 'a theory in which class is defined by agents' objective location within a social structure, which in turn generate a set of interests that govern those agents'

social action'. For Chibber, his materialist analysis does not deny 'that class does operate through culture, but it does so in a way that preserves the autonomous influence of economic structure'. Vivek Chibber, 'Rescuing Class from the Cultural Turn', *Catalyst*, 1.1 (2017), 27–55 (pp. 29–30). Distinct from the approach advanced in the present intervention, Chibber's analysis boils down to a two-stage methodology of class, which begins with the autonomous structure and moves to the separate moment of class formation, wherein contingent 'culture-generating actions', witnessed in some historical periods and places, but not in others, may help to overcome problems of vulnerability, interest aggregation, and free riding. Thus overcome, there is a possibility of workers assuming solidaristic collective resistance to their plight under the conflictual class relations inherent to capitalist structure, rather than the equally plausible, in fact even more probable, outcome of individual accommodation.

Riot

Joshua Clover

INTRODUCTION

Riots are a longstanding, well-remarked, and broadly contested activity within the ‘repertoire of collective actions’ (Tilly, 1977: 493) through which groups try to change their circumstances. Understood as responses to market conditions, and particularly as struggles over the price and availability of market goods, they develop with the development of world trade, particularly of staple grains, drawing on precursors including peasant uprisings and slave rebellions. They are arguably the leading form of collective action from the fourteenth to the eighteenth centuries, at least in the regions that will form the capitalist core, on which this chapter focuses. The term is early on associated with debauchery and tumult; the modern sense of collective and disorderly violence is formalized with Great Britain’s ‘Riot Act’ (1714). However, the varied and inexact definitions which have become entrenched, oriented mostly by unsanctioned violence and public disorder, have largely served to obscure the historical basis of riots and in turn made an adequate theorization difficult. The early riot’s seeming orientation toward market prices, exchange, and consumption (features understood as common to multiple modes of production), rather than toward the particulars of capitalist production, has presented further obstacles to adequate Marxist theorization, which this chapter hopes to rectify.

Debates about the politics of riot have revolved around their causes, intentions, and outcomes. While from a Marxist perspective all history is the history of class struggle, the political question of riot, particularly regarding its relevance to

Marxism and vice versa, lies in *whether it is a form of struggle pertaining to capitalism's particular class structure*. This question includes whether riots effectively advance class politics and, subtending such inquiries, whether they can be grasped as arising from and within capital's material determinations and its stratification of society. Given these considerations, it is apparent that riot cannot escape comparisons with strike, which shifts the terrain of struggle to the workplace and the price of labor, and takes pride of place as the primary form of collective action, albeit unevenly, in the nineteenth century. After this point, and particularly after the 1830s, the historical constancy of riot across the early industrializing nations in turn diminishes without ever vanishing – until it begins to return again in the late twentieth century. These various and connected concerns set the terms for how the political significance of riots might be evaluated by historical materialists.

Herein the riot is understood as the exemplary form within the broader category of 'circulation struggles' conditioned by historically given circumstances of capital and class developing across time (Clover, 2016). In the simplest sense these are the forms of struggle available to those who cannot engage in production struggles such as the strike, most directly because they are excluded from immediate access to the wage via unemployment, informalized labor, and so on. Such exclusions have many determinations, but in the contemporary era are understood to derive from capital's increasing productivity in the manufacturing and industrial sectors, following on massive productivity increases in the agricultural sector, with these populations unable to be absorbed in full by the service sector (Gallman and Weiss, 1969; Kendrick, 1961). Because these exclusions are racialized, the riot both appears to be and is a racialized phenomenon; moreover, it regularly takes the form of direct antagonism with the state rather than capital. These have further obscured its political-economic bases and rendered the riot consistently illegible to both bourgeois and Marxist thinkers.

MAINSTREAM AND MARXIST CRITICISMS

Bourgeois common sense has generally held that riots are 'compulsive, rather than self-conscious or self-activating: they are simple responses to economic stimuli'; E. P. Thompson, surveying British historians of early-modern bread riots, describes this as the 'spasmodic view' (Thompson, 1971: 78). These irruptions are compulsive, rather than self-conscious or self-activating, lacking ratiocination much less political calculation. Such conceptualizations have proved durable. They are renewed in the positivistic, quantitative science of, e.g., the New England Complex Systems Institute. Their 2011 study, focused on low-wage nations, charts a single correlation wherein the authors 'identify a specific food price threshold above which protests become likely' (Lagi et al., 2011: 1). There are more nuanced departures from these underlying suppositions, articulating unbearable rises in commodity prices with broader economic changes, such as the IMF restructuring

programs and enforced trade relations that provide the conditions for precarious food regimes. Emphasizing the constructedness of famine and dearth, these accounts nonetheless assume a veritably autonomic mechanism of stimulus and response. The effective definition of riot here is conditional. It is simply what happens once food prices achieve a certain apogee, a version of the approach Thompson dismissed among 'growth historians' for 'obliterating the complexities of motive, behaviour, and function, which, if they noted it in the work of their marxist analogues, would make them protest' (Thompson, 1971: 78).

Marxist (and more broadly leftist) orthodoxy regarding riots has often followed the bourgeois ideological view, sometimes closely. In the thinnest analyses, they are treated as consumerism run amok, a simple reflection of capitalist ideology. 'We have been all coerced and seduced to view shopping as the recipe for good life and the principal solution of all life problems – but then a large part of the population has been prevented from using that recipe', wrote the sociologist Zygmunt Bauman about the 2011 riots in the UK. 'City riots in Britain are best understood as a revolt of frustrated consumers' (Bauman, 2011). More theoretically ambitious accounts have also tended to replicate the 'spasmodic' approach. Compare Slavoj Žižek's verdict on the London riots of 2011: 'it is difficult to conceive of the UK rioters in Marxist terms, as an instance of the emergence of the revolutionary subject; they fit much better the Hegelian notion of the "rabble", those outside organised social space, who can express their discontent only through "irrational" outbursts of destructive violence' (Žižek, 2011). A parallel orthodoxy, identified with a socialist strain of Marxist thought defined by its 'labor metaphysic' (Mills, 1960), simply reinscribes riots as labor struggles, a subspecies rather than dialectical other of the strike. Compare the Global Social Protest Research Group, which found in the same array of 2011 events a new 'Protest of the Stagnant Relative Surplus Population' which could nonetheless be filed under 'Global Labor Unrest' (Karatatli et al., 2015: 192). Both of these are forms of question-begging: organized labor struggles are simply presupposed as primary.

These entangled accounts have become entrenched for numerous reasons. From the bourgeois perspective, the exclusion of riots from the realm of reason, much less political legitimacy, allows maximum criminalization, along with a diminished obligation to address social demands. The position of what one might call 'left paternalism' offers greater sympathy while still excluding the riot from political salience, unable to locate it within the dialectical development of capitalism and finding it instead to be isolated spasm, throwback, or aberration. From the socialist perspective, the double conclusion that one's status as a laborer provides the only universal relation under capitalism, and that the 'point of production' (a term that often confuses surplus value production and the production of goods) offers the greatest vulnerability for capitalism, has led to the valorization of the productive wage-laborer as the true revolutionary subject and to the habitual affirmation of the labor strike (with accompanying development of the worker's party) as the necessary and sufficient form of collective action.

One notable break with this tradition, communist if not Marxist, is that of Alain Badiou. He registers that the riots of the new millennium, again with particular reference to 2011, possess a logic internal to capitalist modernity, if not to capital itself. They are at once abstractly and concretely historical. He identifies them as an abstract-periodizing fact in the course of its own realization, so that 'several peoples and situations are telling us in a still indistinct language that this period is over; that there is a rebirth of History. We must then remember the revolutionary Idea, inventing its new form by learning from what is happening' (Badiou, 2012: 87). The Idea arises from the event of the riot, to which it then provides an organizational force and duration.

In this schema, rather than a linear, progressive history, there is a concrete alternation between periods in which 'the revolutionary conception of political action has been sufficiently clarified ... and on this basis has secured massive, disciplined support', and 'intervallic periods [when] by contrast, the revolutionary idea of the preceding period ... is dormant' (Badiou, 2012: 38–9). Lacking an ordering idea, these latter periods give rise to the expression of that disorder in the proto-political mode of riot. Badiou sees an 'uncanny resemblance' between our recent past and the French Restoration following the final defeat of the Republican spirit, when 'from the start of the 1830s it was a major period of riots, which were often momentarily or seemingly victorious ... These were precisely the riots, sometimes immediate, sometimes more historical, characteristic of an intervallic period' (Badiou, 2012: 41).

This account provides a useful recognition of riot as historically grounded rather than untimely. It nonetheless repeats the sequestration of the riot from effectively organized political action: these are grasped as distinct rather than continuous phenomena. Moreover, Badiou's account is limited by the impossibility of transposing the specific intervals of French political history onto the globe, or in a more limited sense onto the capitalist core, as well as the more general problem of consigning riots to the autonomy of the political and accompanying evental logic. In this sense such an account is the obverse of the one advanced by the New England Complex Systems Institute, as discussed earlier. If the latter presents the riot as an economically hyper-determined spasm, the former poses the riot as an underdetermined political event.

THE RIOT RETURNS

For materialists, all of these conceptions of riot come under increasing pressure toward the close of the twentieth century. Empirical challenges include the waning of various workers' movements and parties in the early industrializing West; the dramatic decline in large-scale labor actions, particularly within the industrial and manufacturing sectors; and the increase in riots, both as a general tendency and by comparison to strikes.

In this period across the West, riots, sometimes understood as rebellions and uprisings, have been consistently and misleadingly identified as ‘race riots’, associated primarily with blackness in the USA, and with non-white immigrants in continental Europe and the UK. This term risks confusion in that it proposes racial difference and conflict as sufficient explanations, while also eliding the long history of ‘white riots’ designed to subordinate non-white communities (from the San Francisco Riot of 1877 against Chinese immigrants through the Chemnitz riots of 2018 and beyond). Entangled with this racialization of the riot has been the manner in which the socialist tradition in particular has understood the strike as intentional, organized, effective, and part of a revolutionary trajectory, while the riot is instead viewed as irrational, unorganized, ineffective, and non- or even counter-revolutionary. This in turn aligns with the longstanding convention of associating reason with subjects of the European Enlightenment, instinct and unreason with non-white subjects. Finally, this traditional understanding has consistently disassociated the tactic of riot from socialist and communist politics and further from immediate relation to labor markets, a series of errors against which, for instance, the ‘Red Summer’ of 1919 provided a decisive verdict.

Consequent to all of this, strike and riot have often been tacitly coded as expressions of class and race respectively, seeming to rehearse at the level of practical activity a now familiar confrontation between socialism’s insistence on the primacy of class against ethnic studies/postcolonial analyses that foreground race. These aspects in conjunction have posed a specific analytical danger for Marxists: put most directly, the exclusion of the self-activity of non-white populations from the properly political. This tacit exclusion has come under intense pressure in, e.g., the USA in the years since 2013, as rebellions under the loose heading of ‘Black Lives Matter’ – notably the riots spreading from Ferguson, Missouri after the police killing of Michael Brown in 2014 and the George Floyd Uprising in 2020 – have provided the most dramatic and protracted examples of proletarian struggle.

Riot thus poses two fundamental challenges for materialist thought in the twenty-first century and onward. First, the historicity of collective action more broadly within and against capitalism: whether there is a single transcendental form of collective action, or whether leading forms are subject to change in response to changes in the composition of capital and class at a global level. Second, the necessity to further develop understandings of the material determinations that co-constitute race and class.

DEFINING RIOT

The primary difficulty in defining the riot devolves from its profound association with public violence and disorder. Contemporary legal definitions of riot

associate it with, e.g., ‘any group of twelve or more people attempting to assert their will immediately through the use of force outside the normal bounds of the law’ (Gilje, 1999: 4). In a more generalized definition, a riot:

[i]nvolves at least one group publicly, and with little or no attempt at concealment, illegally assaulting at least one other group or illegally attacking or invading property ... in ways that suggest that authorities have lost control ... the attacks on another group or on property to reach a certain threshold of intensity. (Halle and Rafter, 2003: 347)

While developing a nuanced framework, William Sewell, building on Charles Tilly’s study of French history, also returns to the orienting fact of violence: ‘Tilly’s essential argument can still be explicated most economically by using his typology of competitive, reactive, and proactive violence’ (1990: 529). This focus obscures arguably more significant orienting facts. No doubt many riots involve violence – perhaps the great majority, if one includes property damage in the category, as well as explicit or *sub voce* threats. It is not altogether clear that such extensions to the notion of violence are either self-evident or reasonable. That property damage equals violence involves a kind of moral affinity for property which is devoid of any truth value.

Moreover, across more than two centuries, strikes have quite often involved violence as well as pitched battles between workers and police, scabs and mercenaries, which at their zenith resemble military engagements (see, for example, the Battle of Blair Mountain, 1921). If one extends the category of violence to threats on property, it is ubiquitous in the strike, even as a kind of defensive counter-violence. Reporting from France in 1968, Angelo Quattrocchi noted that ‘Workers can threaten to smash the machinery, and the threat alone can prevent an armed intervention. Masters of the factory, their condition of dispossession is their very strength. The machines, the Capital, owned by others and by other manipulated, are now in their hands’ (Quattrocchi, 1998: 49). The real situation he describes, the potential for workers to dispose of the gears of production as they see fit, is at the heart of the strike. In the most confusing concatenations, riot appears as something like the violent phalanx of the labor movement. ‘Even in the opening years of the nineteenth century, just as workers refined their strike tactics, coercion was needed to enforce unity and to persuade owners of the legitimacy of the laborers’ demands’, writes Paul Gilje. ‘Force was often garnered to meet force, and riots and violence represent the signposts of American labor history from the 1830s to the twentieth century ... much of the history of American labor is written in blood as riots’ (Gilje, 1999: 3).

It is clear from this confusion that some other standard is necessary to distinguish between riot and strike. If not violence, what then? Thompson provides the basis for an answer in ‘The Moral Economy of the English Crowd in the Eighteenth Century’. Taking issue with the reductions and depoliticizing force cached within the term ‘bread riot’, he produces a more systematic vision of the riot’s political economy:

It has been suggested that the term 'riot' is a blunt tool of analysis for so many particular grievances and occasions. It is also an imprecise term for describing popular actions. If we are looking for the characteristic form of direct action, we should take, not squabbles outside London bakeries, nor even the great affrays provoked by discontent with the large millers, but the 'risings of the people' (most notably in 1740, 1756, 1766, 1795 and 1800) in which colliers, tanners, weavers and hosiery workers were prominent. What is remarkable about these 'insurrections' is, first, their discipline, and, second, the fact that they exhibit a pattern of behaviour for whose origin we must look back several hundreds of years: which becomes more, rather than less, sophisticated in the eighteenth century; which repeats itself, seemingly spontaneously, in different parts of the country and after the passage of many quiet years. The central action in this pattern is not the sack of granaries and the pilfering of grain or flour but the action of 'setting the price'. (Thompson, 1971: 107–8)

Thompson moves from this to a more broadly applicable formulation: 'Economic class-conflict in nineteenth-century England found its characteristic expression in the matter of wages; in eighteenth-century England the working people were most quickly inflamed to action by rising prices' (Thompson, 1971: 79). R. H. Tawney had made much the same point while ending with the perspective of the emerging capitalist: 'The economy of the mediaeval borough was one in which consumption held somewhat the same primacy in the public mind, as the undisputed arbiter of economic effort, as the nineteenth century attached to profits' (1926: 33). Surveying the volatility in the UK in the early nineteenth century (traditional food riots and risings, Speenhamland relief, machine-breaking, minimum wage struggles), Thompson notes, 'We are coming to the end of one tradition, and the new tradition has scarcely emerged' (Thompson, 1971: 128–9).

We can deduce from this a theoretical pairing of price-setting and wage-setting. Posing this against the historical shift from riot to strike, we are now able to produce an adequate definition of the two. In the first instance, *riot is the setting of prices for market goods, while strike is the setting of prices for labor power*. The purchase of market goods and the sale of labor-power, market dependency and wage dependency, are two bases for reproduction of the household and the individual, and of the local community. Around the turn of the nineteenth century, social reproduction shifts its center of gravity from one location to another, from widespread market dependency following on from destruction of subsistence agriculture to the widespread wage dependency that necessarily follows.

Consumer and laborer however are not two theoretically opposed (much less historically successive) classes, but rather two moments within the reproduction of a single class: the emergent modern proletariat who must make its way within the wage-commodity nexus. If one moment takes precedence over the other, this speaks to the given degree of technical and social development within a society, and the situation of the proletariat therein. In riot, those setting prices in the marketplace may also labor (note Thompson's 'colliers, tanners, weavers and hosiery workers'), but this is not the immediate fact which has brought them there. This recognition allows a refinement of our definitions.

The strike is the form of collective action which:

- 1 struggles to set the price of labor-power (or the conditions of labor, which is much the same thing: the amount of misery that can be purchased by the pound);
- 2 features workers appearing *in their role as workers*;
- 3 unfolds in the context of capitalist production, featuring its interruption at the source via the downing of tools, cordoning of the factory floor, etc.

The riot is the form of collective action which:

- 1 struggles to set the price of market goods (or their availability, which is much the same thing, for the question is similarly one of access);
- 2 features participants with no necessary kinship but their dispossession;
- 3 unfolds in the context of consumption and in circulation more broadly.

While this heuristic apparatus is simple but powerful, and suffices well into the twentieth century, it nonetheless poses problems for the present. The characteristic riots of the late twentieth and early twenty-first centuries in the capitalist core, arising alongside the strike's last flourishing, cannot finally be understood adequately within the framework of price-setting, even in Thompson's expanded sense, in the main because of their character as consistently racialized struggles. But neither can they be understood without reference to that framework.

It will prove more historically and theoretically capacious to relocate strike and riot within broader conceptual categories that help constitute the repertoire of collective action, albeit categories requiring further explication: *production struggles* and *circulation struggles*, with the strike and riot, respectively, functioning as exemplary but not exhaustive forms. This will allow us to understand riots and their transformations, as historical materialism demands, within the larger trajectory of capital's technical and social development. Since our concern here is with riot, we will focus on circulation struggles, that is, struggles taking place within the context of distribution, exchange, and consumption.

CIRCULATION STRUGGLES AND SURPLUS POPULATION

The identification of riot as an exemplary form within the larger conceptual category of the circulation struggle, rather than as a unique and irrational form of social violence, provides the opportunity to consider it more directly in relation to Marx's theoretical and historical categories. We must first reckon with the idea that the spheres of production and circulation can be treated *as if* independent from one another, at least for the sake of conceptual clarification, even as we know that they are dialectically conjoined and that to speak of one is always to speak of the other.

Certainly, Marx does not hesitate to treat them as both theoretically and empirically distinct. He is at great pains, for example, to demonstrate that accumulation

cannot arise in circulation while profit can (Marx, 1976: 258–69) and, more broadly, that production and circulation are the spheres of valorization and realization respectively, oriented by distinct functions of capital. On the one side, no commodity is ever given to bear price in the process of production, only value; on the other, no commodity in the marketplace is ever exchanged for value, only for price – this alone should be clear enough. That each sphere requires the other, and that they overlap (notably in the purchase of labor-power) does not argue against treating them as distinct. Marx himself marks this conceptual operation in a well-known passage, explaining that ‘The consumption of labor-power is completed, as in the case of every other commodity, outside the market or the sphere of circulation’. Significantly, he turns immediately to describe the two spheres, in addition to being useful abstractions within the complex process of capital’s expanded reproduction, as each having their own *social existence*: ‘Let us, therefore, in company with the owner of money and the owner of labour-power, leave this noisy sphere, where everything takes place on the surface and in view of everyone, and follow them into the hidden abode of production’ (Marx, 1976: 279), a passage that takes us through both the metaphorical and real factory gates.

Given that certain activities and circumstances, both abstract and concrete, might be located meaningfully in production or circulation, one might in turn think of the extent to which capital and proletariat locate their existences in the two spheres at any given historical conjuncture. Critically for our understanding of the riot, valorization and realization do not exist in perfect equilibrium. Indeed, the suggestion that they do, that every valorization is met with realization and every realization spurs further valorization, merely restates Say’s Law, which insists that there can be no general glut because of the economy’s self-equilibrating nature, a law commonly and concisely rendered as *supply creates its own demand*. It is this very law that Marx debunked, however, limning in some detail the possibilities and actualities of disequilibrium between production and circulation as the moments M-C and C-M become increasingly independent (Marx, 1992: 681). The history of capital and in particular of capitalist crisis is in some regard the history of progressively greater imbalances between the two spheres, brought back violently into alignment.

Following Giovanni Arrighi’s work in *The Long Twentieth Century* (1996) (which itself follows the course marked out by Fernand Braudel’s work on the Mediterranean as well as his *The Perspective of the World: Civilization and Capitalism, 15th–18th Century* (1992)), we might thus speak of periods of industrial and financial expansion for a given economic power, the latter following consistently on the former as industrial expansion reaches its limits. In the former period, accumulation proceeds apace as production holds sway and circulation serves its needs. In the latter, as industrial and manufacturing profits wane, reinvestment in productive sectors wanes in turn. With this shift, the strategies for profit available to firms shift to the zero-sum sphere of circulation, as non-productive sectors redistribute extant wealth without adding to accumulation. Finance serves here as the exemplary form of capital’s recirculation without

production, hence the concept of an economy's 'financialization', though other non-productive enterprises also rise to the fore, such as insurance, real-estate speculation, and in the present, phenomena such as Google, Facebook, and other concerns whose revenue is mainly accrued through advertising.

We might think of this historically regular development as capital's shift into the sphere of circulation. We must insist one last time that this does not imply that the sphere of production no longer operates, nor that the two spheres have become autonomous – simply that capital's center of gravity shifts from one to the other as strategies for profit and opportunities to earn the average return on investment change. This accurately represents sectoral profitability in the early industrializing core for the latter twentieth century. Moved by the anarchic choices of individual firms seeking profit wherever it is to be found, the total capital rebalances itself toward the sphere of circulation.

It is a relatively straightforward matter to note that this historical motion has a companion motion with which it shares a classically dialectical unity. As a greater fraction of capital shifts into circulation, so does a greater fraction of the proletariat. This is true in at least two senses. The first is that more laborers find work for firms which conduct circulation-based work, centered on distribution, exchange, and consumption. This theoretical certainty is also an empirical verity, unless one believes that certain sectors once thought unproductive have become productive, an argument advanced largely by enthusiasts of the technology sector, as well as by the narrower Italian tradition of *operaismo/autonomia* with its hypothesis about the 'social factory' (Tronti, 1992: 137). Be that as it may, the newly hegemonic forms of labor move increasingly away from the 'point of production' in the postindustrial core, in part via offshoring of labor to locations with lower labor costs, and more dramatically via automation of manufacturing and industrial production (it is in this sense that 'postindustrial' refers not to the end of industrial production but to the waning of industrial employment). Moreover, the period in question is characterized, much as predicted by Marxist theory, by an intensified crisis character within the larger economy which militates against any systematic claim that new sources of accumulation have replaced the losses in the traditionally productive sectors. In this period, recessions (to use the conventional category) are longer, deeper, and most distinctively, feature recoveries that temporarily restore profitability without commensurate restoration of employment. This has led to increased projections of the 'natural rate of unemployment', increases in 'structural unemployment', decreased thresholds for achieving so-called 'full employment', and a return to once-discarded theorizations of 'secular stagnation' among bourgeois economists (Bernanke, 2015; Hansen, 1939; Summers, 2014).

All of these formulations endeavor to describe much of what one would expect according to a Marxist account wherein intercapitalist competition compels ever greater productivity and thus, once expansion ends, throws an ever-greater percentage of the population out of sectors that can be effectively automated. If these former cannot be absorbed by other sectors, this assures the development of a:

[s]urplus population, whose misery is in inverse ratio to the amount of torture it has to undergo in the form of labor. The more extensive, finally, the pauperized sections of the working class, and the industrial reserve army, the greater is official pauperism. *This is the absolute general law of capitalist accumulation.* (Marx, 1976: 798)

Summarizing the argument of the first seven sections of *Capital*, Marx here provides a thoroughgoing account of the proletariat's tendential drift away from the brief historical respite of the regular wage and back into wagelessness and informal employment, that circumstance often contemporarily designated as 'precarity' – a condition that straddles both circulatory labor and unemployment. And so finally we have three transformations of the proletariat in the period in question: an increasing fraction of waged labor conducted for firms that circulate rather than produce commodities; an increasing amount of informal labor, by definition not engaged in commodity valorization; and an increased amount of unemployment plain and simple.

The implications for forms of social contest of these transformations are clear enough. The power of a strike (or other production struggle) is premised on privileged access to a firm's means of production, as possessed by, e.g., factory workers. It is further premised on the tautness of labor markets which limit the replaceability of workers. Finally, deindustrialization and declining profits within productive sectors have led to massive migration into technologically stagnant fields where the absence of productivity gains bars the concomitant labor gains which together formed a double motion during the Long Boom. In a circumstance of stagnant capital where fewer workers possess this privileged access, where workers are more easily replaced both because of an expanded pool of available labor and the desperation of those excluded from the wage, the strike loses some degree of its historical force – a fact borne out by the trajectory of the organized labor movement in the postindustrial core. One would predict that surviving labor actions would themselves shift away from production, toward firms engaged in circulation or toward the public sector.

At the same time, circulation struggles necessarily gain in force. In the simplest sense, it is self-evident to note that unemployed people cannot strike; neither can those engaged in informal labor or 'petty production'. Should they wish to draw on the repertoire of collective action, they can only choose forms of struggle available to them. These forms will be found where this fraction of the proletariat finds itself, in the sphere of circulation. Circulation struggles inevitably unfold not in the factory but in the available spaces of the market in its broadest sense and in the public square – the two spaces designated by the classical term, *agora*. Moreover, the increase in firms engaged in distributing and exchanging goods implies that effective struggles against them can be conducted by anyone in the space of circulation. That is to say – to return to the definitions developed earlier – that struggles in the sphere of circulation are certain to involve workers but they need not appear as workers, as one does not require that privileged position to blockade a road, loot a store, or occupy a public square. The form of

the circulation struggle is indicative of the fact that the proletariat is not identical with the traditional working class but refers more adequately to all of those without reserves.

The set of developments outlined above provides a theoretical basis for the historical return of the riot and for circulation struggles more broadly, relating this return to the development of capitalism more generally. The increase in the frequency of riot both absolutely and in relation to strike registers a shift in class composition featuring a greater fraction of proletarians outside the formal wage, as well as a change in the concrete labors performed by the working class. This begins to demonstrate the way in which the riot and circulation struggle can and should be understood as forms of class politics – that is, as phenomena inextricable from, and explicable in relation to, recompositions of class and capital. This recognition does not however explain all the salient and self-evident features of the modern riot.

RIOT, RACE, AND CLASS

The modern riot in the postindustrial core persistently takes the form of racialized conflict featuring participants who are racialized as non-white. This understanding has clear limits. Historically, riots have been racialized since well before the current era, though in previous periods (notably from the mid-nineteenth to the mid-twentieth century) the racialized riot commonly featured the violent subordination of non-white populations by white rioters, and these persist, particularly in association with fascist and neofascist formations (though these riots do occur regularly in relation to the employment market, as in the anti-Asian riots following the Chinese Exclusion Act of 1882 or the aforementioned Red Summer of 1919, to take two cases from the USA). In the contemporary period there remain many and various forms of riot that do not seem oriented by race and much less subsistence, such as the sports riot, the party riot, and so on. Finally, large ‘race riots’ invariably include participants of heterogeneous races and ethnicities and yet the rioting population is often reduced in the public imagination to a single identity.

Nonetheless, the racialized riot has been, since around 1965, a leading form of political contest. These riots are often understood as uprisings or revolts, a useful registration of the dramatic political force which the conventional use of the term ‘riot’ serves to obscure. They are consistently initiated either by an act of violence, often murder, by a state agent or surrogate (generally a police officer) against a non-white person, or by attendant judicial impunity of the violent actor or actors. They often spread well beyond the site of the initiating event, even across national borders (well-known examples include Watts 1965, Newark and Detroit 1967, Attica 1971, Brixton 1981 and 1985, Los Angeles 1992, Paris 2005, Tottenham 2011, Ferguson 2014, and the George Floyd Uprising of 2020).

Much as the seeming visibility of race itself is a self-apparent phenomenon rather than the outcome of complex historical processes, so the racialized riot. Its reduction to a transiently politicized or non-political antagonism between police and racialized populations conceals beneath its surface truth a set of complex historical developments that make riot a possible or even likely outcome of such antagonism. These include the elaborated relationship between race and employment, which includes persistent racist policies within labor unions, exacerbated by 'last hired, first fired' policies during downturns, and the necessity for capital of preserving racialized differentials in the value of labor, so as to drive down wages more broadly.

In US cities, it is regularly the case that unemployment for black people is twice that of white people, and higher still for young black males. Similar data apply for immigrant populations in the UK and Western Europe, intensifying in periods of slow or no economic growth – particularly periods of and following 'crisis'. Surplus populations, this is to say, are inevitably racialized in the West. Absent wage discipline, these populations must be disciplined otherwise, and in this way a racialized surplus population is disciplined directly by the state to the benefit of capital. As Ruth Wilson Gilmore notes: 'The correspondence between regions suffering deep economic restructuring, high rates of unemployment and underemployment among men, and intensive surveillance of youth by the state's criminal justice apparatus present the relative surplus population as the problem for which prison became the state's solution' (2007: 113).

We might further note the geographical organization first of these racialized labor forces and then of those excluded from formal labor, a process often identified with urbanization and eventually with 'white flight' in the USA and the inverted but fundamentally similar process in the UK and Europe wherein near suburbs function as warehouses for immigrant labor and surplus populations (a pattern which has also begun to appear in the USA, with Ferguson, Missouri, a St. Louis suburb, providing a dramatic example). This spatial ordering allows, among other things, for a greater degree of direct domination in forms of policing populations not subject to wage discipline.

The intersections among racialized policing, low wages, and wagelessness begin to set forth the mutual constitutions of race and class as both theoretical necessities of capitalism (which originally seizes upon preexisting racialized dispossessions and shortly develops its own) and of the lived experience of race, the circumstance summarized in the formulation attributed to Stuart Hall: 'Race is the modality in which class is lived' (Hall et al., 1978: 394). The orienting riot of the modern era is a moment of race and class struggle which appears as racial antagonism. Such an inadequate account has been in turn inflected by readings of 1960s militancy formed by an antinomy between left liberalism and ethnic studies, which affirmed a race–class binary and aligned it with the axis of violence. Further, this coincided with the split between the Old and New Left, in which the former willfully aligned the purportedly pacific strike with class and with

strategic organization, and the presumptively violent riot with race and with non-strategic activity. Race, consequently, becomes the spoken or unspoken mediation through which the riot is once again presented as a spasmodic event, lacking properly political significance and excluded from thinkability as a form of class struggle. Thus are the vulgar clichés of early modern historiography transposed into the present as common sense. This has led to the effacement both of the self-activity of racialized communities and to an inability to register the riot as relevant to Marxist or communist inquiry.

CONCLUSION

In the first instance the riot is a form of class struggle because its form as well as its composition are subject to the determinations of class society and to the degree of capitalist development. The riot is the exemplary form of the broader and more significant category of circulation struggle. The shift from production toward circulation struggles is conditioned by recompositions of capital and proletariat, disclosing the limits to capital's accumulation in particular circumstances of waning manufacture and industry. It is at the same time and in the same motion conditioned by the reapportioning of the labor market away from these sectors; the increase in the surplus population and in the gap between working class and expanded proletariat; and the racialization of these processes across the West fundamental to capital's historically specific imbrication of race and class. The circulation struggle is thus both a site from which to consider transformations of capital, class, and race, and from which to grasp likely forthcoming developments in how struggle will unfold.

Postsecularism and the Critique of Religion

Gregor McLennan

OF TRIANGLES, TURNS, AND RETURNS

In *From Marxism to Post-Marxism?* Goran Therborn (2008: 119) noted that at the dawn of the twenty-first century, Marxism's hallmark 'triangle' – comprising historical-materialist social science, dialectical-materialist philosophy, and class-focused socialist politics – lay 'broken', probably 'irremediably'. This assessment came prior to the 2008 global financial 'crash', in relation to which Marx made a rather spectacular come-back as diagnostician of irrational capitalism. Yet such recognition was limited and did not dispel mounting doubts about both class politics and the existence of a specifically Marxist philosophy. Meanwhile, practitioners of historical materialism have backed away from any prescribed sequence of modes of production; from the presumed primacy of class within historical social formations; and from crude versions of base-superstructure causality holding across epochs. With that degree of latitude, religion can no longer be positioned as merely a derivative historical phenomenon. Thus, Marxists have sought to re-examine the question of religion in a more positive spirit than previous attachments to materialism dictated. In a pithy statement of this mood, Michael Löwy (2005) states the need for a decisive break with the simplistic 'Enlightenment' equation of materialism with progress/knowledge, and of religion with regression/mystification. If there are important differences between Marxism and religion(s), Löwy avers, there are also commonalities, notably a

shared commitment to trans-individual values and a politics of wager or faith in transformative emancipatory change, aspirations that lie beyond the full grasp of empirical and/or rationalist comprehension. The message is that if religions do (sometimes) operate ideologically in conformity with dominant class interests, they can also unmask and help transform oppressive social relations. In this chapter, I develop a four-fold typology of the different ways that Marxism and religion might partially be reconciled, with critical assessment of plausible examples of each category ('relative autonomy', 'anti-secularism', 'religionization', 'theologism'). The argument closes with a call for renewed attention to questions of Marxism and science.

One key problem facing all the 'sympathetic' approaches is that, within the Marxist tradition, its founder appears to be among the least hospitable to religion. David McLellan (1987), probably the best-known commentator on this question, largely consolidated the pre-existing Cold War view: that Marx basically despised religion and provided little evidence for its class-related or economic rationale. One task of what we might call postsecular Marxism has therefore been to lever out of the central texts a more 'appreciative' Marx. Religion, as famously announced in his *Introduction to the Critique of Hegel's Philosophy of Right*, was the opium of the people. But in addition to being dangerous, opium/laudanum in those days was also perceived as a flexible and effective remedy and stimulant, and a spur to creative envisioning. In the same passage Marx declared that the critique of religion was the very premise of all critique, implying that religious commitment/consciousness could play no part in the true path of philosophy (later: science). Yet in the philosophical lineage within which Marx was operating, 'critique' never meant simple rejection/negation; it meant being incorporated or 'sublated' within higher-level synthetic-dialectical comprehension. Marx's specific proposal was to turn the critique of religion *per se* into a critique of the social conditions that channelled the human need for collective fulfilment through 'fantastical' sacred realms and the agency of supra-human personalities. Such phrasings are now taken to represent a less intense mode of engagement than epistemological or ontological rebuttal. So, right alongside the 'opium' and 'premise' tropes, Marx accepts religion's substantial expressive and constructive features: as the heart of a heartless world, as protest against social suffering, as the source of moral sense-making and everyday cognition, as a kind of educative project (Marx and Engels, 1957: 41).

A further complicating factor is that Marx's early- to mid-phase theorizing generally took the form of *intellectualistic* ideology-critique: what Marx made of social phenomena in themselves was largely steered through polemics with thinkers whose abstractions and intellectual personalities he generally found partial, shallow, and self-glorifying. Thus, despite holding atheistic opinions, in *The Holy Family* and *The German Ideology* Marx obsessively sought to expose religion's principal critics as being entrapped – hypocritically – within the limited philosophical problematic of (abstract) truth/faith, in effect replicating rather than

superseding the structure of consciousness in question. The inordinate length and vehemence of Marx's tirades against the 'holier than thou' enterprises of 'Saint Bruno' (Bauer) and 'Saint Max' (Stirner) tend to count against him today; and in any case those particular opponents yielded insights that cannot be dismissed simply as 'religious', whether straightforwardly or deviously. Even so, what comes across in Marx's polemics is that the *refutation* of religion cannot be the principal focus and task. It is then but a short step to the conclusion that far from being its implacable enemy, Marx was rather ambivalent about religion's social role and political potential. Thus: the postsecular Marx?

Of course, there is no strict need for this terminology; the questions and observations are hardly new, after all. Yet despite its ragged conceptual sprawl and indeterminate goals (for different critiques, see McLennan, 2010a and Beckford, 2012), the rubric of a 'postsecular turn' remains useful. Prior to the 2000s, when the heat went out of the debates around postmodernism, few explicitly identified modern social theory's latent *secularism* as arguably its central (and most problematical) presupposition. As postsecular discourse has gained ground, this is now widely recognized, forming difficult terrain on all sides. Moreover, if we take the postsecular as a congeries of revisionist *questioning* rather than claims about a new societal *condition* as such, important themes are provocatively woven together in a way that demands fresh reflexive clarity on the part of anyone still wedded to a secular-atheistic understanding of human history or the human condition. Various, and sometimes cumulatively, postsecularists suggest that the secular and the religious – specifically Christianity – are historically and conceptually intertwined; that religion and science are not philosophically antithetical; that sociological secularization is a variable and reversible process; that the very idea of religion *qua* propositional belief is a Euro-Christian-secular construction; that the normative distinction between public and private, with religion assigned to the latter, is morally unjust and undemocratic; that the secular age means pluralization of ultimate concerns, not the decline or elimination of religion; that secular social science and its presumed 'methodological atheism' are ideological constructs; that religion remains unrivalled – and is nowadays *progressive* – in motivating personal and social transformation.

Clearly, these claims are not equivalent, neither are they of equal merit. Three basic disconnects should be registered straight away. One is that interrogating secularism does not necessarily amount to a vote *for* religion. Thus, one manifesto for 'continental philosophy of religion' which seeks to be 'faithful to the postsecular event' warns against the 'new imperialism' of the 'theological post-secular' (Smith and Whistler, 2010: 11, 14). It is also tendentious to assume that intellectual secularism – what Charles Taylor (2007) describes broadly as commitment to the 'immanent frame' – entails *political* secularism, in the sense of neutral liberal governmentality. In *On the Jewish Question*, Marx argued that the image of the democratic state as guarantor of popular sovereignty and religious freedom alike represented a kind of meta-religious projection in secular garb.

The executive authority of the state, Marx thought, assumes the status of divinely appointed intermediary, guardian of the spiritual democracy in which virtuous citizen-souls are accorded their God-given freedom – and must offer humble adulation in return. Only fully social emancipation, Marx insisted, not the ‘fair’ extension of political rights, would free Jews and Christians alike from inequality and oppression – and eventually from religion itself.

Third, the presumed *prevalence* of ‘strict, narrow’ secularism in Western thought; the pervasive *slippage* in the literature between secularism and atheism; and their supposed conjoint *hostility* to all expressions of religion, are interconnected postulates that should be disputed. As the introduction to the recent *Oxford Handbook of Secularism* makes clear (Zuckerman and Shook, 2017), secularism and secularity are nowadays very pliable ideas.

RELATIVE AUTONOMY

The Marxist approach to religion has habitually been handled as one principal aspect of the theory of ideology, which for many decades in the twentieth century was taken both by orthodox Marxists and their liberal opponents as a matter of identifying the superstructural forms of ‘false consciousness’ that sustained the material interests of ruling classes. For almost as many decades subsequently, that reductionist conception was displaced in favour of ‘relative autonomy’ of one form or another. According to this, class societies do generate understandings that naturalize existing social hierarchies and screen out alternatives. But those ideologies are not necessarily *invented* for that purpose by ruling groups; the social structure as such does not directly *cause* them to arise; and such success as ideology achieves is often only *partial* and contested. Thus, the fit between socio-economic interests and cultural forms (such as religion) should be conceived as loose, contingent – *relatively* autonomous, not completely determined by class-structural processes and interests.

Louis Althusser (1971), often referenced in this context, elaborated the general conception of ideology in terms of a ‘religious’ logic of identification, in which subjectivity is constituted in being ‘hailed’ or interpellated by the original authoritative Subject. Through this mechanism of simultaneous recognition and submission, our part in the rightful imaginary scheme of things is secured. It follows that, rather than being the vehicle of identity/mystification in only class-dominated societies, ideology’s psychic structure has an ‘eternal’ status, essential to the functioning of all social orders (including communism). For ex-Marxists like Paul Hirst (1979), this dramatic conclusion only showed the logical incoherence of Althusserian ‘relative autonomy’. Hirst insisted that either a *necessary correspondence* holds between ideological forms and the economic base/class positions, or there is a *necessary non-correspondence* – no conceptual third way is viable.

US historian of class and racism Alexander Saxton offers one reappraisal of religion that appears to take up the ‘fully autonomous’ option. The founders of historical materialism, Saxton argues in *Religion and the Human Prospect* (2006), gave no workable definition of religion and treated it negatively as (dominant) class ideology, at least in capitalist society (because they noted its radical potential in early Christianity and in peasant rebellions). Marx also over-borrowed from Feuerbach’s divinized conception of humanity, transferring this Promethean idealization to the figure of the modern proletariat, thus endowing the latter with endemic, far-seeing irreligiosity. Yet this was an empirical and political blunder born of atheistic dogma, Saxton insists. Had Marx and Engels been better historical materialists, they would have realized that religion as a social phenomenon pre-dates the division of labour and class society (and thus ‘ideology’ itself). In evolutionary terms, religion has operated as a collective survival mechanism, countering the terror and dominion of death. And had they been more astute humanists, they would have perceived that religion commands vital emotional resources that materialist explication fails to recognize.

Saxton’s critique is not entirely cogent. For example, he does not conclude from his analysis that Marx and Engels were *wrong* to be ‘nonbelievers and foes of institutionalized religion’; neither does he deny that religion functions ‘ideologically’ in certain circumstances (2006: 150, 160). But this then looks more like the *relative* autonomy argument. Further, Saxton holds that in our imperilled ecological era religion has become a serious hindrance to collective problem-solving. This is because its ‘definitive trait’ is giving priority to *believing* over *knowing*, thus providing ‘ideological armour for a politics of denial’ when it comes to the capitalistic ravaging of the planet (Saxton, 2006: 193). So, religion cannot be of trans-historical survival value after all, as Saxton otherwise implies; neither can it stand outside of epistemological evaluation in relation to science.

Dilemmas like Saxton’s are regularly encountered in other variants of what I term ‘expansive secularism’ (McLennan, 2019a), in which the small print tends to undercut the headline propositions. This is exemplified by William Connolly’s much-quoted title *Why I am not a Secularist* (1999). The pattern of thought here is that, while vicariously moved by the positivity of religious motivation and irked by secularist arrogance, the ‘expansives’ nonetheless remain quite firmly attached, in the final analysis, to this worldly, monistic, and time-bound conceptions of human life and society. In Connolly’s case, this is summarized as an ‘ironic evangelical atheism’, signalling ‘nontheistic gratitude for the ... plurivocity of being’ (Connolly, 1999: 159). In another expression (Ledewitz, 2008), an initial religion-envy predominates, such that secular values and practices are felt to need full-scale reanimation by immersion in the sanctifying element of holiness, paradigmatically furnished by religion. Yet the existence of the specific holy entities commanding traditional religious devotion is firmly, if respectfully, denied. In a third instance (Critchley, 2012), key Left ideals – democracy,

socialism, equality, justice – are considered viable only if viewed as possessing the same ‘supreme fiction’ status as the driving myths of religion itself. This is because such totalizing ideals make ‘infinite demands’ upon us that can only be pursued on the basis of ungroundable faith – the ‘faith of the faithless’. Yet quite apart from the question of whether such reflexive and busy academics would really respond infinitely to such militant demands, too many things, forces, and forms of ‘belief’ are being indiscriminately run together here. Faith *qua* hope for a more just and flourishing egalitarian future is patently not the same thing as faith in (for example) the perfect goodness, justice, and mercy of a superhuman being or force in whom we devoutly trust. The respective ontological backdrops are genuinely different, and this cannot but have significantly diverse epistemological, personal, and institutional consequences.

A final illustration of ‘relative autonomy’ strikes a more comparative sociological note. In his rendition of this, Gilbert Achcar (2008) notes that while Marxists have recognized the ‘incitement’ (protest) dimension of religion as well as its ‘expressive’ sense (i.e. expressive of dominant class interests), the emphasis has been on the latter. To get a better balance, Achcar suggests we need recourse to the Weberian idea of ‘elective affinity’ between religious ideas and their social context, albeit with a Marxian twist. Among other things, this emphasis on homology rather than reduction enables Achcar to recognize – as Engels did not, despite giving serious attention to religious ‘protest’ – that it is often precisely the *theology* that pushes these movements in a progressive utopian direction (just as, of course, the theology can prove reactionary). And neither of these outcomes can be taken as already ‘given’ in the socio-economic circumstances or struggles from which they arise.

Such breadth is salutary, but it requires that our metaphysical proclivities be set aside in the process of observation–analysis, and that they should not significantly affect our evaluations of what, in the politics of religion, is progressive or reactionary. Such ‘rules of method’ are not only difficult to follow, they are not obviously compelling, theoretically. It is very plausible, for example, to depict Marx as steadily losing the urge to dismiss religion in the name of atheism, and indeed moving on to a critique *of the critique* of religion towards a very different type of analytical focus – ‘the social emergence of different modes of “real abstraction”’ (Toscano, 2010). But Marx wavered little over the years in holding that religion lacked any *content* of its own, generating only ‘phantoms’, ‘sublimates’, and ‘witchery’. How could these opinions fail to inform his theoretical apparatus and political instincts? As for Weber, his sociologies of religions are more admirably researched and convincingly developed than is usually conceded by those who consider them riddled with Eurocentric bias. But the challenge that in important respects they are governed by Western secularist assumptions is substantial, just as comparative sociology itself (including its Marxian variants) can reasonably be considered to embody ‘methodological atheism’. The proper response to those challenges, it seems to me, needs to be

philosophical and normative as well as explanatory, taking responsibility for, rather than evasively minimizing, whatever underlying assumptions inflect the enquiry and argument.

ANTI-SECULARISM

It is worth underlining the extent to which secularism is felt, even among postsecular thinkers who do not seem especially religious, to require condemnation as well as reappraisal. One set of responses follows Taylor's quasi-Foucauldian suggestions that secularism is a 'productive' (and therefore 'exclusionary') social imaginary, not a neutral reflection of reality or 'science'; and that secular thought involves a drastic 'subtraction' of religion's rich variety of societal and personal resonance. This analysis cannot be assessed here (see McLennan, 2010b, 2019b), except to observe, in *tu quoque* fashion, that the degree of subtractionism being performed upon *secularism* in this literature is striking (for example, Calhoun et al., 2011). More relevant for our purposes is that the *postcolonial* critique of secularism overlaps with and amends the Taylorian intervention, to the effect that it is only in the Western, Christian tradition that a sharp distinction is instituted between religion and secularity, which on closer inspection turns into profound mutuality. Only in that geo-political context, the argument goes, and only when intellectual secularism becomes dominant, does the *singular* concept of 'religion' emerge as definitive, enabling religion to be understood as a matter of propositional *belief* rather than as material, collective, and cultural *practices*. The contents of 'faith' are then all-too-conveniently judged, negatively, in relation to modern non-religious cultures and rationalist theoretical systems. To that end, in modernist social theory (including Marxism and critical sociology) pre-modern societies (and numerous marginalized lifeworlds today) are schematized and stigmatized in terms of developmental *backwardness*, characterized by residual supernaturalism and effusive 'Durkheimian' ritual. The postcolonial response here is two-fold: that it is spurious to think of the Western understanding as lacking its *own* forms of metaphysical and political particularity/irrationality, and that its 'objective' categorizations rationalize real imperial-colonial violence.

Postcolonial thought and Marxism are far from fully congruent (for different angles on this, see Chibber, 2013 and Kaiwar, 2016). Yet Marxism's contemporary relevance depends significantly on hitting the right notes in this vital theoretical and political context. One way of pursuing this agenda summons up the figure of *The Postcolonial Gramsci* (Srivastava and Bhattacharya, 2012). As part of this project, Iain Chambers endorses the anti-secular theorizations of major postcolonial scholars Talal Asad and Gil Anidjar. Thus, Chambers argues that it is not religion as such, but specifically non-Western religious identities that are subject to heinous violence at the hands of authoritarian secularism. This is because the latter is *Christianity's* dependent offspring and active agent; it is

through secularism that Christianity itself continues to orchestrate and underpin the ‘unseen order’ of the West, in a crusade to domesticate the world. In that sense, secularism is saturated by specific religious values; it ‘doubles and disseminates’ the singular sense of historical time, worldly progress, and cultural privilege that have long marked out the imperality of Christianity itself, thus revealing, even now, the ‘ancient rhythms of a theological heartbeat’ (Chambers, 2012: 112, 117).

Gramsci is recruited to this line of argument for his awareness of the internal colonial texture of the Italian South, his grasp of the success of Catholicism in shaping common sense, and his theorization of the relationship between the coercive and educative functions of the state. Yet positioning Gramsci as being *against* political secularism as such – let alone philosophical secularity – is tenuous. Like Marx, Gramsci saw liberal secular modernity, though hugely flawed, as historically necessary, and in observing the popular appeal and local ways of working of the Catholic church, he was seeking a new model for the hegemonic practices of the Modern Prince, the Communist Party. If a more radiating vision were desperately needed than previous Marxist politics could provide, and if lessons could be learned from Catholicism in that regard, the resulting worldview envisaged by Gramsci was still in no sense substantively religious. In any case, Gramsci also admired the intellectual drive of *Protestantism*, seeing it as injecting a much needed *rationalist* consciousness into the complacent ritualistic-collectivist element of the Church. One way or another, Gramsci could be said to have had a fairly positive attitude to the historical potential of the Christian-secular package that Chambers fulminates against.

In more general terms, while postcolonial critiques of secularism (and of Marxism itself) are undeniably testing, no straight or convincing equivalence holds between the postcolonial and the postsecular (Robbins, 2013). When pressed too far, the result is simply a debilitating *essentialism*. In Chambers’ case, and reflecting the tone of much routinized academic postcolonialism, the sense of structural control and ideological saturation said to be produced by the Christo-secular ‘unseen order’ is so pervasive that the various negative associations that pepper the account congeal into a diabolical unitary amalgam: the West, the North, Occidental reason, Christianity, secularism, capitalism, individualism, racism, Islamophobia, progress, singular time, power, and biopolitics. In distinctly un-Gramscian fashion, the intellectual hegemony of the Christian-secular West comes across as nothing but coercive domination, with no significant nuances allowed – historic or emergent, conceptual or ideological – between and among secularism(s) and Christianities. Ironically, anti-secular Christian theologian John Milbank (2013) portrays the incessant, conspiratorial, under-cover operation of the ‘secular order’ itself in exactly this way. In a further theological echo, the only available subjectivities in Chambers’ scenario appear to be (Western) guilt and (postcolonial) grace, a Manichean divide more conducive to moralism than to politics. If it seems surprising to pull such

sophisticated postcolonial scholars under the heading of essentialism – something that their poststructuralist instincts might be assumed to resist – it is hard to view in any other way the supporting statements quoted by Chambers that ‘Christianity is in fact the name, acknowledged or not, of Occidental modernity and globalization’ (Chambers, 2012: 104; Anidjar, 2008: 40), and that ‘liberal violence ... is the violence of universalizing reason itself’ (Chambers, 2012: 111; Asad, 2003: 59).

A greater degree of ambivalence marks the reflections by Asad et al. (2013) when they pose the question (in which Marx is fully implicated): *Is Critique Secular?* On the one hand, critique is strenuously problematized, to say the least. A product of the European Enlightenment, critique is held to operate according to constitutive rhetorical ‘conceits’ whereby the ideologies being unmasked are necessarily taken to be irrational and heteronomous, with the critical standpoint doing the unmasking assumed to be governed only by the autonomous virtues of truth and rationality. In thus positioning itself – absurdly, disingenuously – above the socially situated determinations and ideological projects that no system of ideas can escape, Enlightenment critical reason occludes its complicity in the ideological project of Western (*Christian*) supremacism, the effect of which is the crushing of the religious cultures and social practices of non-Western peoples. As Wendy Brown summarizes in her introduction to the book, the operations of critique thus reflect the ‘religious shape and content of Western public life and its imperial designs’ (Asad et al., 2013: 4).

So far, so forceful – yet once again so essentialist, too. However, in the collective Preface to a later printing, a significantly different impression of this book’s purpose is given. The intention, we are told, was merely to ‘challenge the presumption that critique is necessarily secular’. This is not convincing, because originally it looked for all the world as though critique was being set up as *nothing but* secular-Christian-Western, and all the worse for that. The authors do not explain their change of tack, probably because a rather embarrassing paradox is involved: that their critique of critique shares the same rhetorical form as that of critique itself, deploying the very same ‘conceits’. Thus, the critical standpoint (this time postcolonial insight) is presumed and presented as epistemologically superior and absolute, while the object of critique (now Eurocentric critique itself) is denounced as heteronomous, irrational, ideological. This sets a conundrum for the postcolonial critics because they had argued that it was in large part precisely *because* critical reason possessed exactly that conceited structure that it was complicit in the coercive project of the West.

This is no logic-chopping matter. If the procedures and concepts of this kind of postcolonial critique depend, in their way, upon ‘secular-modernist’ forms of ideology-critique, then essentialist denunciations of ‘Western reason’ are inadequate, not to mention disingenuous (see Mufti, 2015 for a further engagement with Asad along these lines). Chambers quotes Edward Said as troubled, like Asad and Anidjar, by the continued ‘centrality of religious discourse’ to the

West, but Said's concern formed part of his broader judgement that 'it must be a major part of the humanistic vocation to keep a fully rounded secular perspective' (2004: 51).

RELIGIONIZATION

The question then arises: has the time come for a more openly religious Marxism? One form taken by this prospect is what we might call 'compatibilism'. Prominent over the years in various 'dialogues' between Marxism and Christianity, and in the thematics of the later Frankfurt School and Walter Benjamin, this option is perhaps most clearly delineated by Austro-Marxist Max Adler. Adler felt that Marxism's distinctive contribution was as historical social science, a purely secular enterprise geared to causal analysis, with causality in human-historical matters understood as streamed in complex ways through human consciousness. Marxism for Adler was essentially a non-reductionist empirical *sociology* (Adler, in Bottomore and Goode, 1978). As such, it should *not* be expected to deliver an all-encompassing human vision or to fuel all the fires of subjective life. Developing this neo-Kantian conception, Adler criticized the Hegelian and Feuerbachian elements in Marx's thought as responsible for the fatal over-reach of 'dialectical materialism' as a stand-alone philosophy. The alternative was to recognize the limits as well as the necessity of scientific understanding, foregrounding the synthesizing capacity of the human conscience in giving direction to the personality as it shapes up to questions of death, destiny, and perhaps even redemption (Ridolfi, 2011). It was not contrary to Marxism, then, to regard our political and ethical commitments to socialism as motivated by a religious spirit.

Adler's compatibilism did not amount to the kind of cognitive dualism that some philosophers (for example, Scruton, 2014) consider definitive of modern religion. As McLellan noted, Adler's conception of *both* Marxism and religion was 'rather thin', the latter being barely distinguishable from – and described by Adler himself as – a sympathetic 'philosophy of belief' (McLellan, 1987: 88–89). We might say that Adler was a postsecularist *avant la lettre* – concerned to give both Marxism and religion their due, yet reluctant to affirm the actuality of God(s), instead construing ultimate meaning as a matter of existential and ethical choice.

In Therborn's (2008) survey of the Left's theological turn, Terry Eagleton was identified as a notable figure, and his style of compatibilism echoes Adler, up to a point. Thus, in *Why Marx Was Right* (2011) Eagleton re-endorses the validity of Marx's dissection of capitalism and his shredding of its assorted theoretical apologetics. Marx also gave us the tools for grasping why Stalinism was not communism, and for understanding the centrality of class struggle in history, at least in turbulent periods of social transition. At the same time, Eagleton counsels us

against looking to Marx for our metaphysics and morals, because Marx was not in the business of producing a Theory of Everything. In particular, he was almost silent on questions of love, death, and the meaning of life, and was not even much interested in the future (so Utopians should look elsewhere). Yes, Marx was an atheist, a (sensuous) materialist, and a secularist of sorts, but he left plenty of room – and no specific instructions – for spiritual flourishing, artistic creativity, and the work of ideas. Marx would not necessarily be embarrassed, it follows, if our deepest thoughts and hopes were still to be sourced from religion.

In other writings, Eagleton moves towards a thicker religionism, not least in his heavy-handed attempt to crush the New Atheists, aka ‘Ditchkins’ (Eagleton, 2009). *Culture and the Death of God* (Eagleton, 2014) is more considered, sweeping through the paradigms of modern European thought to indicate how the authority of religion, after its ostensible demise, got distributed among secular forms and concepts – Enlightenment reason, philosophical idealism, Romanticism, culture, humanity, art, nature, nationalism, ‘death of God’ atheism, postmodernism. Eagleton’s punchline is never far from the surface: these ideas and isms are but ‘viceroys for God’, shouldering religion’s offices. Put more interestingly, the point is that despite these challenging interventions, an inexplicable ‘striving for the infinite’ persists, sharpening the difficulty faced by all secular perspectives, namely ‘how not to bleach the world of inherent value’. Secularists need not disagree with this, provided Eagleton in turn recognizes that secular systems of thought do have ‘proper business’ of their own and are significant ‘in their own right’ (2014: 44–7, 96, 174). The problem is, however, that no sooner has Eagleton granted that degree of relative autonomy than he snatches it back in a series of newly reductive formulations: that secular thought is nothing but ‘counterfeit theology’, a clandestine agent for religion, a God-substitute. Equally beyond debate, it seems, is the assertion that *only* (Christian) religion can do ‘justice to the symbolic and affective dimensions of social existence’ and *only* religion can fulfil both emotional commitment and solidarity with the powerless (Eagleton, 2014: 161, 208).

Eagleton’s keynote quip is that ‘culture is a secular name for God’ (2014: 77), but he pays no attention to the converse proposition that God might be a religious name for human culture. Similarly, he allots to religion proprietary rights over ‘image, ritual and narrative’ but fails to tackle the obvious rejoinder that religions do not monopolize these resources, something that becomes increasingly apparent as we move ever further away from the social and political lifeworlds whose product was monotheism. When it comes to God’s existence, Eagleton accuses rationalists of a category mistake in treating this as an empirical and causal proposition. Thus, instead of either the forgiving paternal Noboddady or productive ‘mega-manufacturer’, God should be regarded as a creative artist and the ‘reason there is something rather than nothing’ (Eagleton, 2009: 7–8, 111, 2014: 208). But these contrived witticisms plainly fail to dispel questions about the actuality of the being with superhuman qualities, however we choose to paint them.

For Eagleton, Marxism is not a substitute religion. It only – though indispensably – demonstrates that all human and spiritual life has a material basis and takes political expression. He reminds us that Marx was wise to the follies of hubristic humanism, positivistic scientism, and other naïve secularist shibboleths. Plus, there are affinities between his vision of history and Christian theology itself; if Marx were indeed an unbeliever, his atheism could be said to be both incomplete and inauthentic (Eagleton, 2014: 90, 161). Eagleton's tortuous fideism, then, does not stretch to fully religionizing Marxism itself; neither does it aim completely to ground and dictate the specifically political dimension of socialist ideas.

Can a stronger rationale for 'religionizing' Marxism be given, providing a new fusion of subjective intensity and metaphysical reach that might mend the broken triangle? Jolyon Agar's *Post-secularism, Realism and Utopia* (2013) aspires to this ideal. According to him, Marxism only has itself to blame for becoming irrelevant to people struggling for progressive causes, many of whom find succour and inspiration in religion instead. This is because Marxism has drifted out of the *warmstream* of transformative vision into the *coldstream* of secularism and scientism. There may be moments in the tradition when religion is *not* treated as delusional and irrational, but these are rare. And now there is a choice to be made between, in Agar's jargon, *immanent* postsecularism and the full embrace of transcendence that is definitive of *meta*-postsecularism. While the former is held to represent a significant improvement on vulgar secularism, it is the latter that stands as the condition of Left spiritual renewal. To that end, Agar draws out of Hegel, Ernst Bloch, and Roy Bhaskar a conception of deep reality that speaks to the utopian dimension of human self-consciousness. He urges us to see that religion contains many of the 'most sublime imaginings of utopia' and that, together, utopianism and religion represent 'the richest expressions of the search for depth meaning' (Agar, 2013: 3).

Some sceptical observations can give a further flavour of this line of thought. One question is whether it is appropriate to tailor *ontological* considerations so closely to *normative* concerns and pre-critical assumptions. For example, Agar's starting point is that we humans constantly yearn after transcendence, meta-Reality, and meta-utopia. But this (contentious) understanding and terminology are taken as basic premises rather than things to be established. Agar further advises that 'we should have confidence in our ability as a species to invent qualitatively new forms of humanity', a largely ethical and political injunction, but one that – following Bloch – is supposed to indicate how future-orientation and nature-overturning are among most essential features of Being itself, thus giving Utopianism a head-start, courtesy of the fundamental constitution of reality. This manner of philosophizing is characteristically *stipulative and teleological* rather than analytical and exploratory. As with aspects of Bhaskar's philosophical realism even before his declared 'spiritual turn' in *From East to West* (2000), the discourse progressively becomes tedious and uninteresting due to the *a priori*,

self-confirming way that the designated levels of being and consciousness are presented as securing whatever level of Necessity seems to be required.

As it happens, Agar finally vacillates when it comes to clinching the specifically *religious* element of each of his selected thinkers' perspectives. For example, he commends Bloch's general search for an atheistic Marxist religious ontology, deciding that its most obviously transcendent aspects are too anthropomorphic and indeed over-ontologized from the outset. Thus, Agar endorses Bloch's notion of Penultimate Hope, rendered as the power of 'human desire and consciousness of a perfected form of existence', but he declines the higher idea with which Bloch himself paired it, Ultimate Hope. This is because Bloch overblew the latter as the primary emergent property of matter itself, such that all things, life-forms and processes 'move towards the light', drawn up by the magnet that is humanity's Not-Yet. Agar is right to balk at this kind of hyperbolic over-writing of science, of which there are many instances in Bloch, such as the idea that sub-atomic physics might be seen as 'the delivery and mediation of the creations slumbering in the womb of nature ... the most concrete aspect of concrete utopia' (Agar, 2013: 199–205). Agar thus backs off from his initial demand for a thoroughly transcendental imperative, because 'even in the warmer waters there is only scope for immanent utopia at best' (2013: 201).

THEOLOGISM

In the theoretical and moral climate in the last category that I want to propose, 'theologism' is distinctly 'cooler' in Blochian terms than in 'religionization'. For example, in their exchange around *The Monstrosity of Christ*, Slavoj Žižek and John Milbank (2009) show a sense of detached argumentative protocol and mutual respect that neither figure normally offers to others. Some elementary disputation takes place between them about the status of God, Christ, and Saint Paul, followed by an emergent commonality concerning belief in (proper, theologically focused) *belief*. A certain sense of Christian fundamentalism, they jointly hold, is completely necessary for truly radical anti-capitalist politics, and to keep bleaker fundamentalisms at bay. By comparison, postmodern-postsecular reflexivity is deemed philosophically and politically spineless. Milbank probably wins this debate by default because he is a theologian as conventionally understood, his erudition entirely geared to producing a seamless religious view ('Radical Orthodoxy') of the meaning of all existence and all history. By contrast, Žižek's Hegelian-Lacanian ontology countenances *no* ultimate holism. For him, the Real, as embroiled with subjectivity, is intrinsically torn, blocked, doubled, and gapped, the desiring subject forever failing to secure stability of identity or spiritual satisfaction. Any variant or deputy of the impossible Big Other, including God, necessarily slithers out of capture. Nonetheless, Christian theology is instructive and even directive for the sort of faithful, fearless communist

militancy that Žižek wants to resuscitate, so his approach to Marxism and religion can be classed as ‘theologism’ rather than ‘religionization’.

The contemporary scholar who best exemplifies theologism is Roland Boer, whose multi-volume series on Marxism and theology is the most systematic undertaken (Boer, 2007–14). Boer presents his project chiefly as a matter of ‘intimate commentary’, but this underplays the active theorizing that takes place throughout his coverage of some 30 Marxists and quasi-Marxists. By itself, the typology introduced in the first volume of the series, *Criticism of Heaven* (2007), represents a significant contribution, Boer distributing his cast of thinkers into biblical allegorism (Bloch, Benjamin), Catholic ‘ecclesiology’ (Althusser, Gramsci, Lefebvre), and the new ‘Protestant turn’ marked by a ‘materialist theology of grace’ (Badiou, Žižek). Adorno also fits this box to an extent, but Boer utilizes Adorno’s stance of ‘theological suspicion’ to define and evaluate *all* the positions under examination.

In the volume devoted to Marx and Engels, Boer (2012) points up the founders’ divergent views and sensibilities. Certainly, Marx was harsh on religion, but he was far more than a merciless debunker. From the early work through to *Capital*, Marx’s thinking was itself shot through with theological influences and inferences, not least his stage-by-stage deployment of Feuerbachian ‘inversion’ (Boer insists that Feuerbach was fully a theologian, even or especially in his absolute humanism). In that vein, Marx consistently inhabits the motif whereby, sequentially, labour, money, property, the commodity, and the value form give structure to modern capitalism through the ‘religious’ mechanism that projects concrete human, social relationships, and activities into fantastical, fetishized, and alienated forms, thereby securing a mesmerizing hold over both subjectivity and politics. Boer argues that it is quite wrong to think of these forms as merely illusory or superstructural – their embeddedness and effects are entirely material and *real*. Thus, Boer reads Marx as demonstrating that the way capitalism deeply works is, definitively, *theological*. By the same token, the theoretical *exposure* of the mechanisms of capital, and our practical emancipation from them, are theological too, being a materialist variant of the critique of idolatry.

Boer reiterates that he is *not* seeking to show that Marxists are religious at heart, or that Marxism is nothing other than theology in secular guise. Rather, he wants to establish that Marxist thinkers have produced an extensive archive of engagement with theology, genuinely struggling with their own ambivalence towards it – a hallmark, Boer thinks, of theological reflection. To relieve anxiety on this score, Boer makes clear – especially in the final volume of the series, *In the Vale of Tears* (2014) – his heterodox understanding of Christian theology: that it is radically internally conflicted; that it goes well beyond deliberation on God and the elucidation of divinity; that it does not even require belief in God; that its orientating concepts (faith, love, suffering, charity, redemption) are essentially contestable; and that ‘protest atheism’ must be one of its core components.

Boer’s panoply of reversals is intriguing and his commentaries are impressively thorough. However, unless we conclude – surely plausibly – that this way

of thinking is not really theological at all, it is theology *rather than* Marxism that finally emerges as the dominant partner in the relationship. In particular, the (openly acknowledged) Lutheran residue in Boer gives priority to *grace* – whether specifically God’s or somehow materialistically schematized – as the force that arbitrates between fate and agency, something that defies translation into any merely human terms. Boer looks to Alain Badiou’s politics and metaphysics for Marxist credentials here, but this only compounds the problem, because Badiou’s philosophy of Truth and Event, contrived from a Platonistic understanding of set-theory mathematics, is astringently anti-contextualist. At this rarefied level, historical materialism has little relevance.

A further indication of Boer’s overarching idealism is his treatment of both religion and Marxism in terms of *myths and mythologies*, in effect ‘stories to live by’. Leaning on Bloch, Boer conceptualizes myths as Janus-faced, simultaneously containing both reactionary and emancipatory potentials, thus requiring ‘a decent dose of discernment’ to distinguish the ‘moments of rebellion’ in myth from the ‘moments of repression’ (Boer, 2014: 82–4). In taking us through this, Boer never seriously confronts the problem of how such discernment of myth – deciding what is ‘genuinely’ utopian – could be anything other than a matter of subjective interpretation, even if glossed in strenuous ‘political’ terms. Boer’s response to that complaint appears to be that in the final analysis the distinction between truth/reality and imagination/fable is impossible to sustain. In support, he once again pulls in Badiou, this time flagging up the French thinker’s *failure* to demonstrate, except by fiat, how objective Truth as reflected in fidelity to genuine Events differs from misguided adherence to the significance of pseudo-Events. But instead of rooting out Badiou’s own thoroughgoing idealism in that regard – on the grounds that Badiou’s theorization of Truth in terms of *fidelity* is misconceived – Boer pushes towards a more consistent subjectivism: in matters of fidelity to Events, truth is very much in the eyes of the beholder, governed by the value structures of the myths by which we are guided, and their scenarios of redemption.

CONCLUSION: THE MATTER OF SCIENCE
